

## 74ABT574

### Octal D-Type Flip-Flop with 3-STATE Outputs

#### General Description

The ABT574 is an octal flip-flop with a buffered common Clock (CP) and a buffered common Output Enable ( $\overline{OE}$ ). The information presented to the D inputs is stored in the flip-flops on the LOW-to-HIGH Clock (CP) transition.

The device is functionally identical to the ABT374 but has broadside pinouts.

#### Features

- Inputs and outputs on opposite sides of package allowing easy interface with microprocessors
- Useful as input or output port for microprocessors
- Functionally identical to ABT374

- 3-STATE outputs for bus-oriented applications
- Output sink capability of 64 mA, source capability of 32 mA
- Guaranteed output skew
- Guaranteed multiple output switching specifications
- Output switching specified for both 50 pF and 250 pF loads
- Guaranteed simultaneous switching, noise level and dynamic threshold performance
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down cycle
- Non-destructive hot insertion capability

#### Ordering Code:

| Order Number | Package Number | Package Description                                                             |
|--------------|----------------|---------------------------------------------------------------------------------|
| 74ABT574CSC  | M20B           | 20-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide Body |
| 74ABT574CSJ  | M20D           | 20-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide                   |
| 74ABT574CMSA | MSA20          | 20-Lead Shrink Small Outline Package (SSOP), EIAJ TYPE II, 5.3mm Wide           |
| 74ABT574CMTC | MTC20          | 20-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide     |

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

| CP                             | Clock Pulse Input<br>(Active Rising Edge)   |
| $\overline{OE}$                | 3-STATE Output Enable<br>Input (Active LOW) |
| O <sub>0</sub> –O <sub>7</sub> | 3-STATE Outputs                             |

## Functional Description

The ABT574 consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual D inputs that meet the setup and hold times requirements on the LOW-to-HIGH Clock (CP) transition.

With the Output Enable ( $\overline{OE}$ ) LOW, the contents of the eight flip-flops are available at the outputs. When  $\overline{OE}$  is HIGH, the outputs are in a high impedance state. Operation of the  $\overline{OE}$  input does not affect the state of the flip-flops.

## Function Table

| Inputs          |        |   | Internal | Outputs | Function          |
|-----------------|--------|---|----------|---------|-------------------|
| $\overline{OE}$ | CP     | D | Q        | O       |                   |
| H               | H or L | L | NC       | Z       | Hold              |
| H               | H or L | H | NC       | Z       | Hold              |
| H               | ↗      | L | L        | Z       | Load              |
| H               | ↗      | H | H        | Z       | Load              |
| L               | ↗      | L | L        | L       | Data Available    |
| L               | ↗      | H | H        | H       | Data Available    |
| L               | H or L | L | NC       | NC      | No Change in Data |
| L               | H or L | H | NC       | NC      | No Change in Data |

H = HIGH Voltage Level  
 L = LOW Voltage Level  
 X = Immaterial  
 Z = High Impedance  
 ↗ = LOW-to-HIGH Transition  
 NC = No Change

## Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

**Absolute Maximum Ratings**(Note 1)

|                                  |                                      |

**Recommended Operating Conditions**

|                                                 |                |
|-------------------------------------------------|----------------|
| Free Air Ambient Temperature                    | –40°C to +85°C |
| Supply Voltage                                  | +4.5V to +5.5V |
| Minimum Input Edge Rate ( $\Delta V/\Delta t$ ) |                |
| Data Input                                      | 50 mV/ns       |
| Enable Input                                    | 20 mV/ns       |
| Clock Input                                     | 100 mV/ns      |

**Note 1:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** Either voltage limit or current limit is sufficient to protect inputs.

**DC Electrical Characteristics**

| <b>Note 8:</b> This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).                                                                                                                                                                                                                           |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 9:</b> This specification is guaranteed but not tested. The limits represent propagation delay with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.                                                                                                                                                          |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 10:</b> This specification is guaranteed but not tested. The limits represent propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.) with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.                                                                                                                               |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 11:</b> The 3-STATE Delay Times are dominated by the RC network (500Ω, 250 pF) on the output and has been excluded from the datasheet.                                                                                                                                                                                                                                                                          |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |

| <b>Note 12:</b> This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).                                                                                                                                                                                                                          |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 13:</b> This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.                                                                                                                                                                                                                     |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 14:</b> Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH-to-LOW (t <sub>OSHL</sub> ), LOW-to-HIGH (t <sub>OSLH</sub> ), or any combination switching LOW-to-HIGH and/or HIGH-to-LOW (t <sub>OST</sub> ). This specification is guaranteed but not tested. |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 15:</b> This describes the difference between the delay of the LOW-to-HIGH and the HIGH-to-LOW transition on the same pin. It is measured across all the outputs (drivers) on the same chip, the worst (largest delta) number is the guaranteed specification. This specification is guaranteed but not tested.                                                                                                 |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |
| <b>Note 16:</b> Propagation delay variation for a given set of conditions (i.e., temperature and V <sub>CC</sub> ) from device to device. This specification is guaranteed but not tested.                                                                                                                                                                                                                              |                                            |                                                                                                                                |     |                                                                                                                               |     |                                                                                                                                  |      |       |

## Capacitance

| Symbol              | Parameter          | Typ | Units | Conditions<br>$T_A = 25^\circ\text{C}$ |
|---------------------|--------------------|-----|-------|----------------------------------------|
| $C_{IN}$            | Input Capacitance  | 5.0 | pF    | $V_{CC} = 0\text{V}$                   |
| $C_{OUT}$ (Note 17) | Output Capacitance | 9.0 | pF    | $V_{CC} = 5.0\text{V}$                 |

Note 17:  $C_{OUT}$  is measured at frequency  $f = 1\text{ MHz}$ , per MIL-STD-883B, Method 3012.

## AC Loading

\*Includes jig and probe capacitance

FIGURE 1. Standard AC Test Load

FIGURE 2.  $V_M = 1.5\text{V}$

### Input Pulse Requirements

| Amplitude | Rep. Rate | $t_w$  | $t_r$  | $t_f$  |
|-----------|-----------|--------|--------|--------|
| 3.0V      | 1 MHz     | 500 ns | 2.5 ns | 2.5 ns |
