Description

The CA3273 is a power IC equivalent of a P-N-P pass transistor operated as a high-side-driver current switch in either the saturated (ON) or cutoff (OFF) modes. The CA3273 incorporates circuitry to protect the pass currents, excessive input voltage, and thermal overstress. The high-side driver is intended for general purpose, automotive and potentially high-stress applications. If high-stress conditions exist, the use of an external zener diode of 35V or less between supply and load terminals may be required to prevent damage due to severe conditions (such as load dump, reverse battery and positive or negative transients). The CA3273 is designed to withstand a nominal reverse-battery (VBAT = 13V) condition without permanent damage to the IC. The CA3273 is supplied in a modified 3-lead TO-202 plastic power package.

NOTES:

- The calculation for dissipation and junction temperature rise due to dissipation is: $P_D = (V_{CC} - V_O) \times I_O + V_{CC} \times I_{SW}$ and $T_J = T_A + P_D \times \theta_{JA}$ where T_J is device junction temperature, T_A is ambient temperature and θ_{JA} is the junction-to-ambient thermal resistance.
- Thermal limiting occurs at +150°C on the chip.

FIGURE 2. TYPICAL APPLICATION WITH ZENER DIODE FOR OVER-VOLTAGE PROTECTION WITH INDUCTIVE LOAD SWITCHING. V_Z SHOULD BE LESS THAN 35V. WHEN CURRENT IS SWITCHED OFF IN THE OUTPUT LOAD (L), THE INDUCTIVE KICK PULSE GOES NEGATIVE. THE CLAMPED CLAMP LEVEL OF THE NEGATIVE GOING PULSE IS $V_{CC} - V_Z$.

FIGURE 3. OPTIONAL RANGE SHIFTING OF THE V_{CC} INPUT VOLTAGE USING A ZENER DIODE TO OFFSET THE V_{SW} CONTROL PIN. (I.E., THE OVER-VOLTAGE SHUTDOWN THRESHOLD WILL BE INCREASED TO $V_{CC(THD)} + V_Z$ AND THE MINIMUM V_{CC} OPERATING VOLTAGE IS $V_Z + 4V$).
