Memory Stick™ INTERCONNECT EXTENDER CHIPSET WITH LVDS
SN65LVDT14 – ONE DRIVER PLUS FOUR RECEIVERS
SN65LVDT41 – FOUR DRIVERS PLUS ONE RECEIVER

FEATURES

- **Controlled Baseline**
  - **One Assembly/Test Site, One Fabrication Site**
- **Enhanced Diminishing Manufacturing Sources (DMS) Support**
- **Enhanced Product-Change Notification**
- **Qualification Pedigree** (1)
- **Integrated 110-Ω Nominal Receiver Line Termination Resistor**
- **Operate From a Single 3.3-V Supply**
- **Greater Than 125-Mbps Data Rate**
- **Flow-Through Pinout**
- **LVTTL-Compatible Logic I/Os**
- **ESD Protection on Bus Pins Exceeds 12 kV**
- **Meet or Exceed Requirements of ANSI/TIA/EIA-644A Standard for LVDS**
- **20-Pin Thin Shrink Small-Outline Package (PW) With 26-Mil Terminal Pitch**

(1) Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

APPLICATIONS

- **Memory Stick™ Interface Extensions With Long Interconnects Between Host and Memory Stick**
- **Serial Peripheral Interface™ (SPI™) Interface Extension to Allow Long Interconnects Between Master and Slave**
- **MultiMediaCard™ (MMC) Interface in SPI Mode**
- **General-Purpose Asymmetric Bidirectional Communication**

DESCRIPTION

The SN65LVDT14 combines one LVDS line driver with four terminated LVDS line receivers in one package. It is designed to be used at the Memory Stick™ end of an LVDS-based Memory Stick interface extension.

The SN65LVDT41 combines four LVDS line drivers with a single terminated LVDS line receiver in one package. It is designed to be used at the host end of an LVDS-based Memory Stick interface extension.

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.
(3) Tested in accordance with JEDEC Standard 22, Test Method A114-A
(4) Tested in accordance with JEDEC Standard 22, Test Method C101

APPLICATION INFORMATION

Extending the Memory Stick Interface Using LVDS Signaling Over Differential Transmission Cables

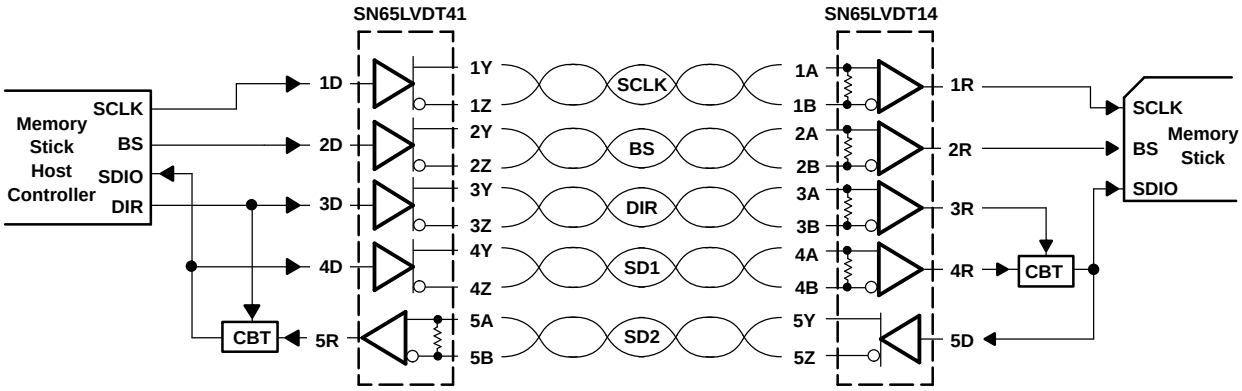

Figure 14. System-Level Block Diagram

The Memory Stick signaling interface operates in a master-slave architecture, with three active signal lines. The host (master) supplies a clock (SCLK) and bus-state (BS) signal to control the operation of the system. The SCLK and BS signals are unidirectional (simplex) from the host to the Memory Stick. The serial data input/output (SDIO) signal is a bidirectional (half-duplex) signal used to communicate both control and data information between the host and the Memory Stick. The direction of data control is managed by the host through a combination of BS line states and control information delivered to the Memory Stick.

The basic Memory Stick interface is capable of operating only over short distances due to the single-ended nature of the digital I/O signals. Such a configuration is entirely suitable for compact and portable devices where there is little if any separation between the host and the Memory Stick. In applications where a greater distance is needed between the host controller and the Memory Stick, it is necessary to utilize a different signaling method, such as low-voltage differential signaling, or LVDS. LVDS, as specified by the TIA/EIA-644-A standard, provides several benefits when compared to alternative long-distance signaling technologies: low radiated emissions, high noise immunity, low power consumption, and inexpensive interconnect cables.

This device pair provides the necessary LVDS drivers and receivers specifically targeted at implementing a Memory Stick interconnect extension. It utilizes simplex links for the SCLK and BS signals and two simplex links for the SDIO data. The half-duplex SDIO data is split into two simplex streams under control of the host processor by means of the direction (DIR) signal. The DIR signal also is carried from the host to the Memory Stick on a simplex LVDS link.

The switching of the SDIO signal-flow direction in the single-ended interfaces is managed by electronic switch devices, identified by the CBT symbol in Figure 7. A suggested CBT device for this application is the TI SN74CBTLV1G125. These devices are available in space-saving SOT-23 or SC-70 packages.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
