

NCP571, NCV571

Voltage Regulator - CMOS, Low I_q, Low Output

150 mA

The NCP571 series of fixed output low dropout linear regulators are designed for handheld communication equipment and portable battery powered applications which require low quiescent current. The NCP571 series features an ultra-low quiescent current of 4.0 μ A. Each device contains a voltage reference unit, an error amplifier, a PMOS power transistor, resistors for setting output voltage, current limit, and temperature limit protection circuits.

The NCP571 has been designed to be used with low cost ceramic capacitors and requires a minimum output capacitor of 0.1 μ F. The device is housed in the TSOP-5 or DFN6 surface mount package. Standard voltage versions are 0.8 V, 0.9 V, 1.0 V and 1.2 V.

Features

- Low Quiescent Current of 4.0 μ A Typical
- Maximum Operating Voltage of 12 V
- Low Output Voltage Option down to 0.8 V
- High Accuracy Output Voltage of 3.0%
- Industrial Temperature Range of -40°C to $+85^{\circ}\text{C}$ (NCV571, $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$)
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

Typical Applications

- Battery Powered Instruments
- Hand-Held Instruments
- Camcorders and Cameras

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

NCP571, NCV571

PIN CONNECTIONS

PIN FUNCTION DESCRIPTION

DFN6	TSOP-5	Pin Name	Description
1	5	V_{out}	Regulated output voltage.
2	4	NC	No Internal Connection. It is recommended to connect this pin to GND potential.
3	2	GND	Power supply ground.
4	3	Enable	This input is used to place the device into low-power standby. When this input is pulled low, the device is disabled. If this function is not used, Enable pin should be connected to V_{in} .
5	–	NC	No Internal Connection. It is recommended to connect this pin to GND potential.
6	1	V_{in}	Positive power supply input voltage.
EP	–	EP	No Internal Connection. It is recommended to connect this pin to GND potential.

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage	V_{in}	0 to 12	V
Enable Voltage	V_{EN}	-0.3 to $V_{in} + 0.3$	V
Output Voltage	V_{out}	-0.3 to $V_{in} + 0.3$	V
Power Dissipation	P_D	Internally Limited	W
Operating Junction Temperature	T_J	+150	°C
Operating Ambient Temperature	T_A	–40 to +85 –40 to +125	°C
Storage Temperature	T_{stg}	–55 to +150	°C
ESD Capability, Human Body Model (Note 1)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 1)	ESD_{MM}	200	V
ESD Capability, Charged Device Model (Note 1)	ESD_{CDM}	1000	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- This device series contains ESD protection and exceeds the following tests:
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
 ESD Charged Device Model tested per EIA/JES D22/C101, Field Induced Charge Model (Jedec Standard)
- Latchup capability (85°C) ± 100 mA DC with trigger voltage.

THERMAL CHARACTERISTICS

Rating	Symbol	Test Conditions	Typical Value	Unit
Junction-to-Ambient	$R_{\theta JA}$	1 oz Copper Thickness, 100 mm ²	250	°C/W
PSIJ-Lead 2	Ψ_{J-L2}	1 oz Copper Thickness, 100 mm ²	68	°C/W
Junction-to-Ambient	$R_{\theta JA}$	1 oz Copper Thickness, 100 mm ²	190	°C/W
PSIJ-Lead 2	Ψ_{J-L2}	1 oz Copper Thickness, 100 mm ²	84	°C/W

NOTE: Single component mounted on an 80 x 80 x 1.5 mm FR4 PCB with stated copper head spreading area. Using the following boundary conditions as stated in EIA/JESD 51-1, 2, 3, 7, 12.

		-	-	0.3	
Output Short Circuit Current ($V_{out} = 0\text{ V}$) (Note 4)	$I_{out(max)}$				mA
0.8 V ($V_{in} = 3.0\text{ V}$)		160	260	600	
0.9 V ($V_{in} = 3.0\text{ V}$)		160	260	600	
1.0 V ($V_{in} = 3.0\text{ V}$)		160	260	600	
1.2 V ($V_{in} = 3.0\text{ V}$)		160	260	600	

3. Maximum package power dissipation limits must be observed.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

4. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.

