SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS

DESCRIPTION

The M35075-XXXFP is a character pattern display control IC can display on the CRT display the liquid crystal display and the plasma display. It uses a silicon gate CMOS process and it housed in a 24-pin shrink SOP package (M35075-XXXFP).
For M35075-001FP that is a standard ROM version of M35075-XXXFP respectively, the character pattern is also mentioned.

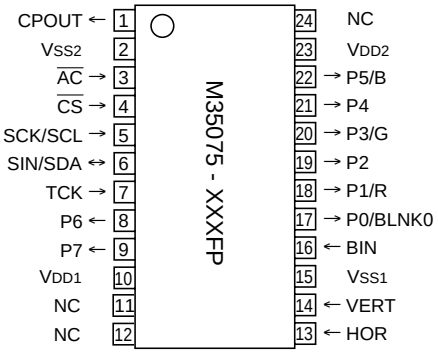
FEATURES

- Screen composition ..... 24 characters × 12 lines
- Number of characters displayed ..... 288 (Max.)
- Character composition ..... 12 × 18 dot matrix
- Characters available ..... ROM character:255 characters
  RAM character:8 characters
- Character sizes available ..... 4 (vertical) × 2 (horizontal)
- Display locations available
  Horizontal direction ..... 2007 locations
  Vertical direction ..... 2047 locations
- Blinking ..... Character units
  Cycle : division of vertical synchronization signal into 32 or 64
  Duty : 25%, 50%, or 75%
- Data input ..... By the I²C-BUS serial input function
- Coloring for ROM character
  Character color ..... 8 colors (Character unit)
  Background coloring ..... 8 colors (Character unit)
  Border (shadow) coloring ..... 8 colors (unit of screen / character unit)
  Raster coloring..... 8 colors (unit of screen)
- Blanking for ROM character
  Character size blanking
  Border size blanking
  Matrix-outline blanking
  All blanking (all raster area)
- Coloring for RAM character..... 8 colors (dot by dot)
- Blanking for RAM character
  Character size blanking
  Matrix-outline blanking
  All blanking (all raster area)
- Output ports
  4 shared output ports (toggled between RGB output)
  4 dedicated output ports
- Display RAM erase function
- Display input frequency range ..... Fosc = 20.0MHz to 110.0MHz
- Horizontal synchronous input frequency
  ..... H.sync = 15 kHz to 130 kHz
- Display oscillation stop function

<VDD=5V>

- Display input frequency range
  External clock mode 1 ..... Fosc = 6.3 MHz to 80.0 MHz
  External clock mode 2 ..... Fosc = 20.0 MHz to 110.0 MHz
  Internal clock mode ..... Fosc = 20.0 MHz to 110.0 MHz
- Horizontal synchronous input frequency
  ..... H.sync = 15 kHz to 130 kHz

PIN CONFIGURATION (TOP VIEW)



Outline 24P2Q

<VDD=3V>

- Display input frequency range
  External clock mode 1 ..... Fosc = 6.3 MHz to 40 MHz
- Horizontal synchronous input frequency
  ..... H.sync = 15 kHz to 60 kHz

