DC-DC Converter

The PQ60050HPB45 PowerQor Peta converter is a next-generation, board-mountable, isolated, fixed switching frequency DC/DC converter that uses synchronous rectification to achieve extremely high conversion efficiency. The power dissipated by the converter is so low that a heatsink is not required, which saves cost, weight, height, and application effort. The Peta series converters offer industry leading output power for a standard half-brick module. In addition to typical single output voltage applications, the Peta units can also be used to provide a wide input range Intermediate Bus for IBA systems. RoHS compliant (see last page).

#### Protection Features

- Input under-voltage lockout disables converter at low  $V_{in}$  conditions
- Output current limit & Short circuit protection
- Active back bias limit prevents damage to converter from external load induced pre-bias
- Output over-voltage protection
- Thermal shutdown protects converter from abnormal conditions

#### Mechanical Features

- Industry standard pin-out configuration
- Standard Size Open Frame: 2.40" x 2.30" (61 x 58.4mm)
- Total Open Frame height only 0.43" (10.8mm), permits better airflow and smaller card pitch
- Open Frame Weight: 2.6 oz. (75g)
- Flanged pins designed to permit surface mount soldering (avoid wave solder) using FPIP technique

#### Control Features

- On/Off control referenced to input side (Positive & Neg logic options)
- Remote sense for  $V_{out}$  compensates for output distribution drops
- Output voltage trim permits custom voltages and voltage margining

#### Safety Features

- UL 60950-1:2007
- CAN/CSA-C22.2 No. 60950-1:2007
- EN60950-1:A12:2011

**PowerQor®**

PQ60050HPx45 Model

#### Operational Features

- Ultra-high efficiency, 91% at full rated load current
- Delivers up to 225W of output power (45A) with minimal derating - no heatsink required
- Wide input voltage range: 35-75V
- Input voltage transient capability: 100V, 100ms
- Fixed frequency switching provides predictable EMI

## Open Frame Mechanical Diagram

**Input: 35-75V**  
**Output: 5.0V**  
**Current: 45A**  
**Package: Half-brick**

### NOTES

- 1) Pins 1, 2, 4, 6-8 are 0.040" (1.02mm) diameter with 0.080" (2.03mm) Dia. Standoff shoulders
- 2) Pins 5 and 9 are 0.080" (2.03 mm) diameter with .125" (3.18mm) Dia. Standoff shoulders
- 3) Other pin extension lengths available.
- 4) All Pins: Material - Copper Alloy  
Finish: Matte Tin over Nickel plate
- 5) Undimensioned components are shown for visual reference only.
- 6) All dimensions in inches (mm)
- 7) Open Frame Weight: 2.6 oz. (75g)
- 8) Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)  
x.xxx +/-0.010 in. (x.xx +/-0.25mm)

### PIN DESIGNATIONS

Pin	Name	Function
1	Vin(+)	Positive input voltage
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
4	Vin(-)	Negative input voltage
5	Vout(-)	Negative output voltage
6	SENSE(-)	Return remote sense
7	TRIM	Output voltage trim
8	SENSE(+)	Positive remote sense
9	Vout(+)	Positive output voltage

## Baseplated Mechanical Diagram

**Input: 35-75V**  
**Output: 5.0V**  
**Current: 45A**  
**Package: Half-brick**

### NOTES

- 1) M3 screws used must not exceed .085" (2.16mm) depth below the surface of the base plate
- 2) Applied torque per screw shall not exceed 6 IN-LB (0.68Nm)
- 3) Base plate flatness tolerance is .004" (.10mm) TIR for surface
- 4) Pins 1, 2, 4, & 6 - 8 are 0.040" (1.02mm) Dia. with 0.080" (2.03mm) Dia. Standoff shoulders
- 5) Pins 5 & 9 are 0.080" (2.03mm) Dia. with 0.125" (3.18mm) Dia. Standoff shoulders
- 6) Other pin extension lengths available.
- 7) All Pins: Material - Copper Alloy  
Finish (RoHS 6/6) - Matte Tin over Nickel plate
- 8) Undimensioned components are shown for visual reference only.
- 9) All dimensions in inches (mm)  
Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)  
x.xxx +/-0.010 in. (x.xx +/-0.25mm)
- 10) Weight: 3.94 oz (111.6 g) typical

