VERSATILE LINK The Versatile Fiber Optic Connection

HFBR-0501
SERIES

327-750 to 890

Features

- **LOW COST FIBER OPTIC COMPONENTS**
- **GUARANTEED LINK PERFORMANCE OVER TEMPERATURE**
High Speed Links: dc to 5 MBd
Extended Distance Links: up to 82 m
Low Current Link: 6 mA Peak Supply Current
Low Cost Standard Link: dc to 1 MBd
Photo Interrupter Link
- **COMPACT, LOW PROFILE PACKAGES**
Horizontal and Vertical Mounting
"N-plex" Stackable
Flame Retardant
- **EASY TO USE RECEIVERS**
TTL, CMOS Compatible Output Level
High Noise Immunity
- **EASY CONNECTING**
Simplex, Duplex and Latching Connectors
Flame Retardant Material
- **LOW LOSS PLASTIC CABLE**
Selected Super Low Loss Simplex
Simplex and Zip Cord Style Duplex
Flame Retardant
- **NO OPTICAL DESIGN REQUIRED**
- **AUTO-INSERTABLE AND WAVE SOLDERABLE**
- **DEMONSTRATED RELIABILITY @ 40°C
EXCEEDS 2 MILLION HOURS MTBF**

Description

The Versatile Link series is a complete family of fiber optic link components for applications requiring a low cost solution. The HFBR-0501 series includes transmitters, receivers, connectors and cable specified for easy design. This series of components is ideal for solving problems with voltage isolation/insulation, EMI/RFI immunity or data security. The Link design is simplified by the logic compatible receivers and complete specifications for each component. No optical design is necessary. The key optical and electrical parameters of links configured with the HFBR-0501 family are fully guaranteed from 0° to 70°C. A wide variety of package configurations and connectors provide the designer with numerous mechanical solutions to meet application requirements. The transmitter and receiver components have been designed for use in high volume/low cost assembly processes such as auto insertion and wave soldering.

Versatile Link Applications

- Reduction of lightning/voltage transient susceptibility
- Motor controller triggering
- Data communications and Local Area Networks
- Electromagnetic Compatibility (EMC) for regulated systems: FCC, VDE, CSA, etc.
- Tempest—secure data processing equipment
- Isolation in test and measurement instruments
- Error free signalling for industrial and manufacturing equipment
- Automotive communications and control networks
- Power supply control
- Communication and isolation in medical instruments
- Noise immune communication in audio and video equipment
- Remote photo interrupter for office and industrial equipment
- Robotics communication
- PC to peripheral links

Link Selection Guide

Versatile Link Product Description

Mechanical: The compact Versatile Link package is made of a flame retardant material (UL V-0) in a standard, eight pin dual-in-line package (DIP) with 7.6 millimetre (0.3 inch) pin spacing. Vertical and horizontal mountable parts are available. These low profile Versatile Link packages are stackable and are enclosed to provide a dust resistant seal. Snap action simplex, simplex latching, duplex, and duplex latching connectors are offered with simplex or duplex cables.

Electrical: Transmitters incorporate a 660 nanometre light emitting diode (LED). Receivers include a monolithic uncoupled, digital IC receiver with open collector Schottky output transistor. An internal pullup resistor is available for use in the HFBR-25X1/2/4 receivers. Transmitter and receiver are compatible with standard TTL circuitry. A shield has been integrated into the receiver IC to provide additional, localized noise immunity.

Optical: Internal optics have been optimized for use with 1 mm diameter plastic optical fiber. Versatile Link specifications incorporate all component interface losses. Therefore, the need of optical calculations for common link applications is eliminated.

Optical power budget is graphically displayed to facilitate electrical design for customized links.

Designing with Versatile Link

When designing with Versatile Link, the following topics should be considered:

Distance and Data Rate

Distances and data rates guaranteed with Versatile Link depend upon the Versatile Link transmitter/receiver pair chosen. See the Versatile Link guide (page 5-14).

