

# **MAXIM**

**CMOS Low Cost 10 Bit  
Multiplying D/A Converter**

### ***General Description***

The MX7533 is a low cost CMOS 4-quadrant multiplying digital-to-analog converter (DAC). An advanced silicon gate CMOS process combines 10 bit linearity, low power consumption, and excellent long term stability. Thin-film resistors provide 1.4% untrimmed gain error and less than 0.1% gain change with temperature over all operating ranges.

The device operates from a single +5V to +15V supply. All digital inputs are compatible with both CMOS and TTL logic levels.

Maxim's MX7533 is pin and functionally compatible with Analog Devices' AD7533 as well as the AD7520. It is packaged in 16-lead DIP and small outline packages.

## ***Applications***

- Machine and Motion Control Systems
- Automatic Test Equipment
- $\mu$ P Controlled Calibration Circuitry
- Programmable Gain Amplifiers
- Digitally Controlled Filters
- Programmable Power Supplies

### ***Typical Operating Circuit***

## **Features**

- ◆ 10 Bit Resolution
- ◆ 8, 9, and 10 Bit End Point Linearity
- ◆ Low Power Consumption - 20mW
- ◆ Four-Quadrant Multiplication
- ◆ TTL and CMOS Compatible
- ◆ Pin-For-Pin Second Source

### ***Ordering Information***

PART	TEMP RANGE	PACKAGE*	ERROR

## ABSOLUTE MAXIMUM RATINGS

$V_{DD}$ to GND	-0.3V, +17V
$V_{REF}$ to GND	$\pm 25V$
$R_{FB}$ to GND	$\pm 25V$
Digital Input Voltage to GND	-0.3V, $V_{DD}$
Output Voltage (OUT1, OUT2) (Note 1)	-0.3V, $V_{DD}$
Power Dissipation	
Plastic DIP (Derate 8.3mW/ $^{\circ}C$ above $+70^{\circ}C$ )	670mW
Ceramic, CERDIP, Small Outline (Derate 6mW/ $^{\circ}C$ above $+75^{\circ}C$ )	450mW

Operating Temperature Range	
Commercial J/K/L	0 $^{\circ}C$ to $+70^{\circ}C$
Industrial A/B/C	-25 $^{\circ}C$ to $+85^{\circ}C$
Military S/T/U	-55 $^{\circ}C$ to $+125^{\circ}C$
Storage Temperature	-65 $^{\circ}C$ to $+150^{\circ}C$
Lead Temperature (Soldering 10 secs)	+300 $^{\circ}C$

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $T_A = T_{MIN}$  to  $T_{MAX}$ ,  $V_{DD} = +15V$ ,  $V_{REF} = +10V$ ,  $V_{OUT1} = V_{OUT2} = GND$ , unless otherwise specified)

## Typical Operating Characteristics

MX7533

## Detailed Description

Figure 1. MX7533 Functional Diagram

The basic MX7533 DAC circuit consists of a thin-film R-2R resistor array with CMOS current switches as shown in Figure 1. Binarily weighted currents are switched to either OUT1 or OUT2 depending on the status of each input bit. Most applications require only an output op-amp and an external reference. The  $V_{REF}$  input accepts a wide range of reference signals including fixed and time-varying voltage or current inputs.

## Equivalent Circuit Analysis

Figures 2 and 3 show the equivalent circuits for the R-2R ladder when all digital inputs are LOW and HIGH respectively. The input resistance at  $V_{REF}$  is nominally  $10k\Omega$  and does not change with digital input code. The  $I_{REF}/1024$  current source, which is actually the ladder termination resistor ( $R_T$ , Figure 1), results in an intentional 1-bit current loss to GND. The  $I_{LEAKAGE}$  current sources represent junction and surface leakage currents.

## CMOS Low Cost 10 Bit Multiplying D/A Converter

Capacitors  $C_{OUT1}$  and  $C_{OUT2}$  represent the switches' ON and OFF capacitances respectively. When all inputs are switched from LOW to HIGH, the capacitance at OUT1 changes from  $35\text{pF}$  to  $100\text{pF}$ . This capacitance is code-dependent and is a function of the number of ON switches that are connected to a specific output.

