

CY7C1425KV18
CY7C1412KV18
CY7C1414KV18

36-Mbit QDR[®] II SRAM Two-Word Burst Architecture

Features

- Separate independent read and write data ports
 - Supports concurrent transactions
- 333 MHz clock for high bandwidth
- Two-word burst on all accesses
- Double data rate (DDR) Interfaces on both read and write ports (data transferred at 666 MHz) at 333 MHz
- Two input clocks (K and \bar{K}) for precise DDR timing
 - SRAM uses rising edges only
- Two input clocks for output data (C and \bar{C}) to minimize clock skew and flight time mismatches
- Echo clocks (CQ and \bar{CQ}) simplify data capture in high speed systems
- Single multiplexed address input bus latches address inputs for both read and write ports
- Separate port selects for depth expansion
- Synchronous internally self-timed writes
- QDR[®] II operates with 1.5 cycle read latency when $\overline{\text{DOFF}}$ is asserted HIGH
- Operates similar to QDR I device with 1 cycle read latency when $\overline{\text{DOFF}}$ is asserted LOW
- Available in $\times 9$, $\times 18$, and $\times 36$ configurations
- Full data coherency, providing most current data
- Core $V_{\text{DD}} = 1.8 \text{ V}$ ($\pm 0.1 \text{ V}$); I/O $V_{\text{DDQ}} = 1.4 \text{ V}$ to V_{DD}
 - Supports both 1.5 V and 1.8 V I/O supply
- Available in 165-ball FBGA package ($13 \times 15 \times 1.4 \text{ mm}$)
- Offered in both Pb-free and non Pb-free Packages
- Variable drive HSTL output buffers
- JTAG 1149.1 compatible test access port
- Phase locked loop (PLL) for accurate data placement

Configurations

CY7C1425KV18 – $4\text{M} \times 9$
 CY7C1412KV18 – $2\text{M} \times 18$
 CY7C1414KV18 – $1\text{M} \times 36$

Functional Description

The CY7C1425KV18, CY7C1412KV18, and CY7C1414KV18 are 1.8 V synchronous pipelined SRAMs, equipped with QDR II architecture. QDR II architecture consists of two separate ports: the read port and the write port to access the memory array. The read port has dedicated data outputs to support read operations and the write port has dedicated data inputs to support write operations. QDR II architecture has separate data inputs and data outputs to completely eliminate the need to “turnaround” the data bus that exists with common I/O devices. Access to each port is through a common address bus. Addresses for read and write addresses are latched on alternate rising edges of the input (K) clock. Accesses to the QDR II read and write ports are completely independent of one another. To maximize data throughput, both read and write ports are equipped with DDR interfaces. Each address location is associated with two 9-bit words (CY7C1425KV18), 18-bit words (CY7C1412KV18), or 36-bit words (CY7C1414KV18) that burst sequentially into or out of the device. Because data can be transferred into and out of the device on every rising edge of both input clocks (K and \bar{K} and C and \bar{C}), memory bandwidth is maximized while simplifying system design by eliminating bus turnarounds.

Depth expansion is accomplished with port selects, which enables each port to operate independently.

