

Programmable Precision References

The TL431, A, B integrated circuits are three–terminal programmable shunt regulator diodes. These monolithic IC voltage references operate as a low temperature coefficient zener which is programmable from V_{ref} to 36 V with two external resistors. These devices exhibit a wide operating current range of 1.0 mA to 100 mA with a typical dynamic impedance of 0.22 Ω . The characteristics of these references make them excellent replacements for zener diodes in many applications such as digital voltmeters, power supplies, and op amp circuitry. The 2.5 V reference makes it convenient to obtain a stable reference from 5.0 V logic supplies, and since the TL431, A, B operates as a shunt regulator, it can be used as either a positive or negative voltage reference.

- Programmable Output Voltage to 36 V
- Voltage Reference Tolerance: ±0.4%, Typ @ 25°C (TL431B)
- Low Dynamic Output Impedance, 0.22 Ω Typical
- Sink Current Capability of 1.0 mA to 100 mA
- Equivalent Full-Range Temperature Coefficient of 50 ppm/°C Typical
- Temperature Compensated for Operation over Full Rated Operating Temperature Range
- Low Output Noise Voltage

PROGRAMMABLE PRECISION REFERENCES

SEMICONDUCTOR TECHNICAL DATA

SOP–8 is an internally modified SO–8 package. Pins 2, 3, 6 and 7 are electrically common to the die attach flag. This internal lead frame modification decreases power dissipation capability when appropriately mounted on a printed circuit board. SOP–8 conforms to all external dimensions of the standard SO–8 package.

NOTES: 1. T_{IOW} = -40°C for TL431AIP, TL431AIP, TL431IP, TL431BID, TL431BID, TL431BIP, TL431BIP, TL431AIDM, TL431BIDM, TL431ACP, TL431ACP, TL431ACP, TL431CP, TL431CP, TL431CP, TL431ACD, TL431BCD, TL431BCD, TL431BCDM, TL431BCDM

Thigh = +85°C for TL431AIP, TL431AILP, TL431IP, TL431IP, TL431BID, TL431BIP, TL431BIP, TL431BIDM, TL431AIDM, TL431AIDM, TL431BIDM = +70°C for TL431ACP, TL431ACP, TL431ACP, TL431ACD, TL431BCP, TL431BCP, TL431BCP, TL431CDM, TL431ACDM, TL431BCDM

2. The deviation parameter ΔV_{ref} is defined as the difference between the maximum and minimum values obtained over the full operating ambient temperature range that applies.

The average temperature coefficient of the reference input voltage, αV_{ref} is defined as:

$$V_{ref} \frac{ppm}{{}^{\circ}C} = \frac{\left(\frac{\Delta \, V_{ref}}{V_{ref} \, @ \, 25 \, {}^{\circ}C}\right) \times \, 10^{6}}{\Delta \, T_{A}} \\ = \frac{\Delta \, \, V_{ref} \, \times \, 10^{6}}{\Delta \, T_{A} \, \left(V_{ref} \, @ \, 25 \, {}^{\circ}C\right)}$$

 $\alpha V_{\text{ref}} \text{ can be positive or negative depending on whether } V_{\text{ref}} \text{ Min or } V_{\text{ref}} \text{ Max occurs at the lower ambient temperature. (Refer to Figure 6.)}$

Example : $\Delta \rm V_{ref} = 8.0~mV$ and slope is positive,

$$V_{ref}$$
 @ 25°C = 2.495 V, ΔT_{A} = 70°C $\alpha V_{ref} = \frac{0.008 \times 10^{6}}{70 (2.495)} = 45.8 \text{ ppm/°C}$

3. The dynamic impedance ZKA is defined as $|Z_{KA}| = \frac{\Delta \ V_{KA}}{\Delta \ I_{K}}$

When the device is programmed with two external resistors, R1 and R2, (refer to Figure 2) the total dynamic impedance of the circuit is defined as:

$$|Z_{KA}'| \approx |Z_{KA}| \left(1 + \frac{R1}{R2}\right)$$

Thigh= +85°C for TL431AIP, TL431AILP, TL431IP, TL431ILP, TL431BID, TL431BIP, TL431BIP, TL431IDM, TL431AIDM, TL431AIDM = +70°C for TL431ACP, TL431ACLP, TL431CP, TL431ACD, TL431BCD, TL431BCP, TL431BCP, TL431CDM, TL431ACDM, TL431BCDM

2. The deviation parameter $\Delta V_{\mbox{ref}}$ is defined as the difference between the maximum and minimum values obtained over the full operating ambient temperature range that applies.

