## 1. OBJECTIVE

This specification provides information and requirements for customer application of the 5 & 8 row Millipacs® HM right angle press-fit receptacles and right angle headers. It is intended to provide general guidance for process development and the use of FCI application tooling. It should be recognized that no single process will work under all customer applications and that customers should develop processes to meet individual needs. However, if the processes vary greatly from the recommended one, FCI cannot guarantee acceptable results.

## 2. SCOPE

This specification provides information and requirements regarding application of 5 & 8 row Millipacs® HM right angle press-fit receptacles and right angle headers to printed circuit boards (PCB) along with the application of associated shielding.

## 3. GENERAL

This document is a general application guide. If there is a conflict between the product drawings and this specification, the drawings take precedence.

Figures 3 & 4 illustrate important features of the Millipacs® HM 5 & 8 row right angle receptacles.

Figure 4 illustrates the bottom features that locate and secure the connectors to the PCB. The compliant press-fit tails provide a reliable electrical connection between the connector and the plated through hole (PTH) of the PCB. Press-fit tails eliminate the need for soldering processing of through-board solder tails.

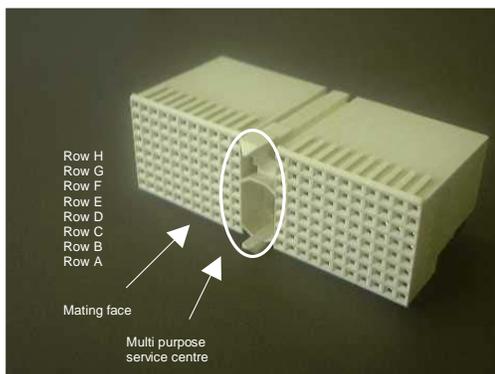

Figure 3

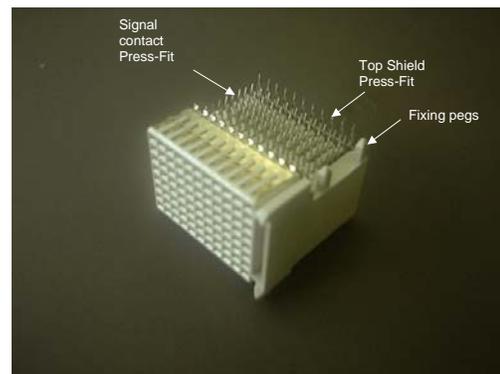

Figure 4

## 5. APPLICATION REQUIREMENTS

For specifics of the PCB layout, refer to the customer drawing of the part number being applied.

To enable proper application and repair/removal of the receptacles, there are recommended keep-out zones (see Figure 5, 6, 7, 8).

### 5.1. *Shielded right angle receptacle connectors*

**5.2. Shielded right angle Header connector**

Same keep out zones as the 5 row receptacle connector.

**5.3. Non-shielded connectors**

For non-shielded connectors there are no keep-out zones specified.

**6. CODING KEYS**

Connectors with a Service Center can be set up with Coding Keys which create defined intermatable pairs preventing all electrical contact to any connector outside of the coded configuration. Coding Keys are inserted into the connector Service Center using FCI tool HM2Y197E.

**Figure 8 -- Coding Keys**

### 7.1. *Push blade (TOP TOOL)*

The Press Bar is a “flat rock” type of tool. The correct length tool is based on the length of the module being applied.

- When applying receptacles (headers) that are stacked end-to-end, a longer Press Bar can be used.
- When applying receptacles (headers) separated by spaces a custom Press Bar may be required.
- When applying shielded and non-shielded connectors stacked end-to-end, a custom Press Bar is required.

### 7.2. *Anvil (BOTTOM TOOL)*

The PCB Support provides a support surface during insertion and includes clearance areas for the press-tails as protrude through the board. FCI offers various PCB Support sizes as listed Table 1.

- When applying receptacles (headers) that are stacked end-to-end, a longer Anvil can be used.

	TYPE	APPLICATION SPECIFICATION		NUMBER	GS-20-022

				AUTHORIZED BY	T. De Rooster		DATE	16-May-02
				<b>UNRESTRICTED</b>				

### 7.3. APPLICATION TOOLING

#### *Insertion Press*

The insertion tooling can work in a variety of presses. Several important items to consider when utilizing an insertion press:

- The press must have sufficient force capabilities to insert the specific receptacle (header) configuration.
- When pressing shielded connectors, the push blade should be sufficiently long to cover the adapter tooling. This will prevent tooling flex.
- The press table should be large enough to properly accommodate the PCB size.

