Capacitors for AC and DC General Purpose Applications

Capacitor Application Data Sheet

To ensure correct selection of a capacitor for your application, please provide the information indicated below. This sheet may be duplicated or additional copies may be obtained from RBC.

Of particular importance are the voltages and current waveforms complete with values of voltage and current over a complete cycle.

Send this data to your local RBC Sales Representative or directly to:

GE Capacitors by Regal Beloit

Descriptive Information

RBC Capacitors for General Purpose Applications

Metallized film capacitors are unsurpassed in terms of size, weight, performance, and reliability for ac applications. RBC - Capcom brings over 60 years of capacitor manufacturing experience to the product lines described in this publication. These capacitors represent the best in product design for long-term reliability and safe operation. RBC's materials, product, and process development work continue to provide capacitor users with outstanding total value.

The specific products in this bulletin are aimed at market/application segments for General Purpose, Power Supply and Electronic Power Conversion.

The Gem III General Purpose Capacitors are used for filtering on a wide variety of light industrial equipment. The conversion of electrical power in uninterruptible power supplies and drive control systems requires filter capacitors. An application note is included to help customers in the correct choice and use of these capacitors.

Descriptive Information

GEM III Construction

RBC 's Gem III capacitors are manufactured with high-grade metallized polypropylene film. This film is in the range of 6 to 10 microns thick, depending on the application voltage and conditions. The metallized electrode is several hundred angstroms thick.

The film is wound into capacitor rolls on high-speed, high-precision machines. The winding is extremely tight so that there is not enough space between the layers for corona (localized partial electrical discharges) to occur. The rolls are sprayed on both ends with metal to make connection to the extremely thin edges of the metallized electrodes.

The rolls are assembled in metal cases, RBC's proprietary Dielektrol VI liquid is introduced under vacuum, and the capacitors are sealed. They are then subjected to 100% electrical testing for capacitance, dissipation factor, and high potential electrical withstand, both terminal-to-terminal and terminal-to-case.

GEM III Series Construction

RBC 's Gem III capacitors are manufactured with high-grade metallized polypropylene film. This film is in the range of 6 to 10 microns thick, depending on the application voltage and conditions. The metallized electrode is several hundred angstroms thick.

The film is wound into capacitor rolls on high-speed, high-precision machines. The winding is extremely tight so that there is not enough space between the layers for corona (localized partial electrical discharges) to occur. The rolls are sprayed on both ends with metal to make connection to the extremely thin edges of the metallized electrodes. This process is critical to the quality and performance of the capacitors.

The rolls are assembled in metal cases, RBC's proprietary Dielektrol VI liquid is introduced under vacuum, and the capacitors are sealed. They are then subjected to 100% electrical testing for capacitance, dissipation factor, and high potential electrical withstand, both terminal-to-terminal and terminal-to-case.

Pressure Sensitive Interrupter

All the capacitors listed in this publication contain RBC's Pressure Sensitive Interrupter (PSI). This device, developed by RBC, is designed to sense the build-up of pressure within the capacitor if a fault occurs and to interrupt the internal electrical connections before the case can rupture.

The PSI carries U.L. * recognition for applications where the specified fault currents are not exceeded. The fault current is the maximum current that is available from the circuit to flow through the capacitor if the capacitor were to become a short circuit with zero impedance. **It is the responsibility of the capacitor user to determine what the available fault current is for a particular application.**

In the Catalog Number listings a four character U.L. Code, Pxxx, is given. This number is part of the listing for RBC in U.L. File No. E7793. When applying to U.L. for approvals or recognition of equipment using these capacitors refer to the Pxxx number and not the Catalog Number of the capacitor in question.

Proper operation of the PSI requires that the cover be able to expand without restriction. The following mounting considerations should be noted in mounting these capacitors.

*Underwriter's Laboratories

Vertical Clearance

There must be sufficient clearance between the tops of the terminals (and/or the assembled wire connectors) and a plane perpendicular to the capacitor terminals. This clearance must be at least 0.5 inches plus the electrical spacing requirements of the end application.