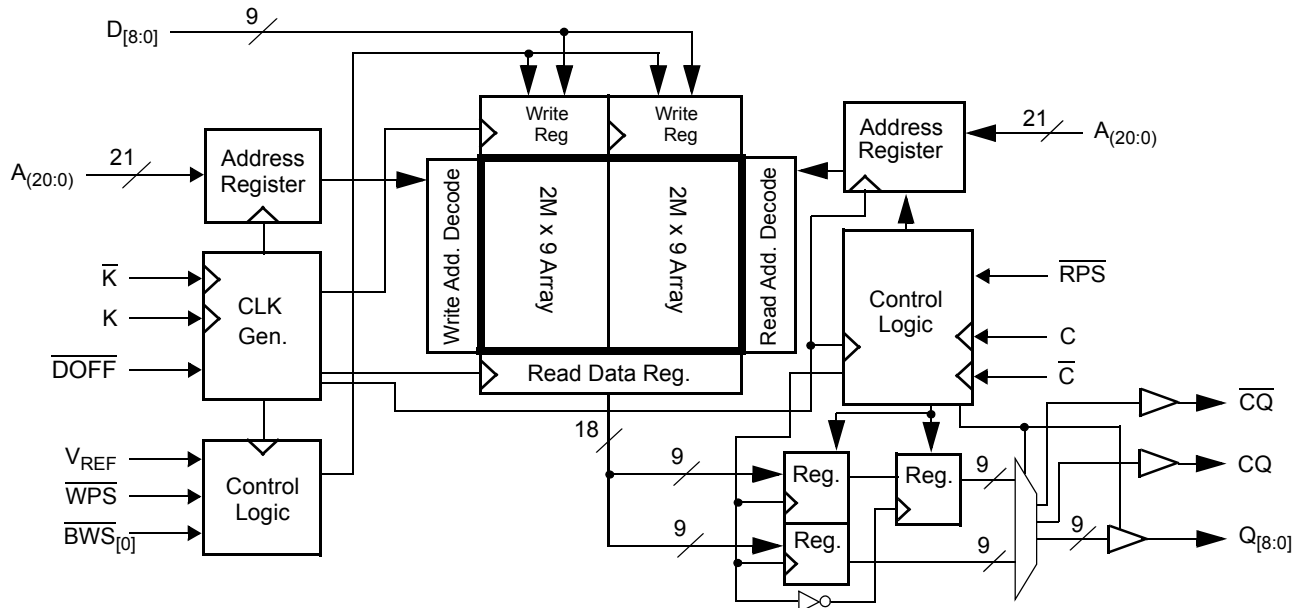

All synchronous inputs pass through input registers controlled by the K or \bar{K} input clocks. All data outputs pass through output registers controlled by the C or \bar{C} (or K or \bar{K} in a single clock domain) input clocks. Writes are conducted with on-chip synchronous self-timed write circuitry.