Typical press types are:

- \* Manual arbor press
- \* Servo driven electrical press

The preferred press type is the servo driven electrical press. This press gives the best control during the insertion process and offers the most flexibility. For more information, contact your local Customer Service Representative.

FCI provides a range of state-of-the-art press-fit insertion machines. The IMPRESS family has the following offerings:

**IMPRESS 2000:** a modular based fully automated pick-and-place insertion machine.

**IMPRESS 1000:** a semi-automatic step-and-repeat press with motor driven xy-table.

**IMPRESS 500E:** a hand-operated servo driven C-frame press.

**Baby IMPRESS:** a flat-bed servo motor driven bench-press.

**IMPRESS 500M+:** a hand-operated C-frame bench-press.

		AUTHORIZED BY T. De Rooster	DATE 16-May-02
<b>UNRESTRICTED</b>			

## 8. APPLICATION PROCEDURE

The application procedure for right angle receptacles and headers is as follows:

- Place receptacle (header) in the desired location on the PCB taking care to assure that all press-fit tails line up with the proper holes.
  
- Place the Push blade and Anvil in the proper location with respect to the receptacle (header) and PCB as shown below.

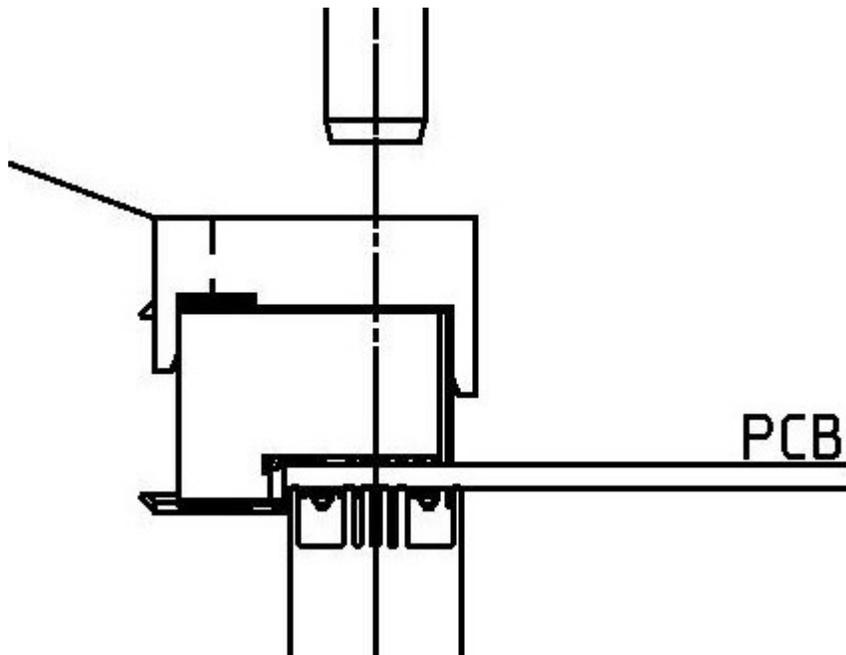

Figure 11 – Insertion Procedure

- To ensure proper insertion, **RECEPTACLES (HEADERS) MUST BE CENTERED BENEATH THE PRESS RAM.** Offset loading may result in improper seating of the receptacle (header) and mating problems.

	TYPE	NUMBER	
	<b>APPLICATION SPECIFICATION</b>	<b>GS-20-022</b>	
TITTLE Application Guide Millipacs <sup>®</sup> HM 5 and 8 Row Right Angle & Straight Signal Receptacles Millipacs <sup>®</sup> HM Right Angle Headers	PAGE	15 of 22	REVISION
	AUTHORIZED BY	T. De Rooster	DATE
			16-May-02
<b>UNRESTRICTED</b>			

- Insertion press guidelines:

Product Version	Recommended Max Force Setting For Application Press
Millipacs <sup>®</sup> HM 5 Row Receptacle or Header	45 N (10.1 lbs) Maximum Force Per Press-Fit
Millipacs <sup>®</sup> HM 8 Row Receptacle	45 N (10.1 lbs) Maximum Force Per Press-Fit

- The recommended maximum force per press-fit has been determined to yield acceptable insertion results for SnPb PTHs. While it is acceptable to use a lower force per press-fit, steps should be taken to guarantee that the receptacle (header) is fully seated (see Section 10). Force settings may vary with different types of PTH finishes. Customers should develop parameters that best suit individual application requirements.

