# **Universal Decade Counter**

The MC10137 is a high speed synchronous counter that can count up, down, preset, or stop count at frequencies exceeding 100 MHz. The flexibility of this device allows the designer to use one basic counter for most applications. The synchronous count feature makes the MC10137 suitable for either computers or instrumentation.

Three control lines (S1, S2, and Carry In) determine the operation mode of the counter. Lines S1 and S2 determine one of four operations; preset (program), increment (count up), decrement (count down), or hold (stop count). Note that in the preset mode a clock pulse is necessary to load the counter, and the information present on the data inputs (D0, D1, D2, and D3) will be entered into the counter. Carry Out goes low on the terminal count. The Carry Out on the MC10137 is partially decoded from Q1 and Q2 directly, so in the preset mode the condition of the Carry Out after the Clock's positive excursion will depend on the condition of Q1 and/or Q2. The counter changes state only on the positive going edge of the clock. Any other input may change at any time except during the positive transition of the clock. The sequence for counting out of improper states is as shown in the State Diagrams.

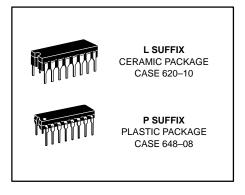

$$\begin{split} P_D &= 625 \text{ mW typ/pkg (No Load)} \\ f_{COUNt} &= 150 \text{ MHz typ} \\ t_{pd} &= 3.3 \text{ ns typ } (C-\underline{Q}) \\ &= 7.0 \text{ ns typ } (\underline{C}-C_{OUt}) \\ &= 5.0 \text{ ns typ } (C_{in}-C_{Out}) \end{split}$$

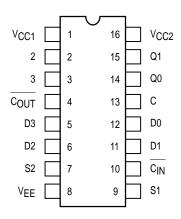

# **FUNCTION SELECT TABLE**

S1	S2	Operating Mode
L	┙	Preset (Program)
L	Н	Increment (Count Up)
Н	L	Decrement (Count Down)
Н	Н	Hold (Stop Count)

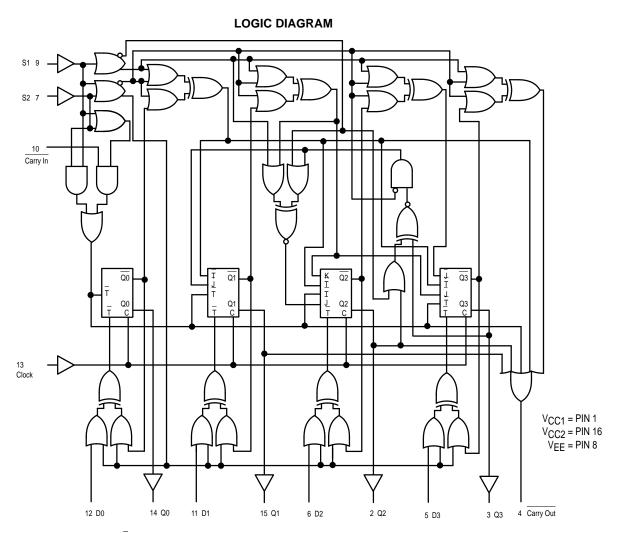

# MC10137

#### **PIN ASSIGNMENT**

NOTE: Flip-flops will toggle when all T inputs are low.

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.

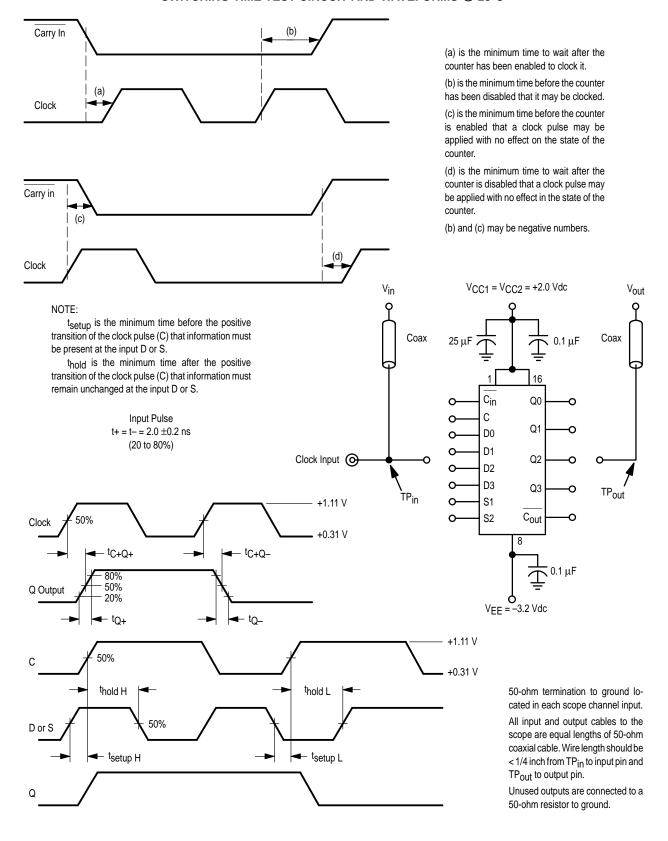

**MOTOROLA** 3-38

Individually test each input; apply V<sub>ILmin</sub> to pin under test.
 Measure output after clock pulse V<sub>II</sub> VIH appears at clock input (Pin 13). Measure output after clock pulse

VIL

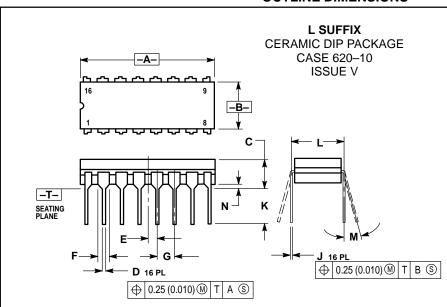

<sup>3.</sup> Before test set all Q outputs to a logic high.
