

## LM137, LM337-N 3-Terminal Adjustable Negative Regulators

### 1 Features

- 1.5-A Output Current
- Line Regulation 0.01%/V (Typical)
- Load Regulation 0.3% (Typical)
- 77-dB Ripple Rejection
- 50 ppm/°C Temperature Coefficient
- Thermal Overload Protection
- Internal Short-Circuit Current Limiting Protections

### 2 Applications

- Industrial Power Supplies
- Factory Automation Systems
- Building Automation Systems
- PLC Systems
- Instrumentation
- IGBT Drive Negative Gate Supplies
- Networking
- Set-Top Boxes

### 3 Description

The LM137 and LM337-N are adjustable 3-terminal negative voltage regulators capable of supplying –1.5 A or more currents over an output voltage range of –1.25 V to –37 V. It requires only two external resistors to set the output voltage and one output capacitor for frequency compensation. The circuit design has been optimized for excellent regulation and low thermal transients. Further, the LM137 and LM337-N feature internal current limiting, thermal shutdown and safe-area compensation, making it virtually blowout-proof against overloads.

The LM137 and LM337-N are ideal complements to the LM117 and LM317 adjustable positive regulators. The LM137 has a wider operating temperature range than the LM337-N and is also offered in military and space qualified versions.

#### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE     | BODY SIZE (NOM)      |
|-------------|-------------|----------------------|
| LM137       | TO (3)      | 8.255 mm × 8.255 mm  |
| LM337-N     | SOT-223 (4) | 3.50 mm × 6.50 mm    |
|             | TO (3)      | 8.255 mm × 8.255 mm  |
|             | TO-220 (3)  | 10.16 mm × 14.986 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet. The LF01 is a lead formed (bent) version of the TO-220 package.

#### Adjustable Negative Voltage Regulator

Full output current not available at high input-output voltages

$$-V_{OUT} = -1.25V \left( 1 + \frac{R2}{120} \right) + (-I_{ADJ} \times R2)$$

†C1 = 1-μF solid tantalum or 10-μF aluminum electrolytic required for stability

\*C2 = 1-μF solid tantalum is required only if regulator is more than 4" from power-supply filter capacitor

Output capacitors in the range of 1-μF to 1000-μF of aluminum or tantalum electrolytic are commonly used to provide improved output impedance and rejection of transients

## 6 Specifications

### 6.1 Absolute Maximum Ratings

|                                       |         | MIN                | MAX | UNIT |
|---------------------------------------|---------|--------------------|-----|------|
| Power dissipation                     |         | Internally Limited |     |      |
| Input-output voltage differential     |         | −0.3               | 40  | V    |
| Operating junction temperature        | LM137   | −55                | 150 | °C   |
|                                       | LM337-N | 0                  | 125 |      |
|                                       | LM337I  | −40                | 125 |      |
| Storage temperature, T <sub>stg</sub> |         | −65                | 150 | °C   |

### 6.2 ESD Ratings

|                    |                         |                                                                   | VALUE | UNIT |
|--------------------|-------------------------|-------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup> | ±2000 | V    |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                |         | MIN | MAX | UNIT |
|--------------------------------|---------|-----|-----|------|
| Operating junction temperature | LM137   | −55 | 150 | °C   |
|                                | LM337-N | 0   | 125 |      |
|                                | LM337I  | −40 | 125 |      |

### 6.4 Thermal Information

| R <sub>θJC(bot)</sub>         | Junction-to-case (bottom) thermal resistance | —                  | —                  | —                | 1                      | °C/W |

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).  
(2) No heat sink.

