# SNx4LVC74A Dual Positive-Edge-Triggered D-Type Flip-Flops With Clear and Preset

## 1 Features

- Operate from 1.65V to 3.6V
- Inputs accept voltages to 5.5V
- Maximum $t_{pd}$ of 5.2ns at 3.3V
- Typical $V_{OLP}$ (output ground bounce) <0.8V at $V_{CC}$ = 3.3V, $T_A$ = 25°C
- Typical $V_{OHV}$ (output $V_{OH}$ undershoot) >2V at $V_{CC}$ = 3.3V, $T_A$ = 25°C
- Latch-up performance exceeds 250mA per JESD 17
- ESD protection exceeds JESD 22
  - 2000V human-body model (A114-A)
  - 1000V charged-device model (C101)

## 2 Applications

- Servers
- Medical, Healthcare, and Fitness
- Telecom Infrastructures
- TVs, Set-Top Boxes, and Audio
- Test and Measurement
- Industrial Transport
- Wireless Infrastructure
- Enterprise Switching
- Motor Drives
- Factory Automation and Control

## 3 Description

The SNx4LVC74A devices integrate two positive-edge triggered D-type flip-flops in one convenient device.

The SN54LVC74A is designed for 2.7V to 3.6V $V_{CC}$ operation, and the SN74LVC74A is designed for 1.65V to 3.6V $V_{CC}$ operation.

## 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

| | | MIN | MAX | UNIT |
|---|---|---|---|---|
| Supply voltage, $V_{CC}$ | | –0.5 | 6.5 | V |
| Input voltage, $V_I$ (2) | | –0.5 | 6.5 | V |
| Output voltage, $V_O$ (2) (3) | | –0.5 | $V_{CC}$ + 0.5 | V |
| Input clamp current, $I_{IK}$ | $V_I$ < 0 | | –50 | mA |
| Output clamp current, $I_{OK}$ | $V_O$ < 0 | | –50 | mA |
| Continuous output current, $I_O$ | | | ±50 | mA |
| Continuous current through $V_{CC}$ or GND | | | ±100 | mA |
| Storage temperature, $T_{stg}$ | | –65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
(3) The value of $V_{CC}$ is provided in *Recommended Operating Conditions* .

## 5.2 ESD Ratings

| | | | VALUE | UNIT |
|---|---|---|---|---|
| $V_{(ESD)}$ | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1) | ±2000 | V |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101(2) | ±1000 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6 Parameter Measurement Information

Phase relationships between waveforms were chosen arbitrarily for the examples listed in the following table. All input pulses are supplied by generators having the following characteristics: PRR ≤ 1MHz, $Z_O$ = 50Ω, $t_t$ ≤ 2.5ns.

The outputs are measured individually with one input transition per measurement.

| $V_{CC}$ | $V_t$ | $R_L$ | $C_L$ | ΔV |
|---|---|---|---|---|
| 1.8V ± 0.15V | $V_{CC}$/2 | 1kΩ | 30pF | 0.15V |

# 7 Detailed Description

## 7.1 Overview

The SNx4LVC74A devices feature two independent positive-edge triggered D flip-flops. Integrated preset ( $\overline{PRE}$) and clear ( $\overline{CLR}$) functions allow for easy setup and control during operation.

The SN54LVC74A device is specified from –55°C to 125°C, and the SN74LVC74A device is specified from –40°C to 125°C.

A low level at the preset ( $\overline{PRE}$) or clear ( $\overline{CLR}$) inputs sets or resets the outputs, regardless of the levels of the other inputs. When $\overline{PRE}$ and $\overline{CLR}$ are inactive (high), data at the data (D) input meeting the setup time requirements is transferred to the outputs on the positive-going edge of the clock pulse. Clock triggering occurs at a voltage level and is not directly related to the rise time of the clock pulse. Following the hold-time interval, data at the D input can be changed without affecting the levels at the outputs.

The data I/Os and control inputs are overvoltage tolerant. This feature allows the use of these devices for down-translation in a mixed-voltage environment.

