Power and Precision

ZSPM4121

Under-Voltage Load Switch for Smart Battery Management

The Analog Mixed Signal Company

Brief Description

The ZSPM4121 battery management load switch can be used to protect a battery from excessive discharge. It actively monitors the battery voltage and disconnects the battery from the load if the battery drops below a set voltage threshold. When the input battery voltage reaches 500mV above the set voltage threshold, the load switch turns on and connects the battery to the load. The 500mV hysteresis between the Off Mode and the On Mode prevents intermittent operation.

The voltage threshold (V_{THRESH}) can be programmed at manufacturing to a customer-selected set point in the voltage range of 1.2V to 4.2V in 100mV increments to support a wide range of applications in consumer, medical, portable, and industrial applications.

This device has ultra-low quiescent current, which makes it ideal for battery-powered applications. Typical quiescent current is 100pA in the Off Mode and 70nA in the On Mode.

The ZSPM4121 includes a slew rate control P-channel load switch, over-current protection, and an open-drain power indicator pin (NPG). The slew-rate controlled turn-on characteristic prevents inrush current and voltage droop on the voltage. The over-current limit protects the device in case of an overload, short-circuit, or ground fault event.

Benefits

- Best-in-class ultra-low quiescent current in Off Mode: 100pA (typical)
- Ultra-low quiescent current in On Mode: 70nA (typical)
- Accurate on/off voltage threshold
- Low Rds(on): 175mΩ (typical) @ 5V

Features

- Threshold voltage options of 1.2V to 4.2V in 100mV steps (factory programmed)
- Wide input voltage range: 1.2V to 5.5V
- Supervisory over-current limit shutdown: (3A)
- Low drop-out disconnect from VCC to loads
- Controlled turn-on slew rate
- 500mV Off Mode to On Mode hysteresis

List of Figures

List of Tables

1 ZSPM4121 Characteristics

Stresses beyond those listed under “Absolute Maximum Ratings” (section 1.1) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those recommended under “Recommended Operating Conditions” (section 1.3) is not implied. Exposure to absolute–maximum conditions for extended periods may affect device reliability.

1.1. Absolute Maximum Ratings

Over operating free–air temperature range unless otherwise noted. All voltage values are with respect to network ground terminal.

Table 1.1 Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Maximum voltage applied to the VCC, VOUT,and NPG pins		-0.3 to 6.0	V
Electrostatic Discharge – Human Body Model, according to the respective JESD22 JEDEC standard		2	kV
Electrostatic Discharge – Charged Device Model, according to the respective JESD22-C101 JEDEC standard		500	V
Operating Junction Temperature Range	T_J	-20 to 85	°C
Storage Temperature Range	T_{stg}	-65 to 150	°C
Lead Temperature (soldering, 10 seconds)		260	°C

1.2. Thermal Characteristics

Table 1.2 Thermal Characteristics for 8-Pin DFN (2mm x 2mm) Package

θ_{JA} (°C/W) [1]	θ_{JC} (°C/W) [2]
73.1	10.7

1) This rating assumes a FR4 board only.

2) This rating assumes a 1oz. copper JEDEC standard board with thermal vias. See section 6.1 for more information.

1.3. Recommended Operating Conditions

Table 1.3 Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Unregulated Supply Input at VCC Pin	V_{CC}	1.2		5.5	V
Operating Ambient Temperature [1]	T_A	-20		55	°C
Operating Junction Temperature	T_J	-20		85	°C

1) Operating ambient temperature is only intended as a guideline. The operating junction temperature requirements must not be exceeded.

1.4. Electrical Characteristics

Electrical characteristics for V_{CC} = 1.2V to 5.5V (unless otherwise noted). Minimum and maximum characteristics are tested at T_J = 25°C.