### PIN DESIGNATIONS

Pin	Name	Function
1	Vin(+)	Positive input voltage
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
4	Vin(-)	Negative input voltage
5	Vout(-)	Negative output voltage
6	SENSE(-)	Return remote sense
7	TRIM	Output voltage trim
8	SENSE(+)	Positive remote sense
9	Vout(+)	Positive output voltage

## PQ60050HPx45 Electrical Characteristics

Ta = 25 °C, airflow rate = 300 LFM, Vin = 48V dc unless otherwise noted; full operating temperature range is -40 °C to +100 °C baseplate temperature with appropriate power derating. Specifications subject to change without notice.

Parameter	Min.	Typ.	Max.	Units	Notes & Conditions
<b>ABSOLUTE MAXIMUM RATINGS</b>

<b>RELIABILITY CHARACTERISTICS</b>					
Calculated MTBF (Telcordia)		2.13		10 <sup>6</sup> Hrs.	TR-NWT-000332; 75% load, 300LFM, 40°C Ta
Calculated MTBF (MIL-217)		1.3		10 <sup>6</sup> Hrs.	MIL-HDBK-217F; 75% load, 300LFM, 40°C Ta
Field Demonstrated MTBF				10 <sup>6</sup> Hrs.	See our website for details

Note 1: For applications requiring reduced output voltage ripple and noise, consult SynQor applications support (e-mail: support@synqor.com)

Note 2: Higher values of isolation capacitance can be added external to the module.

## Technical Specifications

**Input: 35-75V**  
**Output: 5.0V**  
**Current: 45A**  
**Package: Half-brick**

## Standards Compliance & Qualification Testing

Parameter	Notes & Conditions
<b>STANDARDS COMPLIANCE</b>	
UL 60950-1:2007	Basic insulation
CAN/CSA-C22.2 No. 60950-1:2007	
EN60950-1:A12:2011	
IEC 61000-4-2	ESD test, 8 kV - NP, 15 kV air - NP (Normal Performance)

Note: An external input fuse must always be used to meet these safety requirements. Contact SynQor for official safety certificates on new releases or download from the SynQor website.

Parameter	# Units	Test Conditions
<b>QUALIFICATION TESTING</b>		
Life Test	32	95% rated Vin and load, units at derating point, 1000 hours
Vibration	5	10-55 Hz sweep, 0.060" total excursion, 1 min./sweep, 120 sweeps for 3 axis
Mechanical Shock	5	100g minimum, 2 drops in x, y and z axis
Temperature Cycling	10	-40 °C to 100 °C, unit temp. ramp 15 °C/min., 500 cycles
Power/Thermal Cycling	5	Toperating = min to max, Vin = min to max, full load, 100 cycles
Design Marginality	5	Tmin-10 °C to Tmax+10 °C, 5 °C steps, Vin = min to max, 0-105% load
Humidity	5	85 °C, 95% RH, 1000 hours, continuous Vin applied except 5 min/day
Solderability	15 pins	MIL-STD-883, method 2003

Figure 23: Achievable trim-up percentage vs. input voltage at output loads of 0%, 50% and full load.

## BASIC OPERATION AND FEATURES

The PowerQor series converter uses a two-stage power conversion topology. The first stage is a buck-converter that keeps the output voltage constant over variations in line, load, and temperature. The second stage uses a transformer to provide the functions of input/output isolation and voltage step-down to achieve the low output voltage required.

Both the first stage and the second stage switch at a fixed frequency for predictable EMI performance. Rectification of the transformers output is accomplished with synchronous rectifiers. These devices, which are MOSFETs with a very low on-state resistance, dissipate far less energy than Schottky diodes. This is the primary reason that the PowerQor converter has such high efficiency, even at very low output voltages and very high output currents.

