

White LED driver for display backlight

Features

- Boost DC-DC converter
- Drives up to 6 LEDs with a total current up to 20 mA
- Output power capability up to 500 mW
- Input voltage range 2.5 V to 18 V
- Output current control
- 2.3 MHz switching frequency
- PWM input for the output current dimming with 300:1 dimming range
- 350 mA integrated switch
- Overvoltage protection
- Chip overtemperature detection and protection
- Soft-start implemented
- Package DFN6 2 x 2 mm

on/off by the logic signal connected to the EN pin and this pin is also dedicated for the PWM dimming of the output current. Current mode control of the regulation allows a fast response to a change of the enable pin voltage level.

Applications

- PDA and handheld devices
- Cellular phones
- MP3 players

Description

STLA02 is a boost converter that operates from 2.5 V to 18 V and can provide an output voltage as high as 27 V and can drive up to 6 white LEDs connected in series. The total output current capability is 20 mA at an output voltage of 24 V. The total output power capability is up to 500 mW. The regulation is done by the internal error amplifier which works with the feedback voltage from the sensing resistor connected in high side sensing configuration. The device can be turned

Table 2. Pin description

Pin n°	Symbol	Name and function
1	V_{IN}	Supply voltage pin
2	GND	Ground
3	LX	Switching pin
4	V_{OUT}	Output voltage pin
5	FB	Feedback voltage
6	EN/PWM	Enable pin or PWM control input for dimming
Exposed pad	GND	Ground

3 Maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{IN}	Signal supply voltage	- 0.3 to 19	V
V_{LX}	Inductor connection	- 0.3 to 30	V
FB	Feedback connection ⁽¹⁾	- 0.3 to 30	V
EN/PWM	Logic pin/PWM input	- 0.3 to 12	V
V_{OUT}	Output voltage connection	- 0.3 to 30	V
P_{TOT}	Continuous power dissipation (at $T_A = 70\text{ °C}$) ⁽¹⁾	530	mW
T_{OP}	Operating ambient temperature range	- 40 to 85	°C
T_J	Junction temperature	- 40 to 150	°C
T_{STG}	Storage temperature range	- 65 to 150	°C

1. The maximum acceptable difference between the V_{OUT} pin potential and feedback pin potential is 5 V.

Note: *Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.*

Table 4. Thermal data

Symbol	Parameter	Value	Unit
R_{thJA}	Thermal resistance junction-ambient ⁽¹⁾	102	°C/W

1. Power dissipation is dependent on PCB. The recommended PCB design is included in this document (TBD).

7 Introduction

The STLA02 is a boost converter dedicated to powering and controlling the current of white LEDs in an LCD backlight. The device operates at a typical constant switching frequency of 2.3 MHz. It steps an input voltage ranging from 2.5 V to 18 V, up to 27 V. The output current is adjustable by the resistor R_{FB} connected between the V_{OUT} and FB pins. The STLA02 device contains high side sensing to simplify the PCB layout in terms of connection of the LEDs.

The output current is dimmable by the PWM signal applied to the EN pin with minimum PWM frequency equal 100 Hz.

7.1 PWM input (EN)

Light intensity can be dimmed by a signal applied to the PWM (EN) input.

The PWM signal is directly connected to the enable pin of the STLA02. It is recommended to use the frequency of the PWM signal in the range of 100 Hz to 1 kHz and amplitude of the signal 1.8 V min. The result of the direct PWM dimming method (300 Hz PWM and $V_{EN} = 1.8$ V) is shown in [Figure 17](#).

Note: When the device is required to operate in a constant current mode with the EN pin connected to the voltage higher than 1.8 V, then the delay between rise times of V_{IN} voltage of the device and the EN voltage is mandatory to guarantee the proper internal reset of the logic of the device during ramping of the V_{IN} . It is recommended to delay the EN voltage rise time by 2 ms after the rise time on V_{IN} appears.

7.2 Selection of the external components

C_{IN} selection

It is recommended to use 1 μ F as the input capacitor to achieve good stability of the device and low noise on the V_{IN} track.

C_{OUT} selection

It is recommended to use 1 μ F as the optimal value of output capacitor to get the best compromise between output voltage ripple and load transients response. The output ripple can be checked according to the equation for step-up architecture:

Equation 1

$$V_{PK-PK} = \frac{I_{OUT(MAX)} * (V_{OUT} - V_{IN(MIN)}) * 100}{C_{OUT} * V_{OUT}^2 * f} [V; A, V, F, Hz]$$

Inductor selection

A thin shielded inductor with a low DC series winding resistance is recommended for this application. To achieve a good efficiency in step-up mode, it is recommended to use an inductor with a DC series resistance $R_{DCL} = R_D/10$ [Ω ; Ω ; 1], where R_D is the dynamic resistance of the LED [Ω ; Ω ; 1].

For nominal operation, the peak inductor current can be calculated by the formula:

Equation 2

$$I_{PEAK} = \left\{ \left(\frac{I_{OUT}}{\eta} \right) + \frac{[(V_{OUT} - V_{IN}) * V_{IN}^2]}{2 * L * f * V_{OUT}^2} \right\} * \frac{V_{OUT}}{V_{IN}}$$

where:

I_{PEAK}	Peak inductor current
I_{OUT}	Current sourced at the V_{OUT} pin
η	Efficiency of the STLA02
V_{OUT}	Output voltage at the V_{OUT} pin
V_{IN}	Input voltage at the V_{IN} pin
L	Inductance value of the inductor
f	Switching frequency

For the optimal function of the STLA02 device, it is recommended to use the inductor value 10 μ H and higher with low serial resistance and relevant saturation current calculated from the equation above.

R_{FB} value

$$R_{FB} = V_{FB} / I_{LED}$$

In the case of a typical setting $I_{LED} = 20$ mA, $V_{FB} = 200$ mV, and $R_{SENSE} = 10$ Ω . The resistor must be rated for a power dissipation of 10×0.02^2 W = 0.004 W.

PCB layout

STLA02 is a powerful switched device, the PCB must be designed in line with rules for designing switched supplies. It is recommended to use a two layer PCB. The power wirings must be as short as possible and wide. Place all external components close to the STLA02. High-energy switched loops should be as small as possible to reduce EMI. Most LEDs need cooling, which may be done by a defined area of copper on the PCB. Use the reference guide of each LED to design the heatsink. Place the R_{FB} resistor as close as possible to pin 4 and 5. When a change of PCB layer is needed, use enough vias. During routing the PCB must be focused on the minimum area of the application ground - the smaller the ground area of the DC-DC converter ^(a), the better stability and lower noise issues are achieved. It is recommended to place the copper plate, connected through the vias to the Exposed pad, on the bottom layer to create the heatsink of the device.

a. The application ground area is represented by the area which is created by the ground pins of the C_{IN} , C_{OUT} , ground of the DEVICE and GND connection of the load.
