Product Description

Pericom Semiconductor's PI5C series of logic circuits are produced using the Company's advanced 0.8 micron CMOS technology, achieving industry leading speed grades.

The PI5C3125 and PI5C3126 are 4-bit Bus Switches designed with four individual 5 Ohm bus switches with fast individual enables in an industry standard 74XX125/126 pinout. When enabled via the associated Bus Enable ($\overline{BE}$) pin, the "A" pin is directly connected to the "B" pin for that particular gate. The bus switch introduces no additional propagation delay or additional ground bounce noise.

The PI5C3125 device has active LOW enables, and the PI5C3126 has active HIGH enables.

C_{IN}	Input Capacitance	$V_{IN} = 0\text{V}$		6	pF
C_{OFF}	A/B Capacitance, Switch Off	$V_{IN} = 0\text{V}$		6	pF
C_{ON}	A/B Capacitance, Switch On	$V_{IN} = 0\text{V}$		8	pF

Notes:

- For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at $V_{CC} = 5.0\text{V}$, $T_A = 25^{\circ}\text{C}$ ambient and maximum loading.
- Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
- Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A, B) pins.
- This parameter is determined by device characterization but is not production tested.

Power Supply Characteristics

Parameters	Description	Test Conditions ⁽¹⁾		Min.	Typ ⁽²⁾	Max.	Units
I_{CC}	Quiescent Power Supply Current	$V_{CC} = \text{Max.}$	$V_{IN} = \text{GND or } V_{CC}$		0.1	3.0	μA

Notes:

- For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
- Typical values are at $V_{CC} = 5.0\text{V}$, $+25^{\circ}\text{C}$ ambient.
- Per TTL driven input ($V_{IN} = 3.4\text{V}$, control inputs only); A and B pins do not contribute to I_{CC} .
- This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

PI5C3125/PI5C3126 Switching Characteristics over Operating Range

Parameters	Description	Conditions ⁽¹⁾	Com.		Units
			Min.	Max.	
t _{PLH} t _{PHL}	Propagation Delay ^(2,3) A to B, B to A	C _L = 50pF R _L = 500 Ohm		0.25	ns
t _{PZH} t _{PZL}	Bus Enable Time		0.5	5.4	ns
t _{PHZ} t _{PLZ}	Bus Disable Time		0.5	4.7	ns

Notes:

1. See test circuit and wave forms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 50pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