Dissipation throughout the converter is so low that it does not require a heatsink for operation. Since a heatsink is not required, the PowerQor converter does not need a metal baseplate or potting material to help conduct the dissipated energy to the heatsink. The PowerQor converter can thus be built more simply and reliably using high yield surface mount techniques on a PCB substrate.

The PowerQor series of half-brick, quarter-brick and eighth-brick converters uses the industry standard footprint and pin-out configuration.

## CONTROL FEATURES

**REMOTE ON/OFF (Pin 2):** The ON/OFF input, Pin 2, permits the user to control when the converter is on or off. This input is referenced to the return terminal of the input bus,  $V_{in}(-)$ . There are two versions of the converter that differ by the sense of the logic used for the ON/OFF input. In the positive logic version, the ON/OFF input is active high (meaning that a high turns the converter on). In the negative logic version, the ON/OFF signal is active low (meaning that a low turns the converter on). Figure A details five possible circuits for driving the ON/OFF pin. Figure B is a detailed look of the internal ON/OFF circuitry.

**REMOTE SENSE(+)** (Pins 8 and 6): The SENSE(+) inputs correct for voltage drops along the conductors that connect the converter's output pins to the load.

Pin 8 should be connected to  $V_{out}(+)$  and Pin 6 should be connected to  $V_{out}(-)$  at the point on the board where regulation is desired. A remote connection at the load can adjust for a voltage drop only as large as that specified in this datasheet, that is

$$[V_{out}(+) - V_{out}(-)] - [V_{sense}(+) - V_{sense}(-)] \leq \text{Sense Range \%} \times V_{out}$$

Pins 8 and 6 must be connected for proper regulation of the output voltage. If these connections are not made, the converter will deliver an output voltage that is slightly higher than its specified value.

Note: the output over-voltage protection circuit senses the voltage across the output (pins 9 and 5) to determine when it should trigger, not the voltage across the converter's sense leads (pins 8 and 6). Therefore, the resistive drop on the board should be small enough so that output OVP does not trigger, even during load transients.

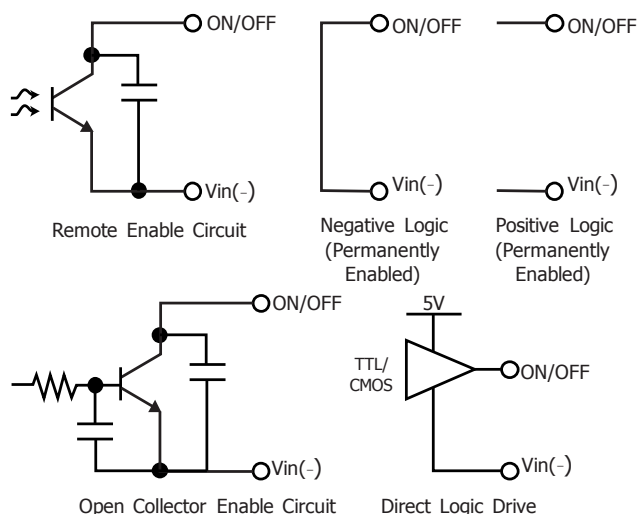

Figure A: Various circuits for driving the ON/OFF pin

Figure B: Internal ON/OFF pin circuitry

**OUTPUT VOLTAGE TRIM (Pin 7):** The TRIM input permits the user to adjust the output voltage across the sense leads up or down according to the trim range specifications.

To decrease the output voltage, the user should connect a resistor between Pin 7 and Pin 6 (SENSE(-) input). For a desired decrease of the nominal output voltage, the value of the resistor should be:

$$R_{\text{trim-down}} = \left( \frac{100\%}{\Delta\%} \right) - 2(k\Omega)$$

where

$$\Delta\% = \left| \frac{V_{\text{nominal}} - V_{\text{desired}}}{V_{\text{nominal}}} \right| \times 100\%$$

To decrease the output voltage, the user should connect a resistor between Pin 7 and Pin 6 (SENSE(-) input). For a desired decrease of the nominal output voltage, the value of the resistor should be:

$$R_{\text{trim-up}} = \frac{\left( \frac{V_{\text{nominal}}}{1.225} - 2 \right) \times V_{\text{DES}} + V_{\text{NOM}}}{V_{\text{DES}} - V_{\text{NOM}}} k\Omega$$

**Note:** the TRIM feature does not affect the voltage at which the output over-voltage protection circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients.

