

### ULTRA PRECISION 4×4 CML SWITCH WITH INTERNAL I/O TERMINATION

Precision Edge<sup>®</sup> SY58040U

### **FEATURES**

- Provides crosspoint switching between any input pair to any output pair
- Ultra-low jitter design:
  - 67fs<sub>RMS</sub> phase jitter (typ)
- Guaranteed AC performance over temperature and voltage:
  - DC to >5Gbps throughput
  - <350ps propagation delay</li>
  - <60ps t<sub>r</sub>/t<sub>f</sub> times
  - <25ps skew (output-to-output)</li>
- Unique, patent-pending, channel-to-channel isolation design provides superior crosstalk performance
- Unique, patent-pending, 50Ω input termination extended CMVR, and VT pin accepts DC- and ACcoupled differential inputs
- 400mV CML output swing
- $50\Omega$  source terminated outputs minimize round-trip reflections
- Power supply 2.5V ±5% or 3.3V ±10%
- –40°C to +85°C temperature range
- Available in 44-pin (7mm × 7mm) QFN package
- Pb-Free green package

Precision Edge®

### DESCRIPTION

The SY58040U is a low jitter, low skew, high-speed 4×4 crosspoint switch optimized for precision telecom and enterprise server/storage distribution applications. The SY58040U distributes clock frequencies from DC to 4GHz, and data rates to 5Gbps guaranteed over temperature and voltage.

The SY58040U differential input includes Micrel's unique, 3-pin input termination architecture that directly interfaces to any differential signal (AC- or DC-coupled) as small as 100mV (200mV<sub>pp</sub>) without any level shifting or termination resistor networks in the signal path. The outputs are  $50\Omega$  source-terminated CML with extremely fast rise/fall times guaranteed to be less than 60ps.

The SY58040U features a patent-pending isolation design that significantly improves on channel-to-channel crosstalk performance.

The SY58040U operates from a 2.5V ±5% or 3.3V ±10% supply and is guaranteed over the full industrial temperature range of –40°C to +85°C. The SY58040U is part of Micrel's high-speed, Precision Edge® product line.

Datasheets and support documentation can be found on Micrel's web site at: <u>www.micrel.com.</u>

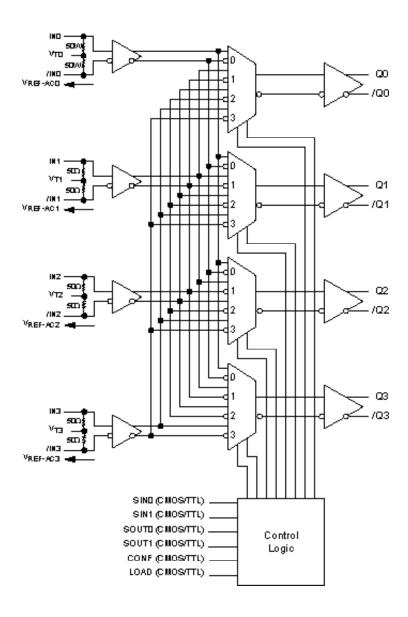

### **APPLICATIONS**

- Data communication systems
- All SONET/SDH data/clock applications
- All Fibre Channel applications
- All Gigabit Ethernet applications

## PIN DESCRIPTION

Pin Number	Pin Name	Pin Function		
17, 15, 10, 8, 4, 2, 41, 39	IN0, /IN0 IN1, /IN1 IN2, /IN2 IN3, /IN3	Differential Inputs: These input pairs are the differential signal inputs to the device. Inputs accept AC or DC-coupled signals as small as 100mV. Each pin of a pair internally terminates to a VT pin through $50\Omega$ . Note that these inputs will default to an indeterminate state if left open. Please refer to the "Input Interface Applications" section for more details.		
16, 9, 3, 40	VT0, VT1 VT2, VT3	nput Termination Center-Tap: Each side of the differential input pair terminates to a VT pin. The VT pins provide a center-tap to a termination network for maximum interface flexibility. See "Input nterface Applications" section for more details.		
14, 11, 1, 42	VRef_AC0 VRef_AC1 VRef_AC2 VRef_AC3	Reference Voltage: This output biases to $V_{CC}$ –1.2V. It is used when AC coupling the inputs. Connect VRef-AC output pin to the VT input pin. Bypass each VRef-AC pin with a 0.01 $\mu$ F low ESR capacitor to $V_{CC}$ . See "Input Interface Applications" section for more details.		
18 19	SIN0 SIN1	These single-ended TTL/CMOS-compatible inputs address the data inputs. Note that these inputs are internally connected to a $25k\Omega$ pull-up resistor and will default to a logic HIGH state if left open.		
38 37	SOUT0 SOUT1	These single-ended TTL/CMOS-compatible inputs address the data outputs. Note that these inputs are internally connected to a $25k\Omega$ pullup resistor and will default to a logic HIGH state if left open.		
5 7	CONF, LOAD	These single-ended TTL/CMOS compatible inputs control the transfer of the addresses to the internal multiplexers. See "Address Tables" and "Timing Diagram" sections for more details. Note that these inputs are internally connected to a $25k\Omega$ pull-up resistor and will default to a logic HIGH state if left open.		
		Configuration Sequence		
		<ol> <li>Load: Loads configuration into buffer, while Configuration Buffer holds existing switch configuration.</li> <li>Configuration: Loads new configuration into the Configuration Buffer and updates switch configuration.</li> </ol>		
		Buffer Mode		
		The SY58040U defaults to buffer mode (IN-to-Q) if the load and configuration control signals are floating.		
23, 24, 26, 27, 29, 30 32, 33	Q0, /Q0, Q1, /Q1, Q2, /Q2, Q3, /Q3,	Differential Outputs: These CML output pairs are the outputs of the device. Please refer to the truth table below for details. Unused output pairs may be left open. Each output is designed to drive 400mV into $100\Omega$ across the pair, or $50\Omega$ to $V_{CC}$ .		
6, 22, 25, 28, 31, 34	VCC	Positive power supply. Bypass with $0.1\mu F//0.01\mu F$ low ESR capacitors and place as close to each $V_{CC}$ pin.		
12, 13, 20, 21, 35, 36, 43, 44	GND, Exposed pad	Ground. GND and EPad must both be connected to most negative potential of chip ground.

#### Notes:

- 1. Permanent device damage may occur if ratings in the "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied for conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
- 2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
- 3. Due to the limited drive capability, use for input of the same package only.
- Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. θ<sub>JA</sub> uses 4-layer in still-air number, unless otherwise stated.
- 5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
- 6. V<sub>IH</sub> (min) not lower than 1.2V.

#### Notes:

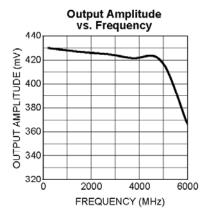

- 8. High-frequency AC-parameters are guaranteed by design and characterization.
- 9. Output-to-output skew is measured between two different outputs under identical input transitions.
- 10. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs
