

TOSHIBA Bi-CMOS INTEGRATED CIRCUIT SILICON MONOLITHIC

TB62709N, TB62709F

7-SEGMENT DRIVERS WITH BUILT-IN DECODERS

(COMMON ANODE CAPABILITY, MAXIMUM 4-DIGIT CONTROL)

The TB62709N and TB62709F are multifunctional, compact, 7-segment LED display drivers.

These ICs can directly drive 7-segment displays and individual LEDs, and can control either a 4-digit display with decimal points, or 32 individual LEDs.

These ICs can also be used with common-anode displays. Their outputs are constant current, the ampere levels at which are set using an external resistor.

A synchronous serial port connects the IC to the CPU.

The different modes of control provided by this device including Duty Control Register Set, Digit Set, Decode Set and Standby Set, are all based on every 16-bit of serial data.

FEATURES

- Control circuit power supply voltage
: $V_{DD} = 4.5$ to $5.5V$
- Digit output rating
: $17V / -400mA$
- Decoder output rating
: $17V / 50mA$
- Built-in decoder
: Decodes the numerals 0 to 9, certain alphabetic characters, and of course blanks code.
- Digit control function
: Can scan digit outputs DIG-0 to DIG-3 when connected to the common anode pins of a 7-segment display.

Weight
SDIP24-P-300-1.78 : 1.62g (Typ.)
SSOP24-P-300-1.00 : 0.32g (Typ.)

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

● The products described in this document are subject to foreign exchange and foreign trade control laws.

● The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.

● The information contained herein is subject to change without notice.

- Maximum transmission frequency
: $f_{CLK} = 15\text{MHz}$
- Decoder outputs (OUT-A to OUT-Dp)
Output current can be set up to a 40mA maximum using an external resistor.
- Constant current tolerance ($T_a = 25^\circ\text{C}$, $V_{DD} = 5.0\text{V}$)
: Variation between bits = $\pm 7\%$, variation between devices
(including variation between bits) = $\pm 15\%$ at $V_{CE} \geq 0.7\text{V}$
- Package
: 24-pin SDIP (SDIP24-P-300-1.78)
24-pin SSOP (SSOP24-P-300-1.00)

PIN ASSIGNMENT (Top view)

BLOCK DIAGRAM

PIN FUNCTIONS

PIN NUMBER	PIN NAME	FUNCTION
1	V _{DD}	5V power pin.
2	DATA-IN (DI)	Serial data input pin.
3	CLOCK (CK)	Clock input pin. The shift register shifts data on the clock's rising edge.
4	LOAD (LD)	Load signal input pin. The data in the D ₈ to D ₁₅ are read on the rising edge and the current load register the is selected from among the Duty Register, the Decode & Digit Register, or Data Registers 0 to 3. The D ₀ to D ₇ bits of the 16-bit shift register contain data corresponding to the same registers just described, which are read on the load signal's falling edge.
5~12	OUT-A to OUT-Dp	Segment drive output pins. The A to Dp outputs correspond to the seven segments. These pins output constant sink current. Connect each of these pins to the corresponding LED's cathode.
13, 21	P-GND	Ground pins, There are two which can be used to ground the output OUT-A to OUT-Dp pins.
14	TEST-IN2	Product test pin. In normal use, be sure to connect to ground.
15	TEST-IN1	Product test pin. In normal use, be sure to connect to ground.
16, 17, 19, 20	DIG-0 to DIG-3	Digit output pins. Each of these pins can control one of the four seven-segment digits in a display. These pins output the V _{CC} pin voltage as a source current output. Connect these pins to the LED anodes.
18	V _{CC}	Power pin for digit output.
22	R-EXT	Current setting pin for the OUT-A to OUT-Dp pins. Connect a resistor between this pin and ground when setting the current.
23	DATA-OUT (DO)	Serial data output pin. Use when TB62709N or TB62709F devices are used in cascade connections.
24	L-GND	Ground pin for logic and analog circuits.