## 7.3 Feature Description

A low level at the preset ( $\overline{PRE}$) or clear ( $\overline{CLR}$) inputs sets or resets the outputs, regardless of the levels of the other inputs. # 8 Application and Implementation

**Note**

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

A common application for the SN74LVC74A is a frequency divider. By connecting the $\overline{Q}$ output to the D input, the Q output toggles states on each positive edge of the incoming clock signal. Because it takes two positive edges, or two clock pulses, to complete one complete pulse on the output (one pulse to toggle from low to high, another to toggle from high to low), the incoming clock frequency is effectively divided by two.

## 8.2 Typical Application

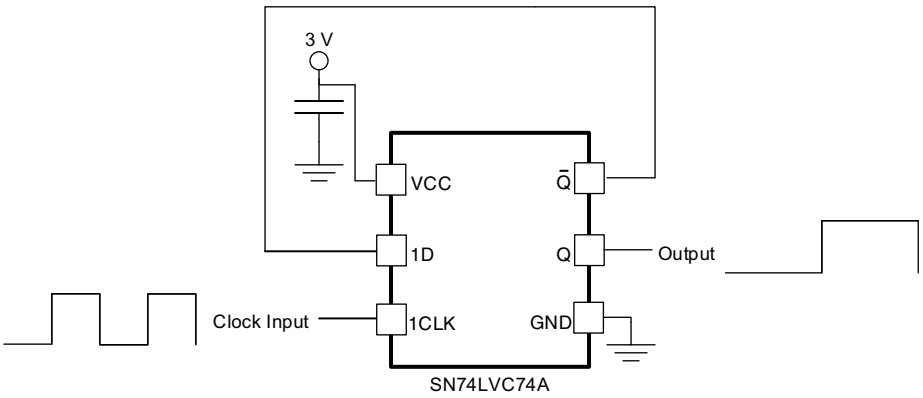

**Figure 8-1. Frequency Divider**

### *8.2.1 Design Requirements*

This device uses CMOS technology and has balanced output drive. Avoid bus contention because it can drive currents in excess of maximum limits. The high drive also creates fast edges into light loads, so consider routing and load conditions to prevent ringing.

### *8.2.2 Detailed Design Procedure*

1. Recommended input conditions:
   - For rise time and fall time specification, see ($\Delta t/\Delta V$) in *Recommended Operating Conditions*.
   - For specified high and low levels, see ($V_{IH}$ and $V_{IL}$) in *Recommended Operating Conditions*.
   - Inputs are overvoltage tolerant allowing them to go as high as ($V_I$ max) in *Recommended Operating Conditions* at any valid $V_{CC}$.
2. Recommended maximum output conditions:

- Load currents must not exceed ($I_O$ max) per output and must not exceed (Continuous current through $V_{CC}$ or GND) total current for the part. These limits are located in *Absolute Maximum Ratings*.
- Outputs must not be pulled above $V_{CC}$.

