

P2040B

Product Preview LCD Panel EMI Reduction IC

Description

The P2040B is a selectable spread spectrum frequency modulator designed specifically for digital flat panel applications. The P2040B reduces electromagnetic interference (EMI) at the clock source which provides system wide reduction of EMI of all clock dependent signals.

The P2040B allows significant system cost savings by reducing the number of circuit board layers and shielding that are traditionally required to pass EMI regulations.

The P2040B uses the most efficient and optimized modulation profile approved by the FCC and is implemented in a proprietary all digital method.

The P2040B modulates the output of a single PLL in order to “spread” the bandwidth of a synthesized clock and, more importantly, decreases the peak amplitudes of its harmonics.

This results in significantly lower system EMI compared to the typical narrow band signal produced by oscillators and most frequency generators. Lowering EMI by increasing a signal’s bandwidth is called ‘spread spectrum clock generation.’

Applications

The P2040B is targeted towards digital flat panel applications for Notebook PCs, Palm-size PCs, Office Automation Equipments, and LCD Monitors.

Features

- Provides up to 15 dB of EMI Suppression
- FCC Approved Method of EMI Attenuation
- Generates a Low EMI Spread Spectrum Clock of the Input Frequency
- 30 MHz to 100 MHz Input Frequency Range
- Optimized for 32.5 MHz, 54 MHz, 65 MHz, 81 MHz, Pixel Clock Frequencies
- Internal Loop Filter Minimizes External Components and Board Space
- 8 Selectable Spread Ranges, up to $\pm 2.0\%$
- SSON# Control Pin for Spread Spectrum Enable and Disable Options
- Low Cycle-to-Cycle Jitter
- 3.3 V Operating Voltage
- Ultra Low Power CMOS Design
- Supports Most Mobile Graphic Accelerator and LCD Timing Controller Specifications
- Available in 8-pin SOIC and TSSOP Packages
- These are Pb-Free Devices

Table 3. PIN DESCRIPTION

Pin#	Pin Name	Type	Description
1	CLKIN	I	External reference frequency input. Connect to externally generated reference signal.
2	CP0	I	Digital logic input used to select charge pump current (see Table 2). This pin has a 100 K Ω internal pull-up resistor.
3	CP1	I	Digital logic input used to select charge pump current (see Table 2). This pin has a 100 K Ω internal pull-up resistor.
4	V _{SS}	P	Ground Connection. Connect to system ground.
5	SSON#	I	Digital logic input used to enable Spread Spectrum function (Active LOW). Spread Spectrum function enable when LOW. This pin has a 100 K Ω internal pull-low resistor.
6	ModOUT	O	Spectrum Clock output.
7	SR0	I	Digital logic input used to select Spreading Range (see Table 2). This pin has a 100 K Ω internal pull-up resistor.
8	V _{DD}	P	Connect to +3.3 V.

Spread Spectrum Selection

Table 2 illustrates the possible spread spectrum options. The optimal setting should minimize system EMI to the fullest without affecting system performance. The spreading is described as a percentage deviation of the center frequency (Note: the center frequency is the frequency of the external reference input on CLKIN, Pin 1).

Example:

P2040B is designed for high resolution flat panel applications and is able to support panel frequencies from 30 MHz to 100 MHz. For a 65 MHz pixel clock frequency, a spreading selection of CP0 = 0, CP1 = 1 and SR0 = 1 gives a percentage deviation of $\pm 1.56\%$ (see Table 2). This results in frequency on ModOUT being swept from 64.5 MHz to 65.5 MHz. This particular example given here is a common EMI reduction method for notebook LCD panel and has already been implemented by most of the leading OEM and mobile graphic accelerator manufacturers.
