## CPC5610/CPC5611 LITELINK™ II Silicon Data Access Arrangement (DAA) IC

### Features

- Full-duplex data and voice transmission
- Transformerless telephone line isolation interface
- Operates at all modem speeds, including V.90 (56K)
- 3.3 or 5 V power supply operation
- Half-wave ring detector (CPC5610) or full-wave ring detector (CPC5611)
- Caller ID signal reception
- Small 32-pin SOIC plastic package
- Printed-circuit board space and cost savings
- Meets PC Card (PCMCIA) height requirements
- Easy interface with modem ICs and voice CODECs
- Worldwide dial-up telephone network compatibility
- Supplied application circuit complies with the requirements of TIA/EIA/IS-968 (FCC part 68), UL1950, UL60950, EN60950, IEC60950, EN55022B, CISPR22B, EN55024, and TBR-21
- CPC5610 and CPC5611 comply with UL1577
- TTL compatible logic inputs and outputs
- Line-side circuit powered from telephone line

### Applications

- Satellite and cable set-top boxes
- V.90 (and other standard) modems
- Fax machines
- Voicemail systems
- Computer telephony
- PBXs
- Telephony gateways
- Embedded modems for such applications as POS terminals, automated banking, remote metering, vending machines, security, and surveillance

### Description

Clare CPC5610 and CPC5611 LITELINKs are silicon data access arrangement (DAA) ICs used in data and voice communication applications to make connections to the public switched telephone network (PSTN). LITELINK uses on-chip optical components and a few inexpensive external components to form a complete voice or high-speed data telephone line interface.

LITELINK eliminates the need for the large isolation transformers or capacitors as used in other DAA configurations. It incorporates the required high-voltage isolation barrier in the surface-mount SOIC package.

The CPC5610 (half-wave ring detect) and CPC5611 (full-wave ring detect) build upon Clare's existing LITELINK line, with improved performance and 3.3 V operation.

### Ordering Information

| Part Number | Description                                                        |
|-------------|--------------------------------------------------------------------|
| CPC5610A    | 32-pin surface mount DAA with half-wave ring detect, tubed         |
| CPC5610ATR  | 32-pin surface mount DAA with half-wave ring detect, tape and reel |
| CPC5611A    | 32-pin surface mount DAA with full-wave ring detect, tubed         |
| CPC5611ATR  | 32-pin surface mount DAA with full-wave ring detect, tape and reel |

## 1. Electrical Specifications

### 1.1 Absolute Maximum Ratings

| Parameter                                                | Minimum | Maximum | Unit             |
|----------------------------------------------------------|---------|---------|------------------|
| Isolation Voltage                                        | 1500    | -       | V <sub>RMS</sub> |
| Continuous Tip to Ring Current ( $R_{ZDC} = 5.2\Omega$ ) |         | 150     | mA               |
| Total Package Power Dissipation                          |         | 1       | W                |
| Operating temperature                                    | 0       | +85     | °C               |
| Storage temperature                                      | -40     | +125    | °C               |
| Soldering temperature                                    | -       | +220    | °C               |

Absolute maximum ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this data sheet is not implied. Exposure of the device to the absolute maximum ratings for an extended period may degrade the device and affect its reliability.

### 1.2 Performance

| Parameter                                   | Minimum | Typical | Maximum | Unit             | Conditions                                                        |
|---------------------------------------------|---------|---------|---------|------------------|-------------------------------------------------------------------|
| <b>DC Characteristics</b>                   |         |         |         |                  |                                                                   |
| Operating Voltage $V_{DD}$                  | 3.0     | -       | 5.50    | V                | Host side                                                         |
| Operating Current $I_{DD}$                  | -       | -       | 10      | mA               | Host side                                                         |
| Operating Voltage $V_{DDL}$                 | 2.8     | -       | 3.2     | V                | Line side, derived from tip and ring                              |
| Operating Current $I_{DDL}$                 | -       | 10.5    | 12      | mA               | Line side, drawn from tip and ring while off-hook                 |
| <b>On-hook Characteristics</b>              |         |         |         |                  |                                                                   |
| Metallic DC Resistance                      | 10      | -       | -       | M $\Omega$       | Tip to ring, 100 Vdc applied                                      |
| Longitudinal DC Resistance                  | 10      | -       | -       | M $\Omega$       | 150 Vdc applied from tip and ring to Earth ground                 |

<sup>1</sup>Through-hole components offer significant cost savings over SMT.