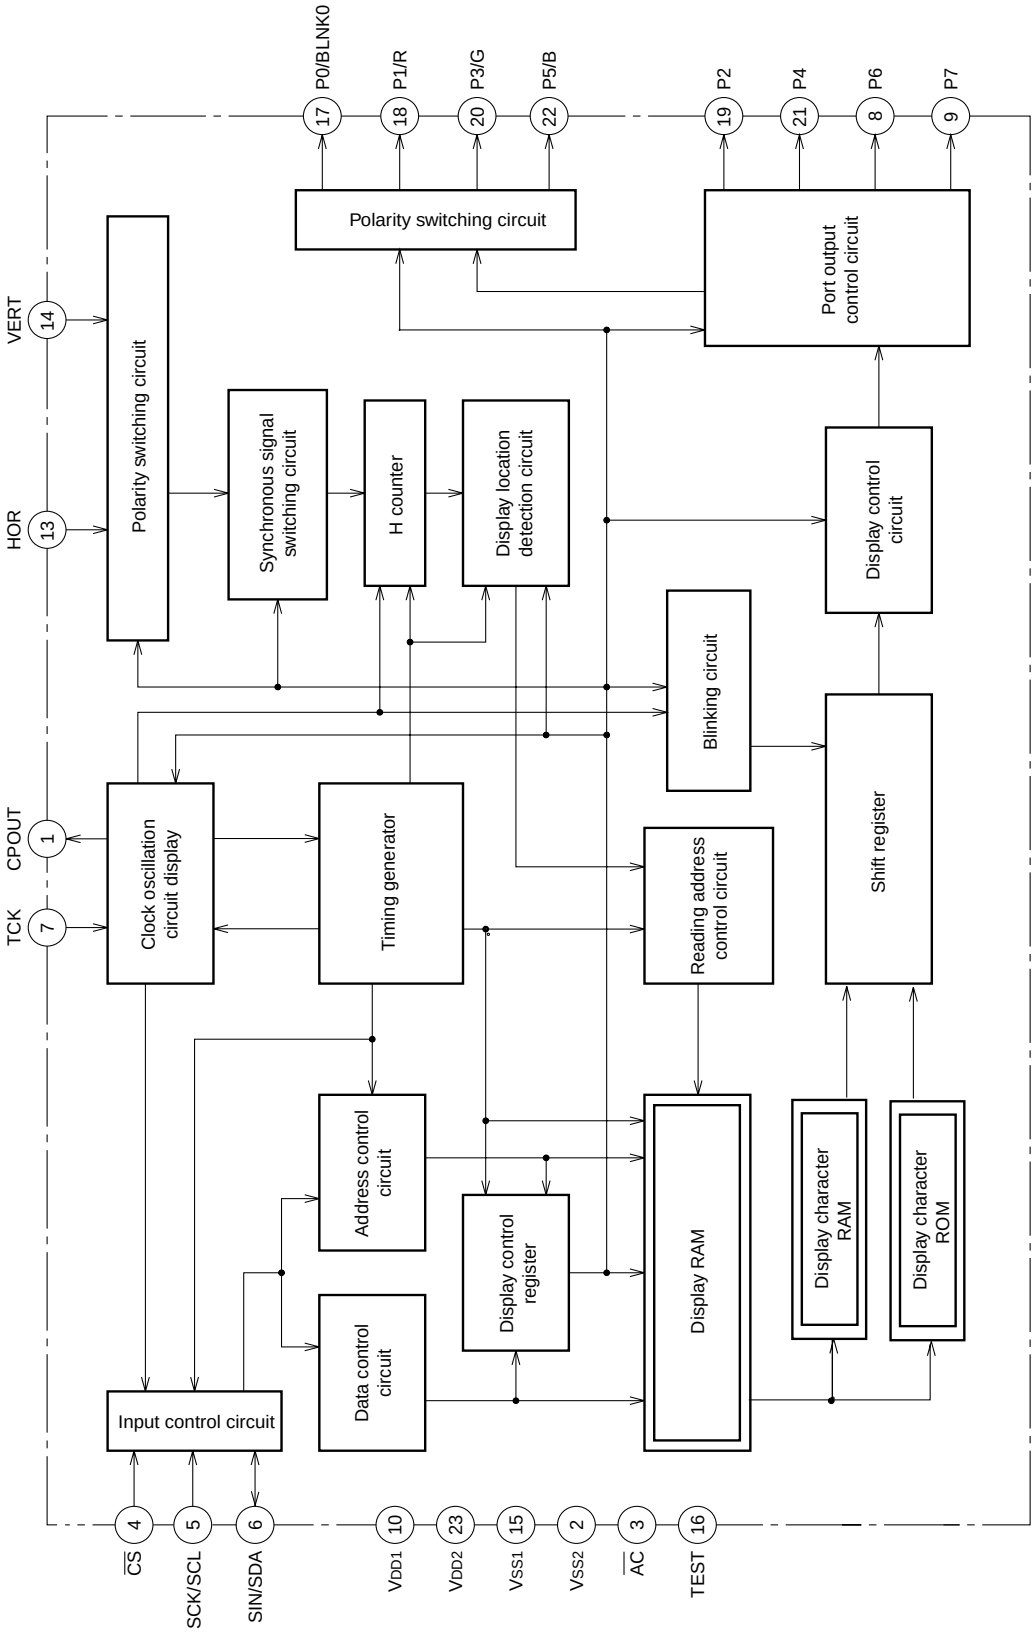
APPLICATION

CRT display, Liquid crystal display, Plasma display

PIN DESCRIPTION

Pin Number	Symbol	Pin name	Input/ Output	Function
1	CPOUT	Filter output	Output	Filter output. Connect loop filter to this pin.
2	V_{SS2}	Earthing pin	–	Please connect to GND using circuit earthing pin.
3	$\overline{AC}$	Auto-clear input	Input	When “L”, this pin resets the internal IC circuit. Hysteresis input. Built-in pull-up resistor.
4	$\overline{CS}$	Chip select input	Input	<at the 16-bit serial communication> Chip select pin. Set this pin to "L" level at serial data transfer. Hysteresis input. Built-in pull-up resistor.
				<at the I²C-BUS serial communication> Set this pin to “H” level.
5	SCK/SCL	Clock input	Input	<at the 16-bit serial communication> SIN pin serial data is taken in when SCK rises at $\overline{CS}$ pin "L" level. Hysteresis input.
				<at the I²C-BUS serial communication> SDA pin serial data is taken in synchronized with SCL.
6	SIN/SDA	Data input	Input	<at the 16-bit serial communication> This is the pin for serial input of display control register and display RAM data. Hysteresis input.
		Data I/O	I/O	<at the I²C-BUS serial communication> Hysteresis input. This is the pin for serial input of display control register and display RAM data. Also this pin output acknowledge signal.
7	TCK	External clock	Input	This is the pin for external clock input.
8	P6	Port P6 output	Output	This is the output port.
9	P7	Port P7 output	Output	This is the output port.
10	V_{DD1}	Power pin	–	Please connect to +5V with the power pin.
11	NC	–	–	This is NC pin. Please open this pin.
12	NC	–	–	This is NC pin. Please open this pin.
13	HOR	Horizontal synchro-nous signal input	Input	This pin inputs the horizontal synchronous signal. Hysteresis input.
14	VERT	Vertical synchro-nous signal input	Input	This pin inputs the vertical synchronous signal. Hysteresis input.
15	V_{SS1}	Earthing pin	–	Please connect to GND using circuit earthing pin.
16	BIN	Test pin	Input	Test pin. Connect to 0V.
17	P0/BLNK0	Port P0 output	Output	This pin can be toggled between port pin output and BLNK0 signal output.
18	P1/R	Port P1 output	Output	This pin can be toggled between port pin output and R signal output.
19	P2	Port P2 output	Output	This is the output port.
20	P3/G	Port P3 output	Output	This pin can be toggled between port pin output and G signal output.
21	P4	Port P4 output	Output	This is the output port.
22	P5/B	Port P5 output	Output	This pin can be toggled between port pin output and B signal output.
23	V_{DD2}	Power pin	–	Please connect to +5V with the power pin.
24	NC	–	–	This is NC pin. Please open this pin.

BLOCK DIAGRAM



MEMORY CONSTITUTION

Address 000_{16} to $11F_{16}$ are assigned to the display RAM, address 120_{16} to 129_{16} are assigned to the display control registers and address 200_{16} to $2F1_{16}$ are assigned to the RAM characters. The internal circuit is reset and all display control registers (address 120_{16} to 129_{16}) are set to "0" when the $\overline{AC}$ pin level is "L". And then, RAM is not erased and be undefinited. For detail, see "DATA INPUT EXAMPLE". Memory constitution is shown in Figure 1 to 9.

REGISTER SUPPLEMENTARY DESCRIPTION

(1) Setting external clock input and display frequency mode

Setting external clock input and display frequency mode (by use of EXCK0, EXCK1 (121_{16}), and DIV10 to DIV0 (120_{16}) as explained here following.

(a) When (EXCK1, EXCK0) = (0, 0) .....External clock mode 1

Fosc = 6.3 to 80 MHz (V_{DD} = 4.75 to 5.25 V)
Fosc = 6.3 to 40 MHz (V_{DD} = 2.50 to 3.50 V)
Input from the TCK pin a constant-period continuous external clock that synchronizes with the horizontal synchronous signal. And input from HOR pin a constant period continuous horizontal synchronous signal.
Never stop inputting the clock while displaying.
Do not have to set a display frequency because the clock just as it is entered from outside is used as the display clock.

(b) When (EXCK1, EXCK0) = (0, 1) .....Internal clock mode

Fosc = 20 to 110 MHz (V_{DD} = 4.75 to 5.25 V)
Clock input from the TCK pin is unnecessary. The multiply clock of the internally generated horizontal synchronous signal is used as the display clock.
The display frequency is set by setting the multiply value of the horizontal synchronous frequency (of the display frequency) in DIV10 to DIV0 (address 120_{16}). Also, set the display frequency range. (See the next page.)
Display frequency is calculated using the below expression.

Display frequency = Horizontal synchronous frequency x Multiply value

(c) When (EXCK1, EXCK0) = (1, 0) ..... Setting disabled

(d) When (EXCK1, EXCK0) = (1, 1) .....External clock mode 2

Fosc = 20 to 110 MHz (V_{DD} = 4.75 to 5.25 V)
Input from the TCK pin a constant-period continuous external clock that synchronizes with the horizontal synchronous signal. And input from HOR pin a constant-period continuous horizontal synchronous signal.
Never stop inputting the clock while displaying.
An internal clock which is in sync with the external input clock is used as the display clock.
Because the display frequency equals the external clock frequency, set N1 (division value) that satisfies the below expressions to DIV10 to DIV0 (address 120_{16}) for make the display frequency is equal to the external clock frequency.

N1 = external clock frequency / horizontal synchronous frequency

$$N1 = \sum_{n=0}^{10} 2^n DIV_n$$

Also, set the display frequency range. (See the next page.)

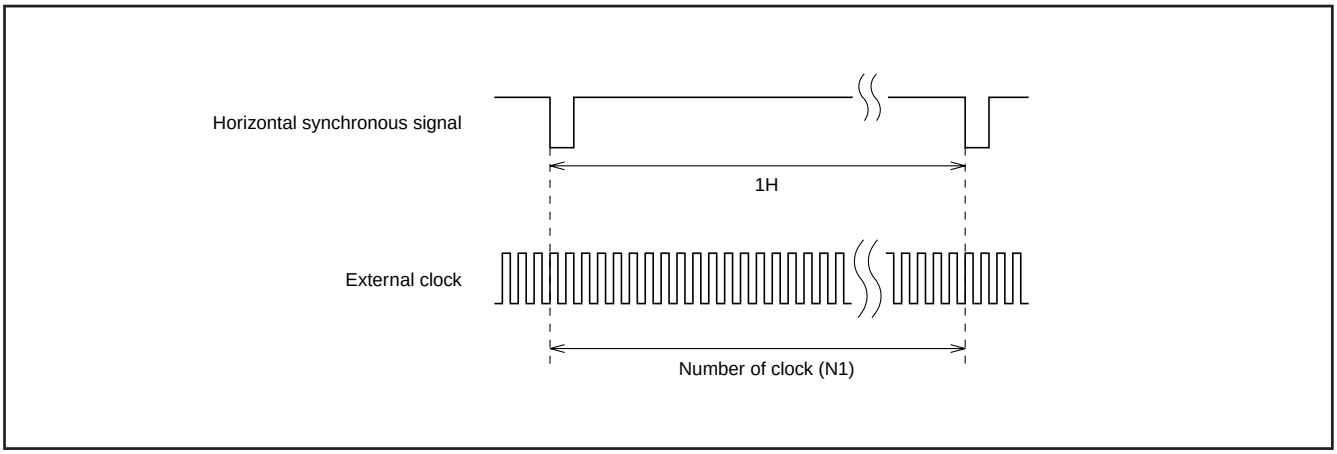

Fig. 12 Example of external clock input

(2) To set display frequency range

Whenever setting display frequency (when EXCK1 = "0", EXCK0 = "1", or EXCK1 = "1", EXCK0 = "1"), always set the display frequency range in accordance with the display frequency. This range is set from DIVS0, DIVS1, DIVS2, RSEL0 and RSEL1 (address 121_{16}). Frequency ranges are given here below.