Typically, a data rate requirement is first specified. This determines the choice of the 5 MBd, 1 MBd or 40 kBd Versatile Link components. Distances guaranteed with Versatile Link then depend upon choice of cable, specific drive condition and circuit configuration. Extended distance operation is possible with pulsed operation of the LED (see Figure 2a, 2b, 2c, 2d, 2e and 2f dotted lines.)

Drive circuits are described on page 5-17. Cable is discussed on page 5-29. Pulsed operation of the LED at larger current will result in increased pulse width distortion of the receiver output signal.

Versatile Link can also be used as a photo interrupter at frequencies up to 500 KHz. This is described on page 10.

Package Orientation

As shown in the photograph, Versatile Link is available in vertical and horizontal packages. Performance and pinouts for the two packages are identical. To provide additional attachment support for the Vertical Versatile Link housing, the designer has the option of using a self-tapping screw through a printed circuit board into a mounting hole at the bottom of the package. For most applications this is not necessary.

Package Housing Color

Versatile Link components and simplex connectors are color coded to eliminate confusion when making connections. The HFBR-15X1/2/4 transmitters are gray, and the HFBR-25X1/2/3/4 receivers are blue. The HFBR-15X3 transmitter is black.

All of the above transmitters and receivers are also available in black versions for special applications. These black components, combined with black fiber optic cable, form a "black link" which has superior immunity to external light. The black link is appropriate where improved housing opacity is required due to very bright ambient light or bright flashes of light. Black link components are otherwise identical to blue and gray components.

Connector Style

As shown, Versatile Link can be used with snap-in connectors: simplex, simplex latching, duplex, and duplex latching.

The simplex connector is intended for applications requiring simple, stable connection capability with a moderate retention force. The simplex latching connector provides similar convenience with a larger retention force. Connector/cable retention force can be improved by using a RTV adhesive within the connector. A suggested adhesive is 3M Company product RTV-739.

The duplex connector connects a cable containing two fibers to two similar Versatile Link components. A lockout feature ensures the connection can be made in only one orientation. The duplex connector is intended for Versatile Link components "n-plexed" together, as discussed in the next section.

N-plexing

Versatile Link components can be stacked or interlocked (n-plexed) together to minimize use of printed circuit board space and to provide efficient, dual connections via the duplex connector. Up to eight identical package styles can be n-plexed and inserted by hand into a printed circuit board without difficulty. However, auto-insertability of stacked units becomes limited when more than two packages are n-plexed together.

Cable

Two cable versions are available: Simplex (single channel) and color coded duplex (dual channel). Each version of the cable is flame retardant (UL VW-1) and of low optical loss.

Two grades of the simplex cable are available: standard cable and improved cable. Improved cable is recommended for applications requiring longer distance needs, as reflected in the Link Selection Guide on page 5-12. Flexible cable construction allows simple cable installation techniques. Cables are discussed in detail on page 5-29.

Accessories

A variety of accessories are available. The bulkhead feed

through adapter discussed on page 5-30 can be used to mate two simplex snap-in connectors. It can be used either as a splice or a panel feedthrough for a panel thickness < 4.1 mm (0.16 inch).

Several accessories are offered to help with proper fiber/connector polishing. These are shown on page 5-31.

Manufacturing with Versatile Link

Non-stacked Versatile Link parts require no special handling during assembly of units onto printed circuit boards. Versatile Link components are auto-insertable. When wave soldering is performed with Versatile Link components, an optical port plug is recommended to be used to prevent contamination of the port. Water soluble fluxes, not rosin based fluxes, are recommended for use with Versatile Link components.

Refer to the Connectoring Section on page 5-33 for details of connectors and cable connectoring.

Versatile Link Performance

5 MEGABITS PER SECOND (NRZ)

1 MEGABIT PER SECOND (NRZ)

40 KILOBITS PER SECOND (NRZ)

The 5 Megabaud (MBd) Versatile Link is guaranteed to perform from dc to 5 Mb/s (megabits per second, NRZ). Distances up to 17 metres are guaranteed when the transmitter is driven with a current of 60 milliamperes. This represents worst case performance throughout the temperature range of 0 to 70 degrees centigrade. With the required drive circuit of Figure 1b and at 60 milliamp drive current, the 1 Megabaud Versatile Link has guaranteed performance over 0 to 70 degrees centigrade from dc to 1 Mb/s (NRZ) up to 34 metres.

