Growing importance of a secure power supply

High performance level

In change-over applications where the loaded switch may need to be operated remotely, adequate durability has been ensured by testing against the IEC 60947-6-1 standard in the specification of endurance requirements.

Utilization categories:

- AC-31 for non-inductive or slightly inductive load
 - AC-33 for motor loads or mixed loads including motors
- ABB change-over switches are rated according to IEC 60947-6-1 standard

Easy installation for local or remote control

ABB change-over switches are very easy to install: the manually operated switch is operated via a handle fixed directly on the switch or on the panel door. The 16 to 125 Ampere sizes can be snapped on to a DIN rail and the front fits in the 45 mm consumer unit cut-out.

The motorized change-over switches have snap-on control wire connections. Auxiliary contacts can be snapped on to the sides of the switches and the power terminals can be connected in parallel with bridging bars.

The automatic transfer switches feature the automatic control unit, which can be adjusted according to the mounting depth of the panel. The voltage sensing kit is installed at the factory thus reducing the expensive and time consuming installation work.

- Quick and easy installation
 - savings in time and expenses

As industrial processes and IT applications diversify, a secure power supply is increasingly important to cut production and maintenance costs. In emergency situations, the system logic of power distribution can become complex with mechanical devices looking after making, breaking, conducting and isolating power. Loads need to be transferred from one supply to another — this will be the case when energy use is restricted or when the supply source is overloaded.

Safe and reliable

ABB automatic transfer switches ensure service continuity with a number of built-in, integrated safety features. The change-over mechanism, for example, offers three stable positions which ensure isolation of the two asynchronous power supplies. This eliminates any risk of short-circuit between them, even in the presence of transient voltages. The automatic transfer switches are equipped with a handle for manual operation in case of emergency.

- ▶ Inbuilt safety

Compact design

The design of ABB change-over switches is advanced and compact, allowing installation in confined spaces at considerable savings. Compact double layer construction.

- ▶ Minimizing the need for space

¹⁾ Dual power source allows the motor operator to be supplied by two separate voltage supplies. This way the motor operator is always energized from the available line.

²⁾ Four options: 0, 5, 10 or 30 seconds

³⁾ Delaying the switching sequence before transferring to generator, guaranteeing that in cold locations the generator is properly warmed up

⁴⁾ Two options: the duration of back-switching delay is the same as switching delay, i.e. the time delay is same for I - II and II - I, or the back-switching delay is fixed 300 seconds

⁵⁾ Two options: the duration of generator stop delay is the same as Switching delay or fixed 5 min

Manual change-over switches, I - I+II - II -operation, closed transition

The OT160...250E_CL change-over switches operate on a closed transition principle, i.e. make-before-break operation without OFF-position. Between positions I and II, there is a position I+II where both switches are closed simultaneously. The overlapping time when both contacts are closed is minimum 20 ms. Operating angle of the handle is 90°. Including a black plastic IP65 I - I+II - II pistol type handle (see the table below), shaft and bolt set for the cable connection. Handle not padlockable and no door interlocking.