Cut-Out Clearance

In certain instances capacitors are mounted with the top of the capacitor case resting against the chassis and the terminals protruding through the chassis. Care must be taken to see that the cutout in the chassis is large enough. The following dimensions are recommended.

Case Style	a	b	Case Style	a
A	2.00	1.00	P	1.62

General Purpose AC Capacitors – Gem III

240 and 370 Volts AC

This series of Gem III is specifically designed for applications such as AC filters where harmonic frequencies greater than 60Hz are common. Application Data is provided starting on page 5 that gives the Equivalent Series Resistance (ESR) for these units. This allows the user to calculate the losses for each design/application and to ensure that they are kept within the permissible limits. Any questions regarding the suitability of a capacitor for a particular application may be referred to RBC Engineers through your RBC sales representative.

SPECIFICATIONS:

Available Capacitance Range:	2 to 120 μ F
Capacitance Tolerance:	$\pm$ 6%
Capacitance Variation with Temperature:	See chart E-3 on page 9.
Rated Voltage:	See Rating Tables. Rating is the 60Hz RMS voltage for a sinusoidal waveform. For other waveforms refer to the Application Note on page 6.
Leakage Current:	30 μ A maximum
Frequency:	50/60 Hz. For higher frequencies refer to the Application Note on page 7.
Operating Temperature:	-40 °C to +70 °C
Storage Temperature:	-40 °C to +90 °C
Operating Life:	60,000 hours with 94% survival
Dissipation Factor:	0.1% maximum
Case Material/Finish:	Unpainted Aluminum case, Ternplate steel cover.
Terminations:	0.250" x 0.031" quick connect blades.
Dielectric Fluid:	Dielektrol VI
Internal Protection:	UL recognized Pressure Sensitive Interrupter. See Ratings Table for RBC's Code Number listed under RBC's UL. File E7793 (N). For UL submittals with these capacitors use the RBC 'Pxxx' number not the Catalog Number. The corresponding generic UL designation that includes the Available Fault Current (AFC) rating is given below. All these capacitors are capable of interrupting available fault currents of up to 10,000 amperes.

Case Style	RBC Code	Generic UL Code
A	P921	A10000AFC
P	P965	P10000AFC
S	P968	S10000AFC

T	2.50	2.62

Case Style A

97F8000 Series 240 and 370 Volts AC

The 97F8000 series of capacitors may be used in AC applications where the voltage waveform is non-sinusoidal. This Application Note is provided to assist in the correct use of the capacitors where higher frequency harmonic currents are present. If you need further assistance please contact RBC's Capacitors Operation through your normal sales channel.

Higher frequency currents are commonly encountered in the filter circuits of Static Power Converters. These frequencies range from 180 to 1500 Hz for a 60 Hz system in various combinations of the odd harmonics depending on the type of converter. Generally, there are not significant harmonic currents above the 25th harmonic.

These capacitors can carry a total current of up to 15 amperes RMS (fundamental plus harmonics). The Equivalent Series Resistance (ESR) for each Catalog Number is shown in the ESR tables on this page. This value may be used to calculate the expected watts loss for a particular application. The user must determine the total RMS current (fundamental plus harmonics) for the application. The watts loss is then calculated using the equation:

$$W = I^2 \times ESR$$

Where **I** = Total RMS current

And **ESR** = Value from ESR tables.

The calculated watts from this equation must not exceed the allowable watts loss shown on the curve corresponding to the particular capacitor. Two sets of curves are shown, one for natural circulation and one for forced air circulation.