The low current link requires only 6 mA peak supply current for the transmitter and receiver combined to achieve an 11 metre link. Extended distances up to 82 metres can

be achieved at a maximum transmitter drive current of 60 mA peak. The 40 kBd Versatile Link is guaranteed to perform from dc to 40 kb/s (NRZ) over 0° to 70°C up to the distances just described.

Receivers are compatible with LSTTL, TTL, CMOS logic levels and offer a choice of an internal pull-up resistor or an open collector output. Horizontal or vertical packages provide identical performance and are compatible with simplex, simplex latching, duplex, and duplex latching connectors. Refer to the connector section (page 5-30) and the cable section (page 5-29) for further information about these products. A list of specific part numbers is found below and in the Selection Guide on page 5-11.

			17			m	$I_{FPK} = 120 \text{ mA}$	
			25	50		m	$I_{FPK} = 120 \text{ mA}$, 25°C	
	Propagation Delay	t_{PLH}		180	250	ns	$R_L = 560 \Omega$, $C_L = 30 \text{ pF}$ $\ell = 0.5 \text{ metre}$ $P_R = -20 \text{ dBm}$	Fig. 3, 5 Notes 3, 8
		t_{PHL}		100	140	ns		
	Pulse Width Distortion	t_D		80		ns	$P_R = -20 \text{ dBm}$ $R_L = 560 \Omega$, $C_L = 30 \text{ pF}$	Fig. 3, 4 Notes 4, 8

Notes:

- For $I_{FPK} > 80 \text{ mA}$, the duty factor must be such as to keep $I_{FDC} \leq 80 \text{ mA}$. In addition, for $I_{FPK} > 80 \text{ mA}$, the following rules for pulse width apply:
 $I_{FPK} \leq 160 \text{ mA}$: Pulse width $\leq 1 \text{ ms}$
 $I_{FPK} \geq 160 \text{ mA}$: Pulse width $\leq 1 \mu\text{s}$, period $\geq 20 \mu\text{s}$
- It is essential that a bypass capacitor, 0.1 μF ceramic, be connected from pin 2 to pin 3 of the HFBR-25X1/25X2/25X4 receivers and from pin 2 to pin 4 of the HFBR-25X3 receiver. Total lead length between both ends of the capacitor and the supply pins should not exceed 20 mm.
- The propagation delay for one metre of cable is typically 5 ns.

- $t_D = t_{PLH} - t_{PHL}$.
- Typical data is at 25°C, $V_{CC} = 5 \text{ V}$.
- Typical propagation delay is measured at $P_R = -15 \text{ dBm}$.
- Estimated typical link life expectancy at 40°C exceeds 10 years at 60 mA.
- Pulsed LED operation at $I_{FPK} > 80 \text{ mA}$ will cause increased link t_{PLH} propagation delay time. This extended t_{PLH} time contributes to increased pulse width distortion of the receiver output signal.
- Pins 5 and 8 of both the transmitter and receiver are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.

Versatile Link Design Considerations

Simple interface circuits for 5 MBd, 1 MBd and 40 kBd applications are shown in Figure 1. The value of the transmitter drive current depends upon the desired link distance. This is shown in Figures 2a through 2f. After selecting a value of transmitter drive current, I_F , the value of R_1 can be determined with the aid of Figures 1a, 1b and 1d. Note that the 5 MBd and 40 kBd Versatile Links can have an overdrive and underdrive limit for the chosen value of I_F while the 1 MBd Versatile Link has only an underdrive limit. Dotted lines in Figures 2a through 2f

represent pulsed operation for extended link distance requirements. For the 1 MBd interface circuit, the R_1C_1 time constant must be > 75 ns. Conditions described in Note 1 must be met for pulsed operation. Refer to Note 8 for performance comments when pulsed operation is used.

All specifications are guardbanded for worst case conditions between 0 to 70 degrees centigrade. All tolerances and variations (including end-of-life transmitter power, receiver sensitivity, coupling variances, connector and cable variations) are taken into account.

