

Features

- 2.5 V or 3.3 V operation
- Split output bank power supplies
- Output frequency range: 6 MHz to 200 MHz
- 50 ps typical matched-pair output-output skew
- 50 ps typical cycle-cycle jitter
- 49.5 / 50.5% typical output duty cycle
- Selectable output drive strength
- Selectable positive or negative edge synchronization
- Eight LVTTL outputs driving 50Ω terminated lines
- LVCMS / LVTTL overvoltage tolerant reference input
- Phase adjustments in 625 / 1250 ps steps up to ± 7.5 ns
- $2\times$, $4\times$ multiply and $(1/2)\times$, $(1/4)\times$ divide ratios
- Spread spectrum compatible
- Industrial temperature range: -40 °C to $+85$ °C
- 32-pin TQFP package

Description

The CY7B9950 RoboClock® is a low voltage, low power, eight-output, 200 MHz clock driver. It features output phase programmability which is necessary to optimize the clock tree design of high performance computer and communication systems.

The user can program the phase of the output banks through $nF[0:1]$ pins. The adjustable phase feature enables the user to skew the outputs to lead or lag the reference clock. Any one of the outputs can be connected to the feedback input to achieve different reference frequency multiplications, divide ratios, and zero input-output delay.

The device also features split output bank power supplies, which enable the user to run two banks (1Qn and 2Qn) at a power supply level different from that of the other two banks (3Qn and 4Qn). Additionally, the three-level PE/HD pin controls the synchronization of the output signals to either the rising or falling edge of the reference clock and selects the drive strength of the output buffers. The high drive option (PE/HD = MID) increases the output current from ± 12 mA to ± 24 mA(3.3 V).

Pin Definitions

Pin	Name	I/O ^[1]	Type	Description
29	REF	I	LVTTL / LVCMOS	Reference clock input.
13	FB	I	LVTTL	Feedback input.
27	TEST	I	Three-level	When MID or HIGH, disables PLL ^[2] . REF goes to outputs of Bank 1 and Bank 2. REF also goes to outputs of Bank 3 and Bank 4 through output dividers K and M. Set LOW for normal operation.
22	sOE#	I, PD	Two-level	Synchronous output enable. When HIGH, it stops clock outputs (except 2Q0 and 2Q1) in a Low state (for PE = H or M) – 2Q0, and 2Q1 may be used as the feedback signal to maintain phase lock. When test is held at MID level and sOE# is HIGH, the nF[1:0] pins act as output disable controls for individual banks when nF[1:0] = LL. Set sOE# Low for normal operation.
4	PE/HD	I, PU	Three-level	Selects Positive or negative edge control and High or low output drive strength. When Low/High the outputs are synchronized with the negative/positive edge of the reference clock, respectively. When at MID level, the output drive strength is increased and the outputs synchronize with the positive edge of the reference clock (see Table 6 on page 5).
24, 23, 26, 25, 1, 32, 3, 2	nF[1:0]	I	Three-level	Select frequency and phase of the outputs (see Table 1 , Table 2 , Table 3 on page 5 , Table 4 on page 5 , and Table 5 on page 5).
31	FS	I	Three-level	Selects VCO operating frequency range (see Table 4 on page 5)
19, 20, 15, 16, 10, 11, 6, 7	nQ[1:0]	O	LVTTL	Four banks of two outputs (see Table 1 , Table 2 , and Table 3 on page 5)
21	V _{DDQ1} ^[3]	PWR	Power	Power supply for Bank 1 and Bank 2 output buffers (see Table 7 on page 5 for supply level constraints).
12	V _{DDQ3} ^[3]	PWR	Power	Power supply for Bank 3 output buffers (see Table 7 on page 5 for supply level constraints).
5	V _{DDQ4} ^[3]	PWR	Power	Power supply for Bank 4 output buffers (see Table 7 on page 5 for supply level constraints).
14, 30	V _{DD} ^[3]	PWR	Power	Power supply for internal circuitry (see Table 7 on page 5 for supply level constraints).
8, 9, 17, 18, 28	V _{SS}	PWR	Power	Ground

Notes

1. PD indicates an internal pull-down and PU indicates an internal pull-up. 3 indicates a three-level input buffer.
2. When TEST = MID and sOE# = HIGH, PLL remains active with nF[1:0] = LL functioning as an output disable control for individual output banks. Skew selections remain in effect unless nF[1:0] = LL.
3. A bypass capacitor (0.1μF) must be placed as close as possible to each positive power pin (< 0.2"). If these bypass capacitors are not close to the pins their high-frequency filtering characteristic are cancelled by the lead inductance of the traces.

