PSON

The PSON# signal is required to remotely turn on/off the power supply. PSON# is an active low signal that turns on the +12 Vdc power rail. When this signal is not pulled low by the system, or left open, the +12 Vdc output turns off. The 5.0 Vsb output remains on. This signal is pulled to a standby voltage by a pull-up resistor internal to the power supply. The power supply fan(s) shall operate at the lowest speed.

Signal Type	Accepts an open collector/drain input from the system. Pulled-up to the 5.0 Vsb located in power supply.	
PSON# = Low	ON	
PSON# = Open	OFF	
	MIN	MAX
Logic level low (power supply ON)	0V	0.8V
Logic level high (power supply OFF)	2.0V	4.125V
Source current, Vpson = low		4 mA
Power up delay: Tpson_on_delay	5 msec	200 msec

PWOK# (Power Good)

PPWOK is a power good signal and will assert HIGH when the outputs are within the regulation limits. PWOK will be pulled LOW by the power supply to indicate when either output falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed. The start of the PWOK# delay time shall be inhibited as long as the +12 Vdc output is in current limit or the 5.0 Vsb output is below the regulation limit.

PWOK Signal Characteristics		
Signal Type	Open collector/drain output from power supply. Pullup to 5.0 Vsb external to the power supply.	
PWOK = High	Power Good	
PWOK = Low	Power Not Good	
	MIN	MAX
To tLogic level low voltage, $I_{sing} = 4 \text{ mA}$	0 V	0.8 V
Logic level high voltage, $I_{source} = 200 \mu\text{A}$	2.0 V	4.125 V
Sink current, PWOK = low		4 mA
Source current, PWOK = high		2 mA
PWOK delay: T_{pwok_on}	100 ms	1000 ms
PWOK rise and fall time		100 μsec
Power down delay: T_{pson_off}	1 msec	1000 msec

PSKILL

The +12 Vdc output only from the power supply shall be disabled if the PSKILL input is high and V Standby will continue to be provided, outputs may be enabled if this signal is low. The power supply includes a pull up to disable all outputs if this signal is open. PSKILL shall not be connected during a hot insertion before all of the other pins are connected.

AC INPUT Present Indicator (ACOK#)

The AC OK# signal is used to indicate presence of AC input to the power supply. This signal shall be connected to 5.0 Vsb through a resistor on the host system side. A logic “High” level on this signal shall indicate AC input to the power supply is present. A Logic “Low” on this signal shall indicate a loss of AC input to the power supply.

ACOK# Signal Characteristics		
Signal Type	Pull up to 5.0 Vsb through a resistor in the host system.	
Present = High	Present	
Present = Low	Not Present	
	MIN	MAX
Logic level low voltage, $I_{sink} = 4 \text{ mA}$	0V	0.8 V
Logic level high voltage, $I_{sink} = 50 \mu\text{A}$	2.0 V	4.125 V
Sink current, PRESENT# = low		4 mA
Sink current, PRESENT# = high		50 μsec

Status Indications

See table below for Summary of Status signals, Ports and Indicators. The condition column assumes 2 or more power supplies present and ON and 5.0 Vsb shared for management interface. On the “Fan Blocked” condition, the assumption is that all outputs are within spec and not over temperature. This would be considered a “warning” condition. On the “Standby” condition, the system differentiates this state by knowing PS_ONL in negated (requesting Standby).