Figure 7. Typical HFBR-15X3/25X3 Link Propagation Delay vs. Optical Power

Versatile Link Photo Interrupter

20 KHz (40 kBd) LINK, 500 kHz (1 MBd) LINK

Versatile Link may be used as a photo-interrupter in optical switches, shaft position sensors, velocity sensors, position sensors, and other similar applications. This link is particularly useful where high voltage, electrical noise, or explosive environments prohibit the use of electromechanical or optoelectronic sensors. The 20 kHz (40 kBd) transmitter/receiver pair has an optical power budget of 25 dB. The 500 kHz (1 MBd) transmitter/receiver pair has an optical power budget of 10 dB. Total system losses (cable attenuation, air gap loss, etc.) must not exceed the link optical power budget.

RECOMMENDED OPERATING CONDITIONS

Recommended operating conditions are identical to those of the Low Current/Extended Distance and High Performance 1 MBd links. Refer to page 5-15.

SYSTEM PERFORMANCE

These specifications apply when using Standard and Improved cable and, unless otherwise specified, under recommended operating conditions. Refer to the appropriate link data on pages 5-17 and 5-18 for additional design information.

Parameter	Min.	Typ. ^[1]	Max.	Units	Conditions	Ref.
HFBR-15X3/25X3						
Max. Count Frequency	dc		20	kHz		
Optical Power Budget	25.4			dB	I _{Fdc} = 60 mA, 0-70°C	Note 2
	27.8	34		dB	I _{Fdc} = 60 mA, 25°C	
HFBR-15X2/25X2						
Max. Count Frequency	dc		500	kHz		
Optical Power Budget	10.4			dB	I _{Fdc} = 60 mA, 0-70°C	Note 2
	12.8	15.6		dB	I _{Fdc} = 60 mA, 25°C	

1. Typical data is at $T_A = 25^\circ\text{C}$, $V_{CC} = 5 \text{ V}$.

2. Optical Power Budget = $P_T \text{ min.} = P_R \text{ (L) min.}$ Refer to page X for additional design information.

Photo Interrupter Link Design Considerations

The fiber optic Transmitter/Receiver pair is intended for applications where the photo interrupter must be physically separated from the optoelectronic emitter and detector. This separation would be useful where high voltage, electrical noise or explosive environments prohibit the use of electronic devices. To ensure reliable long term operation link design for this application should operate with an ample optical power margin $\alpha_M \geq 3$ dB, since the exposed fiber ends are subject to environmental contamination that will increase the optical attenuation of the slot with time. A graph of air gap separation versus attenuation for clean fiber ends with minimum radial error ≤ 0.127 mm (0.005 inches) and angular error ($\leq 3.0^\circ$) is provided in Figure 8.

The following equations can be used to determine the

transmitter output power, P_T , for both the overdrive and underdrive cases. Overdrive is defined as a condition where excessive optical power is delivered to the receiver. The first equation calculates, for a predetermined link length and slot attenuation, the maximum P_T in order not to overdrive the receiver. The second equation defines the minimum P_T allowed for link operation to prevent underdrive condition from occurring, where α_0 is the fiber attenuation.

$$P_T(\text{MAX}) - P_R(\text{MAX}) \leq \alpha_0 \text{ MIN } \ell + \alpha_{\text{SLOT}} \quad \text{Eq. 1}$$

$$P_T(\text{MIN}) - P_{RL}(\text{MIN}) \geq \alpha_0 \text{ MAX } \ell + \alpha_{\text{SLOT}} + \alpha_M \quad \text{Eq. 2}$$

Once $P_T(\text{MIN})$ has been determined in the second equation for a specific link length (ℓ), slot attenuation (α_{SLOT}) and margin (α_M), Figure 9 can then be used to find I_F .

Interlocked (Stacked) Assemblies

STACKING HORIZONTAL MODULES

STACKING VERTICAL MODULES

Recommended stacking assembly of horizontal packages is easily accomplished by placing units upside down with pins facing upward. Initially engage the interlocking mechanism by sliding the L bracket body from above into the L slot body of the lower package. Lay the partially interlocked units on a flat surface and push down with a thin, rigid, rectangular edged object to bring all stacked units into uniform alignment. This technique prevents potential harm that could occur to fingers and hands of assemblers from the package pins. Refer to Figure 1 below that illustrates this assembly. Stacked horizontal packages can be disengaged should there be a need to do so. Repeated stacking and unstacking causes no damage to individual units.