Pin Definitions

Pin Name	I/O	Pin Description
$D_{[x:0]}$	Input-synchronous	Data input signals. Sampled on the rising edge of K and \bar{K} clocks during valid write operations. CY7C1425KV18 – $D_{[8:0]}$ CY7C1412KV18 – $D_{[17:0]}$ CY7C1414KV18 – $D_{[35:0]}$
\overline{WPS}	Input-synchronous	Write port select – active LOW. Sampled on the rising edge of the K clock. When asserted active, a write operation is initiated. Deasserting deselects the write port. Deselecting the write port ignores $D_{[x:0]}$.
\overline{BWS}_0 , \overline{BWS}_1 , \overline{BWS}_2 , \overline{BWS}_3	Input-synchronous	Byte write select 0, 1, 2, and 3 – active LOW. Sampled on the rising edge of the K and \bar{K} clocks during write operations. Used to select which byte is written into the device during the current portion of the write operations. Bytes not written remain unaltered. CY7C1425KV18 – \overline{BWS}_0 controls $D_{[8:0]}$. CY7C1412KV18 – \overline{BWS}_0 controls $D_{[8:0]}$ and \overline{BWS}_1 controls $D_{[17:9]}$. CY7C1414KV18 – \overline{BWS}_0 controls $D_{[8:0]}$, \overline{BWS}_1 controls $D_{[17:9]}$, \overline{BWS}_2 controls $D_{[26:18]}$ and \overline{BWS}_3 controls $D_{[35:27]}$. All the byte write selects are sampled on the same edge as the data. Deselecting a byte write select ignores the corresponding byte of data and it is not written into the device.
A	Input-synchronous	Address inputs. Sampled on the rising edge of the K (read address) and \bar{K} (write address) clocks during active read and write operations. These address inputs are multiplexed for both read and write operations. Internally, the device is organized as $4M \times 9$ (2 arrays each of $2M \times 9$) for CY7C1425KV18, $2M \times 18$ (2 arrays each of $1M \times 18$) for CY7C1412KV18, and $1M \times 36$ (2 arrays each of $512K \times 36$) for CY7C1414KV18. Therefore, only 21 address inputs are needed to access the entire memory array of CY7C1425KV18, 20 address inputs for CY7C1412KV18, and 19 address inputs for CY7C1414KV18. These inputs are ignored when the appropriate port is deselected.
$Q_{[x:0]}$	Output-synchronous	Data output signals. These pins drive out the requested data during a read operation. Valid data is driven out on the rising edge of the C and \bar{C} clocks during read operations, or K and \bar{K} when in single clock mode. When the read port is deselected, $Q_{[x:0]}$ are automatically tristated. CY7C1425KV18 – $Q_{[8:0]}$ CY7C1412KV18 – $Q_{[17:0]}$ CY7C1414KV18 – $Q_{[35:0]}$
\overline{RPS}	Input-synchronous	Read port select – active LOW. Sampled on the rising edge of positive input clock (K). When active, a read operation is initiated. Deasserting deselects the read port. When deselected, the pending access is allowed to complete and the output drivers are automatically tristated following the next rising edge of the C clock. Each read access consists of a burst of two sequential transfers.
C	Input clock	Positive input clock for output data. C is used in conjunction with \bar{C} to clock out the read data from the device. Use C and \bar{C} together to deskew the flight times of various devices on the board back to the controller. See Application Example on page 10 for further details.
\bar{C}	Input clock	Negative input clock for output data. \bar{C} is used in conjunction with C to clock out the read data from the device. Use C and \bar{C} together to deskew the flight times of various devices on the board back to the controller. See Application Example on page 10 for further details.
K	Input clock	Positive input clock input. The rising edge of K is used to capture synchronous inputs to the device and to drive out data through $Q_{[x:0]}$ when in single clock mode. All accesses are initiated on the rising edge of K.
\bar{K}	Input clock	Negative input clock input. \bar{K} is used to capture synchronous inputs being presented to the device and to drive out data through $Q_{[x:0]}$ when in single clock mode.
CQ	Echo clock	CQ referenced with respect to C. This is a free running clock and is synchronized to the input clock for output data (C) of the QDR II. In single clock mode, CQ is generated with respect to K. The timing for the echo clocks is shown in Switching Characteristics on page 25 .
\bar{CQ}	Echo clock	CQ referenced with respect to \bar{C}. This is a free running clock and is synchronized to the input clock for output data (\bar{C}) of the QDR II. In single clock mode, \bar{CQ} is generated with respect to \bar{K} . The timing for the echo clocks is shown in the Switching Characteristics on page 25 .

Pin Definitions *(continued)*

Pin Name	I/O	Pin Description
ZQ	Input	Output impedance matching input. This input is used to tune the device outputs to the system data bus impedance. CQ, \overline{CQ} , and $Q_{[x:0]}$ output impedance are set to $0.2 \times RQ$, where RQ is a resistor connected between ZQ and ground. Alternatively, connect this pin directly to V_{DDQ} , which enables the minimum impedance mode. This pin cannot be connected directly to GND or left unconnected.
DOFF	Input	PLL turn off – active LOW. Connecting this pin to ground turns off the PLL inside the device. The timing in the operation with the PLL turned off differs from those listed in this data sheet. For normal operation, connect this pin to a pull up through a 10 K Ω or less pull-up resistor. The device behaves in QDR I mode when the PLL is turned off. In this mode, the device can be operated at a frequency of up to 167 MHz with QDR I timing.
TDO	Output	TDO pin for JTAG.
TCK	Input	TCK pin for JTAG.
TDI	Input	TDI pin for JTAG.
TMS	Input	TMS pin for JTAG.
NC	N/A	Not connected to the die. Can be tied to any voltage level.
NC/72M	Input	Not connected to the die. Can be tied to any voltage level.
NC/144M	Input	Not connected to the die. Can be tied to any voltage level.
NC/288M	Input	Not connected to the die. Can be tied to any voltage level.
V _{REF}	Input-reference	Reference voltage input. Static input used to set the reference level for HSTL inputs, outputs, and AC measurement points.
V _{DD}	Power supply	Power supply inputs to the core of the device.
V _{SS}	Ground	Ground for the device.
V _{DDQ}	Power supply	Power supply inputs for the outputs of the device.

