

## RoHS Compliant Multimode SFP Transceiver for GbE and Fiber Channel

---

### Description

The LCP-1250A series are hot pluggable 3.3V Small-Form-Factor transceiver modules designed expressly for high-speed communication applications that require rates up to 1.25Gb/s. The transceiver is data rate transparent, which means it can support GbE (1.25Gb/s) as well as 1x Fiber channel (1.062Gb/s) operations

The LCP-1250 series are designed to be compliant with SFF-8472 SFP Multi-source Agreement (MSA) with digital diagnostic monitoring functions: Temperature,  $V_{CC}$ , TX optical power, TX laser bias current, and RX received optical power.

The post-amplifier of the LCP-1250 series also includes a Loss of Signal (LOS) circuit that provides a TTL logic-high output when the received optical level is below a preset LOS Assert threshold.

### FEATURES

- Compliant with SFP Transceiver SFF-8472 MSA specification with internal calibration
- Compliant with Specifications for IEEE 802.3z/Gigabit Ethernet
- Compliant with the 1.0625GBd Fiber Channel FC-PI 100-M5-SN-I Rev.13
- Single + 3.3V Power Supply and TTL Logic Interface
- EEPROM with Serial ID Functionality
- Laser Class 1 Product which comply with the requirements of IEC 60825-1 and IEC 60825-2
- Duplex LC Connector interface

### Applications

- Gigabit Ethernet
- Switch to Switch interface
- Switched backplane applications
- File server interface

### Performance

- 850nm VCSEL Link up to 550m in 50/125 $\mu$ m Multi Mode Fiber

**Notes:**

- 1) TX Fault is an open collector/drain output, which should be pulled up with a 4.7K – 10K $\Omega$  resistor on the host board. Pull up voltage between 2.0V and VccT, R+0.3V. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
- 2) TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7 – 10 K  $\Omega$  resistor. Its states are:

Low (0 – 0.8V):	Transmitter on
(>0.8, < 2.0V):	Undefined
High (2.0 – 3.465V):	Transmitter Disabled
Open:	Transmitter Disabled
- 3) Mod-Def 0,1,2. These are the module definition pins. They should be pulled up with a 4.7K – 10K $\Omega$  resistor on the host board. The pull-up voltage shall be VccT or VccR (see Section IV for further details). Mod-Def 0 is grounded by the module to indicate that the module is present Mod-Def 1 is the clock line of two wire serial interface for serial ID Mod-Def 2 is the data line of two wire serial interface for serial ID
- 4) LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K – 10K $\Omega$  resistor. Pull up voltage between 2.0V and VccT, R+0.3V. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
- 5) VeeR and VeeT may be internally connected within the SFP module.
- 6) RD-/+ : These are the differential receiver outputs. They are AC coupled 100 $\Omega$  differential lines which should be terminated with 100 $\Omega$  (differential) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board. The voltage swing on these lines will be between 370 and 2000 mV differential (185 – 1000 mV single ended) when properly terminated.
- 7) VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V  $\pm$ 5% at the SFP connector pin. Maximum supply current is 300mA. Recommended host board power supply filtering is shown below. Inductors with DC resistance of less than 1 ohm should be used in order to maintain the required voltage at the SFP input pin with 3.3V supply voltage. When the recommended supply-filtering network is used, hot plugging of the SFP transceiver module will result in an inrush current of no more than 30mA greater than the steady state value. VccR and VccT may be internally connected within the SFP transceiver module.
- 8) TD-/+ : These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 $\Omega$  differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board. The inputs will accept differential swings of 500 – 2400 mV (250 – 1200 mV single-ended), though it is recommended that values between 500 and 1200 mV differential (250 – 600 mV single-ended) be used for best EMI performance.