Table 1.4 Electrical Characteristics

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Input Supply						
Input Supply Voltage at VCC pin	V_{CC}		1.2		5.5	V
Quiescent Current: On Mode	$I_{q\text{-}ON}$	V_{CC} = 5V, no load		70	150	nA
Quiescent Current: Off Mode	$I_{q\text{-}OFF}$	$V_{CC} < V_{THRESH}$, no load		100		pA
Load Switch						
Over-Current Shutdown	I_{OC}	V_{CC} = 5.0V		3		A
Over-Current Retry Period	t_{OC}	V_{CC} = 5.0V		1.7		ms
Output Switch Leakage Current	$I_{LEAK\text{-}SW}$	$V_{CC} < V_{THRESH}$; V_{OUT} grounded		100		pA
Switch ON-Resistance	Rds-on	V_{CC} = 5.0V		175		mΩ
		V_{CC} = 3.3V		200		mΩ
		V_{CC} = 1.8V		350		mΩ
Transition Times						
Transition Delay: On Mode to Off Mode	t_{d1}	V_{OFF} = 2.0V, V_{CC} = 3.0V → 1.5V		650		µs
Transition Delay: Off Mode to On Mode	t_{d2}	V_{OFF} = 2.0V, V_{CC} = 1.5V → 3.0V		1.7		ms
Output Turn-on Rise Time	t_{ON}	V_{CC} = 2.5V, R_{LOAD} = 50Ω		200		µs
NPG Output						
Output Leakage	$I_{LEAK\text{-}NPG}$	V_{CC} = 5.0V, V_{NPG} = 5.5V			100	nA
Low-Level Output Voltage	$V_{OL\text{-}NPG}$	I_{NPG} = 5 mA			0.4	V
Off Thresholds						
Off Threshold	V_{OFF}	V_{THRESH} = customer-selected threshold voltage in the range of 1.2V to 4.2V with 100mV steps between options programmed at manufacturing	0.95 * V_{THRESH}	V_{THRESH}	1.05 * V_{THRESH}	V
Off Mode to On Mode Hysteresis	V_{Hys}	Rising Transition: Off Mode to On Mode		500		mV

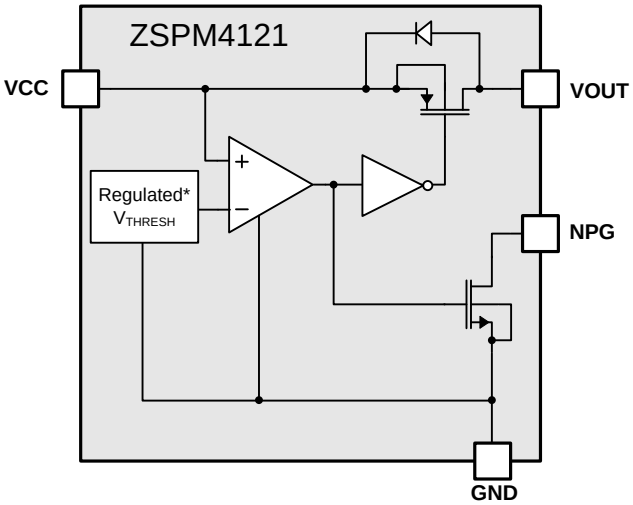
3 Description of Circuit

The ZSPM4121 battery management load switch includes an internally generated threshold voltage, comparator with hysteresis, slew rate control for the load switch, a P-channel load switch, and an open-drain indicator pin. When the input battery voltage rises to 500mV above the threshold, the load switch turns on (the On Mode). When the input battery voltage falls to the threshold voltage or below, the load switch is off (the Off Mode), and the quiescent current draw on the battery is in the order of 100pA (typical). The ZSPM4121 threshold voltage is programmed at manufacturing to an option in the range of 1.2V to 4.2V with 100mV steps between options. The 500mV hysteresis between the Off Mode and the On Mode prevents intermittent operation. The ZSPM4121 also provides over-current protection.

Figure 3.1 ZSPM4121 Block Diagram



* At manufacturing, V_{THRESH} is programmed to a customer-selected threshold voltage in the range of 1.2V to 4.2V with 100mV steps between options.

5.2. Pin Description for 8-Pin DFN (2x2 mm)

Figure 5.2 ZSPM4121 Pin Assignments (top view)

