LM3490
100 mA, SOT-23, Quasi Low-Dropout Linear Voltage Regulator with Logic-Controlled ON/$\overline{\text{OFF}}$

General Description

The LM3490 is an integrated linear voltage regulator. It features operation from an input as high as 30V and a guaranteed maximum dropout of 1.2V at the full 100 mA load. Standard packaging for the LM3490 is the 5-lead SOT-23 package. A logic-controlled ON/$\overline{\text{OFF}}$ feature makes the LM3490 ideal for powering subsystems ON and OFF as needed.

The 5, 12, and 15V members of the LM3490 series are intended as tiny alternatives to industry standard LM78LXX series and similar devices. The 1.2V quasi low dropout of LM3490 series devices makes them a nice fit in many applications where the 2 to 2.5V dropout of LM78LXX series devices precludes their (LM78LXX series devices) use.

The LM3490 series features a 3.3V member. The SOT packaging and quasi low dropout features of the LM3490 series converge in this device to provide a very nice, very tiny 3.3V, 100 mA bias supply that regulates directly off the system 5V ±5% power supply.

Key Specifications

- 30V maximum input for operation
- 1.2V guaranteed maximum dropout over full load and temperature ranges
- 100 mA guaranteed load current
- ±5% guaranteed output voltage tolerance over full load and temperature ranges
- −40 to +125°C junction temperature range for operation

Features

- 3.3, 5, 12, and 15V versions available
- Logic-controlled ON/$\overline{\text{OFF}}$
- Packaged in the tiny 5-lead SOT-23 package

Applications

- Tiny alternative to LM78LXX series and similar devices
- Tiny 5V±5% to 3.3V, 100 mA converter
- Post regulator for switching DC/DC converter
- Bias supply for analog circuits

Typical Application Circuit

Absolute Maximum Ratings (Note 4)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Input Voltage (IN to GND)	35V
Voltage ON/$\overline{\text{OFF}}$ to GND	5.5V
Power Dissipation (Note 5)	400 mW
Junction Temp. (T_J) (Note 5)	+150°C
Ambient Storage Temp.	−65 to +150°C
Soldering Time, Temp. (Note 6)	
Wave	4sec., 260°C
Infrared	10sec., 240°C
Vapor Phase	75sec., 219°C
ESD (Note 7)	
ON/$\overline{\text{OFF}}$	1.0kV
All Other Pins	2.0kV

Operating Ratings (Note 4)

Maximum Input Voltage (IN to GND)	30V
Voltage ON/$\overline{\text{OFF}}$ to GND	0 to 5V
Junction Temperature (T_J)	−40 to +125°C
Maximum Power Dissipation (Note 8)	300 mW

Electrical Characteristics

LM3490-3.3, LM3490-5.0

$V_{IN} = V_{NOM} + 1.5V$ unless otherwise noted. Typicals and limits appearing in normal type apply for $T_A = T_J = 25°C$. Limits appearing in boldface type apply over the entire junction temperature range for operation, −40 to +125°C. (Notes 9, 10, 11)

Nominal Output Voltage (V_{NOM})			3.3V		5.0V		Units

Note 1: The package code MA05B is internal to National Semiconductor Corporation and indicates a specific version of the SOT-23 package and associated mechanical drawings.

Note 2: The suffix "I" indicates the junction temperature range for operation is the industrial temperature range, −40 to +125°C. The suffix "M5" indicates the die is packaged in the 5-lead SOT-23 package. The suffix "X" indicates the devices will be supplied in blocks of 3k units as opposed to blocks of 250 units.

Note 3: Because the entire part number does not fit on the SOT-23 package, the SOT-23 package is marked with this code instead of the part number.

Note 4: Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

Note 5: The Absolute Maximum power dissipation depends on the ambient temperature and can be calculated using $P = (T_J - T_A)/\theta_{JA}$ where T_J is the junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance. The 400 mW rating results from substituting the Absolute Maximum junction temperature, 150°C, for T_J, 50°C for T_A, and 250°C/W for θ_{JA}. More power can be safely dissipated at lower ambient temperatures. Less power can be safely dissipated at higher ambient temperatures. The Absolute Maximum power dissipation can be increased by 4 mW for each °C below 50°C ambient. It must be derated by 4 mW for each °C above 50°C ambient. A θ_{JA} of 250°C/W represents the worst-case condition of no heat sinking of the 5-lead plastic SOT-23 package. Heat sinking enables the safe dissipation of more power. The LM3490 actively limits its junction temperature to about 150°C.

Note 6: Times shown are dwell times. Temperatures shown are dwell temperatures. For detailed information on soldering plastic small-outline packages, refer to the *Packaging Databook* available from National Semiconductor Corporation.

Note 7: For testing purposes, ESD was applied using the human-body model, a 100 pF capacitor discharged through a 1.5 kΩ resistor.

Note 8: As with the Absolute Maximum power dissipation, the maximum power dissipation for operation depends on the ambient temperature. The 300 mW rating appearing under Operating Ratings results from substituting the maximum junction temperature for operation, 125°C, for T_J, 50°C for T_A, and 250°C/W for θ_{JA} in $P = (T_J - T_A)/\theta_{JA}$. More power can be dissipated at lower ambient temperatures. Less power can be dissipated at higher ambient temperatures. The maximum power dissipation for operation appearing under Operating Ratings can be increased by 4 mW for each °C below 50°C ambient. It must be derated by 4 mW for each °C above 50°C ambient. A θ_{JA} of 250°C/W represents the worst-case condition of no heat sinking of the 5-lead plastic SOT-23 package. Heat sinking enables the dissipation of more power during operation.

Note 9: A typical is the center of characterization data taken with $T_A = T_J = 25°C$. Typicals are not guaranteed.

Note 10: All limits are guaranteed. All electrical characteristics having room-temperature limits are tested during production with $T_A = T_J = 25°C$. All hot and cold limits are guaranteed by correlating the electrical characteristics to process and temperature variations and applying statistical process control.

Note 11: All voltages except dropout are with respect to the voltage at the GND pin.

Typical Performance Characteristics

Unless indicated otherwise, $V_{IN} = V_{NOM} + 1.5V$, $C_{IN} = 0.1\ \mu F$, $C_{OUT} = 0.1\ \mu F$, and $T_A = 25°C$.

Applications Information

ON/$\overline{\text{OFF}}$ Pin

The LM3490 features a logic controlled ON/$\overline{\text{OFF}}$ pin that will allow the output voltage to be disabled, or enabled, as needed. The defined operating voltage range for this pin is 0.0V to 5.0V. The ON/$\overline{\text{OFF}}$ pin can not be left floating, as the output status cannot be guaranteed. Additionally, the ON/$\overline{\text{OFF}}$ pin should not be biased below ground potential as unpredictable device behavior may occur.

Pulling the ON/$\overline{\text{OFF}}$ pin voltage to a value between the V_{IH} threshold and 5.0V will enable the output voltage. Pulling the ON/OFF pin voltage to a value between the V_{IL} threshold and Ground potential will disable the output voltage. Although the ON/$\overline{\text{OFF}}$ threshold is typically 725mV, and has no hysteresis, the ON/$\overline{\text{OFF}}$ signal must rise and fall, cleanly and promptly, from voltage levels that are below the V_{IL} threshold and above the V_{IH} threshold.

The ON/$\overline{\text{OFF}}$ pin has no internal pull-up or pull-down to establish a default condition and, as a result, this pin must be terminated, either actively or passively, to an appropriate voltage level.