NCP571, NCV571

5. NCP571 $T_{low} = -40^{\circ}\text{C}$ $T_{high} = +85^{\circ}\text{C}$
 NCV571 $T_{low} = -40^{\circ}\text{C}$ $T_{high} = +125^{\circ}\text{C}$.

APPLICATIONS INFORMATION

A typical application circuit for the NCP571 series is shown in Figure 2.

Input Decoupling (C1)

A 0.1 μF capacitor either ceramic or tantalum is recommended and should be connected close to the NCP571 package. Higher values and lower ESR will improve the overall line transient response.

Output Decoupling (C2)

The NCP571 is a stable Regulator and does not require any specific Equivalent Series Resistance (ESR) or a minimum output current. Capacitors exhibiting ESRs ranging from a few $\text{m}\Omega$ up to $3.0\ \Omega$ can thus safely be used. The minimum decoupling value is 0.1 μF and can be augmented to fulfill stringent load transient requirements. The regulator accepts ceramic chip capacitors as well as tantalum devices. Larger output capacitors can be used

without fear of instabilities. Larger values improve noise rejection and load regulation transient response.

Enable Operation

The enable pin will turn on or off the regulator. These limits of threshold are covered in the electrical specification section of this data sheet. If the enable is not used then the pin should be connected to V_{in} . It is not recommended to leave this pin on air. In case the voltage of Enable signal is higher than Input voltage of NCP571 device it is necessary add an resistor divider in order to keep voltage at Enable pin below Input voltage. A single gate device of VHC family could be used for this logic level translation. The NL17SZ06 device could be chosen for non inverting open-drain buffer as shown in Figure 19. Other possibility is using NL17SZ16 device as shown in Figure 20. More information is mentioned in Application Note AND8101/D.

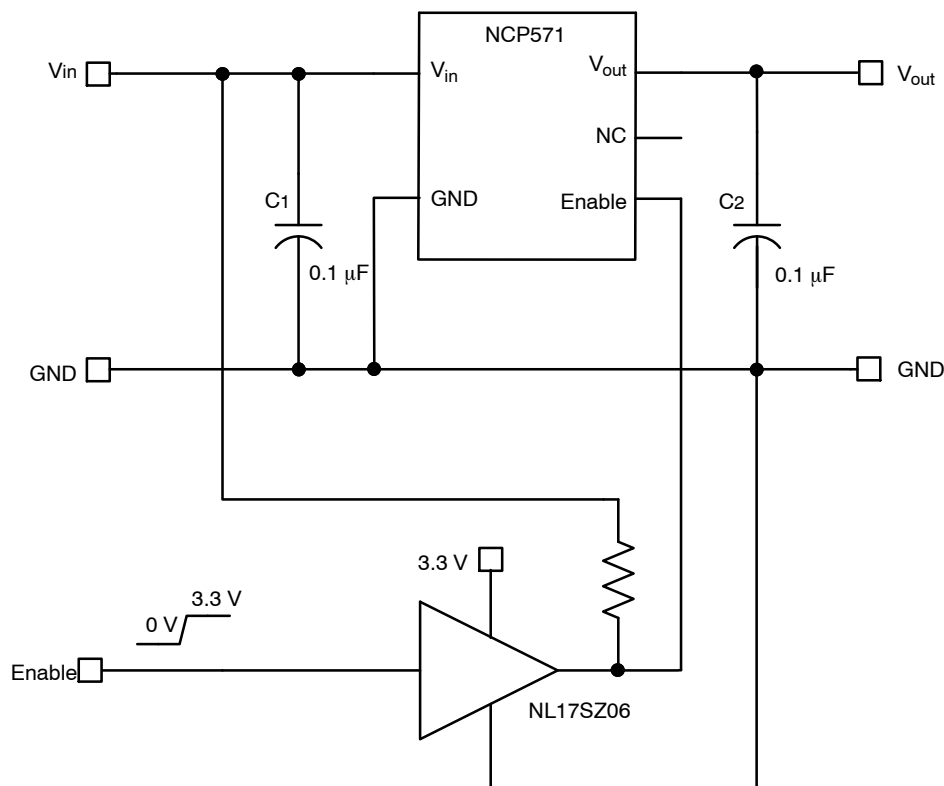

Figure 19.

