Functional description

The AS7C32096A is a high-performance CMOS 2,097,152-bit Static Random Access Memory (SRAM) device organized as 262,144 words × 8 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times (t_{AA}, t_{RC}, t_{WC}) of 10/12/15/20 ns with output enable access times (t_{OE}) of 4/5/6/7 ns are ideal for high-performance applications. The chip enable input $\overline{CE}$ permits easy memory expansion with multiple-bank memory systems.

When $\overline{CE}$ is high the device enters standby mode. The device is guaranteed not to exceed 28.8mW power consumption in CMOS standby mode.

A write cycle is accomplished by asserting write enable ($\overline{WE}$) and chip enable ($\overline{CE}$). Data on the input pins I/O1–I/O8 is written on the rising edge of $\overline{WE}$ (write cycle 1) or $\overline{CE}$ (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ($\overline{OE}$) or write enable ($\overline{WE}$).

A read cycle is accomplished by asserting output enable ($\overline{OE}$) and chip enable ($\overline{CE}$), with write enable ($\overline{WE}$) high. The chip drives I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible, and operation is from a single 3.3V supply voltage. This device is available as per industry standard 44-pin TSOP 2 package.

NOTE: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes

1 During V_{CC} power-up, a pull-up resistor to V_{CC} on $\overline{\text{CE}}$ is required to meet I_{SB} specification.
2 For test conditions, see *AC Test Conditions*.
3 t_{CLZ} and t_{CHZ} are specified with C_L = 5pF as in Figure B. Transition is measured ±500 mV from steady-state voltage.
4 This parameter is guaranteed, but not tested.
5 $\overline{\text{WE}}$ is HIGH for read cycle.
6 $\overline{\text{CE}}$ and $\overline{\text{OE}}$ are LOW for read cycle.
7 Address valid prior to or coincident with $\overline{\text{CE}}$ transition Low.
8 All read cycle timings are referenced from the last valid address to the first transitioning address.
9 All write cycle timings are referenced from the last valid address to the first transitioning address.
10 C=30pF, except on High Z and Low Z parameters, where C=5pF.