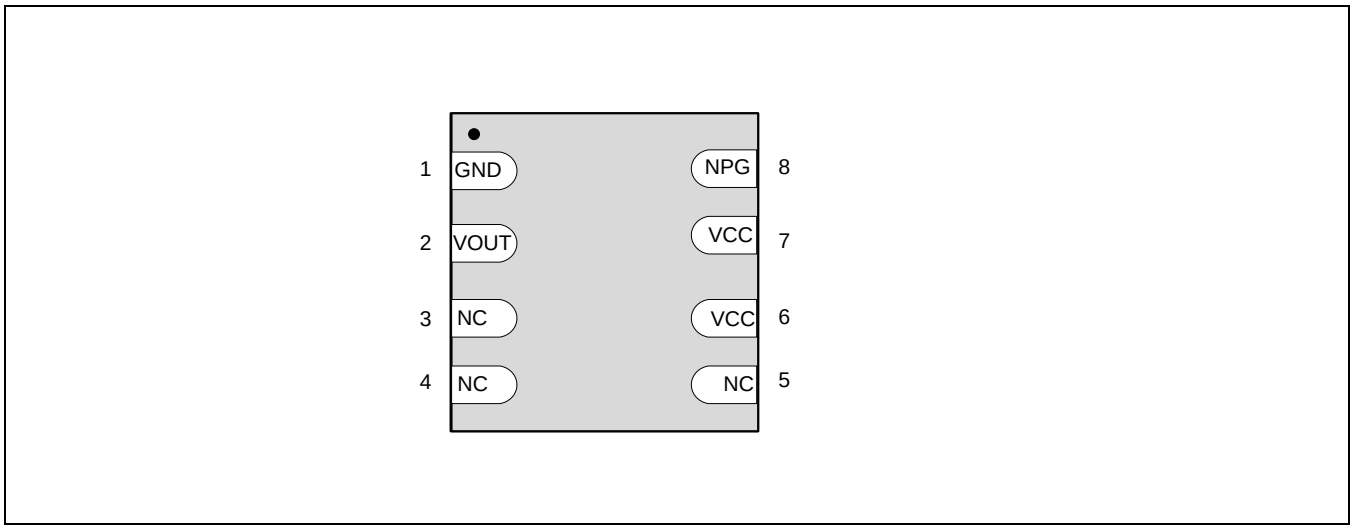

Table 5.1 Pin Description, 8-Pin DFN (2x2)

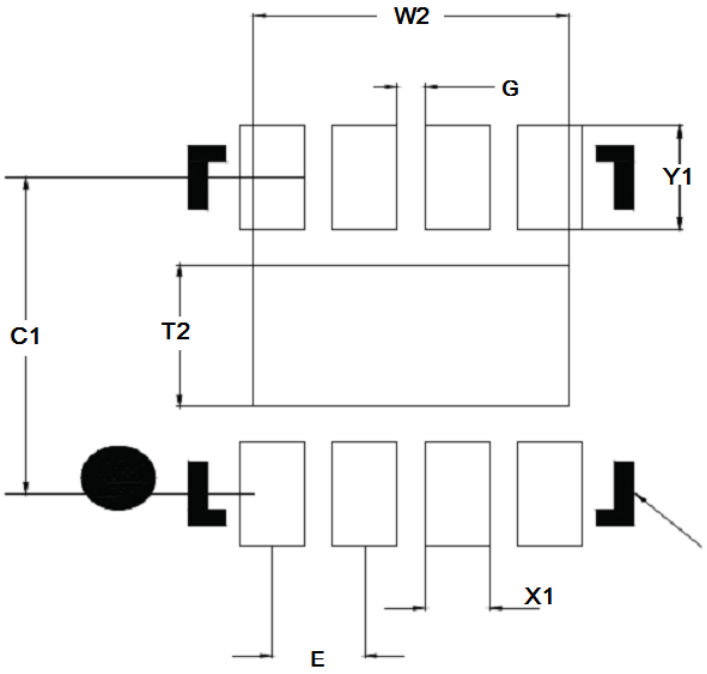
Pin #	Name	Function	Description
1	GND	Ground	GND
2	VOUT	Output	Output to system load
3	NC		No connection (connect to GND or float)
4	NC		No connection (connect to GND or float)
5	NC		No connection (connect to GND or float)
6	VCC	Supply	Supply input (connect to pin 7 and VCC supply rail)
7	VCC	Supply	Supply input (connect to pin 6 and VCC supply rail)
8	NPG	Output	Open-drain N-channel output (low indicates “Power Good”)

6 Layout and Soldering Requirements

To maximize the efficiency of this package for applications on a single layer or multi-layer printed circuit board (PCB), certain guidelines must be followed when laying out this part on the PCB.

6.1. Recommended Landing Pattern for PCBs

Figure 6.1 Recommended Landing Pattern for 8-Pin DFN



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Optional Center Pad Width	W2	-	-	1.70
Optional Center Pad Length	T2	-	-	0.90
Contact Pad Spacing	C1	-	2.00	-
Contact Pad Width (X8)	X1	-	-	0.35
Contact Pad Length (X8)	Y1	-	-	0.65
Distance Between Pads	G	0.15	-	-

6.2. Multi-Layer PCB Layout

The following are guidelines for mounting the exposed pad ZSPM4121 on a multi-Layer PCB with ground a plane. In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, and thickness of copper, etc.