Functional Overview

The CY7C1425KV18, CY7C1412KV18, and CY7C1414KV18 are synchronous pipelined burst SRAMs with a read port and a write port. The read port is dedicated to read operations and the write port is dedicated to write operations. Data flows into the SRAM through the write port and flows out through the read port. These devices multiplex the address inputs to minimize the number of address pins required. By having separate read and write ports, the QDR II completely eliminates the need to turn around the data bus and avoids any possible data contention, thereby simplifying system design. Each access consists of two 9-bit data transfers in the case of CY7C1425KV18, two 18-bit data transfers in the case of CY7C1412KV18, and two 36-bit data transfers in the case of CY7C1414KV18 in one clock cycle.

This device operates with a read latency of one and half cycles when DOFF pin is tied HIGH. When DOFF pin is set LOW or connected to V_{SS} then the device behaves in QDR I mode with a read latency of one clock cycle.

Accesses for both ports are initiated on the rising edge of the positive input clock (K). All synchronous input timing is referenced from the rising edge of the input clocks (K and \overline{K}) and all output timing is referenced to the output clocks (C and \overline{C} , or K and \overline{K} when in single clock mode).

All synchronous data inputs ($D_{[x:0]}$) pass through input registers controlled by the input clocks (K and \overline{K}). All synchronous data outputs ($Q_{[x:0]}$) pass through output registers controlled by the

rising edge of the output clocks (C and \overline{C} , or K and \overline{K} when in single clock mode).

All synchronous control (\overline{RPS} , \overline{WPS} , $\overline{BWS}_{[x:0]}$) inputs pass through input registers controlled by the rising edge of the input clocks (K and \overline{K}).

CY7C1412KV18 is described in the following sections. The same basic descriptions apply to CY7C1425KV18, and CY7C1414KV18.

Read Operations

The CY7C1412KV18 is organized internally as two arrays of $1M \times 18$. Accesses are completed in a burst of two sequential 18-bit data words. Read operations are initiated by asserting \overline{RPS} active at the rising edge of the positive input clock (K). The address is latched on the rising edge of the K clock. The address presented to the address inputs is stored in the read address register. Following the next K clock rise, the corresponding lowest order 18-bit word of data is driven onto the $Q_{[17:0]}$ using C as the output timing reference. On the subsequent rising edge of C, the next 18-bit data word is driven onto the $Q_{[17:0]}$. The requested data is valid 0.45 ns from the rising edge of the output clock (C and \overline{C} or K and \overline{K} when in single clock mode).

Synchronous internal circuitry automatically tristates the outputs following the next rising edge of the output clocks (C/ \overline{C}). This enables for a seamless transition between devices without the insertion of wait states in a depth expanded memory.

Write Operations

Write operations are initiated by asserting \overline{WPS} active at the rising edge of the positive input clock (K). On the same K clock rise the data presented to $D_{[17:0]}$ is latched and stored into the lower 18-bit write data register, provided $BWS_{[1:0]}$ are both asserted active. On the subsequent rising edge of the negative input clock (\overline{K}), the address is latched and the information presented to $D_{[17:0]}$ is also stored into the write data register, provided $BWS_{[1:0]}$ are both asserted active. The 36 bits of data are then written into the memory array at the specified location.

When deselected, the write port ignores all inputs after the pending write operations are completed.

Byte Write Operations

Byte write operations are supported by the CY7C1412KV18. A write operation is initiated as described in the [Write Operations](#) section. The bytes that are written are determined by BWS_0 and BWS_1 , which are sampled with each set of 18-bit data words. Asserting the appropriate byte write select input during the data portion of a write latches the data being presented and writes it into the device. Deasserting the byte write select input during the data portion of a write enables the data stored in the device for that byte to remain unaltered. This feature is used to simplify read, modify, or write operations to a byte write operation.

Concurrent Transactions

The read and write ports on the CY7C1412KV18 operate completely independently of one another. As each port latches the address inputs on different clock edges, the user can read or write to any location, regardless of the transaction on the other port. The user can start reads and writes in the same clock cycle. If the ports access the same location at the same time, the SRAM delivers the most recent information associated with the specified address location. This includes forwarding data from a write cycle that was initiated on the previous K clock rise.