RSEL1	RSEL0	DIVS2	DIVS1	DIVS0	Display frequency range MHz
1	1	0	0	0	100.0 to 110.0
1	0	0	0	0	–
0	1	0	0	0	92.0 to 100.0
0	0	0	0	0	73.0 to 92.0
1	1	0	0	1	66.5 to 73.0
1	0	0	0	1	–
0	1	0	0	1	61.0 to 66.5
0	0	0	0	1	49.0 to 61.0
1	1	0	1	0	–
1	0	0	1	0	–
0	1	0	1	0	45.5 to 49.0
0	0	0	1	0	36.5 to 45.5
1	1	0	1	1	33.5 to 36.5
1	0	0	1	1	–
0	1	0	1	1	30.5 to 33.5
0	0	0	1	1	24.5 to 30.5
1	1	1	0	0	–
1	0	1	0	0	–
0	1	1	0	0	23.0 to 24.5
0	0	1	0	0	20.0 to 23.0

(3) Notes on setting display frequency

To change external clock (display) frequency or horizontal synchronization frequency, always use the following procedures.

To set EXCK1 = "0", EXCK0 = "1"

(a) Turn the display OFF. … DSPON (address 129_{16}) = "0"
(b) Set the display frequency. … Set from DIV10 to DIV0(address 120_{16}) , DIVS0, DIVS1, DIVS2, RSEL0 and RSEL1 (address 121_{16}).
(c) Wait 20 ms while the horizontal synchronization signal is being input.
(d) Turn the display ON. … DSPON (address 129_{16}) = "1"

To set EXCK1 = "1", EXCK0 = "1"

(a) Turn the display OFF. … DSPON (address 129_{16}) = "0"
(b) Set the display frequency. … Set from DIV10 to DIV0(address 120_{16}) , DIVS0, DIVS1, DIVS2, RSEL0 and RSEL1 (address 121_{16}).
(c) Wait 20 ms while the horizontal synchronization signal and external clock are being input.
(d) Turn the display ON. … DSPON (address 129_{16}) = "1"

DISPLAY FORM 1

M35075-XXXFP has the following four display forms.

(1) ROM character blanking mode

Character size

: Blanking same as the character size.

Border size

: Blanking the background as a size from character.

Matrix-outline size

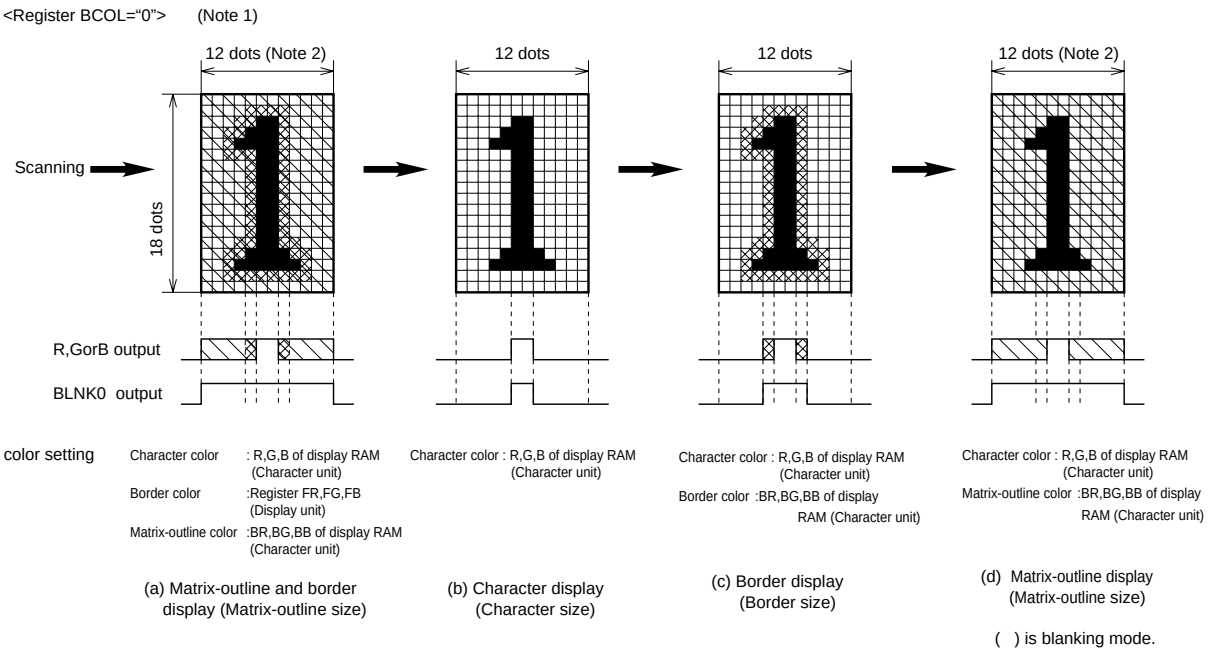
: Blanking the background 12 × 18 dot.

All blanking size

: When set register BCOL to "1", all raster area is blanking.

The display mode and blanking mode can be set line-by-line, as follows, from registers BCOL, BLK1, BLK0 (address 129_{16}), DSP0 to DSP11 (address 125_{16}).

BCOL	BLK1	BLK0	Line of DSPn = "0"		Line of DSPn = "1"	
			Display mode	Blanking mode	Display mode	Blanking mode
0	0	0	Matrix-outline border display	Matrix-outline size	Matrix-outline display	Matrix-outline size
	0	1	Character display	Character size	Border display	Border size
	1	0	Border display	Border size	Matrix-outline display	Matrix-outlinesize
	1	1	Matrix-outline display	Matrix-outline size	Character display	Character size
1	0	0	Matrix-outline border display	All blanking size	Matrix-outline display	All blanking size
	0	1	Character display		Border display	
	1	0	Border display		Matrix-outline display	
	1	1	Matrix-outline display		Character display	



Note 1. When register BCOL is set to "1", the raster range of the display modes set respectively by BLK1 and BLK0 are colored by registers RR, RG, and RB (address 128_{16}). And the blanking mode is set all blanking size (all raster size) regardless of the BLK1 and BLK0 settings.

Note 2. The horizontal size of the full matrix-outline size can be set to 14 dots by register BETA14 (address 128_{16}). BLNK0 can also be output at 14 dots.

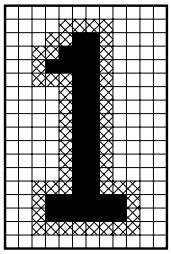
Fig. 13 Display form

(2) Shadow display

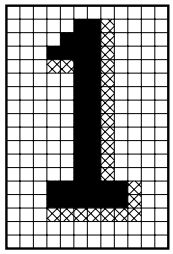
When border display mode, if set SYAD (address 129_{16}) = "0" to "1", it change to shadow display mode.

Border and shadow display are shown below.

Set shadow display color by BR, BG and BB of display RAM or by register FR, FG and FB.



Register SYAD(129_{16} address) = “0”
Border display



Register SYAD(129_{16} address) = “1”
Shadow display

Note : Border display is invalid in RAM characters.