TIMING DIAGRAM

DATA INPUT

- Transfer data to the DATA-IN pin on every 16-bit combining address (8bits) and data (8bits). After the 16th clock signal input following this data transfer input a load signal from the LD pin.
- Input the load signal using an Active High pulse. The register address is set on the rising edge of the load pulse. On the subsequent falling edge, the data are read as data of the mode of the register.

DESCRIPTION OF OPERATION

- Data input (SERIAL-IN, CLOCK, LOAD)

The data are input serially using the SERIAL-IN pin. The data input interface consists of a total of three inputs : SERIAL-IN, LOAD, and CLOCK.

Binary code stored in the 16-bit shift register offers control modes including duty Control Register Set, Digitset, Decode Set, and Standby Set,

The data are shifted on the rising edge of the clock, starting from the MSB. Cascade-connecting TB62709N or TB62709F devices provides capability for controlling a larger number of digits.

The serial data in the 16-bit shift register are used as follows : the four bits D₁₅ (MSB) to D₁₂ select the IC operating mode (Table 1), while D₁₁ (MSB) to D₈ select the register corresponding to the operating mode (Table 2).

Bits D₇ to D₀ of the 16-bit shift register (LSB) are used for detail settings, such as number of digits in use, character settings in each digit, and light intensity.

The internal registers are loaded on the rising edge of the LOAD signal, which causes loading of data from an external source into the D₁₅ (MSB) to D₈ bits of the shift register, operating mode and the corresponding register selection data. On the subsequent falling edge, the detail setting data of D₇ to D₀ (LSB) are loaded.

Normally LOAD is Low. After a serial transfer of 16bits, the input of a High-level pulse loads the data.

Note the following caution : Use the D₁₅ to D₈ setting and the D₇ to D₀ detail data setting as a pair. If only the D₇ to D₀ data are input without setting D₁₅ to D₈ an error condition may result, in which the device will not operate normally. If the current mode is set again by a new signal, the data for D₁₅ to D₈ must also be re-input.

- Operating precautions

At power-on or after operation in Clear mode (in initial state), set the IC to Normal mode again. Otherwise, the IC will not drive the LED.

Operating the IC in Blank mode (all lights off) or in All On mode (all lights lit) does not affect the internal data. Setting the IC to Normal mode again continues the LED lighting in the state governed by the settings made immediately before mode change.

Normal mode (not Shut Down, Clear, Blank, or All On mode) continues the operations set in Load Register mode. In Normal mode, operations are governed by any new settings made in the Load Register, as soon as the changed setting values are loaded.

- Operating modes (Table 1.)

These ICs support the following five operating modes :

1. Blank : Forcibly turns OFF the constant-current output both for data and for digit setting. This mode is not affected by the values in bits D₁₁ to D₀.
2. Normal Operate : Used for display operations after the settings of the digits are complete. Note that setting this mode without making any other settings will cause display of the numeral 0.
3. Load Register : Used for the detail settings of the Duty Control Register, for setting Decode / No Decode, for inputting display data, and for setting the number of digits to drive. D₁₁ to D₀ of the shift register are used for the detail settings of the digits currently being driven (Table 2).
4. All On : Forcibly turns ON the data-side constant-current output. This mode is not affected by D₁₁ to D₀.
The initial setting is four digits. When the digits must be changed, use Load Register mode to set the number of digits to drive.
5. Standby : Used to set Standby state (in which internal data are not cleared) and to clear data (initialization). The settings in D₃ to D₀ of the shift register determine the choice between standby state or initialization.

Table 1 Operating mode settings

	REGISTER DATA								INITIAL SETTING
	D ₁₅	D ₁₄	D ₁₃	D ₁₂	D ₁₁ ~D ₈	D ₇ ~D ₄	D ₃ ~D ₀	HEX CODE	
BLANK (OUT-n & DIG-0~3 ALL-OFF)	0	0	0	0	—	—	—	0---H	★
NORMAL (OPERATION)	0	0	0	1	—	—	—	1---H	
LOAD REGISTER (DUTY, DECODE, DIGIT & DATA)	0	0	1	0	X	X	X	2XXXH	
ALL ON (OUTn ALL-ON)	0	0	1	1	—	—	—	3---H	
STAND-BY	0	1	0	0	—	—	X	4--XH	

X = Input H or L. "—" = Are not affected by the truth table.