It is not necessary for the user to add capacitance at the Trim pin. The node is internally bypassed to eliminate noise.

**Total DC Variation of Vout:** For the converter to meet its full specifications, the maximum variation of the DC value of Vout, due to both trimming and remote load voltage drops, should not be greater than that specified for the output voltage trim range.

Figure C: Trim Graph 5V Module.

## Protection Features

**Input Under-Voltage Lockout:** The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability". The lockout circuitry is a comparator with DC hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specification page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off.

**Input Over-Voltage Shutdown:** Available on PQ48 models only. The converter turns off when the input voltage is too high, allowing the converter to withstand an input voltage as high as 100V without destruction. The shutdown circuitry is a comparator with DC hysteresis. When the input voltage exceeds the typical Input Over-Voltage Shutdown value, the converter will turn off. Once the converter is off, it will turn back on when the input voltage falls below the minimum Input Over-Voltage Shutdown value.

**Output Current Limit:** The maximum current limit remains constant as the output voltage drops. However, once the impedance of the short across the output is small enough to make the output voltage drop below the specified Output DC Current-Limit Shutdown Voltage, the converter turns off. The converter then enters a "hiccup mode" where it repeatedly turns on and off at a 5 Hz (nominal) frequency with a 5% duty cycle until the short circuit condition is removed. This prevents excessive heating of the converter or the load board.

**Output Over-Voltage Limit:** If the voltage across the output pins exceeds the Output Over-Voltage Protection threshold, the converter will immediately stop switching. This prevents damage to the load circuit due to 1) excessive series resistance in output current path from converter output pins to sense point, 2) a release of a short-circuit condition, or 3) a release of a current limit condition. Load capacitance determines exactly how high the output voltage will rise in response to these conditions. After 200 ms the converter will automatically restart.

**Over-Temperature Shutdown:** A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

### APPLICATION CONSIDERATIONS

**Input System Instability:** This condition can occur because any DC/DC converter appears incrementally as a negative resistance load. A detailed application note titled "Input System Instability" is available on the SynQor web site ([www.synqor.com](http://www.synqor.com)) which provides an understanding of why this instability arises, and shows the preferred solution for correcting it.

**Application Circuits:** Figure D presented below provides a typical circuit diagram which details the input filtering and voltage trimming.

**Input Filtering and External Input Capacitance:** Figure E below provides a diagram showing the internal input filter components. This filter dramatically reduces input terminal ripple current, which otherwise could exceed the rating of an external electrolytic input capacitor. The recommended external input capacitance is specified in the "Input Characteristics" section. More detailed information is available in the application note titled "EMI Characteristics" on the SynQor website.