Depth Expansion

The CY7C1412KV18 has a port select input for each port. This enables for easy depth expansion. Both port selects are sampled

on the rising edge of the positive input clock only (K). Each port select input can deselect the specified port. Deselecting a port does not affect the other port. All pending transactions (read and write) are completed before the device is deselected.

Programmable Impedance

An external resistor, RQ, must be connected between the ZQ pin on the SRAM and V_{SS} to enable the SRAM to adjust its output driver impedance. The value of RQ must be 5X the value of the intended line impedance driven by the SRAM. The allowable range of RQ to guarantee impedance matching with a tolerance of $\pm 15\%$ is between 175 Ω and 350 Ω , with $V_{DDQ} = 1.5$ V. The output impedance is adjusted every 1024 cycles upon power-up to account for drifts in supply voltage and temperature.

Echo Clocks

Echo clocks are provided on the QDR II to simplify data capture on high speed systems. Two echo clocks are generated by the QDR II. CQ is referenced with respect to C and \overline{CQ} is referenced with respect to \overline{C} . These are free running clocks and are synchronized to the output clock of the QDR II. In the single clock mode, CQ is generated with respect to K and \overline{CQ} is generated with respect to \overline{K} . The timing for the echo clocks is shown in [Switching Characteristics on page 25](#).