**EXAMPLE:** For one Millipacs<sup>®</sup> HM 5 row Type A receptacle, there are 110 press-fit tails being inserted into the PC board (signals only). Therefore, the maximum recommended press setting would be 4950 N (110 press-fit tails x 45 N).

**EXAMPLE:** For one Millipacs<sup>®</sup> HM 8 row Type D receptacle, there are 176 press-fit tails being inserted into the PC board (including both signals and grounds). Therefore, the maximum recommended press setting would be 7920 N (176 press-fit tails x 45 N).

- Actuate the insertion press
  - Actuation of the insertion press should be slow and controlled, not fast like a punch press. Inserting to a certain pressure will yield more consistent results than inserting to a set distance. Be sure to follow any safety requirements associated with the application equipment.

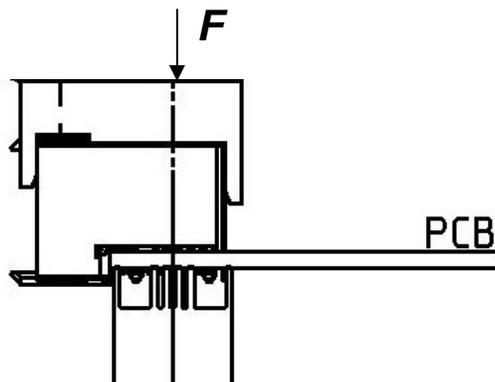

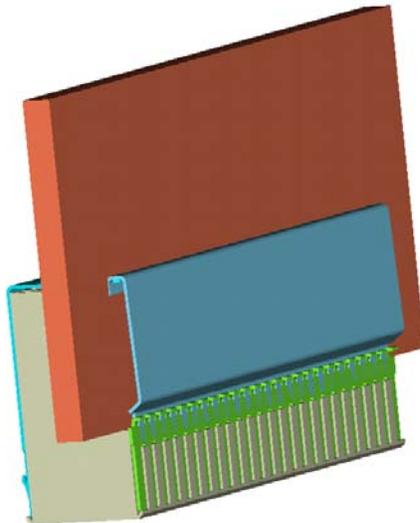

Figure 12 – Applying Force

- Remove assembly from insertion press.
- Inspect product for proper application.

	TYPE <b>APPLICATION SPECIFICATION</b>	NUMBER <b>GS-20-022</b>

## 9. COVER SHIELD INSTALLATION

The Cover Shield is an optional component and is applied to the bottom side of the PCB opposite the side the connector is mounted on for the purpose of bottom side electrical shielding. There are two Cover Shield designs that are available (Shown in Figures 13 and 14).