## 2.2 Reactive Termination Application Circuit

### Figure 4. Reactive Termination Application Circuit Schematic

<sup>1</sup>This design was tested and found to comply with FCC Part 68 with this part. Other compliance requirements may require a different part.

<sup>2</sup>Higher-noise power supplies may require substitution of a 220  $\mu$ H inductor, Toko 380HB-2215 or similar. See the Power Quality section of Clare application note AN-146, [Guidelines for Effective LITELINK Designs](#) for more information.

## 2.2.1 Reactive Termination Application Circuit Part List

<sup>1</sup>Through-hole components offer significant cost savings over SMT.

### 3. Using LITELINK

As a full-featured telephone line interface, LITELINK performs the following functions:

- DC termination
- AC impedance control
- V/I slope control
- 2-wire to 4-wire conversion (hybrid)
- Current limiting
- Ring detection
- Caller ID signal reception
- Switch hook

LITELINK can accommodate specific application features without sacrificing basic functionality and performance. Application features include, but are not limited to:

- High gain (+3 dBm) operation
- Pulse dialing
- Ground start
- Loop start
- Parallel telephone off-hook detection (911 feature)
- Battery reversal
- Line presence
- World-wide programmable operation

This section of the data sheet describes LITELINK operation in standard configuration for usual operation. Clare offers additional application information on-line ([see Section 5 on page 14](#)). These include information on the following topics:

- Circuit isolation considerations
- Optimizing LITELINK performance
- Data Access Arrangement architecture
- LITELINK circuit descriptions
- Surge protection
- EMI considerations

Other specific application materials are also referenced in this section as appropriate.

#### 3.1 Switch Hook Control (On-hook and Off-hook States)

LITELINK operates in one of two conditions, on-hook and off-hook. In the on-hook condition the telephone line is available for calls. In the off-hook condition the telephone line is engaged. Use the  $\overline{\text{OH}}$  control input to place LITELINK in one of these two states. With  $\overline{\text{OH}}$  high, LITELINK is on-hook and ready to make or receive a call. The snoop circuit is enabled. Assert  $\overline{\text{OH}}$  low to place LITELINK in the off-hook state. In the off-

hook state, loop current flows through LITELINK and the system is answering or placing a call.

### 3.2 On-hook Operation

The LITELINK application circuit leakage current is less than 10  $\mu\text{A}$  with 100 V across ring and tip, equivalent to greater than 10 M $\Omega$  on-hook resistance.

#### 3.2.1 Ring Signal Detection via the Snoop Circuit

In the on-hook state ( $\overline{\text{OH}}$  and  $\overline{\text{CID}}$  not asserted), an internal multiplexer turns on the snoop circuit. This circuit monitors the telephone line for two conditions; an incoming ring signal, and caller ID data bursts.

Refer to the application schematic diagram ([see Figure 3 on page 6](#)). C7 ( $\text{C}_{\text{SNP-}}$ ) and C8 ( $\text{C}_{\text{SNP+}}$ ) provide a high-voltage isolation barrier between the telephone line and SNP- and SNP+ on the LITELINK while coupling AC signals to the snoop amplifier. The snoop circuit “snoops” the telephone line continuously while drawing no current. In the LITELINK, ringing signals are compared to a threshold. The comparator output forms the  $\overline{\text{RING}}$  signal output from LITELINK. This signal must be qualified by the host system as a valid ringing signal. A low level on  $\overline{\text{RING}}$  indicates that the LITELINK ring signal threshold has been exceeded.

For the CPC5610 (with the half-wave ring detector), the frequency of the  $\overline{\text{RING}}$  output follows the frequency of the ringing signal from the central office (CO), typically 20 Hz. The  $\overline{\text{RING}}$  output of the CPC5611 (with the full-wave ring detector) is twice the ringing signal frequency.

Hysteresis is employed in the LITELINK ring detector circuit to provide noise immunity. The setup of the ring detector comparator causes  $\overline{\text{RING}}$  output pulses to remain low for most of the ringing signal half-cycle. The  $\overline{\text{RING}}$  output returns high for the entire negative half-cycle of the ringing signal for the CPC5610. For the CPC5611, the  $\overline{\text{RING}}$  output returns high for a short period near the zero-crossing of the ringing signal before returning low during the positive half-cycle. For both the CPC5610 and CPC5611, the  $\overline{\text{RING}}$  output remains high between ringing signal bursts.