Recommended stacking of vertical packages is to hold two vertical units, one in each hand, with the pins facing away from the assembler and the optical ports located in the bottom front of each unit. Engage completely, the L bracket unit from above into the lower L slot unit. Package to package alignment is easily insured by laying the full, flat, bottom side of the assembled units onto a flat surface pushing with a finger the two packages into complete, parallel alignment. The thin rectangular edged tool, used for horizontal package alignment, is not needed with the vertical packages. Stacked vertical packages can be disengaged should there be a need to do so. Repeated stacking and unstacking causes no damage to individual units.

Figure 11. Interlocked (Stacked) Horizontal or Vertical Packages.

Versatile Link Transmitters

HFBR-1521/1531 (5 MBd - High Performance)
 HFBR-1522/1532 (1 MBd - High Performance)
 HFBR-1523/1533 (40 kBd - Low Current/Extended Distance)
 HFBR-1524/1534 (1 MBd - Standard)

Versatile Link transmitters incorporate a 660 nanometer LED in a horizontal or vertical housing. The HFBR-152X/153X transmitter housing is black. HFBR-15X1/2/4 standard housings are gray, but black versions are available. The transmitters can be easily interfaced to standard TTL or CMOS logic. The optical output power of the HFBR-152X/153X series is specified at the end of 0.5 m cable. The mechanical and electrical pin spacing and connections are identical for both the horizontal and vertical packages.

Notes:

- 1.6 mm below seating plane.
- 1 μs pulse, 20 μs period.
- Measured at the end of 0.5 m Standard Fiber Optic Cable with large area detector.
- Optical power, P (dBm) = 10 Log [P (μW)/1000 μW]
- Typical data is at 25°C.
- Rise and fall times are measured with a voltage pulse driving the transmitter and a series connected 50 ohm load. A wide bandwidth optical to electrical waveform analyzer (trans-

ducer), terminated to a 50 ohm input of a wide bandwidth oscilloscope, is used for this response time measurement.

- Pins 5 and 8 of the transmitter are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.

WARNING: When viewed under some conditions, the optical port of the Transmitter may expose the eye beyond the Maximum Permissible Exposure recommended in ANSI Z-136-1, 1981. Under most viewing conditions there is no eye hazard.

atile Link Receivers

- 2521/2531 (5 MBd - High Performance)
- 2522/2532 (1 MBd - High Performance)
- 2524/2534 (1 MBd - Standard)

Versatile Link receivers feature a shielded, integrated photodetector and a wide bandwidth dc amplifier with high common mode immunity. A Schottky clamped open-collector output transistor allows interfacing to common logic families and enables "wired-OR" circuit designs. The open collector output is specified up to 18 V. An integrated 1000 ohm resistor internally connected to V_{CC} may be externally connected to provide a pull-up for ease of use with +5 V logic. Under

pulsed LED current operation ($I_F > 80 \text{ mA}$), the combination of a high optical power level and the optical falling edge of the LED transmitter will result in increased pulse width distortion of the receiver output signal. The standard receiver housings are blue; black versions are available.

- Measured at the end of Fiber Optic Cable with large area detector.
- R_L is open
- Typical data is at 25°C, $V_{CC} = 5$ V.
- It is essential that a bypass capacitor 0.01 μF be connected from pin 2 to pin 3 of the receiver. Total lead length between both ends

High Sensitivity Receiver

HFBR-25X3

The blue plastic HFBR-25X3 Receiver module has a sensitivity of -39 dBm. It features an integrated photodetector and dc amplifier with high EMI immunity. The output is an open collector with a 150 μA internal current source pull up and is compatible with TTL/LSTTL and most CMC logic families. For minimum rise time add an external pull up resistor of at least 3.3K ohms. V_{CC} must be greater than or equal to the supply voltage for the pull-up resistor.

Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units	Ref.

Notes:

- 1.6 mm below seating plan.
- Optical flux, P (dBm) = $10 \log [P (\mu W)/1000 \mu W]$
- Measured at the end of Fiber Optic Cable with large area detector.
- Because of the very high sensitivity of the HFBR-25X3, the digital output may switch in response to ambient light levels when a cable not occupying the receiver optical port. The designer should take care to filter out signals from this source if they pose a hazard to the system.

of the capacitor and the pins should not exceed 20 mm

- Pins 5 and 8 of both the transmitter and receiver are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.
- Pulsed LED operation at $I_F > 80$ mA will cause increased link t_{PLH} propagation delay time. This extended t_{PLH} time contributes to increased pulse width distortion of the receiver output signal.
- The LED driver circuit of Figure 1b (Link Design Considerations) is required for 1 Mbd operation of the HFBR-2522/2532/2524/2534

- It is recommended that a bypass capacitor 0.01 μF to 0.1 μF ceramic be connected from pin 2 to pin 4 of the receiver.
- Pins 5 and 8 are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.

Plastic Fiber Optic Cable

Simplex Fiber Optic Cable is constructed of a single standard index plastic fiber sheathed in a plastic jacket. Duplex Fiber Optic Cable has two plastic fibers, each in a cable construction similar to the Simplex Cable, joined with a web. The individual channels are identified by a marking on one channel of the cable. The Improved Fiber Optic Cable is identical to the Standard Cable except that the attenuation is lower.

These cables are UL recognized components and pass UL VW-1 flame retardancy specification. Safe cable properties in flammable environments, along with non-conductive electrical characteristics of the cable may make the use of conduit unnecessary. Plastic cable is available unconnected or connected. Refer to page 5-34 for part numbers.

12		nA	50 kV, $\ell = 0.3$ m	

Notes:

1. Less than 30 minutes.
2. Less than 1 hour, non-operating.
3. 90° bend on 10 mm radius mandrel. Bend radius is the radius of the mandrel around which the cable is bent.
4. Tested at 1 impact according to MIL-STD-1678, Method 2031 Procedure 1.
5. Typical data is at 25°C.
6. Travel time constant is the reciprocal of the group velocity for propagation of optical power. Group velocity is $v = c/n$, where c is the

velocity of light in space (3×10^8 m/s) and n equals effective core index of refraction. Unit length of cable is ℓ .

7. In addition to standard Hewlett-Packard 100% product testing, HP provides additional margin to ensure link performance. Under certain conditions, cable installation and improper connecting may reduce performance. Contact Hewlett-Packard for recommendations.
8. Improved cable is available in 500 metre spools and in factory-connected lengths less than 100 metres.

Versatile Link Fiber Optic Connectors

CONNECTORS FEEDTHROUGH/SPLICE POLISHING TOOLS

Versatile Link transmitters and receivers are compatible with three connector styles; simplex, simplex latching, and duplex. All connectors provide a snap-action when mated to Versatile Link components. Simplex connectors are color coded to match with transmitter and receiver color coding. Duplex connectors are keyed so that proper orientation is ensured. When removing a connector from a module, pull at the connector body. Do not pull on the cable alone. The same, quick and simple connecting technique is used with all connectors and cable. This technique is described on page 18. Note that simplex and duplex crimp rings are different.

Simplex Connector Styles

HFBR-4501/4511 — Simplex

The simplex connector provides a quick and stable connection for applications that require a component to provide retention force of 8 newtons (1.8 lb). These connectors are available in colors of gray (HFBR-4501) or blue (HFBR-4511).

HFBR-4503/4513 — Simplex Latching

The simplex latching connector is designed for rugged applications requiring greater retention force, 80 N (18 lbs) than that provided by a simplex connector. When inserting the simplex latching connector into a module, the connector latch mechanism should be aligned with the top surface of the horizontal module, or with the tall vertical side of the vertical module. Misorientation of an inserted latching connector into either module housing will not result in a positive latch. The connector is released by depressing the rear section of the connector lever, and then pulling the connector assembly away from the module housing.