Figure 6.2 Package and PCB Land Configuration for Multi-Layer PCB

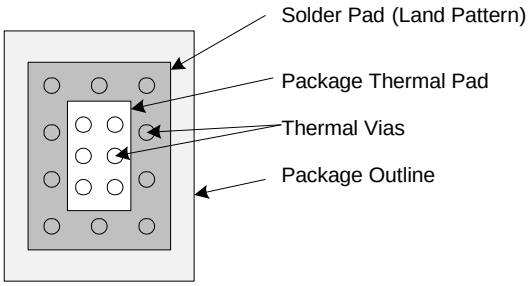


Figure 6.3 JEDEC Standard FR4 Multi-Layer Board – Cross-Sectional View

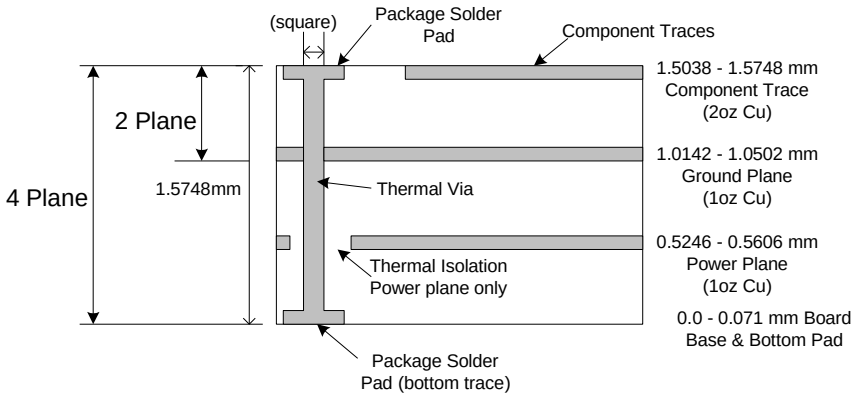

Figure 6.4 is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations, and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating of the linear regulators might need to be de-rated for higher ambient temperatures. The de-rated value will depend on the calculated worst-case power dissipation and the thermal management implementation in the application.

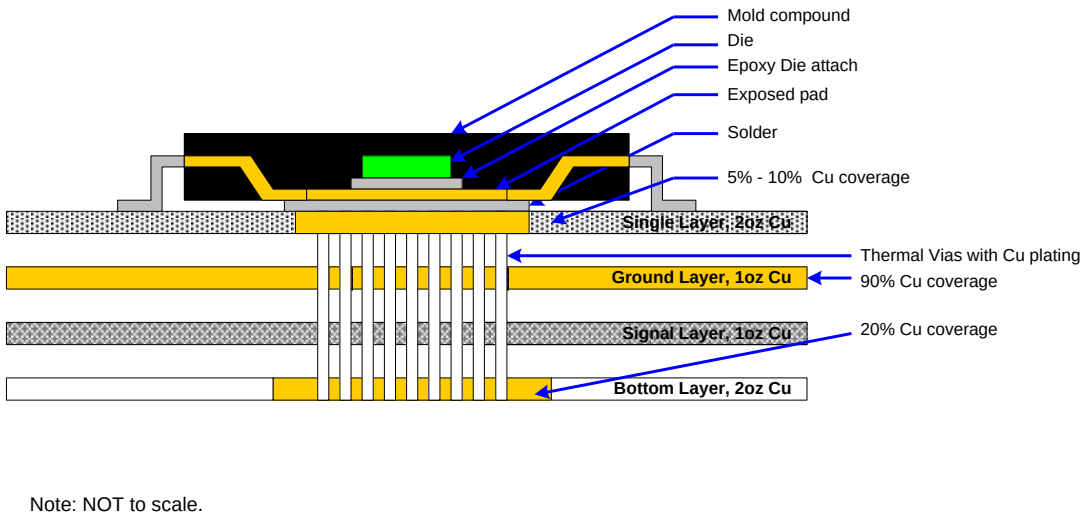
Figure 6.4 Conducting Heat Away from the Die using an Exposed Pad Package

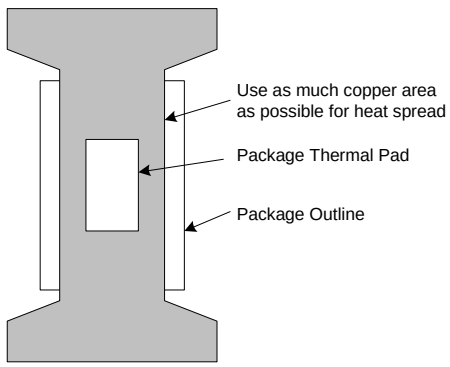


6.3. Single-Layer PCB Layout

Layout recommendations for a single-layer PCB: Utilize as much copper area for power management as possible. In a single-layer board application, the thermal pad is attached to a heat spreader (copper areas) by using a low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above, it is advisable to use as much copper trace as possible to dissipate the heat.

Figure 6.5 Application Using a Single-Layer PCB



Important: If the attachment method is NOT implemented correctly, the functionality of the product is NOT guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.
