

3A, Radiation Hardened, Positive, Ultra Low Dropout Regulator

ISL75051SEH

The ISL75051SEH is a radiation hardened low-voltage, high-current, single-output LDO specified for up to 3.0A of continuous output current. These devices operate over an input voltage range of 2.2V to 6.0V and are capable of providing output voltages of 0.8V to 5.0V adjustable based on resistor divider setting. Dropout voltages as low as 65mV can be realized using the device.

The OCP pin allows the short circuit output current limit threshold to be programmed by means of a resistor from the OCP pin to GND. The OCP setting range is from 0.5A minimum to 8.5A maximum. The resistor sets the constant current threshold for the output under fault conditions. The thermal shutdown disables the output if the device temperature exceeds the specified value. It subsequently enters an ON/OFF cycle until the fault is removed. The ENABLE feature allows the part to be placed into a low current shutdown mode that typically draws about 1μA. When enabled, the device operates with a typical low ground current of 11mA, which provides for operation with low quiescent power consumption.

The device is optimized for fast transient response and single event effects. This reduces the magnitude of SET seen on the output. Additional protection diodes and filters are not needed. The device is stable with tantalum capacitors as low as 47μF and provides excellent regulation all the way from no load to full load. Programmable soft-start allows the user to program the in-rush current by means of the decoupling capacitor value used on the BYP pin.

Applications

- LDO regulator for space application
- DSP, FPGA and μP core power supplies
- Post-regulation of switched mode power supplies
- Down-hole drilling

Features

- [DLA SMD#5962-11212](#)
 - Output current up to 3.0A at $T_J = +150^\circ\text{C}$
 - Output accuracy $\pm 1.5\%$ over MIL temp range
 - Ultra low dropout:
 - 65mV (Typ) dropout at 1.0A
 - 225mV (Typ) dropout at 3.0A
 - Noise of 100μV_{RMS} from 300Hz to 300kHz
 - SET mitigation with no added filtering/diodes
 - Input supply range: 2.2V to 6.0V
 - Fast load transient response
 - Shutdown current of 1μA (Typ)
 - Output adjustable using external resistors
 - PSRR 66dB (Typ) at 1kHz
 - Enable and PGood feature
 - Programmable soft-start/in-rush current limiting
 - Adjustable overcurrent limit from 0.5A to 8.5A
 - Over-temperature shutdown
 - Stable with 47μF min tantalum capacitor
 - 18 Ld ceramic flatpack package
 - Radiation environment
 - High dose rate (50-300rad(Si)/s) 100krad(Si)
 - Low dose rate (0.01rad(Si)/s) 100krad(Si)*
- *Product capability established by initial characterization. The "EH" version is acceptance tested on a wafer-by-wafer basis to 50 krad(Si) at low dose rate

Pin Configuration

NOTE: The ESD triangular mark is indicative of pin #1. It is a part of the device marking and is placed on the lid in the quadrant where pin #1 is located.

Pin Descriptions

PIN NUMBER	PIN NAME	DESCRIPTION
12, 13, 14 15, 16, 17	VIN	Input supply pins.
18	PG	VOUT in regulation signal. Logic low defines when VOUT is not in regulation. Must be grounded if not used.
1	GND	GND pin.
2, 3, 4 5, 6, 7	VOUT	Output voltage pins.
8	VADJ	VADJ pin allows VOUT to be programmed with an external resistor divider.
9	BYP	To filter the internal reference, connect a 0.1μF capacitor from BYP pin to GND.
10	EN	VIN independent chip enable. TTL and CMOS compatible.
11	OCP	Allows current limit to be programmed with an external resistor.
Top Lid	GND	The top lid is connected to GND pin of the package.

Ordering Information

ORDERING NUMBER (Notes 1, 2)	PART NUMBER	TEMP RANGE (°C)	PACKAGE (RoHS Compliant)	PKG DWG. #

NOTES:

- These Intersil Pb-free Hermetic packaged products employ 100% Au plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations.
- Specifications for Rad Hard QML devices are controlled by the Defense Logistics Agency Land and Maritime (DLA). The SMD numbers listed in this "Ordering Information" table must be used when ordering.

