

# Very Low Supply Current 3-Pin Microprocessor Reset Monitors

## MAX809 Series, MAX810 Series

The MAX809 and MAX810 are cost-effective system supervisor circuits designed to monitor  $V_{CC}$  in digital systems and provide a reset signal to the host processor when necessary. No external components are required.

The reset output is driven active within 10  $\mu$ sec of  $V_{CC}$  falling through the reset voltage threshold. Reset is maintained active for a timeout period which is trimmed by the factory after  $V_{CC}$  rises above the reset threshold. The MAX810 has an active-high RESET output while the MAX809 has an active-low RESET output. Both devices are available in SOT-23 and SC-70 packages.

The MAX809/810 are optimized to reject fast transient glitches on the  $V_{CC}$  line. Low supply current of 0.5  $\mu$ A ( $V_{CC} = 3.2$  V) makes these devices suitable for battery powered applications.

### Features

- Precision  $V_{CC}$  Monitor for 1.5 V, 2.5 V, 3.0 V, 3.3 V, and 5.0 V Supplies
- Precision Monitoring Voltages from 1.2 V to 4.9 V Available in 100 mV Steps
- Four Guaranteed Minimum Power-On Reset Pulse Width Available (1 ms, 20 ms, 100 ms, and 140 ms)
- RESET Output Guaranteed to  $V_{CC} = 1.0$  V.
- Low Supply Current
- Compatible with Hot Plug Applications
- $V_{CC}$  Transient Immunity
- No External Components
- Wide Operating Temperature:  $-40^{\circ}\text{C}$  to  $105^{\circ}\text{C}$
- These Devices are Pb-Free and are RoHS Compliant

### Typical Applications

- Computers
- Embedded Systems
- Battery Powered Equipment
- Critical Microprocessor Power Supply Monitoring

## PIN DESCRIPTION

| Pin No. | Symbol         | Description                                                                                                                                              |
|---------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1       | GND            | Ground                                                                                                                                                   |
| 2       | RESET (MAX809) | RESET output remains low while $V_{CC}$ is below the reset voltage threshold, and for a reset timeout period after $V_{CC}$ rises above reset threshold  |
| 2       | RESET (MAX810) | RESET output remains high while $V_{CC}$ is below the reset voltage threshold, and for a reset timeout period after $V_{CC}$ rises above reset threshold |
| 3       | $V_{CC}$       | Supply Voltage (Typ)                                                                                                                                     |

## ABSOLUTE MAXIMUM RATINGS

| Rating                                                                                                                                   | Symbol                             | Value                      | Unit                        |
|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|----------------------------|-----------------------------|
| Power Supply Voltage ( $V_{CC}$ to GND)                                                                                                  | $V_{CC}$                           | -0.3 to 6.0                | V                           |
| RESET Output Voltage (CMOS)                                                                                                              |                                    | -0.3 to ( $V_{CC} + 0.3$ ) | V                           |
| Input Current, $V_{CC}$                                                                                                                  |                                    | 20                         | mA                          |
| Output Current, $\overline{\text{RESET}}$                                                                                                |                                    | 20                         | mA                          |
| dV/dt ( $V_{CC}$ )                                                                                                                       |                                    | 100                        | V/ $\mu\text{sec}$          |
| Thermal Resistance, Junction-to-Air (Note 1)                                                                                             | SOT-23<br>SC-70<br>$R_{\theta JA}$ | 301<br>314                 | $^{\circ}\text{C}/\text{W}$ |
| Operating Junction Temperature Range                                                                                                     | $T_J$                              | -40 to +125                | $^{\circ}\text{C}$          |
| Storage Temperature Range                                                                                                                | $T_{stg}$                          | -65 to +150                | $^{\circ}\text{C}$          |
| Lead Temperature (Soldering, 10 Seconds)                                                                                                 | $T_{sol}$                          | +260                       | $^{\circ}\text{C}$          |
| ESD Protection<br>Human Body Model (HBM): Following Specification JESD22-A114<br>Machine Model (MM): Following Specification JESD22-A115 |                                    | 2000<br>200                | V                           |
| Latchup Current Maximum Rating: Following Specification JESD78 Class II<br>Positive<br>Negative                                          | $I_{\text{Latchup}}$               | 200<br>200                 | mA                          |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This based on a 35x35x1.6mm FR4 PCB with 10mm<sup>2</sup> of 1 oz copper traces under natural convection conditions and a single component characterization.
2. The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(\max)} - T_A}{R_{\theta JA}} \quad \text{with } T_{J(\max)} = 150^{\circ}\text{C}$$

