

TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

TC9412AP, TC9412AF, TC9413AP

ELECTRONIC VOLUME CONTROL

The TC9412AP, TC9412AF, TC9413AP are electronic volume control ICs developed for use in home stereos and other audio equipment.

Using serial data input from external sources, it controls the sound volume, balance and loudness circuits.

FEATURES

- Sound volume can be controlled in 62 steps from 0 to 78dB or up to an infinite level in 1 or 2dB increments.
- Incorporating two channels of volume control circuits, the device allows independent volume control : therefore, it also provides the balancing function.
- A loudness circuit (20dB tap) is built in TC9412AP and TC9412AF.
- Can operate with a single or dual power supplies.
- Can control up to 4 chips on the same bus by using chip select input.
- Thanks to its polysilicon resistor, the device allows you to configure a low-distortion, high-performance volume control system.

DEVICE OPERATION**1. Setting up volume value (amount of attenuation)**

Serial data consisting of 13 bits is used to set a volume value.

- Data format

- 1) The bits "L" and "R" respectively are the left- and right-channel select data.
The left-channel volume is set when L = 1 : the right-channel volume is set when R = 1.
(L = R = 1 are set simultaneously.)
- 2) The bit "LD" is the loudness setup data. Loudness is turned on when LD = 1.
(This only applies to the TC9412AP and TC9412AF. Set this bit to "0" for the TC9413AP.)

3) The bits "D1" through "D6" are the volume setup data. For details, see the tables below.

EXAMPLE OF APPLICATION CIRCUIT (TC9412AP)

* Used to prevent noise when loudness control is turned on or off. $R = 220 \sim 470k\Omega$

(Note) Since a high-frequency digital signal is input to the CK, DATA and STB pins, corrective measures must be taken to prevent it from getting mixed in the analog circuit to generate noise by, for example, guarding the above signal lines with ground patterns or using shielding wire for these lines.