## 6.5 Electrical Characteristics

Unless otherwise specified, these specifications apply  $-55^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$  for the LM137,  $0^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$  for the LM337-N;  $V_{\text{IN}} - V_{\text{OUT}} = 5\text{ V}$ ; and  $I_{\text{OUT}} = 0.1\text{ A}$  for the TO package and  $I_{\text{OUT}} = 0.5\text{ A}$  for the SOT-223 and TO-220 packages. Although power dissipation is internally limited, these specifications are applicable for power dissipations of 2 W for the TO and SOT-223, and 20 W for the TO-220.  $I_{\text{MAX}}$  is 1.5 A for the SOT-223 and TO-220 packages, and 0.2 A for the TO package.

| PARAMETER                               | TEST CONDITIONS                                                                                                                                                          |                                                         | LM137  |        |        | LM337-N |        |        | UNIT          |

## 7 Detailed Description

### 7.1 Overview

In operation, the LM137 and LM337-N develops a nominal  $-1.25\text{-V}$  reference voltage between the output and adjustment terminal. The reference voltage is impressed across program resistor R1 (120  $\Omega$  for example) and, because the voltage is constant, a constant current then flows through the output set resistor R2, giving an output voltage calculated by [Equation 1](#).

$$-V_{OUT} = -1.25V \left( 1 + \frac{R2}{120} \right) + (-I_{ADJ} \times R2) \quad (1)$$

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Thermal Regulation

When power is dissipated in an IC, a temperature gradient occurs across the IC chip affecting the individual IC circuit components. With an IC regulator, this gradient can be especially severe because power dissipation is large. Thermal regulation is the effect of these temperature gradients on output voltage (in percentage output change) per Watt of power change in a specified time. Thermal regulation error is independent of electrical regulation or temperature coefficient, and occurs within 5 ms to 50 ms after a change in power dissipation. Thermal regulation depends on IC layout as well as electrical design. The thermal regulation of a voltage regulator is defined as the percentage change of  $V_{OUT}$ , per Watt, within the first 10 ms after a step of power is applied. The LM137 device's specification is 0.02%/W, maximum.

## Feature Description (continued)

LM137  
 $V_{OUT} = -10\text{ V}$   
 $V_{IN} - V_{OUT} = -40\text{ V}$   
 $I_{IL} = 0\text{ A} \rightarrow 0.25\text{ A} \rightarrow 0\text{ A}$   
 Vertical sensitivity, 5 mV/div

**Figure 13. Output Drift (10W Pulse for 10ms)**

In [Figure 13](#), a typical LM137 device's output drifts only 3 mV (or 0.03% of  $V_{OUT} = -10\text{ V}$ ) when a 10-W pulse is applied for 10 ms. This performance is thus well inside the specification limit of  $0.02\%/W \times 10\text{ W} = 0.2\%$  maximum. When the 10-W pulse is ended, the thermal regulation again shows a 3-mV step at the LM137 chip cools off.

### NOTE

The load regulation error of about 8 mV (0.08%) is additional to the thermal regulation error.

In [Figure 14](#), when the 10-W pulse is applied for 100 ms, the output drifts only slightly beyond the drift in the first 10 ms, and the thermal error stays well within 0.1% (10 mV).

## Feature Description (continued)

LM137  
 $V_{OUT} = -10\text{ V}$   
 $V_{IN} - V_{OUT} = -40\text{ V}$   
 $I_L = 0\text{ A} \rightarrow 0.25\text{ A} \rightarrow 0\text{ A}$   
 Horizontal sensitivity, 20 ms/div

**Figure 14. Output Drift (10-W Pulse for 100 ms)**

## 7.4 Device Functional Modes

### 7.4.1 Protection Diodes

When external capacitors are used with any IC regulator, it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator. Most 10- $\mu\text{F}$  capacitors have low enough internal series resistance to deliver 20-A spikes when shorted. Although the surge is short, there is enough energy to damage parts of the IC.

When an output capacitor is connected to a negative output regulator and the input is shorted, the output capacitor pulls current out of the output of the regulator. The current depends on the value of the capacitor, the output voltage of the regulator, and the rate at which  $V_{IN}$  is shorted to ground.

The bypass capacitor on the adjustment terminal can discharge through a low current junction. Discharge occurs when either the input, or the output, is shorted. [Figure 15](#) shows the placement of the protection diodes.