Fig.14 Border and shadow display

DISPLAY FORM 2

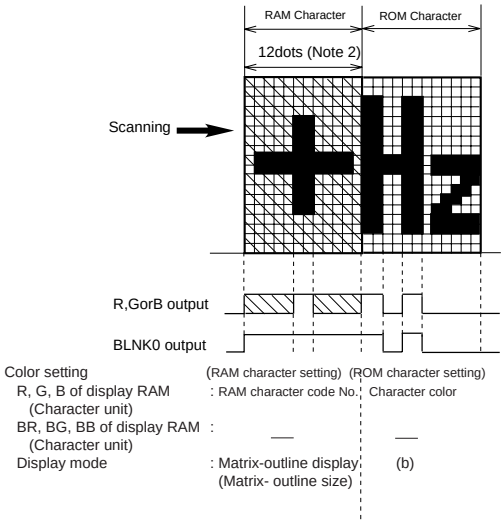
This IC can display both ROM character and RAM character at the same time. The display form is shown in Figure 15 and 16.

(1) RAM character blanking mode

BCOL	RBLK0	Display mode	Blanking mode
0	0	Matrix-outline display	Matrix-outline size
	1	Character display (Note1)	Character size (Note2)
1	0	Matrix-outline display	All blanking size
	1	Character display (Note1)	All blanking size

Note1: The part of the appointed color by BR, BG and BB of the display RAM changes that is not coloring.
Note2: The part of the appointed color by BR, BG and BB of the display RAM changes that the blanking is "OFF"

< Regiser BCOL = “0”, RBLK0 = “0”> (Note 1)



Color setting	(RAM character setting)	(ROM character setting)
R, G, B of display RAM (Character unit)	: RAM character code No.	Character color
BR, BG, BB of display RAM (Character unit)	: —— (Note 3)	Matrix-outline color
FR, FG, FB of register (Display unit)	: ——	Border color
Display mode	: Matrix-outline display (Matrix-outline size) (Note 3)	(a)

( ) is blanking mode.
Refer to DISPLAY FORM 1 about (a)-(d).

Note 1 : When register BCOL = "1", the raster range of the display modes set respectively by RBLK0 is colored by register RR, RG and RB (address 128_{16}) . And the blanking mode is set all blanking size (all raster size) independent of the RBLK0 settings.
Note 2 : The horizontal size of the full matrix-outline size can be set to 14 dots by register BETA14 (address 128_{16}). BLNK0 can also be output at 14 dots.
Note 3 : When display mode (setting by register BLK1, BLK0, DSPn) is Matrix-outline display or Matrix-outline border display, register RBLK0= "1" setting (coloring prohibition color setting) is invalid.

Note 1 : After clearing or setting all character RAM areas, and use the RAM characters.

Note 2 : The RAM character's dots are set RED, GREEN and BLUE data, which are controlled by BS, GS and RS bit. (Can be set at same time)

Fig.17 Setting of the data of RAM character

CHARACTER FONT

Images are composed on a 12 × 18 dot matrix, and characters can be linked vertically and horizontally with other characters to allow the display the continuous symbols.
Character code FF_{16} is fixed as a blank without background. Therefore, cannot register a character font in this code.

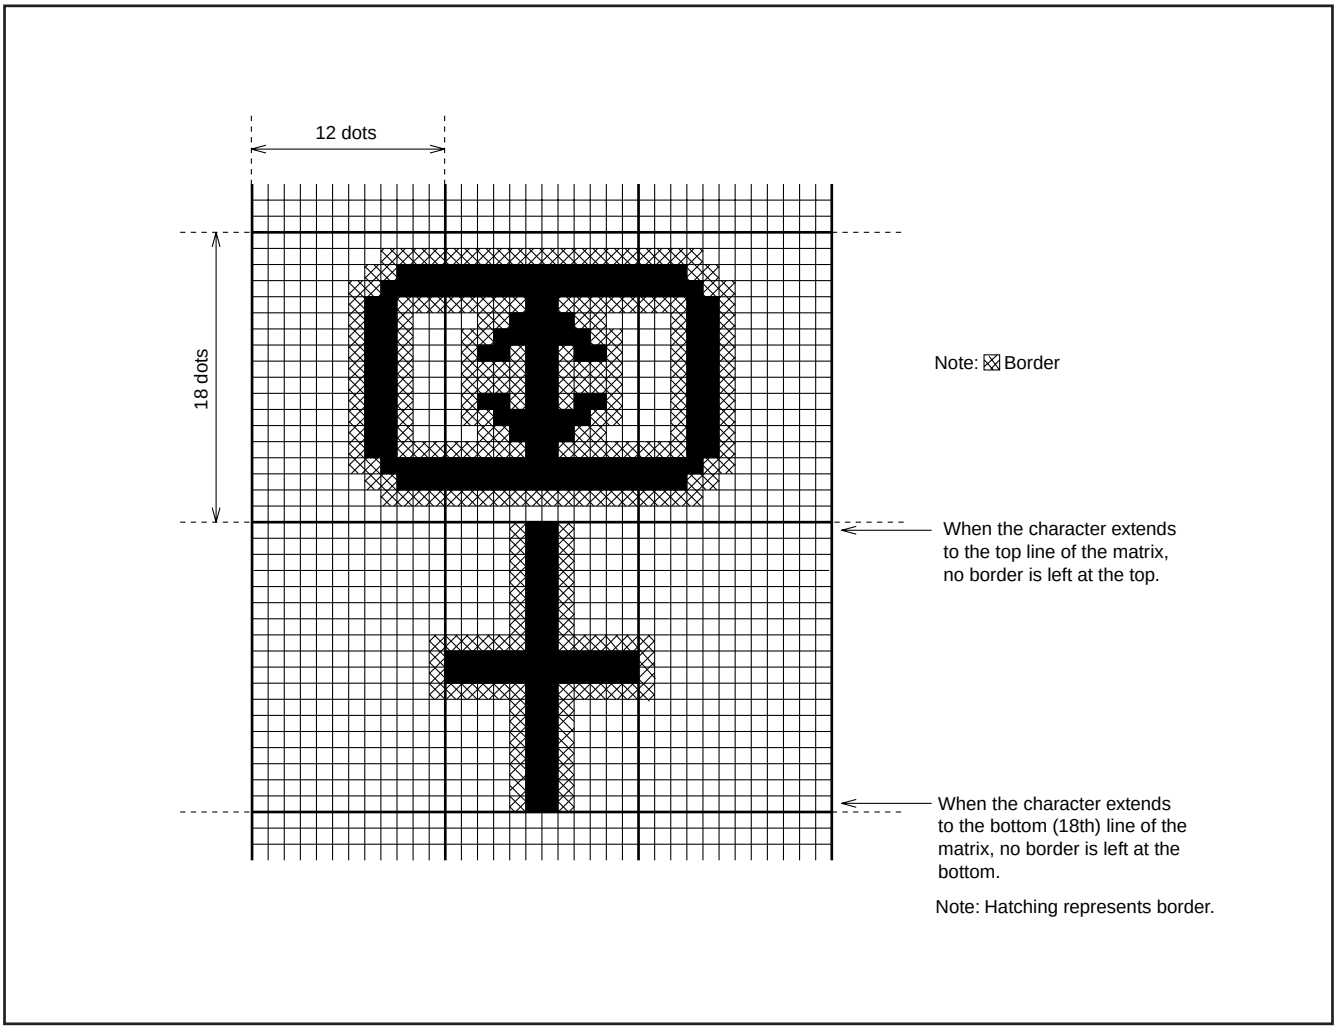

Fig.18 Example of border display

DATA INPUT EXAMPLE

Data of display RAM and display control registers can be set by the I²C-BUS serial input function. Example of data setting is shown in Figure 19 (at EXCK0 = "1", EXCK1 = "0" setting).