The ring detection threshold depends on the values of R3 ( $\text{R}_{\text{SNPD}}$ ), R6 ( $\text{R}_{\text{SNP-}}$ ), R7 ( $\text{R}_{\text{SNP+}}$ ), C7 ( $\text{C}_{\text{SNP-}}$ ), and C8 ( $\text{C}_{\text{SNP+}}$ ). The values for these components shown in the typical application circuits are recommended for

typical operation. The ring detection threshold can be changed according to the following formula:

$$V_{RINGPK} = \left( \frac{750mV}{R_3} \right) \sqrt{\left[ (2R_6 + R_3)^2 + \frac{1}{(\pi f_{RING} C_7)^2} \right]}$$

Clare Application Note AN-117 **Customize Caller ID Gain and Ring Detect Voltage Threshold** is a spreadsheet for trying different component values in this circuit. Changing the ring detection threshold will also change the caller ID gain and the timing of the polarity reversal detection pulse, if used.

### 3.2.2 Polarity Reversal Detection with CPC5611

The full-wave ring detector in the CPC5611 makes it possible to detect tip and ring polarity reversal using the  $\overline{RING}$  output. When the polarity of tip and ring reverses, a pulse on  $\overline{RING}$  indicates the event. Your host system must be able to discriminate this single pulse of approximately 1 msec (using the recommended snoop circuit external components) from a valid ringing signal.

### 3.2.3 On-hook Caller ID Signal Processing

On-hook caller ID (CID) signals are processed by LITELINK by coupling the CID data burst through the snoop circuit to the LITELINK RX outputs under control of the  $\overline{CID}$  pin. In North America, CID data signals are typically sent between the first and second ringing signal.

**Figure 5. On-hook Caller ID Signal Timing in North America for CPC5610 (with Half-wave Ring Detect)**

Signal levels not to scale

In North American applications, follow these steps to receive on-hook caller ID data via the LITELINK RX outputs:

1. Detect the first ringing signal outputs on  $\overline{RING}$ .
2. Assert  $\overline{CID}$  low.
3. Process the CID data from the RX outputs.
4. De-assert  $\overline{CID}$  (high or floating).

Note: Taking LITELINK off-hook (via the  $\overline{OH}$  pin) disconnects the snoop path from both the receive outputs and the  $\overline{RING}$  output, regardless of the state of the  $\overline{CID}$  pin.

CID gain from tip and ring to RX+ and RX- is determined by:

$$GAIN_{CID}(dB) = 20 \log \left[ \frac{6R_3}{\sqrt{\left[ (2R_6 + R_3)^2 + \frac{1}{(\pi f C_7)^2} \right]}} \right]$$

where  $f$  is the frequency of the CID data signal.

The recommended components in the application circuit yield a gain 0.27 dB at 200 Hz. Clare Application Note AN-117 **Customize Caller ID Gain and Ring Detect Voltage Threshold** is a spreadsheet for trying different component values in this circuit. Changing the CID gain will also change the ring detection threshold and the timing of the polarity reversal detection pulse, if used.

For single-ended snoop circuit output of 0 dBm, set the total resistance across the series resistors ( $R_6/R_{44}$  and  $R_7/R_{45}$ ) to 1.4 M $\Omega$ .

## 3.3 Off-Hook Operation

### 3.3.1 Receive Signal Path

Signals to and from the telephone network appear on the tip and ring connections of the application circuit. Receive signals are extracted from transmit signals by the LITELINK two-wire to four-wire hybrid. Next, the receive signal is converted to infrared light by the receive photodiode amplifier and receive path LED. The intensity of the light is modulated by the receive signal and coupled across the electrical isolation barrier by a reflective dome.

On the host equipment side of the barrier, the receive signal is converted by a photodiode into a photocur-

rent. The photocurrent, a linear representation of the receive signal, is amplified and converted to a differential voltage output on RX+ and RX-.

Variations in gain are controlled to within  $\pm 1$  dB by an on-chip automatic gain control (AGC) circuit, which sets the output of the photoamplifier to unity gain.

To accommodate single-supply operation, LITELINK includes a small DC bias on the RX outputs of 1.0 Vdc. Most applications should AC couple the RX outputs as shown in Figure 6.

LITELINK may be used for differential or single-ended output as shown in Figure 6. Single-ended use will produce 6 dB less signal output amplitude. Do not exceed 0 dBm into 600  $\Omega$  (2.2 V<sub>P-P</sub>) signal input.

**Figure 6. Differential and Single-ended Receive Path Connections to LITELINK**

### 3.3.2 Transmit Signal Path

Connect transmit signals from the host equipment to the TX+ and TX- pins of LITELINK. Do not exceed a signal level of 0 dBm in 600  $\Omega$  (or 2.2 V<sub>P-P</sub>). Differential transmit signals are converted to single-ended signals in LITELINK. The signal is coupled to the transmit photodiode amplifier in a similar manner to the receive path.

