

74F827 • 74F828 10-Bit Buffers/Line Drivers

General Description

The 74F827 and 74F828 10-bit bus buffers provide high performance bus interface buffering for wide data/address paths or buses carrying parity. The 10-bit buffers have NOR output enables for maximum control flexibility.

The 74F828 is an inverting version of the 74F827.

Features

- 3-STATE output
- 74F828 is inverting

Functional Description

The 74F827 and 74F828 are line drivers designed to be employed as memory address drivers, clock drivers and bus-oriented transmitters/receivers which provide improved PC board density. The devices have 3-STATE outputs controlled by the Output Enable ($\overline{OE}$) pins. The outputs can sink 64 mA and source 15 mA. Input clamp diodes limit high-speed termination effects.