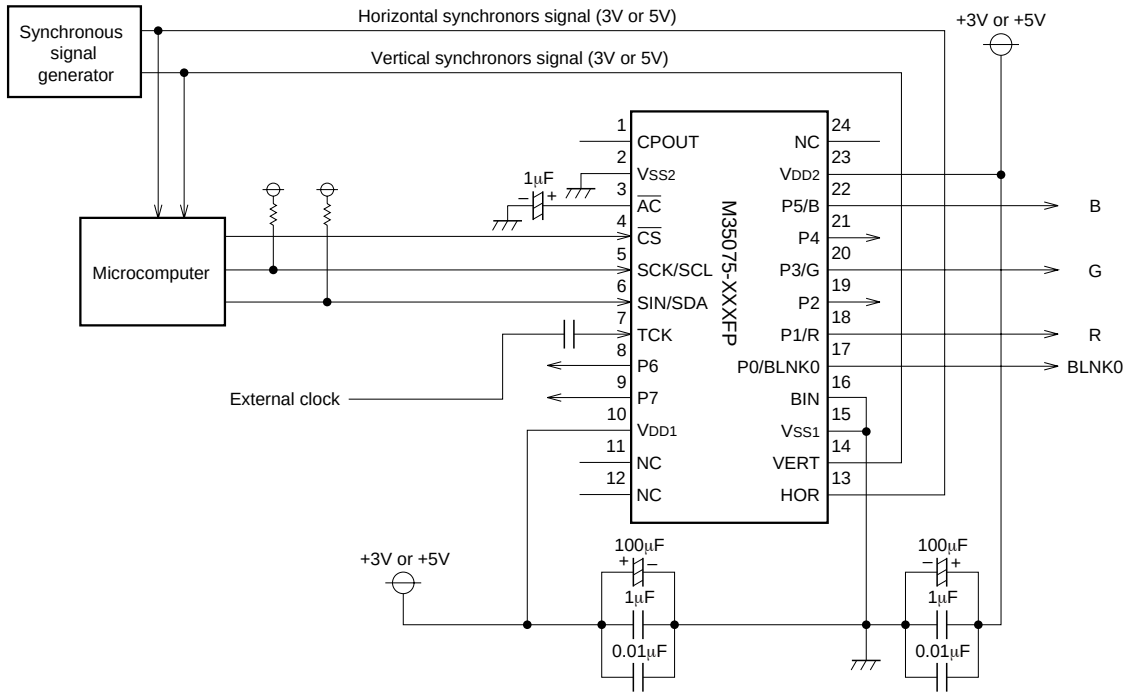
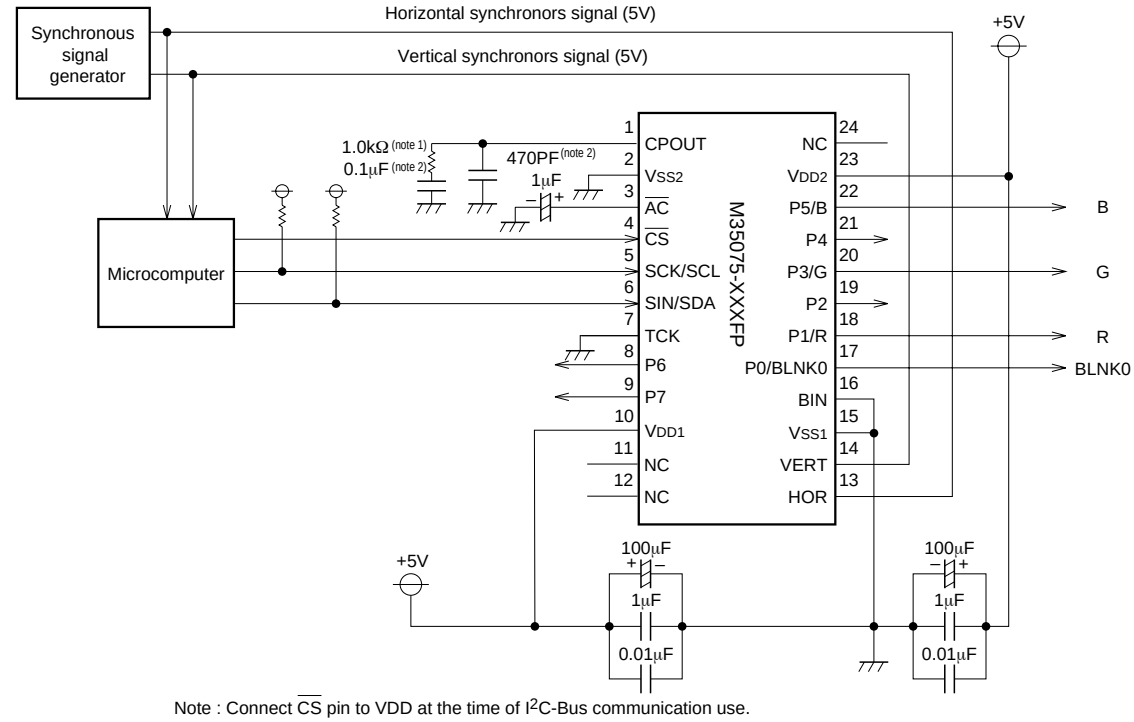
Notes 1 : Input a continuous clock of constant period from the TCK pin. Also, input a horizontal synchronous signal into the HOR pin and a vertical synchronous signal into the VERT pin.
2 : Matrix-outline display in this data.
3 : Secure the waiting time of 200ms after releasing $\overline{AC}$, and set data from setting the display frequency (setting of the register).
4 : Set data to Display RAM and Display character RAM at internal clock (display clock) is stabilized.

Fig. 19 Example of data setting



Notes 1: CPOUT pin can be opened when use only EXCK1= “0” and EXCK= “0.”
2: Connect $\overline{CS}$ pin to VDD at the time of I^2C-Bus communication use.

Fig.20 Example of the M35075-XXXFP peripheral circuit (Internal synchronous. At EXCK1 = "0", EXCK0 = "0")



Note : Connect $\overline{CS}$ pin to VDD at the time of I^2C-Bus communication use.

Note 1: Use this 1% precision element
Note 2: Use this 10% precision element

Fig.21 Example of the M35075-XXXFP peripheral circuit (External synchronous. At EXCK1 = "0", EXCK0 = "1")