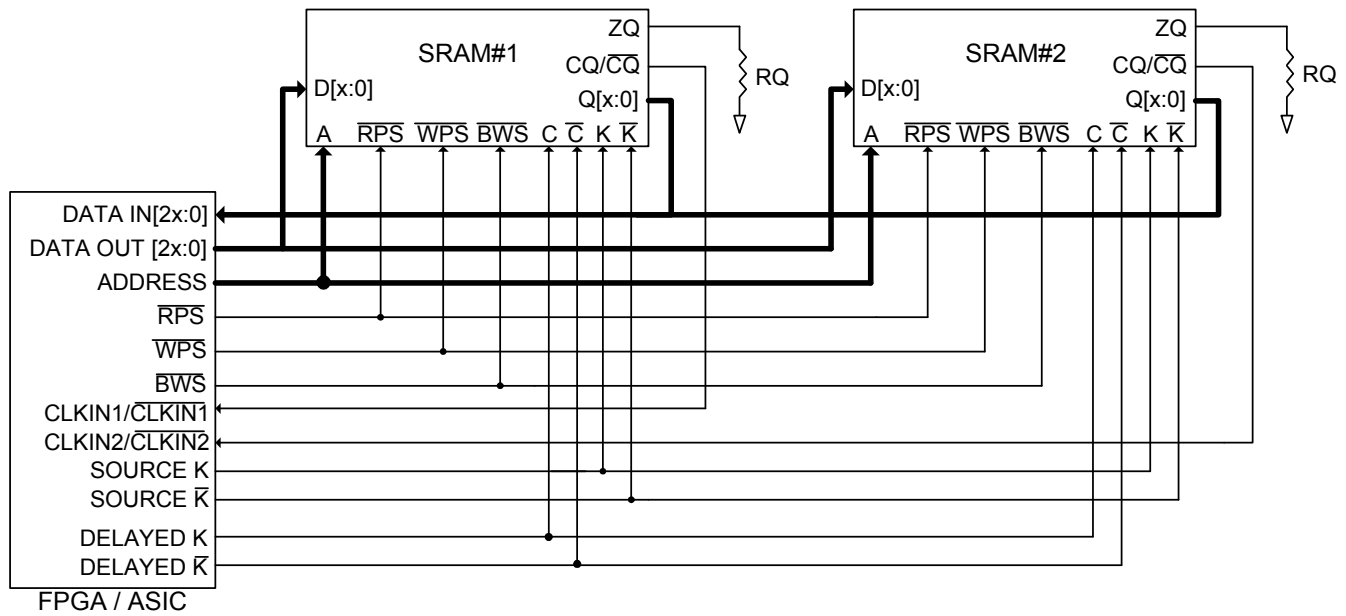

PLL

These chips use a PLL which is designed to function between 120 MHz and the specified maximum clock frequency. During power up, when the \overline{DOFF} is tied HIGH, the PLL is locked after 20 μs of stable clock. The PLL can also be reset by slowing or stopping the input clocks K and \overline{K} for a minimum of 30 ns. However, it is not necessary to reset the PLL to lock to the desired frequency. The PLL automatically locks 20 μs after a stable clock is presented. The PLL may be disabled by applying ground to the \overline{DOFF} pin. When the PLL is turned off, the device behaves in QDR I mode (with one cycle latency and a longer access time).

Application Example

Figure 2 shows two QDR II used in an application.

Figure 2. Application Example (Width Expansion)

Truth Table

The truth table for CY7C1425KV18, CY7C1412KV18, and CY7C1414KV18 follow. [2, 3, 4, 5, 6, 7]

Operation	K	\overline{RPS}	\overline{WPS}	DQ	DQ
Write cycle: Load address on the rising edge of \overline{K} ; input write data on K and \overline{K} rising edges.	L–H	X	L	D(A + 0) at K(t) \uparrow	D(A + 1) at $\overline{K}(t)$ \uparrow
Read cycle: Load address on the rising edge of K; wait one and a half cycle; read data on \overline{C} and C rising edges.	L–H	L	X	Q(A + 0) at $\overline{C}(t + 1)$ \uparrow	Q(A + 1) at C(t + 2) \uparrow
NOP: No operation	L–H	H	H	D = X Q = high Z	D = X Q = high Z

Notes

- X = "Don't Care," H = Logic HIGH, L = Logic LOW, \uparrow represents rising edge.
- Device powers up deselected with the outputs in a tristate condition.
- "A" represents address location latched by the devices when transaction was initiated. A + 0, A + 1 represents the internal address sequence in the burst.
- "t" represents the cycle at which a read/write operation is started. t + 1, and t + 2 are the first, and second clock cycles respectively succeeding the "t" clock cycle.
- Data inputs are registered at K and \overline{K} rising edges. Data outputs are delivered on C and \overline{C} rising edges, except when in single clock mode.
- Ensure that when the clock is stopped K = K and C = C = HIGH. This is not essential, but permits most rapid restart by overcoming transmission line charging symmetrically.
- Is based on a write cycle that was initiated in accordance with the Truth Table. \overline{BWS}_0 , \overline{BWS}_1 , \overline{BWS}_2 , and \overline{BWS}_3 can be altered on different portions of a write cycle, as long as the setup and hold requirements are achieved.

Write Cycle Descriptions

The write cycle description table for CY7C1425KV18 follow. [9, 10]

\overline{BWS}_0	K	\overline{K}	Comments
L	L-H	-	During the data portion of a write sequence, the single byte ($D_{[8:0]}$) is written into the device.
L	-	L-H	During the data portion of a write sequence, the single byte ($D_{[8:0]}$) is written into the device.
H	L-H	-	No data is written into the device during this portion of a write operation.
H	-	L-H	No data is written into the device during this portion of a write operation.

Notes

9. X = "Don't Care," H = Logic HIGH, L = Logic LOW, \uparrow represents rising edge.

10. Is based on a write cycle that was initiated in accordance with the [Truth Table on page 11](#). \overline{BWS}_0 , \overline{BWS}_1 , \overline{BWS}_2 , and \overline{BWS}_3 can be altered on different portions of a write cycle, as long as the setup and hold requirements are achieved.

IEEE 1149.1 Serial Boundary Scan (JTAG)

These SRAMs incorporate a serial boundary scan test access port (TAP) in the FBGA package. This part is fully compliant with IEEE Standard #1149.1-2001. The TAP operates using JEDEC standard 1.8 V I/O logic levels.

Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW (V_{SS}) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternatively be connected to V_{DD} through a pull-up resistor. TDO must be left unconnected. Upon power-up, the device comes up in a reset state, which does not interfere with the operation of the device.

Test Access Port

Test Clock

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. This pin may be left unconnected if the TAP is not used. The pin is pulled up internally, resulting in a logic HIGH level.

