DESCRIPTION

The ST750A is an adjustable output CMOS, step-down switching regulator. The ST750A accepts inputs between 4V and 11V and delivers 450mA. Typical efficiencies are 85% to 96%. Quiescent supply current is 0.8mA and only 0.3 μ A in shutdown mode. The output does not exhibit frequency over this specified range. Pulse-width modulation (PWM) current-mode control provides

precise output regulation and excellent transient responses. Output voltage accuracy is guaranteed to be $\pm 4.5\%$ plus feedback resistor tolerance over line, load, and temperature variations.

Fixed-frequency switching and absence of subharmonic ripple allows easy filtering of output ripple and noise, as well as the use of small external components. This regulators require only a single inductor value to work in most applications, so no inductor design is necessary. Typical applications are: Cellular phones & radios, portable Instruments, Portable Communications Equipments and Computer Peripherals.

CONNECTION DIAGRAM (top view)**PIN DESCRIPTION**

Pin N°	Symbol	Name and Function
1	SHDN	Shutdown control (active low): If connected to GND the IC is in shutdown. Connect to V_{CC} for normal operation (ON MODE)
2	REF	Reference Output Voltage: (1.25V): Bypass to GND with a capacitor that does not exceed 47nF
3	SS	Soft Start: a capacitor between SS and GND provides soft-start and short-circuit protections.
4	CC	Compensation Capacitor Input: externally compensates the outer (voltage) feedback loop. Connect to OUT with 330pF capacitor
5	IC	Internal Connection: make no external connection to this pin
6	GND	Ground
7	LX	Switch Output. Drain of internal P-Channel Power MOSFET
8	V_{CC}	Supply Voltage Input. Bypass to GND with 1 μ F ceramic capacitance and large value electrolytic capacitor in parallel. The 1 μ F capacitor must be as close as possible to the GND and V_{CC} pins