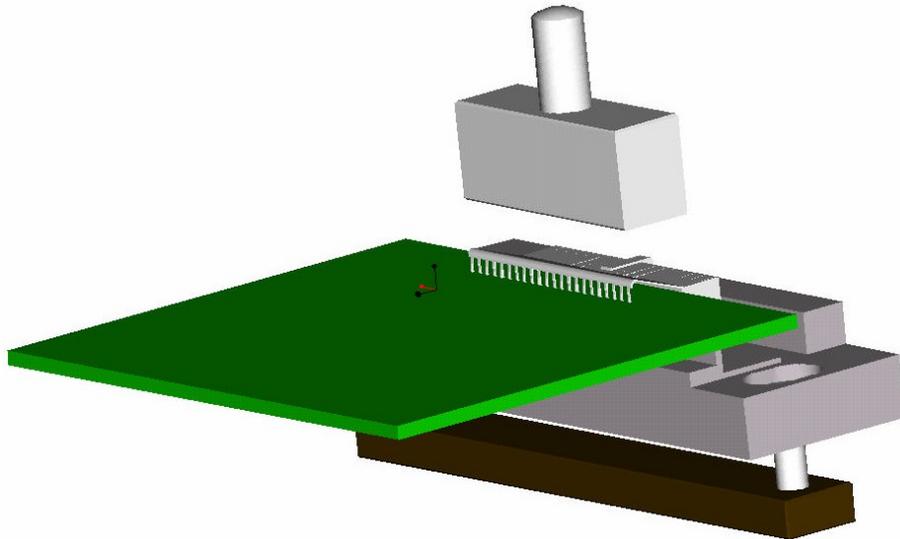

**Figure 13 – Clip on cover shield**

**Figure 14 – One piece cover shield**

		AUTHORIZED BY T. De Rooster	DATE 16-May-02
<b>UNRESTRICTED</b>			

## 9.2. *Clip on Cover Shield with 8 row connectors*

**Figure 15 - Clip on Cover Shield Tool HM2Y290**

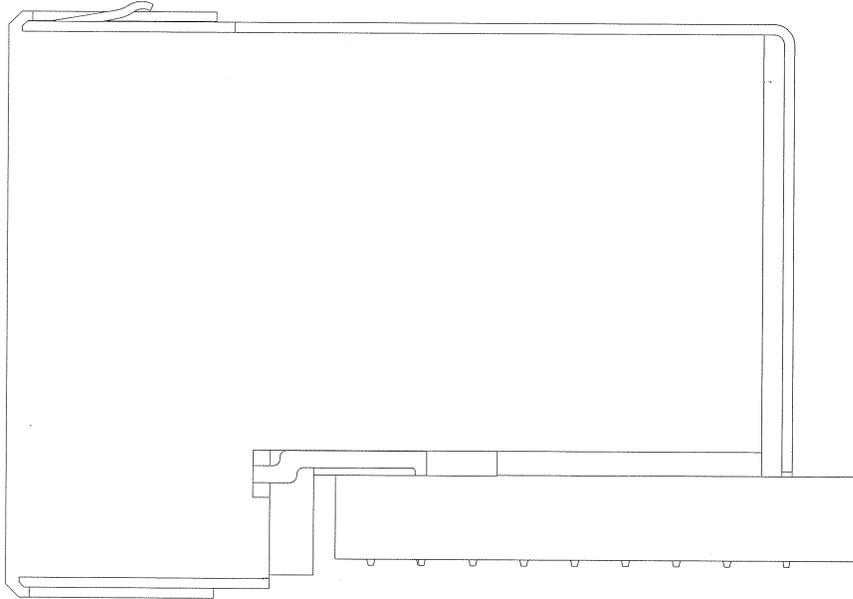

- ✓ Use the tool HM2Y290 for placing the Clip on cover shield in the connector
- ✓ Manually place the Clip on cover shield in the tool.
- ✓ Place the tool with the shield over the connector pins and by squeezing the tool manually the shield is pressed over the press fit pins.
- ✓ For more detail information, check the instruction manual of the tool.

	TYPE <b>APPLICATION SPECIFICATION</b>	NUMBER <b>GS-20-022</b>

		AUTHORIZED BY T. De Rooster	DATE 16-May-02
<b>UNRESTRICTED</b>			

## 10. POST-APPLICATION INSPECTION REQUIREMENTS

Post-application inspection should consist of several simple checks to assure that the receptacle (header) is applied properly.

- Visually assure that all press-fit tails are seated in the proper PCB holes and that none have been crushed during application.
- Visually assure that the plastic standoffs on the bottom of the assembly are seated within 0.13 mm of flush to the PCB but not crushed (see Figure 16). A larger gap beneath the standoffs may indicate that the receptacle (header) is not seated parallel to the board. This can cause receptacle (header) misalignment with adjacent Millipacs® HM components.

**Figure 16 -- Proper Receptacle (header) assembly**

	TYPE <b>APPLICATION SPECIFICATION</b>	NUMBER <b>GS-20-022</b>

## 11. REMOVAL TOOLING

Removal tooling for the 5 & 8 Row right angle press-fit receptacle consists of the following:

### 11.1. *Removal tooling for the clip on cover shield*

The shield can easily be removed manually.

### 11.2. *Removal tooling for one piece cover shield*

**Figure 17 -- Shielding Removal tooling HM2Y463**

- Place the tool over the shielding and by turning the handle the shield will be extracted from the PCB.
- For more detail information, check the instruction manual of the tool.

	TYPE <b>APPLICATION SPECIFICATION</b>	NUMBER <b>GS-20-022</b>

		AUTHORIZED BY T. De Rooster	DATE 16-May-02
<b>UNRESTRICTED</b>			

### 11.3. Removal tooling for the 5+8 row connector

**Figure 17 -- Connector Removal tooling HM2Y350**

- For more detail information, check the instruction manual of the tool.

#### **FEATURES:**

- Removes one (1) receptacle connector.
- By cutting the connector the connector can be easily removed.
- Removal kit includes Xcelite Pliers, a Comb Removal Tool and the Connector Removal Tool. The Xcelite Pliers are for removal of the top shield.
- The hand tool can be adjusted to remove a connector in the middle of the row.
- A manual force of 20 – 30 lbs is required to properly operate the Removal Tool.