NCP571, NCV571

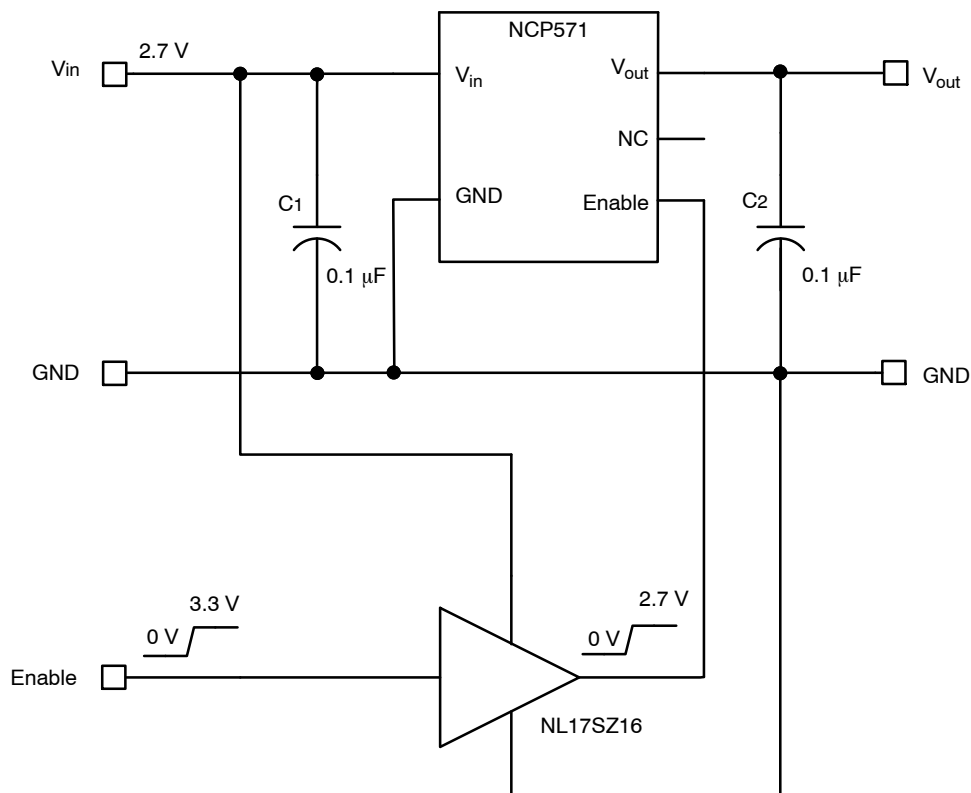

Figure 20.

Hints

Please be sure the V_{in} and GND lines are sufficiently wide. When the impedance of these lines is high, there is a chance to pick up noise or cause the regulator to malfunction.

Set external components, especially the output capacitor, as close as possible to the circuit, and make leads as short as possible.

Thermal

As power across the NCP571 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature effect the rate of temperature rise for the part. This is stating that when the NCP571 has good thermal

conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

The maximum dissipation the package can handle is given by:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

If junction temperature is not allowed above the maximum 125°C, then the NCP571 can dissipate up to 400 mW @ 25°C.

The power dissipated by the NCP571 can be calculated from the following equation:

$$P_{tot} = V_{in(max)}(I_{GND} + I_{out}) - V_{out} * I_{out}$$

If a 150 mA output current is needed then the ground current from the data sheet is 4.0 μA.