## MAX809 Series, MAX810 Series

**ELECTRICAL CHARACTERISTICS**  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  unless otherwise noted. Typical values are at  $T_A = +25^{\circ}\text{C}$ . (Note 3)

| Characteristic                                                                                                                                                                                                                                                                                                         | Symbol   | Min                  | Typ                  | Max                      | Unit          |

## MAX809 Series, MAX810 Series

### Detail Operation Description

The MAX809/810 series microprocessor reset supervisory circuits are designed to monitor the power supplies in digital systems and provide a reset signal to the processor without any external components. Figure 2 shows the timing diagram and a typical application below. Initially consider that input voltage  $V_{CC}$  is at a nominal level greater than the voltage detector upper threshold ( $V_{TH+}$ ). And the  $\overline{RESET}$  (RESET) output voltage (Pin 2) will be in the high state for MAX809, or in the low state for MAX 810 devices.

If there is an input power interruption and  $V_{CC}$  becomes significantly deficient, it will fall below the lower detector threshold ( $V_{TH-}$ ). This event causes the RESET output to be in the low state for the MAX809, or in the high state for the NCP810 devices. After completion of the power interruption,  $V_{CC}$  will rise to its nominal level and become greater than the  $V_{TH}$ . This sequence activates the internal oscillator circuitry and digital counter to count. After the count of the timeout period, the reset output will revert back to the original state.

Figure 15. Timing Waveforms

## APPLICATIONS INFORMATION

### V<sub>CC</sub> Transient Rejection

The MAX809 provides accurate V<sub>CC</sub> monitoring and reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative-going transients (glitches) on the power supply line. Figure 16 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive which lies **under** the curve will **not** generate a reset signal. Combinations above the curve are detected as a brownout or power-down. Typically, transient that goes 100 mV below the reset threshold and lasts 5.0 μs or less will not cause a reset pulse. Transient immunity can be improved by adding a capacitor in close proximity to the V<sub>CC</sub> pin of the MAX809.

**Figure 16. Maximum Transient Duration vs. Overdrive for Glitch Rejection at 25°C**

### RESET Signal Integrity During Power-Down

The MAX809 RESET output is valid to V<sub>CC</sub> = 1.0 V. Below this voltage the output becomes an “open circuit” and does not sink current. This means CMOS logic inputs to the Microprocessor will be floating at an undetermined voltage. Most digital systems are completely shutdown well above this voltage. However, in situations where RESET must be

maintained valid to V<sub>CC</sub> = 0 V, a pull-down resistor must be connected from RESET to ground to discharge stray capacitances and hold the output low (Figure 17). This resistor value, though not critical, should be chosen such that it does not appreciably load RESET under normal operation (100 kΩ will be suitable for most applications).

**Figure 17. Ensuring RESET Valid to V<sub>CC</sub> = 0 V**

### Processors With Bidirectional I/O Pins

Some Microprocessor's have bidirectional reset pins. Depending on the current drive capability of the processor pin, an indeterminate logic level may result if there is a logic conflict. This can be avoided by adding a 4.7 kΩ resistor in series with the output of the MAX809 (Figure 18). If there are other components in the system which require a reset signal, they should be buffered so as not to load the reset line. If the other components are required to follow the reset I/O of the Microprocessor, the buffer should be connected as shown with the solid line.

**Figure 18. Interfacing to Bidirectional Reset I/O**

## MAX809 Series, MAX810 Series

### ORDERING, MARKING AND THRESHOLD INFORMATION

| Part Number | V <sub>TH</sub> * (V) | Timeout* (ms) | Description | Marking | Package | Shipping† |
|-------------|-----------------------|---------------|-------------|---------|---------|-----------|
|-------------|-----------------------|---------------|-------------|---------|---------|-----------|

#### DISCONTINUED (Note 9)

|                   |      |         |                 |     |                      |                    |
|-------------------|------|---------|-----------------|-----|----------------------|--------------------|
| MAX809TTRG        | 3.08 | 140–460 | Push–Pull RESET | SPU | SOT23–3<br>(Pb–Free) | 3000 / Tape & Reel |
| NCV809SN293D1T1G* | 2.93 | 1–3.3   | Push–Pull RESET | ACT | SOT23–3<br>(Pb–Free) | 3000 / Tape & Reel |

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

\*NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC–Q100 Qualified and PPAP Capable.

\*\*Contact your **onsemi** sales representative for other threshold voltage options.

9. **DISCONTINUED:** These devices are not recommended for new design. Please contact your **onsemi** representative for information. The most current information on these devices may be available on [www.onsemi.com](http://www.onsemi.com).

SCALE 4:1

SC-70 (SOT-323)

GENERIC  
MARKING DIAGRAM

XX = Specific Device Code  
M = Date Code  
▪ = Pb-Free Package

\*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "▪", may or may not be present. Some products may not follow the Generic Marking.

\* For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