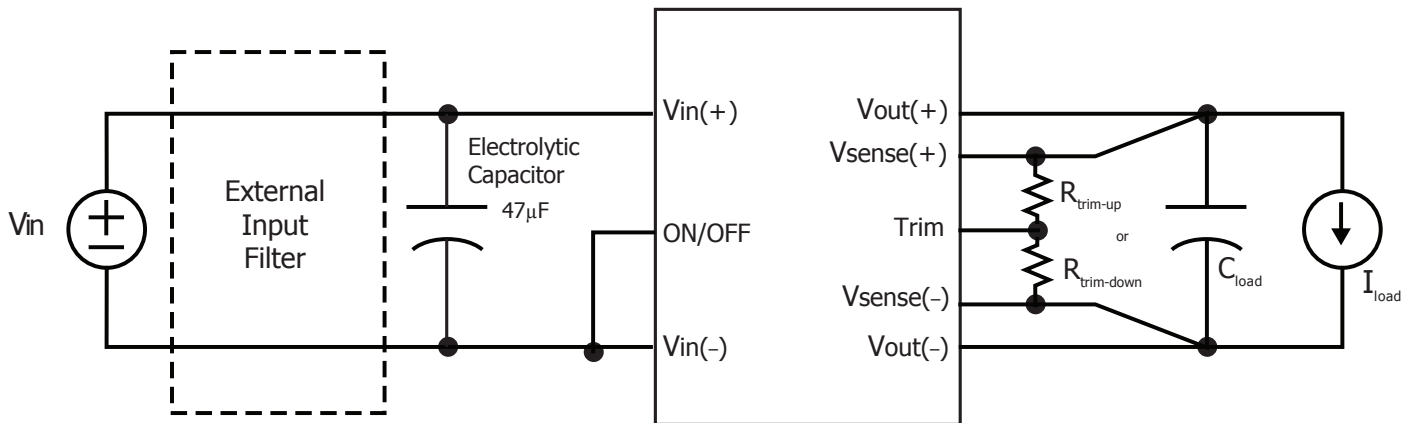

Figure D: Typical application circuit (negative logic unit, permanently enabled).

Figure E: Internal Input Filter Diagram (component values listed on page 3).

**Startup Inhibit Period:** The Startup Inhibit Period ensures that the converter will remain off for approximately 200ms when it is shut down for any reason. When an output short is present, this generates a 5Hz "hiccup mode," which prevents the converter from overheating. In all, there are seven ways that the converter can be shut down, initiating a Startup Inhibit Period:

- Input Under-Voltage Lockout.
- Input Over-Voltage Shutdown (*not present in Quarter-brick*)
- Output Over-Voltage Protection
- Over Temperature Shutdown
- Current Limit
- Short Circuit Protection
- Turned off by the ON/OFF input

Figure F shows three turn-on scenarios, where a Startup Inhibit Period is initiated at  $t_0$ ,  $t_1$ , and  $t_2$ :

Before time  $t_0$ , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above the UVL threshold, the Input Under-Voltage Lockout is released, and a Startup Inhibit Period is initiated. At the end of this delay, the ON/OFF pin is evaluated, and since it is active, the unit turns on.

At time  $t_1$ , the unit is disabled by the ON/OFF pin, and it cannot be enabled again until the Startup Inhibit Period has elapsed.

When the ON/OFF pin goes high after  $t_2$ , the Startup Inhibit Period has elapsed, and the output turns on within the typical Turn-On Time.