The average temperature coefficient of the reference input voltage, $\alpha V_{\mbox{ref}}$ is defined as:

$$V_{ref} \frac{ppm}{{}^{\circ}C} = \frac{\left(\frac{\Delta \, V_{ref}}{V_{ref} \, @ \, 25 \, {}^{\circ}C}\right) \times \, 10^{6}}{\Delta \, T_{A}} = \frac{\Delta \, \, V_{ref} \, \times \, 10^{6}}{\Delta \, T_{A} \, \, (V_{ref} \, @ \, 25 \, {}^{\circ}C)}$$

 $\alpha V_{\mbox{ref}} \mbox{ can be positive or negative depending on whether } V_{\mbox{ref}} \mbox{ Min or } V_{\mbox{ref}} \mbox{ Max occurs at the lower ambient temperature. (Refer to Figure 6.)}$

Example :
$$\Delta V_{ref} = 8.0$$
 mV and slope is positive, $V_{ref} @ 25^{\circ}C = 2.495 \text{ V}, \Delta T_{A} = 70^{\circ}C$ $\alpha V_{ref} = \frac{0.008 \times 10^{6}}{70 \text{ (2.495)}} = 45.8 \text{ ppm/}^{\circ}C$

3. The dynamic impedance Z_{KA} is defined as $|Z_{KA}| = \frac{\Delta \ V_{KA}}{\Delta \ I_{K}}$

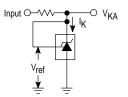

When the device is programmed with two external resistors, R1 and R2, (refer to Figure 2) the total dynamic impedance of the circuit is defined as:

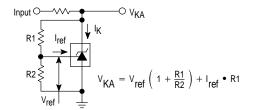

$$|Z_{\mbox{\scriptsize KA}}{}'| \; \approx |Z_{\mbox{\scriptsize KA}}| \; \left(\; \; 1 \, + \frac{\mbox{\scriptsize R1}}{\mbox{\scriptsize R2}} \; \right) \;$$

TL431, A, B Series APPLICATIONS INFORMATION

The TL431 is a programmable precision reference which is used in a variety of ways. It serves as a reference voltage in circuits where a non-standard reference voltage is needed. Other uses include feedback control for driving an optocoupler in power supplies, voltage monitor, constant current source, constant current sink and series pass regulator. In each of these applications, it is critical to maintain stability of the device at various operating currents and load capacitances. In some cases the circuit designer can estimate the stabilization capacitance from the stability boundary conditions curve provided in Figure 15. However, these typical curves only provide stability information at specific cathode voltages and at a specific load condition. Additional information is needed to determine the capacitance needed to optimize phase margin or allow for process variation.

A simplified model of the TL431 is shown in Figure 31. When tested for stability boundaries, the load resistance is 150 Ω . The model reference input consists of an input transistor and a dc emitter resistance connected to the device anode. A dependent current source, Gm, develops a current whose amplidute is determined by the difference between the 1.78 V internal reference voltage source and the input transistor emitter voltage. A portion of Gm flows through compensation capacitance, Cp2. The voltage across Cp2 drives the output dependent current source, Go, which is connected across the device cathode and anode.

Model component values are:

 $V_{ref} = 1.78 \text{ V}$

 $Gm = 0.3 + 2.7 \exp(-I_C/26 mA)$

where IC is the device cathode current and Gm is in mhos

Go = 1.25 (
$$V_{CD}$$
2) µmhos.

Resistor and capacitor typical values are shown on the model. Process tolerances are $\pm 20\%$ for resistors, $\pm 10\%$ for capacitors, and $\pm 40\%$ for transconductances.

An examination of the device model reveals the location of circuit poles and zeroes:

P1 =
$$\frac{1}{2\pi} \frac{1}{R_{GM} C_{P1}} = \frac{1}{2\pi * 1.0 M * 20 pF} = 7.96 \text{ kHz}$$

$$P2 = \frac{1}{2\pi R_{P2}C_{P2}} = \frac{1}{2\pi * 10 M * 0.265 pF} = 60 \text{ kHz}$$

$$Z1 = \frac{1}{2\pi R_{71}C_{P1}} = \frac{1}{2\pi*15.9 k*20 pF} = 500 kHz$$

In addition, there is an external circuit pole defined by the load:

$$P_{L} = \frac{1}{2\pi R_{I} C_{I}}$$

Also, the transfer dc voltage gain of the TL431 is:

$$G = G_M R_{GM} GoR_L$$

Example 1:

 $\rm I_{\mbox{\scriptsize C}} = 10$ mA, $\rm R_{\mbox{\scriptsize L}} = 230~\Omega, \rm C_{\mbox{\scriptsize L}} = 0.$ Define the transfer gain.