### 8.2.3 Application Curves

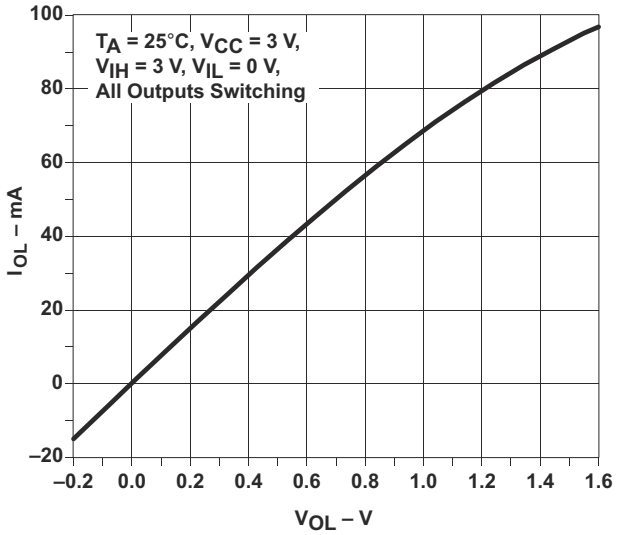

**Figure 8-2. Output Drive Current ($I_{OL}$) vs LOW-level Output Voltage ($V_{OL}$)**

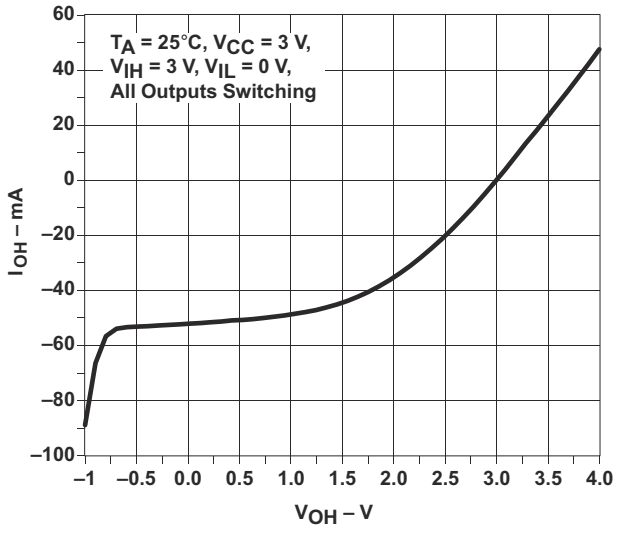

**Figure 8-3. Output Drive Current ($I_{OH}$) vs HIGH-level Output Voltage ($V_{OH}$)**

## 8.3 Power Supply Recommendations

The power supply may be any voltage between the minimum and maximum supply voltage rating located in *Recommended Operating Conditions* .

Each $V_{CC}$ terminal must have a good bypass capacitor to prevent power disturbance. A 0.1-µF capacitor is recommended for devices with a single supply. If there are multiple $V_{CC}$ terminals, then 0.01-µF or 0.022-µF capacitors are recommended for each power terminal. It is permissible to parallel multiple bypass capacitors to reject different frequencies of noise. Multiple bypass capacitors may be paralleled to reject different frequencies of noise. The bypass capacitor must be installed as close to the power terminal as possible for the best results.

## 8.4 Layout

### 8.4.1 Layout Guidelines

Inputs must not float when using multiple bit logic devices. In many cases, functions or parts of functions of digital logic devices are unused. Some examples include situations when only two inputs of a triple-input AND gate are used, or when only 3 of the 4-buffer gates are used. Such input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states.

Specified in Figure 8-4 are rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, they are tied to GND or $V_{CC}$, whichever makes more sense or is more convenient.