If the cable/connector will be used at elevated operating temperatures or experience frequent and wide temperature cycling effects, the cable/connector attachment can be strengthened by applying a RTV adhesive within the connector. A recommended adhesive is GE Company RTV-128. In most applications, use of RTV is unnecessary. The simplex latching connector is available in gray (HFBR-4503) or blue (HFBR-4513).

Duplex Connector HFBR-4506 — Duplex

Duplex connectors provide convenient duplex cable termination and are keyed to prevent incorrect connection. The duplex connector is compatible with dual combinations of identical Versatile Link components (e.g., two horizontal transmitters, two vertical receivers, a horizontal transmitter and a horizontal receiver, etc.). A duplex connector cannot connect to two different packages simultaneously. The duplex connector is an off-white color.

Feedthrough/Splice HFBR-4505/4515 — Adapter

The HFBR-4505/4515 adapter mates two simplex connectors for panel/bulkhead feedthrough of plastic fiber cable. Maximum panel thickness is 4.1 mm (0.16 inch). This adapter can serve as a cable in-line splice using two simplex connectors. The colors of the adapters are gray (HFBR-4505) and blue (HFBR-4515). The adapter is not compatible with the duplex or simplex latching connectors.

Notes:

1. Factory polish or field polish per recommended procedure.
2. No perceivable reduction in insertion force was observed after 2000 insertions. Destructive insertion force was typically at 178 N (40 lbs).
3. For applications where frequent temperature cycling over temperature extremes is expected please contact Hewlett-Packard for alternate connecting techniques.
4. All mechanical forces were measured after units were stored at 70°C for 168 hours and returned to 25°C for one hour.
5. Minimum and maximum limits of α_{CC} are for 0°C to 70°C temperature range. Typical value of α_{CC} is at 25°C.

Connecting

The following easy procedure describes how to make cable terminations. It is ideal for both field and factory installation. If a high volume connecting technique is required please contact your Hewlett-Packard sales engineer for the recommended procedure and equipment.

Connecting the cable is accomplished with the Hewlett-Packard HFBR-4593 Polishing Kit consisting of a Polishing Fixture, 600 grit abrasive paper and 3- μ m pink lapping film (3M Company, OC3-14). No adhesive material is needed to secure the cable in the connector, and the connector can be used immediately after polishing. Improved connection to cable attachment can be achieved with the use of a RTV (GE Company, RTV-128) adhesive for frequent, extreme temperature cycling environments or for elevated temperature operation.

Connectors may be easily installed on the cable ends with readily available tools. Materials needed for the terminating procedure are:

- 1) Hewlett-Packard Plastic Fiber Optic Cable
- 2) HFBR-4593 Polishing Kit
- 3) HFBR-4501/4503 Gray Simplex/Simplex Latching Connector and Silver Color Crimp Ring
- 4) HFBR-4511/4513 Blue Simplex/Simplex Latching Connector and Silver Color Crimp Ring
- 5) HFBR-4506 Parchment Duplex Connector and Duplex Crimp Ring
- 6) Industrial Razor Blade or Wire Cutters
- 7) 16 Gauge Latching Wire Strippers
- 8) Crimp Tool, HFBR-4597

Step 1

The zip cord structure of the duplex cable permits easy separation of the channels. The channels should be separated approximately 50 mm (2.0 in.) back from the ends to permit connecting and polishing.

After cutting the cable to the desired length strip off approximately 7 mm (0.3 in.) of the outer jacket with the 5 gauge wire strippers. Excess webbing on duplex cable may have to be trimmed to allow the simplex or simplex latching connector to slide over the cable.

When using the duplex connector and duplex cable, the separated duplex cable must be stripped to equal lengths on each cable. This allows easy and proper seating of the cable into the duplex connector.

Step 2

Place the crimp ring and connector over the end of the cable; the fiber should protrude about 3 mm (0.12 in.) through the end of the connector. Carefully position the crimp ring so that it is entirely on the connector with the rim of the crimp ring flush with the connector, leaving a small space between the crimp ring and the flange. Then crimp the ring in place with the crimping tool. One crimp tool is used for all connector crimping requirements.