## SFP timing parameters for SFP management

Parameter	Symbol	Min.	Max.	Unit	Note
TX_DISABLE Assert time	t_off		10	μsec	1
TX_DISABLE Negate time	t_on		1	msec	2
Time to initialize, including reset of TX_FAULT	t_init		300	msec	3
TX Fault Assert Time	t_fault		100	μsec	4
TX_DISABLE to reset	t_rest	10		μsec	5
LOS Assert Time	t_loss_on		100	μsec	6
LOS Deassert Time	t_loss_off		100	μsec	7
Serial ID Clock Rate	f_serial_clock		100	kHz	

### Notes:

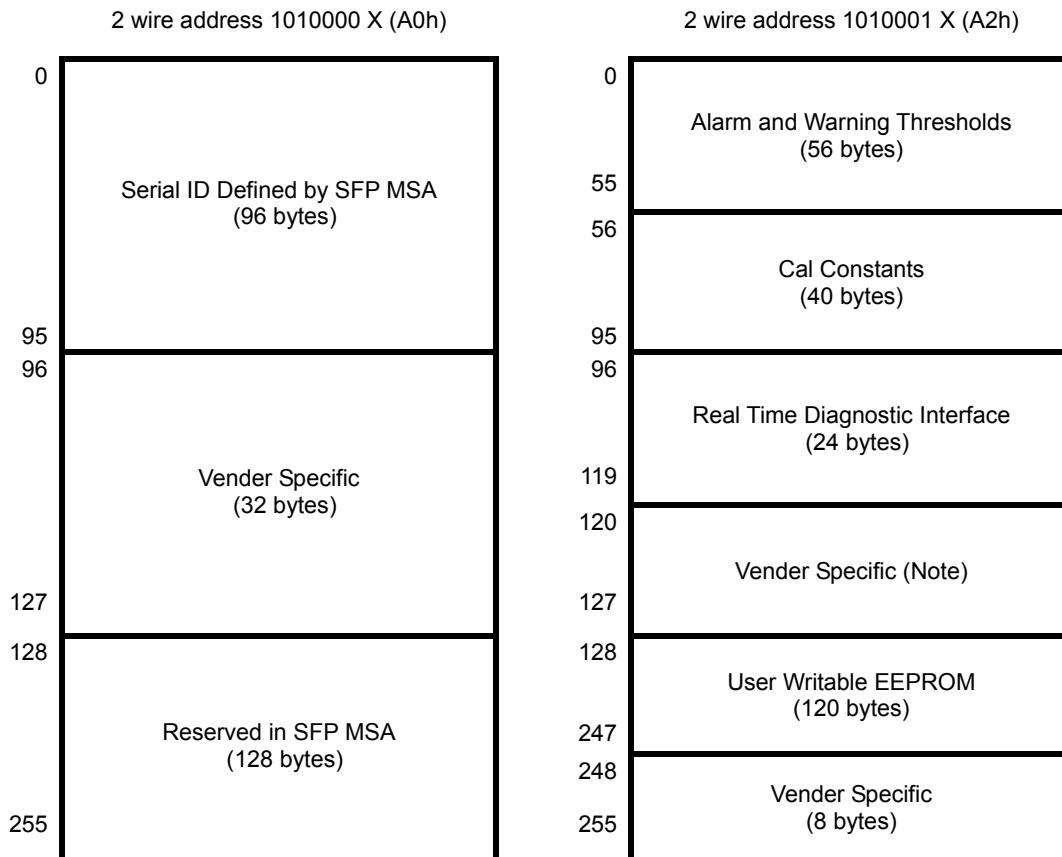

- 1) Time from rising edge of TX\_DISABLE to when the optical output falls below 10% of nominal
- 2) Time from falling edge of TX\_DISABLE to when the modulated optical output rises above 90% of nominal
- 3) From power on or negation of TX\_Fault using TX Disable
- 4) Time from fault to TX fault on.
- 5) Time TX Disable must be held high to reset TX\_Fault
- 6) Time from LOS state to Rx LOS assert
- 7) Time from non-LOS state to Rx LOS deassert

## Enhanced Digital Diagnostic Interface

The memory map in the following describes an extension to the memory map defined in SFP MSA. The enhanced interface uses the two wire serial bus address 1010001X(A2h) to provide diagnostic information about the module's present operating conditions.

**Digital Diagnostic Memory Map Specific Data Field Descriptions**

**Note:**

- 1) Write the password (11h, 11h, 11h, 11h) on the bytes of 123-126 of address A2h then the address of bytes 128-255 (User Writable) can be read and written.