## Device Functional Modes (continued)

\*When  $C_L$  is larger than  $20\mu F$ ,  $D1$  protects the LM137 in case the input supply is shorted

\*\*When  $C2$  is larger than  $10\mu F$  and  $-V_{OUT}$  is larger than  $-25V$ ,  $D2$  protects the LM137 in case the output is shorted

**Figure 15. Regulator With Protection Diodes**

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM137 and LM337-N are versatile, high performance, negative output linear regulators with high accuracy and a wide temperature range. An output capacitor can be added to further improve transient response, and the ADJ pin can be bypassed to achieve very high ripple-rejection ratios. The device's functionality can be utilized in many different applications that require negative voltage supplies, such as bipolar amplifiers, operational amplifiers, and constant current regulators.

### 8.2 Typical Applications

#### 8.2.1 Adjustable Negative Voltage Regulator

The LM137 and LM337-N can be used as a simple, negative output regulator to enable a variety of output voltages needed for demanding applications. By using an adjustable R2 resistor, a variety of negative output voltages can be made possible as shown in [Figure 16](#).

Full output current not available at high input-output voltages

†C1 = 1-μF solid tantalum or 10-μF aluminum electrolytic required for stability

\*C2 = 1-μF solid tantalum is required only if regulator is more than 4 inches from power-supply filter capacitor

Output capacitors in the range of 1 μF to 1000 μF of aluminum or tantalum electrolytic are commonly used to provide improved output impedance and rejection of transients

**Figure 16. Adjustable Negative Voltage Regulator**

$$-V_{OUT} = -1.25V \left( 1 + \frac{R2}{120} \right) + (-I_{ADJ} \times R2) \quad (2)$$

#### 8.2.1.1 Design Requirements

The device component count is very minimal, employing two resistors as part of a voltage divider circuit and an output capacitor for load regulation. An input capacitor is needed if the device is more than 4 inches from the filter capacitors.

#### 8.2.1.2 Detailed Design Procedure

The output voltage is set based on the selection of the two resistors, R1 and R2, as shown in [Figure 16](#).

## Typical Applications (continued)

### 8.2.1.3 Application Curve

As shown in Figure 17, the maximum output current capability is limited by the input-output voltage differential, package type, and junction temperature.

**Figure 17. Current Limit**

### 8.2.2 Adjustable Lab Voltage Regulator

The LM337-N can be combined with a positive regulator such as the LM317-N to provide both a positive and negative voltage rail. This can be useful in applications that use bi-directional amplifiers and dual-supply operational amplifiers.

Full output current not available at high input-output voltages

\*The 10 μF capacitors are optional to improve ripple rejection

## Typical Applications (continued)

### 8.2.3 Current Regulator

A simple, fixed current regulator can be made by placing a resistor between the  $V_{OUT}$  and ADJ pins of the LM137. By regulating a constant 1.25 V between these two terminals, a constant current can be delivered.

$$I_{OUT} = \frac{1.250V}{R1}$$

(3)

$$*0.8\ \Omega \leq R1 \leq 120\ \Omega$$

(4)

### 8.2.4 -5.2-V Regulator with Electronic Shutdown

The LM337-N can be used with a PNP transistor to provide shutdown control from a TTL control signal. The PNP can short or open the ADJ pin to GND. When ADJ is shorted to GND by the PNP, the output is -1.3V. When ADJ is disconnected from GND by the PNP, then the LM337-N outputs the programmed output of -5.2 V.

Minimum output  $\approx -1.3$  V when control input is low

## Typical Applications (continued)

### 8.2.5 High Stability –10-V Regulator

Using a high stability shunt voltage reference in the feedback path, such as the LM329, provides damping necessary for a stable, low noise output.

## 9 Power Supply Recommendations

The input supply to the LM137 and LM337-N must be kept at a voltage level such that its maximum input to output differential voltage rating is not exceeded. The minimum dropout voltage must also be met with extra headroom when possible to keep the LM137 and LM337-N in regulation. TI recommends an input capacitor, especially when the input pin is placed more than 4 inches away from the power-supply filter capacitor.