NOTES

- (1) In no case should the **total RMS current** of **15 amperes** be exceeded for any of these capacitors.
- (2) Running the capacitors at case temperatures above 70 °C will have a significant effect on expected life. (See chart G-1 on page 8)
- (3) Running the capacitors at voltages above the nominal rated voltage will also result in significantly reduced life. (See chart G-2 on page 8)

27L Series

660 Volts AC (series section)

The 27L series of capacitors on the attached product sheet may be used in AC applications where the voltage waveform is non-sinusoidal. This Application Note is provided to assist in the correct use of the capacitors where higher frequency harmonic currents are present. If you need further assistance please contact RBC's Capacitor's Operation through your normal sales channel.

Higher frequency currents are commonly encountered in the filter circuits of static Power Converters. These frequencies range from 180 to 1500 Hz for a 60 Hz system in various combinations of the odd harmonics depending on the type of converter. Generally, there are not significant harmonic currents above the 25th harmonic.

These capacitors can carry a total current of up to 15 amperes RMS (fundamental plus harmonics). The Equivalent Series Resistance (ERS) for each Catalog Number is shown in the ESR tables on this page. This value may be used to calculate the expected watts loss for a particular application. The user must determine the total RMS current (fundamental plus harmonics) for the application. The watts loss is then calculated using the equation:

$$W = I^2 \times ESR$$

Where **I** = Total RMS current

And **ESR** = Value from ESR tables.

The calculated watts from this equation must not exceed the allowable watts loss shown on the curve corresponding to the particular capacitor. Two sets of curves are shown, one for natural circulation and one for forced air circulation.

NOTES

- (1) In no case should the **total RMS current** of **15 amperes** be exceeded for any of these capacitor
- (2) Running the capacitors at case temperatures above 70 °C will have a significant effect on expected life. (See chart G-1 on page 20)
- (3) Running the capacitors at voltages above the nominal rated voltage will also result in significantly reduced life. (See chart G-2 on page 20)

Allowable Watts Loss - 27L (660 Volt) Series Section

The above charts are intended as general reference only. Any indication of extended life by reducing voltage or temperature is in no way a guarantee of extended product life.

1000 Volts Peak

This line of dual Rated AC/DC Capacitors is specifically designed for applications such as AC/DC filters where harmonic frequencies greater than 60 Hz are common. These capacitors are typically used in DC filters at voltages above those served by electrolytic type construction.

SPECIFICATIONS

Available Capacitance Range:	3.0 to 50 μ F														
Capacitance Tolerance:	97F $\pm$ 6%														
Capacitance Variation with Temperature:	$\pm$ 5% from -40 °C to +70 °C														
Rated Voltage:	See Rating Tables. Rating is Maximum Peak DC Voltage.														
Ripple Voltage	The RMS ripple voltage should not exceed the following percentages of the rated voltage for these frequencies:														
	<table> <tr> <th>Frequency</th><th>% of Rated Voltage</th></tr> <tr> <td></td><td><u>97F</u></td></tr> <tr> <td>60 Hz</td><td>44</td></tr> <tr> <td>120 Hz</td><td>30</td></tr> <tr> <td>400 Hz</td><td>12</td></tr> <tr> <td>1,000 Hz</td><td>8</td></tr> <tr> <td>10,000 Hz</td><td>0.6</td></tr> </table>	Frequency	% of Rated Voltage		<u>97F</u>	60 Hz	44	120 Hz	30	400 Hz	12	1,000 Hz	8	10,000 Hz	0.6
Frequency	% of Rated Voltage														
	<u>97F</u>														
60 Hz	44														
120 Hz	30														
400 Hz	12														
1,000 Hz	8														
10,000 Hz	0.6														
Operating Temperature:	-30 °C to +70 °C														
Storage Temperature:	-55 °C to +70 °C														
Operating Life:	60,000 hours with 90% survival with proper derating.														
Dissipation Factor:	0.3% maximum														
Case Material/Finish:	Aluminum Case (NO PAINT)														
Terminations:	97F (3) or (4) 0.250" x 0.031" inch quick connect blades per terminal (see outline drawing).														
Dielectric Fluid:	97 F: Dielektrol VI														
Internal Protection:	Pressure Sensitive Interrupter.