- Load Register Selection modes (Table 2)

These modes select the register to provide the data to control the IC operation. The Load Register selection mode is determined by the settings of D₁₅ to D₁₂ and D₁₁ to D₈ of the shift register.

1. Duty Register : The data in D₇ to D₀ of this register set the digit output duty cycle. Duty settings can be made in 16 steps from 0/16 to 15/16.
(See Table 3)
2. Decode & Digit Register : Sets Decode/No Decode and the number of digits to drive. Decode can be set using D₇ to D₄.
The number of digits driven can be set using D₃ to D₀. Decode / No Decode and the number of digits driven are set simultaneously.
3. Data registers 0 to 3 : Set the display data corresponding to DIG0 to DIG3 respectively. D₇ to D₀ of the shift register are used to set the display data.

Table 2 Load register selection

	REGISTER DATA							
	D ₁₅ ~D ₁₂	D ₁₁	D ₁₀	D ₉	D ₈	D ₇ ~D ₄	D ₃ ~D ₀	HEX CODE
LOAD DUTY REGISTER	2H	0	0	0	0	X	X	20XXH
LOAD DECODE & DIGIT REGISTER	2H	0	0	0	1	X	X	21XXH
LOAD DATA REGISTER 0	2H	0	0	1	0	X	X	22XXH
LOAD DATA REGISTER 1	2H	0	0	1	1	X	X	23XXH
LOAD DATA REGISTER 2	2H	0	1	0	0	X	X	24XXH
LOAD DATA REGISTER 3	2H	0	1	0	1	X	X	25XXH

X = Input H or L.

DUTY CONTROL REGISTER SETTINGS

- Duty Control Register detail settings and operation (Table 3)

Writing 20H to D₁₅~D₈ and writing 0~FH to D₃~D₀ sets the duty cycle shown in the following table for the digit-side source driver output. The duty cycle can be set in 16 steps.

The initial setting is 15 / 16. After Data Clear, the setting is also 15 / 16.

The current settings continue until changed (by reset execution, or to the initial state, Data Clear state, or standby state).

Table 3 Duty control register settings

DUTY CYCLE	REGISTER DATA							INITIAL SETTING
	D ₁₅ ~D ₈	D ₇ ~D ₄	D ₃	D ₂	D ₁	D ₀	HEX CODE	
0 / 16	20H	—	0	0	0	0	20X0H	
1 / 16	20H	—	0	0	0	1	20X1H	
2 / 16	20H	—	0	0	1	0	20X2H	
3 / 16	20H	—	0	0	1	1	20X3H	
4 / 16	20H	—	0	1	0	0	20X4H	
5 / 16	20H	—	0	1	0	1	20X5H	
6 / 16	20H	—	0	1	1	0	20X6H	
7 / 16	20H	—	0	1	1	1	20X7H	
8 / 16	20H	—	1	0	0	0	20X8H	
9 / 16	20H	—	1	0	0	1	20X9H	
10 / 16	20H	—	1	0	1	0	20XAH	
11 / 16	20H	—	1	0	1	1	20XBH	
12 / 16	20H	—	1	1	0	0	20XCH	
13 / 16	20H	—	1	1	0	1	20XDH	
14 / 16	20H	—	1	1	1	0	20XEH	
15 / 16	20H	—	1	1	1	1	20XFH	★

X = Input H or L. "—" = Are not affected by the truth table.

DIGIT SETTINGS

- Setting the number of digits (Table 4)

Writing 21H to D₁₅~D₈ and at the same step writing 0H~3H to D₃~D₀ sets the number of digits to a maximum of four the display. The initial setting is four digits, and four will also be set by a Data Clear.

The current settings continue until changed (by reset execution, or to the initial state, Data Clear state, or standby state).

When changing the number of digits, also set D₇ to D₄.