Absolute Maximum Ratings

V _{IN} Relative to GND (Note 3)	-0.3 to + 6.7V
V _{OUT} Relative to GND (Note 3)	-0.3 to + 6.7V
PG, EN, OCP/ADJ Relative to GND (Note 3)	-0.3 to + 6.7VDC
Junction Temperature (T _J)	+175°C
ESD Rating	
Human Body Model (Tested per MIL-PRF-883 3015.7)	2.5kV
Machine Model (Tested per JESD22-A115-A)	250V
Charged Device Model (Tested per JESD22-C101D)	1kV

Recommended Operating Conditions ([Note 4](#))

Ambient Temperature Range (T _A)	-55°C to +125°C
Junction Temperature (T _J) (Note 3)	+150°C
V _{IN} Relative to GND	2.2V to 6.0V
V _{OUT} Range	0.8V to 5.0V
PG, EN, OCP/ADJ Relative to GND	0V to +6.0V

Thermal Information

Thermal Resistance (Typical)	θ _{JA} (°C/W)	θ _{JC} (°C/W)
18 Ld CDFP Package (Notes 7, 8)	28	4
18 Ld CDFP Package with Bottom Metal and Solder Mount (Notes 7, 8)	24	3.3
Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see TB493	

Radiation Information

Maximum Total Dose	
Dose Rate = 50-300rad(Si)/s	100krad (Si)
Dose Rate = 0.01rad(Si)/s (Note 5)	100krad (Si)
SEE Performance	
SET (V _{OUT} < ±5% During Events) (Note 6)	.86MeV • cm ² /mg
SEL/SEB (No Latchup/Burnout)	.86MeV • cm ² /mg

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- Extended operation at these conditions may compromise reliability. Exceeding these limits will result in damage. Recommended operating conditions define limits where specifications are guaranteed.
- Refer to [“Thermal Guidelines” on page 16](#).
- Product capability established by initial characterization. The "EH" version is acceptance tested on a wafer-by-wafer basis to 50 krad(Si) at low dose rate.
- Specify EVAL test conditions for SET/SEB/SEL here.
- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief [TB379](#)
- For θ_{JC}, the “case temp” location is the center of the package underside.
- The device can work down to V_{OUT} = 0.8V; however, the SET performance of < ±5% at LET = 86MeV • cm²/mg is guaranteed at V_{OUT} = >1.5V only. SET tests performed with 220μF 10V 25mΩ and 0.1μF CDR04 capacitor on the input and output.

Electrical Specifications Unless otherwise noted, all parameters are guaranteed over the following specified conditions: V_{IN} = V_{OUT} + 0.4V, V_{OUT} = 1.8V, C_{IN} = C_{OUT} = 220μF 25mΩ and 0.1μF X7R, T_J = +25°C, I_L = 0A. Applications must follow thermal guidelines of the package to determine worst-case junction temperature (see [Note 13](#)). **Boldface limits apply across the operating temperature range, -55°C to +125°C.** Pulse load techniques used by ATE to ensure T_J = T_A defines guaranteed limits.

(Continued)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN (Note 10)	TYP	MAX (Note 10)	UNITS
PG Leakage Current		$V_{IN} = 6.0V$, PG = 6.0V		0.01	1	μA

NOTES:

- Parameters with MIN and/or MAX limits are 100% tested at $-55^\circ C$, $+25^\circ C$ and $+125^\circ C$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
- Line and Load Regulation done under pulsed condition for $T < 10ms$.
- Dropout is defined as the difference between the supply V_{IN} and V_{OUT} , when the supply produces a 2% drop in V_{OUT} from its nominal value. Data measured within a 3ms period.
- Please refer to ["Applications Information" on page 14](#) of the datasheet and Tech Brief [TB379](#).

High Dose Rate Post Radiation Characteristics $T_A = +25^\circ C$, unless otherwise noted. This data is typical test data post radiation exposure at a rate of 50 to 300rad(Si)/s. This data is intended to show typical parameter shifts due to high dose rate radiation (see [Note 14](#)). These are not limits nor are they guaranteed.

Applications Information

Input Voltage Requirements

This RH LDO will work from a V_{IN} in the range of 2.2V to 6.0V. The input supply can have a tolerance of as much as $\pm 10\%$ for conditions noted in the “[Electrical Specifications](#)”. The minimum guaranteed input voltage is 2.2V. However, due to the nature of an LDO, V_{IN} must be some margin higher than the output voltage, plus dropout at the maximum rated current of the application, if active filtering (PSRR) is expected from V_{IN} to V_{OUT} . The dropout spec of this family of LDOs has been generously specified to allow applications to design for efficient operation.

Adjustable Output Voltage

The output voltage of the RH LDO can be set to any user programmable level between 0.8V to 5.0V. This is achieved with a resistor divider connected between the OUT, ADJ and GND pins. With the internal reference at 0.52V, the divider ratio should be fixed such that when the desired V_{OUT} level is reached, the voltage presented to the ADJ pin is 0.52V. Resistor values for typical voltages are shown in [Table 1](#).

