

HD74LS375 • Quadruple Bistable Latches

The HD74LS375 bistable latch is electrically and functionally identical to the HD74LS75, respectively. Only the arrangement of the terminals has been changed in the HD74LS375. This latch is ideally suited for use as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data (D) input is transferred to the Q output when the enable (G) is high and the Q output will follow the data input as long as the enable remains high. When the enable goes low, the information (that was present at the data input at the time the transition occurred) is retained at the Q output until the enable goes high.

■ TESTING METHOD

1) Test Circuit

- Notes)
1. Test is put into the each latch.
 2. All diodes are 1S2074 (H).
 3. C_L includes probe and jig capacitance.

Waveform

- Notes)
1. Input pulse: D input: $PRR=500kHz$, G input: $PRR=1MHz$, $t_{THL} \leq 10ns$, $t_{TLH} \leq 10ns$.
 2. When measuring propagation delay times from the D input, the corresponding G input must be held high.
