MAX3747/MAX3747A Evaluation Kit

General Description

The MAX3747/3747A evaluation kit (EV kit) simplifies evaluation of the MAX3747/3747A limiting amplifiers. The EV kit enables testing of all the device's functions. SMA connectors with 50 Ω controlled-impedance transmission lines to the MAX3747/3747A are provided for all input and output ports.

The EV kit provides input and output test points and jumpers for all TTL signals.

Features

- ◆ Independent Input and Output Voltage Terminations
- ◆ SMA Connectors for All High-Speed Inputs and Outputs
- ◆ Test Points for LOS Output
- ◆ Fully Assembled and Tested

Quick Start

- 1) Shunt the center pin of JU1 to TP3 to connect DISABLE to LOS.
- 2) Shunt the center pin of JU2 to 4.75k Ω . Shunt the center pin of JU3 to VCC. This terminates LOS to VCC through a 4.75k Ω resistor.
- 3) Turn all positions of the dipswitch (U2) off. Turn the 4 and 5 switch to on. This sets the minimum LOS threshold.
- 4) Connect a +3.3V supply to VCC (J10). Connect the power supply ground to J11 (GND).
- 5) Connect a 100mV_{P-P} 2.125Gbps signal to J1 (IN+) and J2 (IN-)
- 6) Connect J3 (OUT+) and J4 (OUT-) to a 50 Ω high-speed oscilloscope. The differential output of the MAX3747 should be 500mV_{P-P}. The differential output of the MAX3747A should be 800mV_{P-P}.

Detailed Description

Dipswitch

The dipswitch allows for quick setting of various threshold levels. When only switch 4 and 5 are turned on, the MAX3747/MAX3747A are set to the low threshold level. Switch 3 and 6 sets to the medium threshold level, and switch 2 and 7 sets to the high threshold level. Switch 1 and 8 connect the potentiometer allowing the user to set any threshold level.

Jumper JU1

Jumper JU1 allows the user to connect the DISABLE pin to LOS, VCC, or GND

Jumper JU2

Jumper JU2 allows the user to terminate the LOS output to 4.75k Ω or 10.0k Ω .

Jumper JU3

Jumper JU3 connects the LOS termination resistor or to a separate supply connected to TP4.