The output of the photodiode amplifier is coupled to a voltage-to-current converter via a transconductance stage where the transmit signal modulates the telephone line loop current. As in the receive path, gain is set to unity automatically, limiting insertion loss to 0,  $\pm 1$  dB.

**Figure 7. Differential and Single-ended Transmit Path Connections to LITELINK**

## 3.4 DC Characteristics

The CPC5610 and CPC5611 are designed for worldwide application regarding DC characteristics, including use under the requirements of TBR-21. The ZDC, DCS1, and DCS2 pins control the VI slope characteristics of LITELINK. Selecting appropriate resistor values for R<sub>ZDC</sub> (R16) and R<sub>DCS</sub> (R15) in the provided application circuits assure compliance with DC requirements.

### 3.4.1 Resistive Termination Applications

LITELINK includes a telephone line current limit feature that is selectable by selecting the desired value for R<sub>ZDC</sub> (R16) using the following formula:

$$I_{CL} \text{ Amps} = \frac{1V}{R_{ZDC}} + 0.011A$$

Clare recommends using 8.2  $\Omega$  for R<sub>ZDC</sub> in North America and Japan, limiting telephone line current to 133 mA.

### 3.4.2 Reactive Termination Applications

TBR-21 sets the telephone line current limit at 60 mA. To meet this requirement, set R<sub>ZDC</sub> (R16) to 22.1  $\Omega$ .

See Clare application note AN-146 [Guidelines for Effective LITELINK Designs](#) for information on FET heat sinking in this application.

## 3.5 AC Characteristics

### 3.5.1 Resistive Termination Applications

North American and Japanese telephone line AC termination requirements are met with a resistive 600  $\Omega$  AC termination. Receive termination is applied to the LITELINK ZNT pin (pin 29) as a 301  $\Omega$  resistor,  $R_{ZNT}$  (R10). A 150  $\Omega$  resistor, R18 ( $R_{ZTX}$ ), applied to the LITELINK ZTX pin (pin 30) sets the correct transmit gain and impedance.

### 3.5.2 Reactive Termination Applications

Many areas use a single-pole complex impedance to model the telephone network transmission line characteristic impedance as shown in the table below.

**Line Impedance Model**

|                                                                                   |    | TBR-21 | Australian |
|-----------------------------------------------------------------------------------|----|--------|------------|
|  | Ra | 750    | 820        |
|                                                                                   | Rb | 270    | 220        |
|                                                                                   | C  | 150 nF | 120 nF     |

Matching a complex impedance requires the use of complex networks on ZNT and ZTX. In order to accommodate high power levels, it is necessary to modify the transmit and receive gain characteristics of your LITELINK implementation. The complex network on the ZTX pin increases transmit gain by 7 dB. A 7 dB pad may be inserted before the TX+ and TX- pins to provide overall unity gain. Similarly, with a complex network, the ratio of R12 ( $R_{NTF}$ ) and R13 ( $R_{NTS}$ ) must be modified from 1:1 to 1:.287, which introduces a 7 dB loss in the receive path from tip and ring to ZNT.

## 4. Regulatory Information

LITELINK can be used to build products that comply with the requirements of TIA/EIA/IS-968 (formerly FCC part 68), FCC part 15B, TBR-21, EN60950, UL1950, EN55022B, IEC950/IEC60950, CISPR22B, EN55024, and many other standards. LITELINK complies with the requirements of UL1577. LITELINK provides supplementary isolation. Metallic surge requirements are met through the inclusion of a Sidactor in the application circuit. Longitudinal surge protection is provided by LITELINK's optical-across-the-barrier technology and the use of high-voltage components in the application circuit as needed.

The information provided in this document is intended to inform the equipment designer but it is not sufficient to assure proper system design or regulatory compliance. Since it is the equipment manufacturer's responsibility to have their equipment properly designed to conform to all relevant regulations, designers using LITELINK are advised to carefully verify that their end-product design complies with all applicable safety, EMC, and other relevant standards and regulations. Semiconductor components are not rated to withstand electrical overstress or electro-static discharges resulting from inadequate protection measures at the board or system level.

## 5. LITELINK Design Resources

### 5.1 Clare, Inc. Design Resources

The Clare, Inc. web site has a wealth of information useful for designing with LITELINK, including application notes and reference designs that already meet all applicable regulatory requirements. LITELINK data sheets also contains additional application and design information. See the following links:
