

Inverted Logic, High CMR Optocoupler for Intelligent Power Modules and IGBT/MOSFET Gate Drive

Data Sheet

Description

The high-speed ACPL-P481/W481 optocoupler contains a GaAsP LED, a photo detector, and a Schmitt trigger that eliminates the requirement for external waveform conditioning circuits.

The totem pole output eliminates the requirement for a pull-up resistor. An Intelligent Power Module, Power MOSFET, or IGBT can be driven directly.

Propagation delay difference between devices has been minimized to maximize inverter efficiency through reduced switching dead time.

Applications

- IPM Interface Isolation
- Isolated IGBT/MOSFET Gate Drive
- AC and Brushless DC Motor Drives
- Industrial Inverters
- General Digital Isolation

Notes:

- Derate total package power dissipation, P_T , linearly above 70°C free-air temperature at a rate of $4.5\text{ mW}/^\circ\text{C}$.
- Detector requires a V_{CC} of 4.5V or higher for stable operation as output might be unstable if V_{CC} is lower than 4.5V . Be sure to check the power ON/OFF operation other than the supply current.
- Duration of output short circuit time should not exceed 10 ms .
- Input capacitance is measured between pin 1 and pin 3.
- Device considered a two-terminal device: pins 1, 2, and 3 shorted together and pins 4, 5, and 6 shorted together.
- The t_{PLH} propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3V point on the trailing edge of the output pulse. The t_{PHL} propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3V point on the leading edge of the output pulse.
- CM_H is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic high state, $V_O > 2.0\text{V}$.
 CM_L is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic low state, $V_O < 0.8\text{V}$.
- In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage. $4500\text{V}_{\text{RMS}}$ ($6000\text{V}_{\text{RMS}}$ for ACPL-W481) for one second (leakage detection current limit, $I_{\text{L-O}} \leq 5\text{ }\mu\text{A}$). This test is performed before the 100% production test for partial discharge (Method b) shown in the IEC/EN/DIN EN 60747-5-5 Insulation Characteristics Table, if applicable.
- Pulse Width Distortion (PWD) is defined as $|t_{\text{PHL}} - t_{\text{PLH}}|$ for any given device.
- Use of a $0.1\text{ }\mu\text{F}$ bypass capacitor connected between pins 4 and 6 is recommended.
- The difference between t_{PLH} and t_{PHL} between any two devices under the same test condition.