## 10 Layout

### 10.1 Layout Guidelines

Some layout guidelines must be followed to ensure proper regulation of the output voltage with minimum noise. Traces carrying the load current must be wide to reduce the amount of parasitic trace inductance and the feedback loop from  $V_{OUT}$  to ADJ must be kept as short as possible. To improve PSRR, a bypass capacitor can be placed at the ADJ pin and must be placed as close as possible to the IC. In cases when  $V_{IN}$  shorts to ground, an external diode must be placed from  $V_{IN}$  to  $V_{OUT}$  to divert the surge current into the output capacitor and protect the IC. Similarly, in cases when a large bypass capacitor is placed at the ADJ pin and  $V_{OUT}$  shorts to ground, an external diode must be placed from  $V_{OUT}$  to ADJ to provide a path for the bypass capacitor to discharge. These diodes must be placed close to the corresponding IC pins to increase their effectiveness.

### 10.2 Layout Example

Figure 18. Layout Example (SOT-223)

## 10.3 Thermal Considerations

### 10.3.1 Heatsinking SOT-223 Package Parts

The SOT-223 DCY packages use a copper plane on the PCB and the PCB itself as a heatsink. To optimize the heat sinking ability of the plane and PCB, solder the tab of the package to the plane.

Figure 19 and Figure 20 show the information for the SOT-223 package. Figure 20 assumes a  $\theta_{(J-A)}$  of 75°C/W for 1 ounce copper and 51°C/W for 2 ounce copper and a maximum junction temperature of 125°C.

Figure 19.  $\theta_{(J-A)}$  vs Copper (2 ounce) Area for the SOT-223 Package

Figure 20. Maximum Power Dissipation vs  $T_{AMB}$  for the SOT-223 Package

See AN-1028, [SNVA036](#), for power enhancement techniques to be used with the SOT-223 package.

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

DCY (R-PDSO-G4)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil recommendations. Refer to IPC 7525 for stencil design considerations.

## NOTES:

1. All controlling linear dimensions are in inches. Dimensions in brackets are in millimeters. Any dimension in brackets or parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

**TO-220 - 4.69 mm max height**

This mechanical drawing illustrates the dimensions for a 10-pin D-subminiature connector. The drawing includes the following specifications:

- Pin Dimensions:**
  - 3X (.110) [2.8] (Pin 1, 2, 3)
  - 3X (.039) [1] (Pin 4, 5, 6)
  - 2X (.100) [2.54] (Pin 7, 8)
  - 6X (.050) [1.27] (Pin 9, 10)
  - 2X (.054) [1.37] (Pin 11, 12)
- Overall Dimensions:**
  - Overall Width: (.479) [12.16]
  - Overall Height: (.400) [10.16]
  - Pin Pitch: (.050) [1.27]
  - Pin Spacing: (.059) [1.49]
  - Pin Diameter: (.002) [0.05]
- Other Features:**
  - PKG (Package)
  - PKG SYMM (Package Symmetry)
  - (Ø.008) TYP VIA [0.2] (Typical Via Diameter)
  - (.229) [5.81] (Pin 1 to Pin 2)
  - (.177) [4.5] (Pin 2 to Pin 3)
  - 4X (.047) [1.2] (Pin 4 to Pin 5)
  - 8X (.046) [1.18] (Pin 6 to Pin 7)
  - (.328) [8.32] (Pin 8 to Pin 9)
  - (.305) [7.74] (Pin 10 to Pin 11)

EXPOSED METAL

SOLDER MASK OPENING

NON SOLDER MASK DEFINED

Diagram illustrating the Solder Mask Defined process. The diagram shows a rectangular opening in the solder mask, labeled "SOLDER MASK OPENING". The area within the opening is labeled "EXPOSED METAL". The surrounding area is labeled "METAL UNDER SOLDER MASK". The thickness of the solder mask is indicated as ".003 MIN [0.07] ALL AROUND". The overall process is labeled "SOLDER MASK DEFINED".

3. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 ([www.ti.com/lit/slm002](http://www.ti.com/lit/slm002)) and SLMA004 ([www.ti.com/lit/slma004](http://www.ti.com/lit/slma004)).

4. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