TABLE 1. RESISTOR VALUES FOR TYPICAL VOLTAGES

V_{OUT} (V)	R_{BOTTOM}	R_{TOP} (k)
0.8	7.87k	4.32
1.5	2.26k	4.32
1.8	1.74k	4.32
2.5	1.13k	4.32
4.0	634	4.32
5.0	499	4.32

$$R_{BOTTOM} = \frac{R_{TOP}}{\left(\frac{V_{OUT}}{V_{ADJ}}\right) - 1} \quad (EQ. 1)$$

Input and Output Capacitor Selection

The RH operation requires the use of a combination of tantalum and ceramic capacitors to achieve a good volume-to-capacitance ratio. The recommended combination is a 220 μ F, 10V, 25m Ω rated DSSC 04051-032 series tantalum capacitor, in parallel with a 0.1 μ F MIL-PRF-49470 CDR04 ceramic capacitor to be connected between V_{IN} to GND pins and V_{OUT} to GND pins of the LDO, with PCB traces no longer than 0.5cm.

The stability of the device depends on the capacitance and ESR of the output capacitor. The usable ESR range for the device is 6m Ω to 100m Ω . At the lower limit of ESR = 6m Ω , the phase margin is about 51°. On the high-side, an ESR of 100m Ω is found to limit the gain margin at around 10dB. The typical GM/PM seen with capacitors are shown in [Table 2](#).

TABLE 2. TYPICAL GM/PM WITH VARIOUS CAPACITORS

CAPACITANCE (μ F)	ESR (m Ω)	GAIN MARGIN (dB)	PHASE MARGIN (°)
47	35	14	55
100	25	16	57
220	6	19	51
220	25	16	69
100	100	10	62

Type numbers of KEMET capacitors used in the device are shown in [Table 3](#).

TABLE 3. KEMET CAPACITORS USED IN DEVICE

KEMET TYPE NUMBER	CAPACITOR DETAILS
T525D476M016ATE035	47 μ F, 10V, 35m Ω
T525D107M010ATE025	100 μ F, 10V, 25m Ω
T530D227M010ATE006	220 μ F, 10V, 6m Ω
T525D227M010ATE025	220 μ F, 10V, 25m Ω
T495X107K016ATE100	100 μ F, 16V, 100m Ω

A typical gain phase plot measured on the ISL75051SRHEVAL1Z evaluation board for $V_{IN} = 3.3V$, $V_{OUT} = 1.8V$ and $I_{OUT} = 3A$ with a 220 μ F, 10V, 25m Ω capacitor is shown in [Figure 27](#) and is measured at GM = 16.3dB and PM = 69.16°.

FIGURE 27. TYPICAL GAIN PHASE PLOT

Enable

The device can be enabled by applying a logic high on the EN pin. The enable threshold is typically 0.9V. A soft-start cycle is initiated when the device is enabled using this pin. Taking this pin to logic low disables the device.

The EN can be driven from either an open drain or a totem pole logic drive between EN pin and GND. Assuming an open-drain configuration, M1 will actively pull-down the EN line, as shown in [Figure 28](#), and thereby discharge the input capacitance, shutting off the device immediately.

FIGURE 28. ENABLE

Power-Good

The Power-Good pin is asserted high when the voltage on the ADJ pin crosses the rising threshold of $0.9 \times V_{ADJ}$ (typ). On the falling threshold, Power-Good is asserted low when the voltage on the ADJ pin crosses the falling threshold of $0.88 \times V_{ADJ}$. The power-good output is an open-drain output rated for a continuous sink current of 1mA.

Soft-start

Soft-start is achieved by means of the charging time constant of the BYP pin. The capacitor value on the pin determines the time constant and can be calculated using [Equations 2](#) through [4](#) based on V_{IN} range:

If V_{IN} range is $2.2V \leq V_{IN} < 2.7V$:

$$t_{SS} = (-4.8376 \cdot V_{IN}) + (0.0254 \cdot T_A) + (0.0522 \cdot C_{BYP}) + 11.8526 \quad (\text{EQ. 2})$$

If V_{IN} range is $2.7V \leq V_{IN} < 4.0V$:

$$t_{SS} = (-1.4711 \cdot V_{IN}) + (0.0179 \cdot T_A) + (0.0377 \cdot C_{BYP}) + 4.7430 \quad (\text{EQ. 3})$$

If V_{IN} range is $4.0V \leq V_{IN} < 6.0V$:

$$t_{SS} = (-0.4458 \cdot V_{IN}) + (0.0130 \cdot T_A) + (0.0295 \cdot C_{BYP}) + 1.8527 \quad (\text{EQ. 4})$$

where t_{SS} = soft-start time (ms), V_{IN} = Input supply (V), T_A = Ambient Temperature and C_{BYP} = BYPASS capacitor (nF).

The BYPASS capacitor, C_1 , charges with a current source and provides an EA reference, -IN, with an SS ramp. V_{OUT} , in turn, follows this ramp. The ramp rate can be calculated based on the C_1 value. For conditions in which C_1 is opened, or for small values of C_1 , the ramp is provided by $C_2 = 50pF$, with a source of $0.5\mu A$. Connecting C_1 min = $0.1\mu F$ to the BYPASS pin is recommended for normal operation.