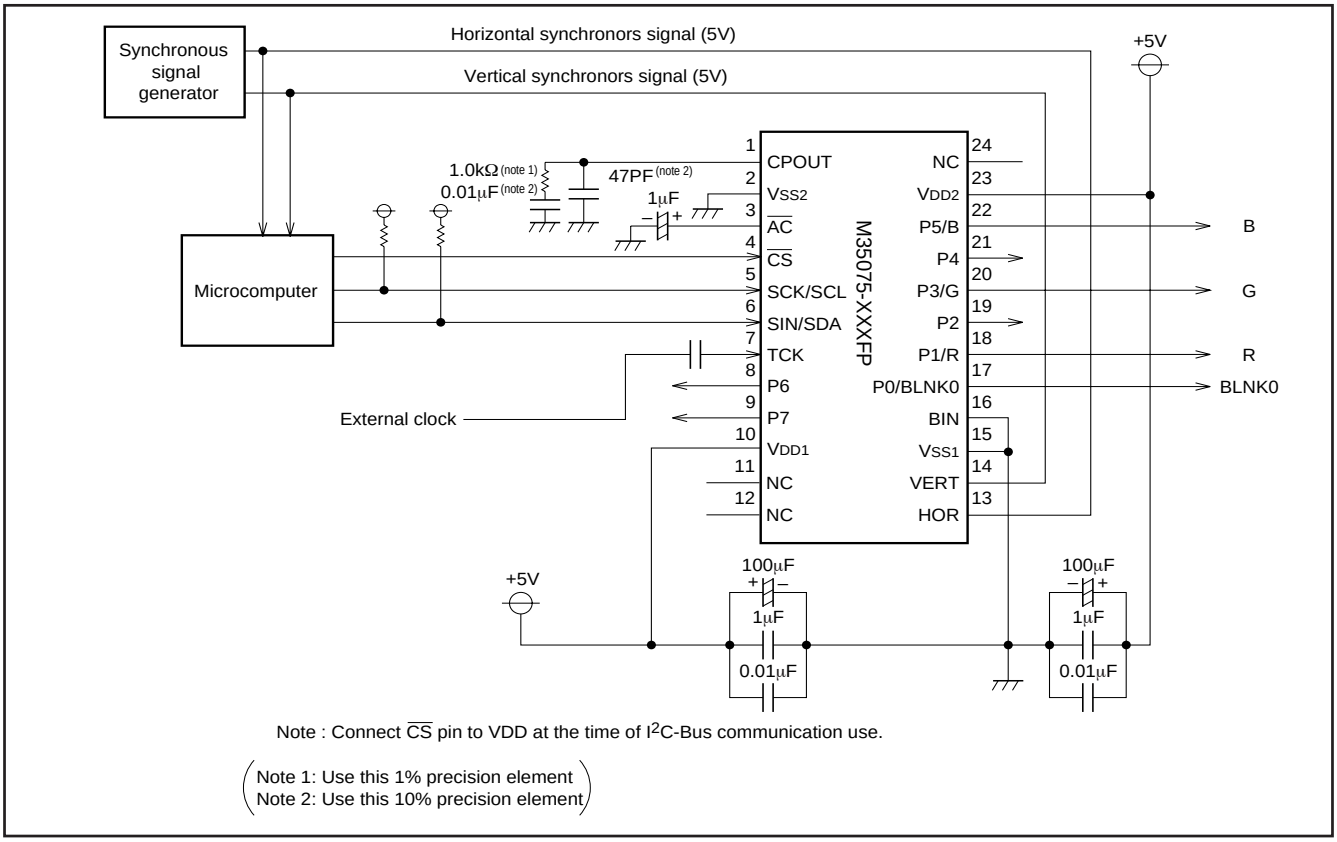


Fig.22 Example of the M35075-XXXFP peripheral circuit (External clock mode 2. At EXCK1 = "1", EXCK0 = "1")

DATA INPUT 1

(1) The16-bit communication function

(a)Serial data should be input with the LSB first.

(b)The address consists of 16 bits.

(c)The data consists of 16 bits.

(d)The 16 bits in the SCK after the $\overline{CS}$ signal has fallen are the address, and for succeeding input data, the address is incremented every 16 bits. Therefore, it is not necessary to in put the address from the second data.

Note. Stop the input to SCK pin and fix it to “H” at $\overline{CS}$ pin “H” level.

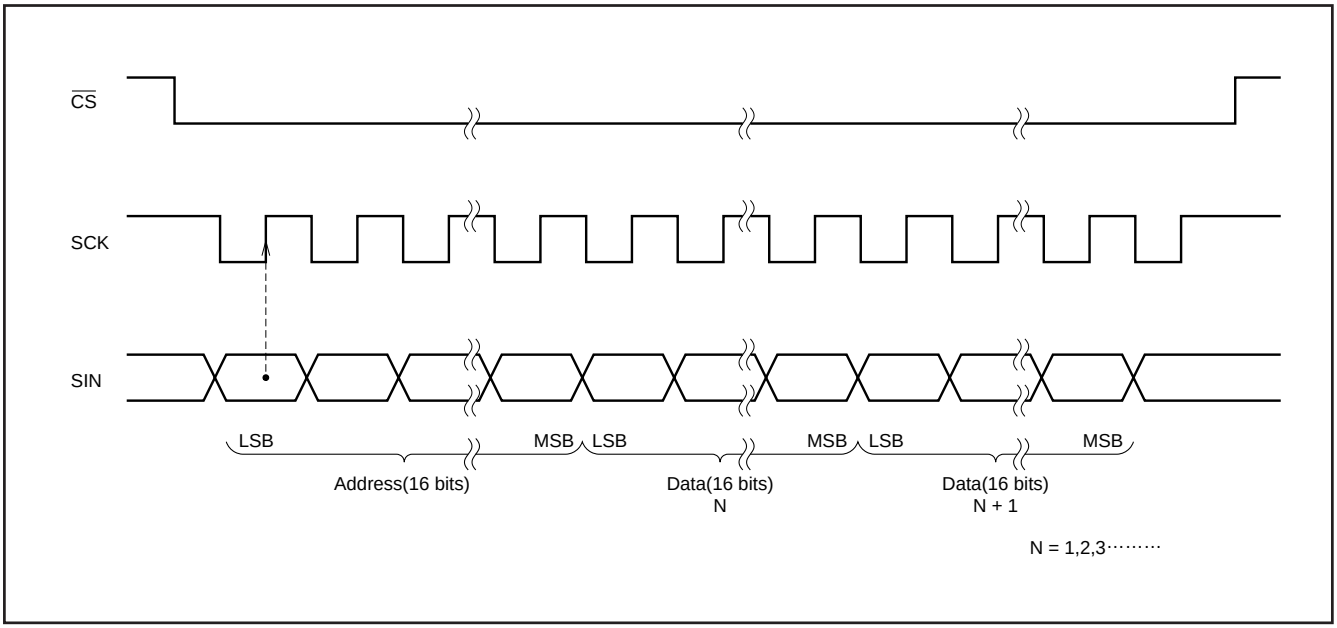

Fig.23 Serial input timing

(2)Timing requirements
Data input

Symbol	Parameter	Limits			Unit	Remarks
		Min.	Typ.	Max.		
$t_{w(SCK)}$	SCK width	200	—	—	ns	See Figure 24
$t_{su(\overline{CS})}$	$\overline{CS}$ setup time	200	—	—	ns	
$t_{h(\overline{CS})}$	$\overline{CS}$ hold time	2	—	—	µs	
$t_{su(SIN)}$	SIN setup time	200	—	—	ns	
$t_{h(SIN)}$	SIN hold time	200	—	—	ns	
t_{word}	1 word writing time	10	—	—	µs	