Table 4 Digit settings

	REGISTER DATA							INITIAL SETTING
	D ₁₅ ~D ₈	D ₇ ~D ₄	D ₃	D ₂	D ₁	D ₀	HEX CODE	
ACTIVATED DIG--0 ONLY	21H	X	0	0	0	0	21X0H	
ACTIVATED DIG--0~1	21H	X	0	0	0	1	21X1H	
ACTIVATED DIG--0~2	21H	X	0	0	1	0	21X2H	
ACTIVATED DIG--0~3	21H	X	0	0	1	1	21X3H	★

X = Input H or L.

DECODE SETTINGS

- Decode settings (Table 5)

The settings for Decode are the same as the settings for the number of digits, described under setting, above.

Writing 21H to D₁₅~D₈ and writing 0~1H to D₇~D₄ set Decode mode.

When using this IC for controlling the lighting on individual LEDs used for a dot matrix rather than a 7-segment display, set to No Decode.

As Table 6 shows, D₀ in the data register is used to turn OUT-a ON and OFF ; D₁ turns OUT-b ON and OFF.

The initial setting is Decode mode, and Decode mode will also be set by a Data Clear.

The current settings continue until changed (by reset execution, or to the initial state, Data Clear state, or standby state).

Since D₃ to D₀ are also used for setting the number of digits, when changing the Decode setting, also set D₃ to D₀.

Table 5 Decode settings

	REGISTER DATA							INITIAL SETTING
	D ₁₅ ~D ₈	D ₇	D ₆	D ₅	D ₄	D ₃ ~D ₀	HEX CODE	
PASS DECODER (NO DECODE)	21H	0	0	0	0	X	210XH	
DECODE	21H	0	0	0	1	X	211XH	★

X = Input H or L.

THE FOLLOWING TABLE SHOWS THE CORRESPONDENCE BETWEEN THE SERIAL DATA AND THE OUTPUT PINS WHEN NO DECODE IS SET

Table 6 Correspondence between serial data and output pins in no decode mode

REGISTER DATA	OUTPUT	INITIAL STATE	NOTE
D ₀	OUT-a	L	Output is ON when data = H and OFF when data = L.
D ₁	OUT-b	L	
D ₂	OUT-c	L	
D ₃	OUT-d	L	
D ₄	OUT-e	L	
D ₅	OUT-f	L	
D ₆	OUT-g	L	
D ₇	OUT-Dp	L	

STANDBY SETTINGS

- Standby mode settings and operation (Table 7)

Writing 4H to D₁₅~D₁₂ and writing 0H to D₃~D₀ sets Standby mode. Writing 4H to D₁₅~D₁₂ and writing 1H to D₃~D₀ sets All Data Clear mode.

Standby mode maintains the settings made immediately before this mode came in force, turns the output current OFF, and controls the bias current flowing in the internal circuits. All Data Clear resets all settings to their initial states.

Table 7 Standby settings

	REGISTER DATA						
	D ₁₅ ~D ₈	D ₇ ~D ₄	D ₃	D ₂	D ₁	D ₀	HEX CODE
STANDBY (NO DATA CLEAR)	4-H	—	0	0	0	0	4XX0H
ALL DATA CLEAR	4-H	—	0	0	0	1	4XX1H

X=Input H or L. "—" Are not affected by the truth table.

LIST OF CHARACTER GENERATOR DECODING DATA

- Character generator decoding (Table 8)

As the following table shows, the characters are decoded using combinations of the data in D₀ to D₃ and D₅ to D₄.

In decoding, D₆ is used exclusively for setting decimal points.

Spaces where (D₀, D₁, D₂, D₃) = (0000) and (D₅, D₄) = (01) are regarded as blank.