Note: Place the gray connector on the cable end to be connected to the transmitter and the blue connector on the cable end to be connected to the receiver to maintain the color coding (both connectors are the same mechanically). For duplex connector and duplex cable application, align the color coded side of the cable with the appropriate ferrule of the duplex connector in order to match connections to the respective optical ports. The simplex connector crimp ring cannot be used with the duplex connector. The duplex connector crimp ring cannot be used with the simplex or simplex latching connectors. The simplex crimp has a dull lustre; the duplex ring is shiny and has a thinner wall.

SIMPLEX

SIMPLEX LATCHING

DUPLEX/DUPLEX LATCHING

Step 3

Any excess fiber protruding from the connector end may be cut off; however, the trimmed fiber should extend at least 1.5 mm (0.06 in.) from the connector end.

Insert the connector fully into the polishing fixture with the trimmed fiber protruding from the bottom of the fixture. This plastic polishing fixture can be used to polish two simplex connectors or two simplex latching connectors simultaneously, or one duplex connector.

Note: The four dots on the bottom of the polishing fixture are wear indicators. Replace the polishing fixture when any dot is no longer visible.

Place the 600 grit abrasive paper on a flat smooth surface. Pressing down on the connector, polish the fiber and the connector using a figure eight pattern of strokes until the connector is flush with the bottom of the polishing fixture. Wipe the connector and fixture with a clean cloth or tissue.

Step 4

Place the flush connector and polishing fixture on the dull side of the 3 micron pink lapping film and continue to polish the fiber and connector for approximately 25 strokes. The fiber end should be flat, smooth and clean.

The cable is now ready for use.

Note: Use of the pink lapping film fine polishing step results in approximately 2dB improvement in coupling performance of either a transmitter-receiver link or a bulk-head/splice over 600 grit polish alone. This fine polish is comparable to Hewlett-Packard factory polish. The fine polishing step may be omitted where an extra 2dB of optical power is not essential, as with short link lengths. Proper polishing of the tip of the fiber/connector face results in a tip diameter between 2.8 mm (0.110 in.) minimum and 3.2 mm (0.125 in.) maximum.

For simultaneous multiple connector polishing techniques please contact Hewlett-Packard.

ACCESSORIES

HFBR-4522	500 Port Plugs
HFBR-4525	1000 Simplex Crimp Rings
HFBR-4526	500 Duplex Crimp Rings
HFBR-4593	Polishing Kit (one polishing tool, two pieces 600 grit abrasive paper, and two pieces 3-μm lapping film).
HFBR-4597	Crimping Tool

A Note About Ordering Cable

Four steps are required to determine the proper part number for a desired cable.

Step 1 Select Standard or Improved Cable.

As explained on page 5-29, two levels of attenuation are available: Standard and Improved.

Step 2 Select the connector style.

Connector styles are described on page 5-30.

Step 3 Select Simplex or Duplex.

Step 4 Determine the cable length.

To determine the appropriate part number, select the letter corresponding to your selection and fill in the following:

For example:

HFBR-PUD500 is a Standard Attenuation, Unconnected, Duplex, 500 metre cable.

HFBR-QLS001 is an Improved Attenuation, Latching Simplex Connected, Simplex, 1 metre cable.

HFBR-PMD010 is a Standard Attenuation, Standard Duplex Connected, Duplex, 10 metre cable.

HFBR-PND100 is a Standard Attenuation, Standard Simplex Connected, Duplex, 100 metre cable.

Note: 0.1 metre Standard Attenuation Simplex lengths are available; 0.5 metre Standard Attenuation Simplex and Duplex lengths are also available. The lengths are ordered as HFBR-xxx10M or HFBR-xxx50M.

ATTENTION: Pre-connected simplex cables have oppositely colored (GRAY vs. BLUE) connectors at the opposite ends of the same fiber, although oppositely colored, the connectors are mechanically identical. For duplex cables with simplex connectors, the same rule applies to each fiber; also, the side-by-side fibers at each end of the cable have oppositely colored connectors. For duplex cables with duplex connectors similar rules apply, so the connectors at opposite ends are oppositely keyed relative to the marked fiber in a duplex cable.
