

74160, 74161, 74163, LS160A, LS161A, LS162A, LS163A Counters

Logic Products

'160, '162 BCD Decade Counter
'161, '163 4-Bit Binary Counter
Product Specification

FEATURES

- Synchronous counting and loading
- Two Count Enable inputs for n-bit cascading
- Positive edge-triggered clock
- Asynchronous reset ('160, '161)
- Synchronous reset ('162, '163)
- Hysteresis on Clock input (LS only)

DESCRIPTION

Synchronous presettable decade (74160, 74LS160A, 74LS162A) and 4-bit (74161, 74LS161A, 74163, 74LS163A) counters feature an internal carry look-ahead and can be used for high-speed counting. Synchronous operation is provided by having all flip-flops clocked simultaneously on the positive-going edge of the clock. The Clock input is buffered.

The outputs of the counters may be preset to HIGH or LOW level. A LOW level at the Parallel Enable (PE) input disables the counting action and causes the data at the D₀-D₃ inputs to be loaded into the counter on the positive-going edge of the clock (providing that the set-up and hold requirements for PE are met). Preset takes place regardless of the levels at Count Enable (CEP, CET) inputs.

PIN CONFIGURATION

LOGIC SYMBOL

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74160 - 74163	32MHz	61mA
74LS160A - 74LS163A	32MHz	19mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V _{CC} = 5V ± 5%; T _A = 0°C to +70°C
Plastic DIP	N74160N, N74LS160AN, N74161N, N74LS161AN, N74LS162AN, N74163N, N74LS163AN
Plastic SO	N74LS161AD, N74S163AD

NOTE:

For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74	74LS
CP, CET	Inputs	2uI	2LSuI
D, CEP	Inputs	1uI	1LSuI
PE	Input	1uI	2LSuI
All	Outputs	10uI	10LSuI
MR	Input ('160, '161)	1uI	1LSuI
MR	Input ('162, '163)	1uI	2LSuI

NOTE:

Where a 74 unit load (uI) is understood to be 40μA I_{IH} and -1.6mA I_{IL}, and a 74LS unit load (LSuI) is 20μA I_{IH} and -0.4mA I_{IL}.

Counters

74160, 74161, 74163, LS160A, LS161A, LS162A, LS163A

A LOW level at the Master Reset ($\overline{MR}$) input sets all four outputs of the flip-flops ($Q_0 - Q_3$) in '160, 'LS160A, '161, and 'LS161A to LOW levels regardless of the levels at CP, $\overline{PE}$, CET and CEP inputs (thus providing an asynchronous clear function).

For the 'LS162A, '163, and LS163A, the clear function is synchronous. A LOW level at the Master Reset ($\overline{MR}$) input sets all four outputs of the flip-flops ($Q_0 - Q_3$) to LOW levels after the next positive-going transition on the Clock (CP) input (providing that the set-up and hold requirements for $\overline{MR}$ are met). This action occurs regardless of the levels at $\overline{PE}$, CET, and CEP inputs. This synchronous reset fea-

ture enables the designer to modify the maximum count with only one external NAND gate (see Figure A).

The carry look-ahead simplifies serial cascading of the counters. Both Count Enable inputs (CEP and CET) must be HIGH to count. The CET input is fed forward to enable the TC output. The TC output thus enabled will produce a HIGH output pulse of a duration approximately equal to the HIGH level output of Q_0 . This pulse can be used to enable the next cascaded stage (see Figure B).

For conventional operation of 74160, 74161 and 74163, the following transitions should be avoided.

1. HIGH-to-LOW transition on the CEP or CET input if clock is LOW.
2. LOW-to-HIGH transitions on the Parallel Enable input when CP is LOW, if the count enables and $\overline{MR}$ are HIGH at or before the transition.

For 74163 there is an additional transition to be avoided.

3. LOW-to-HIGH transition on the $\overline{MR}$ input when clock is LOW, if the Enable and $\overline{PE}$ inputs are HIGH at or before the transition.

These restrictions are not applicable to 74LS160A, 74LS161A, 74LS162A and 74LS163A.

H = HIGH voltage level steady state.

L = LOW voltage level steady state.

h = HIGH voltage level one set-up time prior to the LOW-to-HIGH clock transition.

l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition.

X = Don't care.

q = Lower case letters indicate the state of the referenced output prior to the LOW-to-HIGH clock transition.

↑ = LOW-to-HIGH clock transition.

NOTES:

(a) The TC output is HIGH when CET is HIGH and the counter is at Terminal Count (HHHH for '161 and HLLH for '160).

(b) The HIGH-to-LOW transition of CEP or CET on the 74161 and 74160 should only occur while CP is HIGH for conventional operation.

(c) The LOW-to-HIGH transition of PE on the 74161 and 74160 should only occur while CP is HIGH for conventional operation.

(d) The TC output is HIGH when CET is HIGH and the counter is at Terminal Count (HLLH for '162 and HHHH for '163).

(e) The HIGH-to-LOW transition of CEP or CET on the 74163 should only occur while CP is HIGH for conventional operation.

(f) The LOW-to-HIGH transition of PE or MR on the 74163 should only occur while CP is HIGH for conventional operation.

		I _{CCL} All outputs LOW			63	101	19 32	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.

2. All typical values are at V_{CC} = 5V, T_A = 25°C.

3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.

4. I_{COH} is measured with PE input HIGH, again with PE input LOW, all other inputs HIGH and outputs open. I_{CCL} is measured with Clock input HIGH, again with Clock input LOW, all other inputs low and outputs open.