Figure 2. Equivalent DAC Circuit (All digital inputs HIGH)

Figure 3. Equivalent DAC Circuit (All digital inputs LOW)

Figure 4. Unipolar Binary Operation (2-Quadrant Multiplication)

### Application Information

#### Unipolar Operation

The most common configuration for the MX7533 is shown in Figure 4. The circuit is used for unipolar binary operation and/or 2-quadrant multiplication.  $R_1$  is used for gain adjustment. If no adjustment is desired,  $R_1$  and  $R_2$  can be omitted. The code table for unipolar operation is given in Table 1. Note that the output polarity is the inverse of the reference input.

A compensation capacitor,  $C_1$ , may be needed when the DAC is used with a high speed amplifier. The purpose of the capacitor is to cancel the pole formed by the DAC's output capacitance and internal feedback resistance. The correct compensation value depends on the type of op-amp used but typically ranges from 10 to  $33\text{pF}$ .

The output op-amp's offset voltage can degrade DAC linearity by causing OUT1 to be terminated at a non-zero voltage. The resulting linearity error is typically  $2/3\text{V}_{OS}$ . For best performance, a low-offset amplifier such as the MAX400 should be used or the amplifier offset must be trimmed to typically more than  $1/10$  of an LSB's value. The op-amp's input bias current ( $I_B$ ) can also limit performance since  $I_B \times R_{FB}$  generates an offset error as well.  $I_B$  should therefore be much less than the DAC's output current for 1 LSB, which is typically  $1\mu\text{A}$  for the MX7533.

#### Bipolar Operation

Bipolar, or four-quadrant, operation is shown in Figure 5. A second amplifier and three matched resistors are required.  $R_3$ ,  $R_4$ , and  $R_5$  should be matched or trimmed to 0.05% to maintain 10 bit performance. The output vs. code table is listed in Table 2. In multiplying applications, the MSB determines output polarity while the remaining bits control amplitude.

To adjust the circuit, load the DAC with a code of 10000 00000 and trim  $R_1$  for a 0V output. With  $R_1$  and  $R_2$  omitted, an alternative zero trim is to adjust the ratio of  $R_3$  and  $R_4$  for 0V out. Full scale can be trimmed by loading the DAC with all "zeros" or all "ones" and adjusting the amplitude of  $V_{REF}$  or varying  $R_5$  until the desired positive or negative output is obtained. The op-amp recommendations made in the Unipolar Operation section apply for bipolar operation as well.

#### Voltage Mode (Single Supply)

The MX7533 is connected as a voltage output DAC in Figure 6. OUT1 is connected to the external reference and OUT2 is grounded.  $V_{REF}$ , now the DAC output, is a voltage source with a constant output resistance of  $R_{ladder}$  (nominally  $10\text{k}\Omega$ ). In most circuits this output is buffered with an op-amp.

An advantage of voltage mode operation is single supply operation for the complete circuit, i.e. a negative reference is not required for a positive output. It is important to note that the range of the reference is restricted. The reference input (voltage at OUT1) must

## CMOS Low Cost 10 Bit Multiplying D/A Converter

**MX7533**

Figure 5. Bipolar Operation (4-Quadrant Multiplication)

always be positive and is limited to no more than 3.5V when  $V_{DD}$  is 15V. If the reference voltage is greater than 3.5V, or  $V_{DD}$  is reduced, linearity is degraded.

### Dynamic Considerations

In static or DC applications, the AC characteristics of the output amplifier are not critical. In higher speed applications, where either the reference input is an AC signal or the DAC output must quickly settle to a new programmed value, the AC parameters of the output op-amp must be considered.

Another error source in dynamic applications is parasitic coupling of signal from the  $V_{REF}$  terminal to OUT1 or OUT2. This is normally a function of board layout and package lead-to-lead capacitance. Signals can also be injected into the DAC outputs when the digital inputs are switched. This digital feedthrough is mostly dependent on circuit board layout and on-chip capacitive coupling. Layout induced feedthrough can be minimized with guard traces between digital inputs,  $V_{REF}$ , and the DAC outputs.

Figure 6. Voltage Mode Operation