FIGURE 29. SOFT-START

Current Limit Protection

The RH LDO incorporates protection against overcurrent due to any short or overload condition applied to the output pin. The current limit circuit becomes a constant current source when the output current exceeds the current limit threshold, which can be adjusted by means of a resistor connected between the OCP pin and GND. If the short or overload condition is removed from V_{OUT} , then the output returns to normal voltage mode regulation. The OCP can be calculated with [Equation 5](#):

$$OCP = 4.1115 \times ROCP^{-0.75} \quad (\text{EQ. 5})$$

where OCP = Overcurrent Threshold in amps, and ROCP = OCP resistor in kΩ.

In the event of an overload condition based on the set OCP limit, the die temperature may exceed the internal over-temperature limit, and the LDO begins to cycle on and off due to the fault condition ([Figure 30](#)). However, thermal cycling may never occur if the heatsink used for the package can keep the die temperature below the limits specified for thermal shutdown.

FIGURE 30. OCP vs ROCP

Thermal Guidelines

If the die temperature exceeds typically +175°C, then the LDO output shuts down to zero until the die temperature cools to typically +155°C. The level of power combined with the thermal impedance of the package (θ_{JC} of 4°C/W for the 18 Ld CDFP package) determines whether the junction temperature exceeds the thermal shutdown temperature specified in the [“Electrical Specifications”](#) table on page 5.

The device should be mounted on a high effective thermal conductivity PCB with thermal vias, per JESD51-7 and JESD51-5. Place a silpad between package base and PCB copper plane. The V_{IN} and V_{OUT} ratios should be selected to ensure that dissipation for the selected V_{IN} range keeps T_J within the recommended operating level of +150°C for normal operation.

Weight Characteristics

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest revision.

DATE	REVISION	CHANGE
December 15, 2014	FN8294.5	Made correction to Charged Device Model testing information from Tested per CDM-22C10ID to JESD22-C101D
October 27, 2014		Added Related Literature section on page 1. Added ESD ratings under the Abs Max section on page 4. Human Body Model (Tested per MIL-PRF-883 3015.7).....2.5kV Machine Model (Tested per JESD22-A115-A).....250V Charged Device Model (Tested per CDM-22C10ID).....1kV
September 15, 2014	FN8294.4	Replaced Equation 2 and added Equations 3 and 4 on page 15. Removed second line of Yaxis title for Figures 3, 4, 5, 7 and 8 as it was redundant information that was already in the Figure titles.
March 28, 2014	FN8294.3	Thermal Information, page 4: Updated θ_{JC} (°C/W) for the 18 Ld CDFP Package with Bottom Metal and Solder Mount from "4" to "3.3". Removed both "Enable Pin Turn-on Delay" rows from "Electrical Specifications" on page 5. Added EQ1 to page 14.
February 11, 2014	FN8294.2	Soft-Start section, page 15: 1) EQ1 Changed From: Trise (ms)=0.00577xCss (nF) To: Trise (ms)=0.0326xCss (nF) 2) Changed From: "a 90µA source current " To: " a current source"
September 12, 2013	FN8294.1	Updated Equation 2 on page 15.
September 6, 2013		Weight Characteristics on page 17: Added K18.E: 1.07 Grams typical with leads clipped. Updated Equation 2 on page 15.
August 30, 2013		Added a note to the pin configuration figure on page 3. Ordering information table on page 3: Added part number ISL75051SRHX/SAMPLE. Updated Equation 2 on page 15.
August 27, 2013		Added part numbers ISL75051SEHVFE and ISL75051SEHFE/PROTO (18 Ld CDFP with bottom metal) to ordering information table on page 3. Added 18 Ld CDFP Package theta ja= 28 and theta jc = 4 to thermal information table on page 4. Updated POD for k18.D from Rev3 to Rev5: Added bottom of lead to bottom of package. Added POD k18.E: 18 Ld ceramic metal seal flatpack package with bottom metal.
August 28, 2012	FN8294.0	Initial Release.

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

Package Outline Drawing K18.D

18 LEAD CERAMIC METAL SEAL FLATPACK PACKAGE

Rev 5, 3/13

NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab may be used to identify pin one.
2. If a pin one identification mark is used in addition to a tab, the limits of the tab dimension do not apply.
3. The maximum limits of lead dimensions (section A-A) shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
4. Measure dimension at all four corners.
5. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
6. Dimension shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension minimum shall be reduced by 0.0015 inch (0.038mm) maximum when solder dip lead finish is applied.
7. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
8. Dimensions = INCH (mm). Controlling dimension: INCH.