Table 8 List of character generator decoding data

		D ₀	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1
		D ₁	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
		D ₂	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
		D ₃	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Clock Load Time (LOAD-CLOCK)	t_{LD-CLK}	—	—	—	50	—	ns
OUT-a to Dp Output Delay Time (LOAD-OUTn)	$t_{pHL-SEG}$	—	$C_L = 10pF$	—	—	5.0	μs
	$t_{pLH-SEG}$		$C_L = 10pF$	—	—	5.0	
OUT-a to Dp Output Rise Time (OUTn)	$t_r SEG$	—	$C_L = 10pF$	0.2	1.0	—	μs
OUT-a to Dp Output Fall Time (OUTn)	$t_f SEG$	—	$C_L = 10pF$	0.2	1.0	—	μs
DIG-0~DIG-3 Output Delay Time (LOAD-DIGn)	$t_{pHL-DIG}$	—	$C_L = 10pF$	—	—	10.0	μs
	$t_{pLH-DIG}$		$C_L = 10pF$	—	—	10.0	
DIG-0~DIG-3 Output Rise Time (DIGn)	$t_r DIG$	—	$C_L = 10pF$	0.4	2.0	—	μs
DIG-0~DIG-3 Output Fall Time (DIGn)	$t_f DIG$	—	$C_L = 10pF$	0.4	2.0	—	μs

RECOMMENDED OPERATING CONDITIONS(Unless otherwise stated, $V_{DD} = 5.0V$, $V_{CC} = 5.0V$, $T_a = -40 \sim 85^\circ C$)

CHARACTERISTIC	SYMBOL	TEST CIR-CUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Voltage for Output Block	V_{CC}	—	—	4.0	—	6.0	V
DIG-0 to DIG-3 Output Source Current	I_{DIG}	—	$V_{OUT} = 3.0V$	—	—	- 320	mA
OUT-a to OUT-Dp Output Sink Current	I_{SEG}	—	$V_{CE} = 0.7V$	—	—	40	mA

Logic block

CHARACTERISTIC	SYMBOL	TEST CIR-CUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Voltage for Logic Block	V_{DD}	—	—	4.5	—	5.5	V
High Input Current for Logic Circuits	I_{IH}	—	DATA-IN, LOAD & CLOCK, $V_{IN} = V_{DD}$	—	—	1	μA
Low Input Current for Logic Circuits	I_{IL}	—	DATA-IN, LOAD & CLOCK, $V_{IN} = 0V$	—	—	- 1	μA
High Input Voltage for Logic Circuits	V_{IH}	—	—	0.7 V_{DD}	—	—	V
Low Input Voltage for Logic Circuits	V_{IL}	—	—	—	—	0.3 V_{DD}	V

SWITCHING CONDITIONS

CHARACTERISTIC	SYMBOL	TEST CIR-CUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Data Hold Time (D-IN-CLOCK)	t_{DHO}	—	—	30	—	—	ns
Data Setup Time (D-IN-CLOCK)	t_{DST}	—	—	50	—	—	ns
Serial Output Delay Time (CLOCK-D-OUT)	t_{PDSO}	—	$C_L = 10pF$	50	—	—	ns
High Clock Pulse Width	t_{CKH}	—	—	30	—	—	ns
Low Clock Pulse Width	t_{CKL}	—	—	30	—	—	ns
Load Pulse Width	t_{WLD}	—	—	150	—	—	ns
Load Clock Time (CLOCK-LOAD)	t_{CLKLD}	—	—	100	—	—	ns
Clock Load Time (LOAD-CLOCK)	t_{LDCLK}	—	—	100	—	—	ns

DUTY CYCLE SETTINGS AND OUTPUT CURRENT VALUES

EXTERNAL RESISTANCE AND OUTPUT CURRENT VALUES

The following diagram shows application circuits.

Because operation may be unstable due to influences such as the electromagnetic induction of the wiring, the IC should be located as close as possible to the LED.

The L-GND and P-GND of this IC are connected to the substrate in the IC.

Take care to avoid a potential difference exceeding 0.4V at two pins.

When executing the pattern layout, Toshiba recommends not including inductance components in the GND or output pin lines, and not inserting capacitance components exceeding 50pF between the R_{EXT} pin and GND.

APPLICATION CIRCUIT EXAMPLE (Connection example)

PRECAUTIONS for USING

Utmost care is necessary in the design of the output line, V_{CC} (V_{DD}) and GND (L-GND, P-GND) line since IC may be destroyed due to short-circuit between outputs, air contamination fault, or fault by improper grounding.