Device Configuration

The outputs of the CY7B9950 can be configured to run at frequencies ranging from 6 to 200 MHz. Banks 3 and 4 output dividers are controlled by 3F[1:0] and 4F[1:0] as indicated in [Table 1](#) and [Table 2](#), respectively.

Table 1. Output Divider Settings — Bank 3

3F[1:0]	K — Bank3 output divider
LL	2
HH	4
Other ^[4]	1

Table 2. Output Divider Settings — Bank 4

4F[1:0]	M — Bank4 output divider
LL	2
Other ^[4]	1

The three-level FS control pin setting determines the nominal operating frequency range of the divide-by-one outputs of the device. The CY7B9950 PLL operating frequency range that corresponds to each FS level is given in [Table 3 on page 5](#).

Table 3. Frequency Range Select

FS	PLL frequency range
L	24 to 50 MHz
M	48 to 100 MHz
H	96 to 200 MHz

The selectable output skew is in discrete increments of time units (t_U). The value of t_U is determined by the FS setting and the maximum nominal frequency. The equation used to determine the t_U value is: $t_U = 1 / (f_{NOM} \times MF)$, where MF is a multiplication factor, which is determined by the FS setting as indicated in [Table 4](#).

Table 4. MF Calculation

FS	MF	f_{NOM} at which t_U is 1.0 ns (MHz)
L	32	31.25
M	16	62.5
H	8	125

Table 5. Output Skew Settings

nF[1:0]	Skew (1Q[0:1],2Q[0:1])	Skew (3Q[0:1])	Skew (4Q[0:1])
LL ^[5]	$-4t_U$	Divide by 2	Divide by 2
LM	$-3t_U$	$-6t_U$	$-6t_U$

Notes

4. These states are used to program the phase of the respective banks (see [Table 5 on page 5](#)).
5. LL disables outputs if TEST = MID and sOE# = HIGH.
6. When 4Q[0:1] are set to run inverted (HH mode), sOE# disables these outputs HIGH when PE/HD = HIGH or MID and sOE# disables them LOW when PE/HD = LOW.
7. Please refer to "DC Parameters" section for I_{OH}/I_{OL} specifications.
8. $V_{DDQ1/3/4}$ must not be set at a level higher than that of V_{DD} . They can be set at different levels from each other, e.g., $V_{DD} = 3.3$ V, $V_{DDQ1} = 3.3$ V, $V_{DDQ3} = 2.5$ V and $V_{DDQ4} = 2.5$ V.

Table 5. Output Skew Settings(continued)

nF[1:0]	Skew (1Q[0:1],2Q[0:1])	Skew (3Q[0:1])	Skew (4Q[0:1])
LH	$-2t_U$	$-4t_U$	$-4t_U$
ML	$-1t_U$	$-2t_U$	$-2t_U$
MM	Zero skew	Zero skew	Zero skew
MH	$+1t_U$	$+2t_U$	$+2t_U$
HL	$+2t_U$	$+4t_U$	$+4t_U$
HM	$+3t_U$	$+6t_U$	$+6t_U$
HH	$+4t_U$	Divide by 4	Inverted ^[6]

In addition to determining whether the outputs synchronize to the rising or the falling edge of the reference signal, the 3-level PE/HD pin controls the output buffer drive strength as indicated in [Table 6](#).

The RoboClock® CY7B9950 features split power supply buses for Banks 1 and 2, Bank 3 and Bank 4, which enables the user to obtain both 3.3 V and 2.5 V output signals from one device. The core power supply (VDD) must be set at a level that is equal to or higher than any one of the output power supplies.

Table 6. PE/HD Settings

PE/HD	Synchronization	Output drive strength ^[7]
L	Negative	Low drive
M	Positive	High drive
H	Positive	Low drive

Table 7. Power Supply Constraints

V_{DD}	V_{DDQ1} ^[8]	V_{DDQ3} ^[8]	V_{DDQ4} ^[8]

t_{CCJ}	Cycle-cycle jitter	Divide by one output frequency, FS = L, FB = divide by 1, 2, 4.	—	50	100	ps
		Divide by one output frequency, FS = M/H, FB = divide by 1, 2, 4.	—	70	150	ps

Notes

10. Test load = 20 pF, terminated to $V_{CC}/2$. All outputs are equally loaded.

11. t_{PD} is measured at 1.5 V for $V_{DD} = 3.3 \text{ V}$ and at 1.25 V for $V_{DD} = 2.5 \text{ V}$ with REF rise/fall times of 0.5 ns between 0.8 V–2.0 V.

12. t_{LOCK} is the time that is required before outputs synchronize to REF. This specification is valid with stable power supplies which are within normal operating limits.

13. Lock detector circuit may be unreliable for input frequencies lower than 4 MHz, or for input signals which contain significant jitter.