The DC gain is:

$$G = G_{M}R_{GM}GoR_{L} =$$

$$(2.138)(1.0 \text{ M})(1.25 \text{ }\mu)(230) = 615 = 56 \text{ dB}$$

$$Loop gain = G \frac{8.25 \text{ k}}{8.25 \text{ k} + 15 \text{ k}} = 218 = 47 \text{ dB}$$

The resulting transfer function Bode plot is shown in Figure 32. The asymptotic plot may be expressed as the following equation:

Av = 615
$$\frac{\left(\frac{1 + jf}{500 \text{ kHz}}\right)}{\left(\frac{1 + jf}{8.0 \text{ kHz}}\right)\left(\frac{1 + jf}{60 \text{ kHz}}\right)}$$

The Bode plot shows a unity gain crossover frequency of approximately 600 kHz. The phase margin, calculated from the equation, would be 55.9 degrees. This model matches the Open–Loop Bode Plot of Figure 12. The total loop would have a unity gain frequency of about 300 kHz with a phase margin of about 44 degrees.

Figure 31. Simplified TL431 Device Model

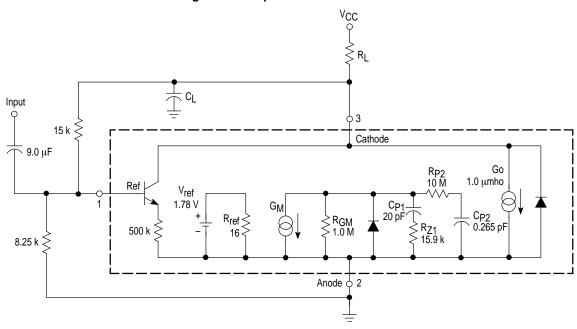

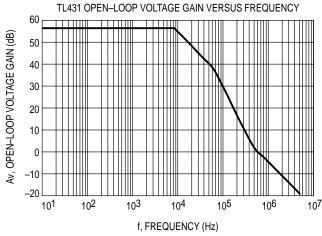

Figure 32. Example 1 Circuit Open Loop Gain Plot

Example 2.

 $I_C=7.5$ mA, $R_L=2.2~k\Omega,\,C_L=0.01~\mu F.$ Cathode tied to reference input pin. An examination of the data sheet stability boundary curve (Figure 15) shows that this value of load capacitance and cathode current is on the boundary. Define the transfer gain.

The DC gain is:

$$G = G_M R_{GM} GoR_L = \label{eq:Gomega}$$
 (2.323)(1.0 M)(1.25 μ)(2200) = 6389 = 76 dB

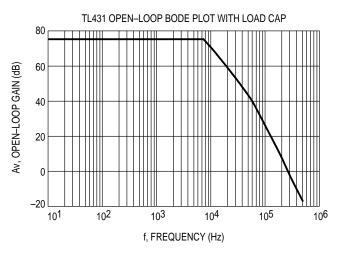

The resulting open loop Bode plot is shown in Figure 33. The asymptotic plot may be expressed as the following equation:

$$Av = 615 \frac{\left(\frac{1 + jf}{500 \text{ kHz}}\right)}{\left(\frac{1 + jf}{8.0 \text{ kHz}}\right) \left(\frac{1 + jf}{60 \text{ kHz}}\right) \left(\frac{1 + jf}{7.2 \text{ kHz}}\right)}$$

Note that the transfer function now has an extra pole formed by the load capacitance and load resistance.

Note that the crossover frequency in this case is about 250 kHz, having a phase margin of about -46 degrees. Therefore, instability of this circuit is likely.

Figure 33. Example 2 Circuit Open Loop Gain Plot

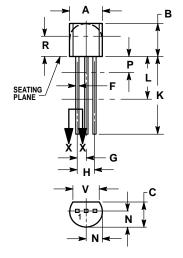

With three poles, this system is unstable. The only hope for stabilizing this circuit is to add a zero. However, that can only be done by adding a series resistance to the output capacitance, which will reduce its effectiveness as a noise filter. Therefore, practically, in reference voltage applications, the best solution appears to be to use a smaller value of capacitance in low noise applications or a very large value to provide noise filtering and a dominant pole rolloff of the system.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights or others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part.