## 9.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

## 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

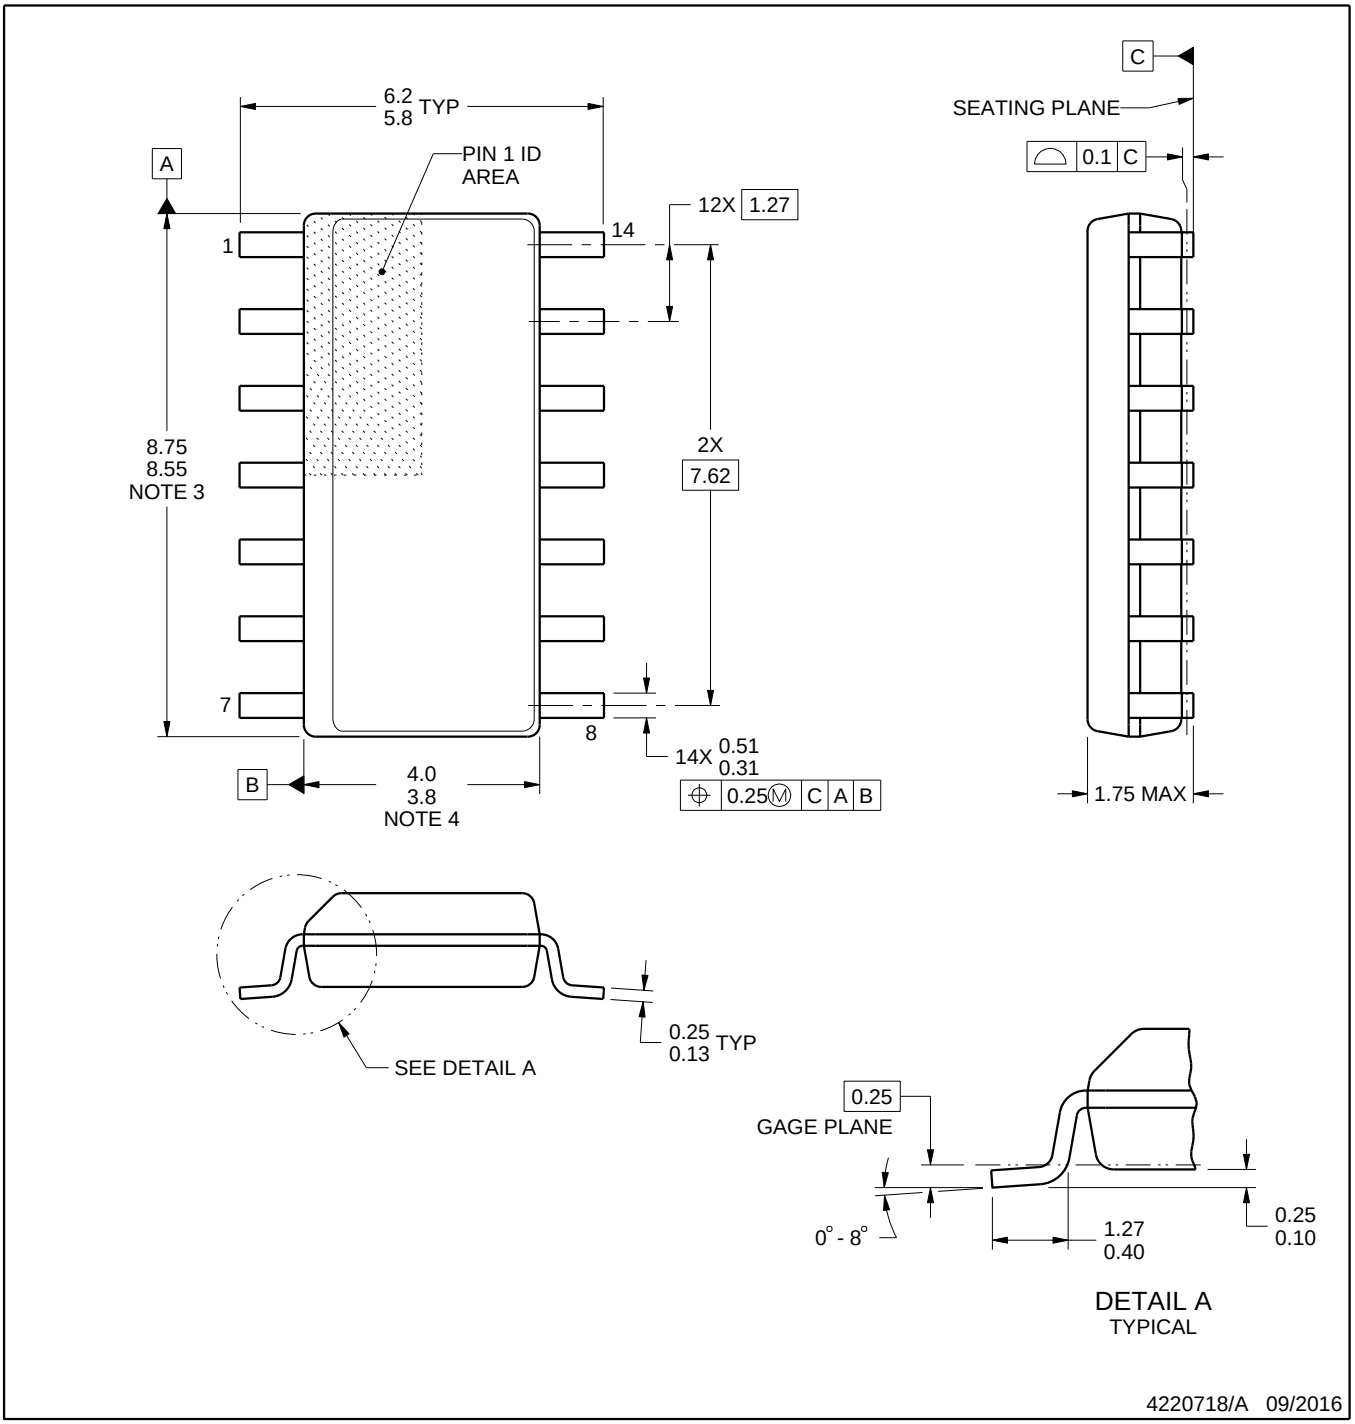
## D0014A

## SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT



NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm, per side.
5. Reference JEDEC registration MS-012, variation AB.