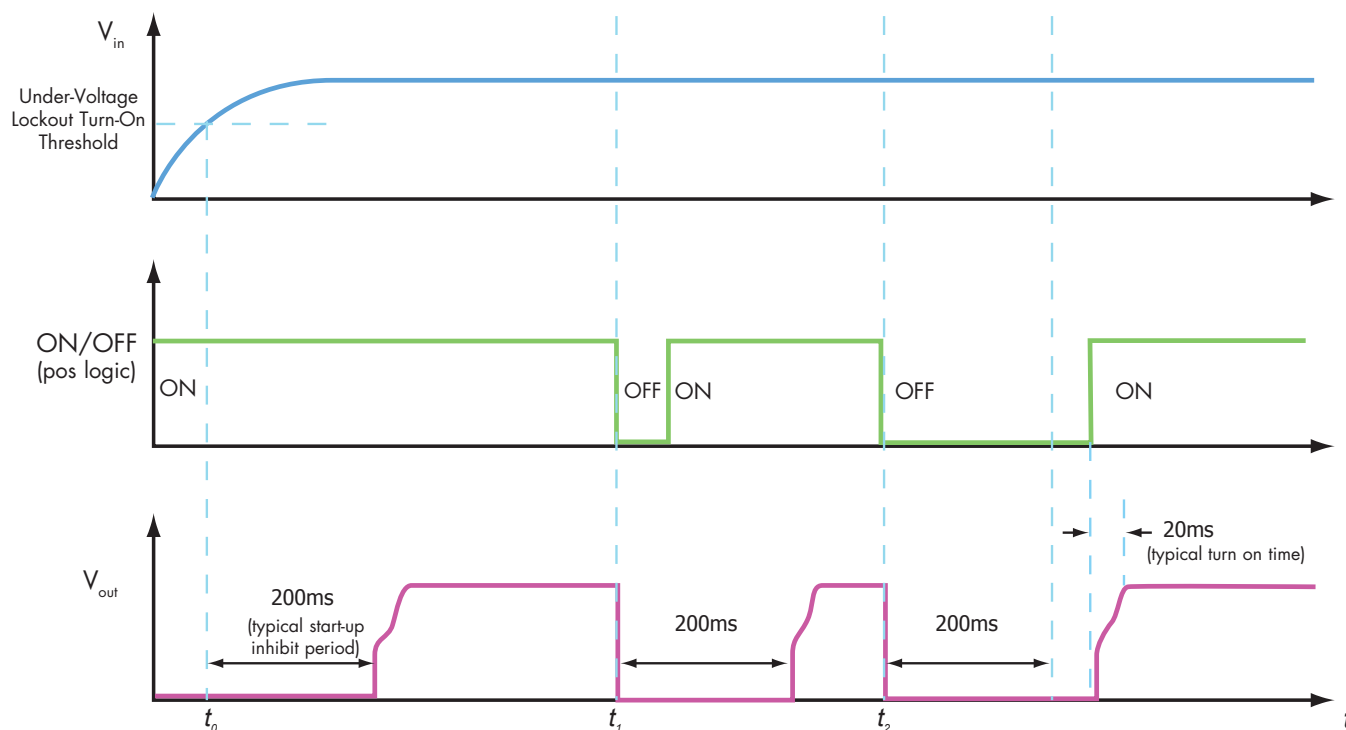

Figure F: Startup Inhibit Period (turn-on time not to scale)

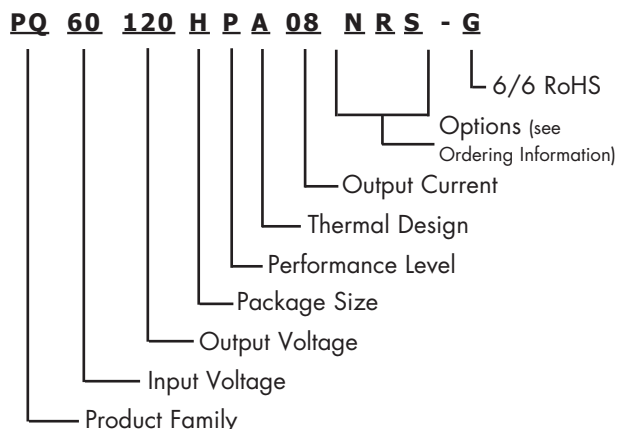

## Ordering Information

# Technical Specification PQ60050HPx45

### Part Numbering System

The part numbering system for SynQor's dc-dc converters follows the format shown in the example below.

The first 12 characters comprise the base part number and the last 3 characters indicate available options. The "-G" suffix indicates 6/6 RoHS compliance.

### Application Notes

A variety of application notes and technical white papers can be downloaded in pdf format from our [website](#).

**RoHS Compliance:** The EU led RoHS (Restriction of Hazardous Substances) Directive bans the use of Lead, Cadmium, Hexavalent Chromium, Mercury, Polybrominated Biphenyls (PBB), and Polybrominated Diphenyl Ether (PBDE) in Electrical and Electronic Equipment. This SynQor product is 6/6 RoHS compliant. For more information please refer to SynQor's RoHS addendum available at our [RoHS Compliance / Lead Free Initiative web page](#) or e-mail us at [rohs@synqor.com](mailto:rohs@synqor.com).

### Ordering Information

The tables below show the valid model numbers and ordering options for converters in this product family. When ordering SynQor converters, please ensure that you use the complete 15 character part number consisting of the 12 character base part number and the additional characters for options. Add "-G" to the model number for 6/6 RoHS compliance.

Model Number	Input Voltage	Output Voltage	Max Output Current
PQ60050HPw45xyz-G	35-75V	5V	45A

The following options must be included in place of the **wxyz** spaces in the model numbers listed above.

Options Description: <b>wxyz</b>			
Thermal Design	Enable Logic	Pin Style	Feature Set