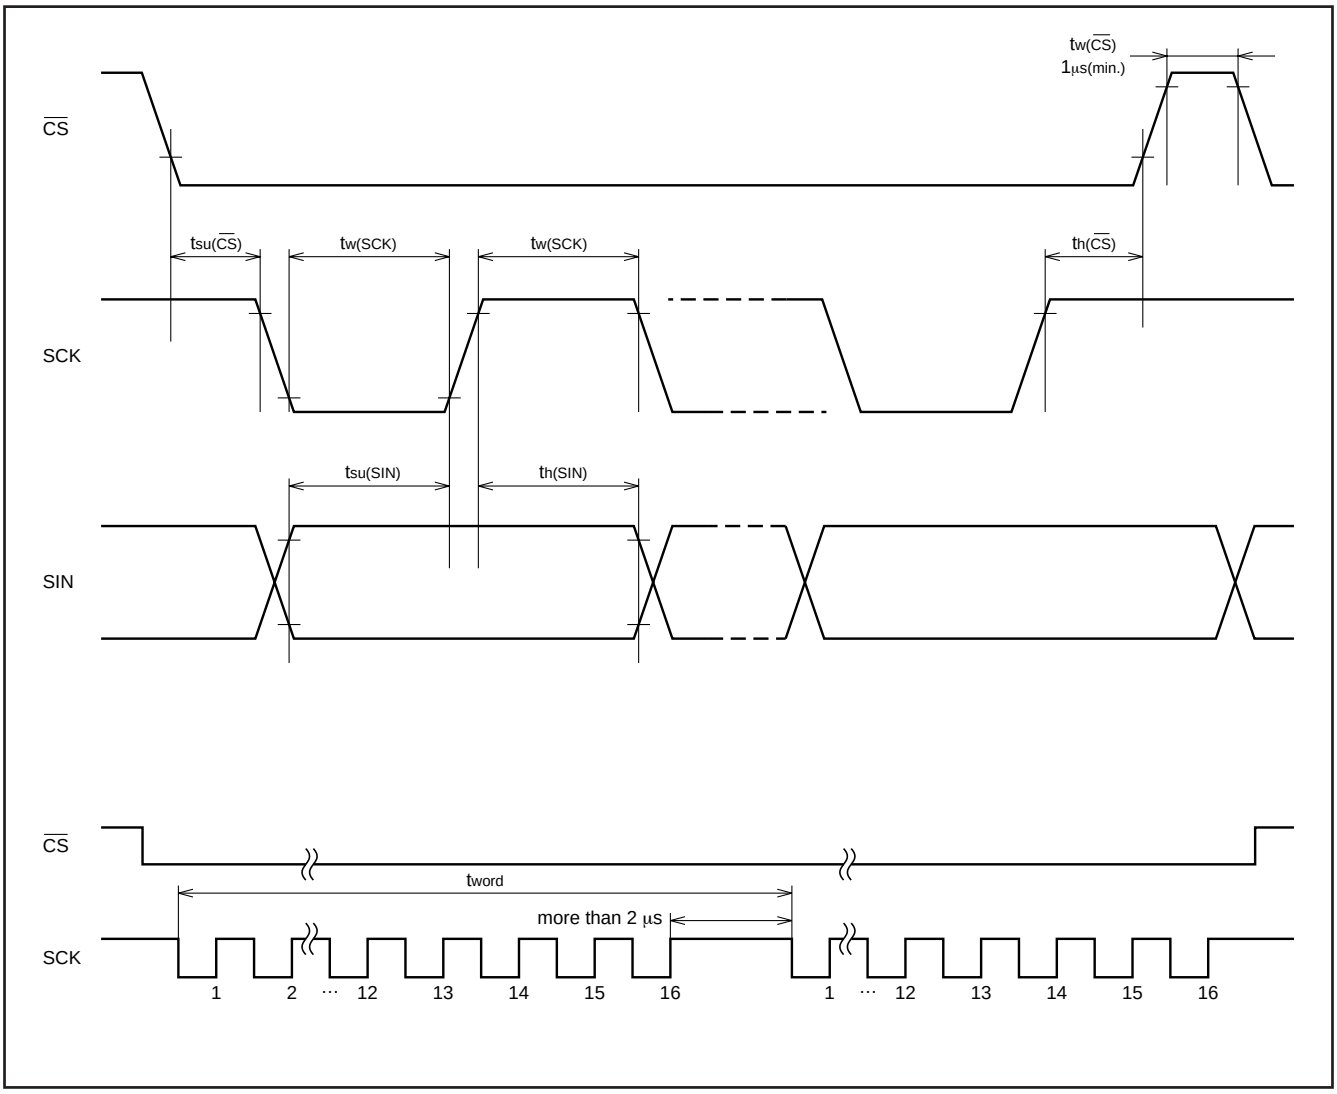

Fig. 24 Serial input timing requirements

DATA INPUT 2

(1) I²C-Bus communication function

This IC has a built-in data transmission interface which utilizes 2 unidirectional buses. In communications, this IC functions as a slave reception device.

Must connect $\overline{CS}$ pin to "H" at the time of I²C-Bus communication use.

The IC is synchronized with the serial clock (SCL) sent from the master device and receives the data (SDA).

Communications are controlled from the start/stop states.

Also, always in put the control byte after attaining the start state.

The below chart shows the start/stop state and control byte configuration.

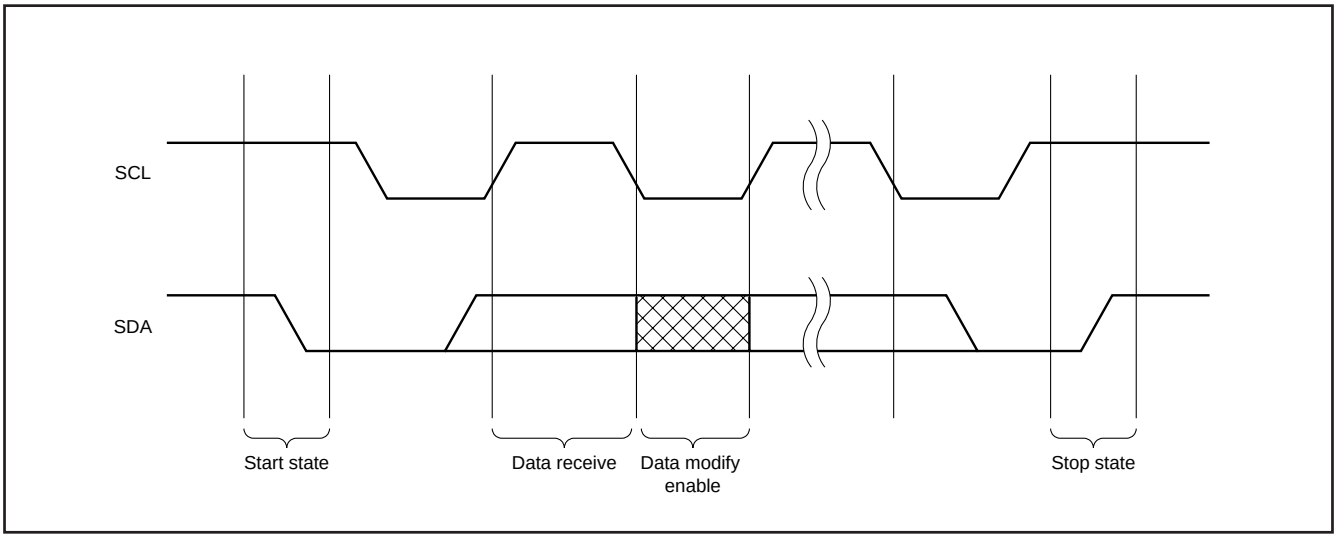

Fig.25 Start state / Stop state

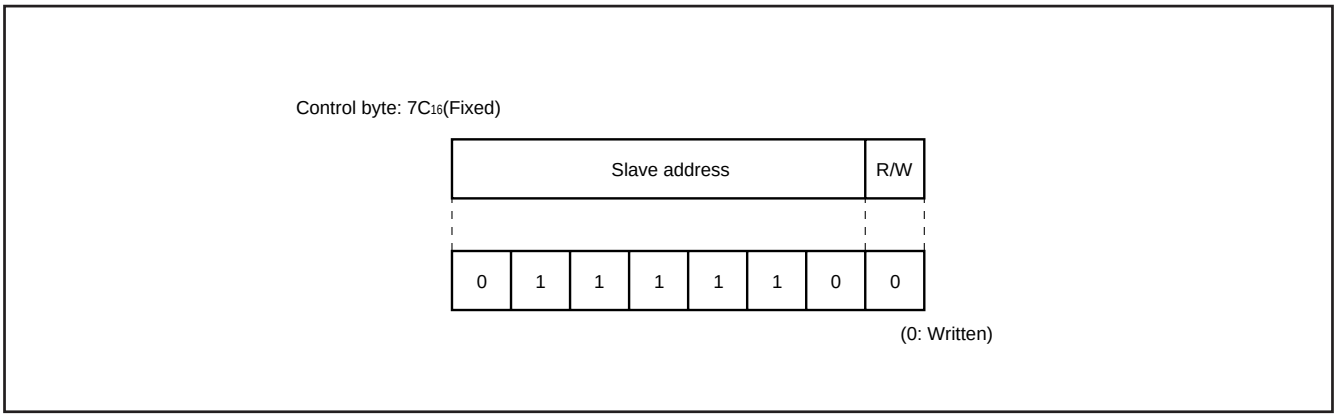

Fig.26 Control byte configuration

(2) Data input (Sequence)

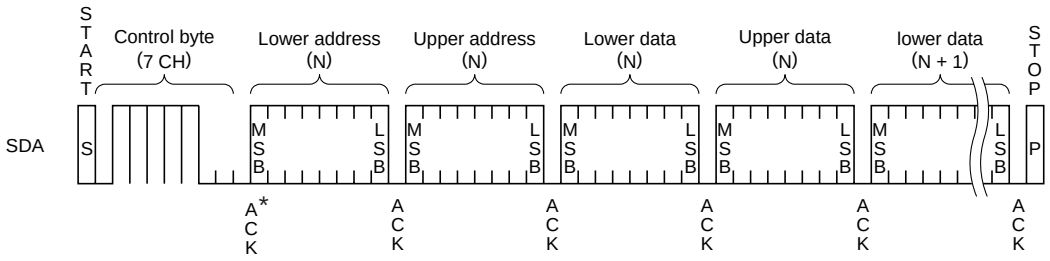
(a) Addresses are consists of 16 bits.

