

Preliminary

155M~2.67Gbps Spring-latch SFP Transceiver

(With monitoring function, for 2~15km transmission, RoHS compliance)

Features

- ◆ Support 155M~2.67Gbps multi-rate data links
- ◆ 1310nm FP laser and PIN photodiode for 2km transmission
- ◆ 1310nm uncooled DFB laser and PIN photodiode for 15km transmission
- ◆ Digital diagnostic monitor interface compatible with SFF-8472
- ◆ SFP MSA package with duplex LC connector
- ◆ With spring latch for high density application
- ◆ Class I laser product
- ◆ Hot-pluggable capability
- ◆ Operating case temperature: 0 to +70°C

Applications

- ◆ 1×/2× Fiber Channel
- ◆ Gigabit Ethernet
- ◆ SDH/SONET/ATM
- ◆ Other optical links

Standard

- ◆ Compatible with SFP MSA
- ◆ Compatible with SFF-8472 Rev 9.3

Members of Flexon™ Family

- ◆ Compatible with ITU-T G.957 and G.958
- ◆ Compatible with Telcordia GR-253-CORE
- ◆ Compatible with FCC 47 CFR Part 15, Class B
- ◆ Compatible with FDA 21 CFR 1040.10 and 1040.11, Class I
- ◆ RoHS compliance

Description

Fiberxon 155M ~ 2.67Gbps Spring-latch SFP transceiver is high performance, cost effective module that supports data-rate up to 2.67Gbps and transmission distance from 2km to 15km.

The transceiver consists of two sections: The transmitter section incorporates a FP or uncooled DFB laser, and the receiver section consists of a PIN photodiode integrated with a trans-impedance preamplifier (TIA). All modules satisfy class I laser safety requirements.

The optical output can be disabled by a TTL logic high-level input of Tx Disable. Tx Fault is provided to indicate degradation of the laser. Loss of signal (LOS) output is provided to indicate the loss of an input optical signal of receiver.

The transceiver provides an enhanced monitoring interface, which allows real time access to the transceiver operating parameters such as transceiver temperature, laser bias current, transmitted optical power, received optical power and transceiver supply voltage by reading a built-in memory with I2C interface. For further information, please refer to SFF-8472 Rev 9.3.

Fiberxon's SFP transceivers are compliant with RoHS.

Regulatory Compliance

The transceivers have been tested according to American and European product safety and electromagnetic compatibility regulations (See Table 1). For further information regarding regulatory certification, please refer to Flexon™ regulatory specification and safety guidelines, or contact Fiberxon, Inc. America sales office listed at the end of the documentation.

EEPROM Information

The SFP MSA defines a 256-byte memory map in EEPROM describing the transceiver's capabilities, standard interfaces, manufacturer, and other information, which is accessible over a two-wire serial interface at the 8-bit address 1010000X (A0h). The memory contents refer to Table 6

Monitoring Specification

The digital diagnostic monitoring interface also defines another 256-byte memory map in EEPROM, which makes use of the 8 bit address 1010001X (A2h). Please see Figure 1. For detail EEPROM information, please refer to the related document of SFF-8472 Rev 9.3. The monitoring specification of this product is described in Table 7

Notes:

1. TX Fault is an open collector output, which should be pulled up with a 4.7k~10kΩ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates a laser fault of some kind. In the low state, the output will be pulled to less than 0.8V.
2. TX Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7k~10kΩ resistor. Its states are:
 Low (0~0.8V): Transmitter on
 (>0.8V, <2.0V): Undefined
 High (2.0~3.465V): Transmitter Disabled
 Open: Transmitter Disabled
3. MOD-DEF 0,1,2 are the module definition pins. They should be pulled up with a 4.7k~10kΩ resistor on the host board. The pull-up voltage shall be VccT or VccR.
 MOD-DEF 0 grounded by the module indicates that the module is present
 MOD-DEF 1 is the clock line of two-wire serial interface for serial ID
 MOD-DEF 2 is the data line of two-wire serial interface for serial ID
4. LOS is an open collector output, which should be pulled up with a 4.7k~10kΩ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates loss of signal. In the low state, the output will be pulled to less than 0.8V.
5. These are the differential receiver outputs. They are AC-coupled 100Ω differential lines which should be terminated with 100Ω (differential) at the user SERDES.
6. These are the differential transmitter inputs. They are AC-coupled, differential lines with 100Ω differential termination inside the module.