(b) Data is consists of 16 bits.

(c) Addresses and data are communicated in 8-bit units. Input the lower 8 bits before the upper 8 bits. Make input from the MSB side.

(d) After the start state has been attained and the control byte (7CH) received, the next 16 bits (2 bytes) are for inputting the address. Addresses are increased in increments for every 16 bits (2 bytes) of data input thereafter. As a result, it is not necessary to input the address from the second data.

Note:During external synchronous , do not stop the external clock input from the TCK pin while inputting data.



ACK* (Acknowledge) : Output the acknowledge signal whenever one byte input after the start state. Output the acknowledge signal and recieve the data thereafter when match the slave address (7CH).

Fig.27 Data input sequence

(2) Timing requirements
Data input

Symbol	Parameter	Limits				Unit	Remarks
		Typ. mode		High-speed mode			
		Min.	Max.	Min.	Max.

			Min.	Typ.	Max.	
V_{DD}	Supply voltage	Ta = –20 to +85°C	2.50	3.00	3.50	V
I_{DD}	Supply current	V_{DD} = 3.00V	—	20	30	mA
V_{OH}	"H" level output voltage P0 to P7 (Note1)	V_{DD} = 2.70V, I_{OH} = -0.1mA	2.30	—	—	V
V_{OL}	"L" level output voltage P0 to P7 (Note2)	V_{DD} = 2.70V, I_{OH} = 0.1mA	—	—	0.4	V
R_I	Pull-up resistance $\overline{AC}$, $\overline{CS}$	V_{DD} = 3.00V	30	—	150	kΩ
V_{TCK}	External clock input width	2.50V ≤ V_{DD} ≤ 3.50V	0.9V_{DD}	—	V_{DD}	V

Notes 1. The current from the IC must not exceed – 0.1 mA/port at any of the port pins (P0 to P7).
2. The current flowing into the IC must not exceed 0.1 mA/port at any of port pins (P0 to P7).

NOTE FOR SUPPLYING POWER

(1)Timing of power supplying to $\overline{AC}$ pin

The internal circuit of M35075-XXXFP is reset when the level of the auto clear input pin $\overline{AC}$ is "L". This pin in hysteresis input with the pull-up resistor.

The timing about power supplying of $\overline{AC}$ pin is shown in Figure 29.

After supplying the power (V_{DD} and V_{SS}) to M35075-XXXFP and the supply voltage becomes more than 0.8 × V_{DD}, it needs to keep V_{IL} time; tw of the $\overline{AC}$ pin for more than 1ms.

Start inputting from microcomputer after $\overline{AC}$ pin supply voltage becomes more than 0.8 × V_{DD} and keeping 200ms wait time.

(2)Timing of power supplying to V_{DD1} and V_{DD2}.

Supply power to V_{DD1} and V_{DD2} at the same time.

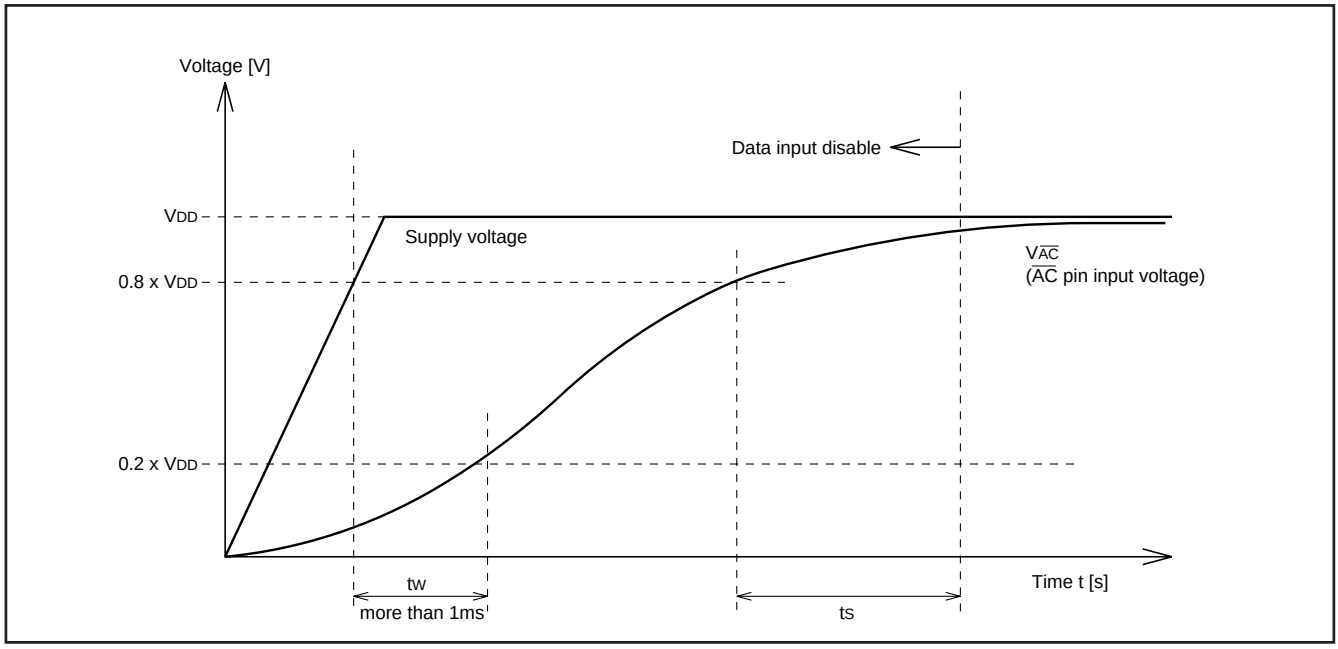

Fig.29 Timing of power supplying to $\overline{AC}$ pin

PRECAUTION FOR USE

Notes on noise and latch-up

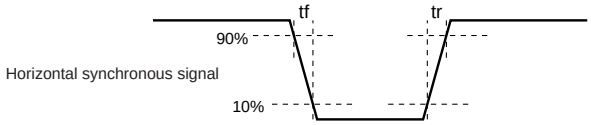
In order to avoid noise and latch-up, connect a bypass capacitor (≈0.1µF) directly between the V_{DD1} pin and V_{SS1} pin, and the V_{DD2} pin and V_{SS2} pin using a heavy wire.

Note for waveform timing of the horizontal signals to the HOR pin

Set horizontal synchronous signal edge* waveform timing to under 5ns and input to HOR pin.

Set only the side which set by B/$\overline{F}$ register waveform timing under 5ns and input to HOR pin.

*: Set front porch edge or back porch edge by B/$\overline{F}$ register.



DATA REQUIRED FOR MASK ROM ORDERING

Please send the following data for mask orders.

(1) M35075-XXXFP mask ROM order confirmation form

(2) 24P2Q mark specification form

(3) ROM data : EPROMs or floppy disks

*In the case of EPROMs, thres sets of EPROMs are required per pattern.

*In the case of floppy disks, 3.5-inch 2HD disk (1BM format) is required per pattern.

STANDARD ROM TYPE : M35075-001FP

M35075-001FP is a standard ROM type of M35075-XXXFP.
The character patterns are fixed to the contents of Figure 30 to 33.

REVISION HISTORY	M35075-XXXFP

Rev.	Date	Description	
		Page	Summary
1.00	Mar 01, 2002	-	First edition issued
1.10	Feb 13, 2006	P36	"RECOMMENDED OPERATING CONDITIONS" and "ELECTRICAL CHARACTERISTICS 1" are changed.
		P37	"ELECTRICAL CHARACTERISTICS 2" is changed.