Test Data-In (TDI)

The TDI pin is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information about loading the instruction register, see the [TAP Controller State Diagram on page 15](#). TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) on any register.

Test Data-Out (TDO)

The TDO output pin is used to serially clock data out from the registers. The output is active, depending upon the current state of the TAP state machine (see [Instruction Codes on page 19](#)). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

Performing a TAP Reset

A Reset is performed by forcing TMS HIGH (V_{DD}) for five rising edges of TCK. This Reset does not affect the operation of the SRAM and is performed when the SRAM is operating. At power up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

TAP Registers

Registers are connected between the TDI and TDO pins to scan the data in and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction registers. Data is serially loaded into the TDI pin on the rising edge of TCK. Data is output on the TDO pin on the falling edge of TCK.

Instruction Register

Three-bit instructions are serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO pins, as shown in [TAP Controller Block Diagram on page 16](#). Upon power-up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state, as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to enable fault isolation of the board level serial test path.

Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between TDI and TDO pins. This enables shifting of data through the SRAM with minimal delay. The bypass register is set LOW (V_{SS}) when the BYPASS instruction is executed.

Boundary Scan Register

The boundary scan register is connected to all of the input and output pins on the SRAM. Several No Connect (NC) pins are also included in the scan register to reserve pins for higher density devices.

The boundary scan register is loaded with the contents of the RAM input and output ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO pins when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD, and SAMPLE Z instructions are used to capture the contents of the input and output ring.

The [Boundary Scan Order on page 20](#) shows the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in [Identification Register Definitions on page 19](#).

TAP Instruction Set

Eight different instructions are possible with the three-bit instruction register. All combinations are listed in [Instruction Codes on page 19](#). Three of these instructions are listed as RESERVED and must not be used. The other five instructions are described in this section in detail.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO pins. To execute the instruction after it is shifted in, the TAP controller must be moved into the Update-IR state.

IDCODE

The IDCODE instruction loads a vendor-specific, 32-bit code into the instruction register. It also places the instruction register between the TDI and TDO pins and shifts the IDCODE out of the device when the TAP controller enters the Shift-DR state. The IDCODE instruction is loaded into the instruction register at power up or whenever the TAP controller is supplied a Test-Logic-Reset state.

SAMPLE Z

The SAMPLE Z instruction connects the boundary scan register between the TDI and TDO pins when the TAP controller is in a Shift-DR state. The SAMPLE Z command puts the output bus into a high Z state until the next command is supplied during the Update IR state.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the input and output pins is captured in the boundary scan register.

The TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output undergoes a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times (t_{CS} and t_{CH}). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and CK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD places an initial data pattern at the latched parallel outputs of the boundary scan register cells before the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required, that is, while the data captured is shifted out, the preloaded data can be shifted in.

BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO pins. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

EXTEST

The EXTEST instruction drives the preloaded data out through the system output pins. This instruction also connects the boundary scan register for serial access between the TDI and TDO in the Shift-DR controller state.

EXTEST OUTPUT BUS TRISTATE

IEEE Standard 1149.1 mandates that the TAP controller be able to put the output bus into a tristate mode.

The boundary scan register has a special bit located at bit #108. When this scan cell, called the "extest output bus tristate," is latched into the preload register during the Update-DR state in the TAP controller, it directly controls the state of the output (Q-bus) pins, when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a high Z condition.

This bit is set by entering the SAMPLE/PRELOAD or EXTEST command, and then shifting the desired bit into that cell, during the Shift-DR state. During Update-DR, the value loaded into that shift-register cell latches into the preload register. When the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is pre-set LOW to enable the output when the device is powered up, and also when the TAP controller is in the Test-Logic-Reset state.

Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

TAP Controller State Diagram

The state diagram for the TAP controller follows. ^[11]

Note

11. The 0/1 next to each state represents the value at TMS at the rising edge of TCK.

TAP Controller Block Diagram

TAP Electrical Characteristics

Over the Operating Range

Parameter [12, 13, 14]	Description	Test Conditions	Min	Max	Unit
V_{OH1}	Output HIGH voltage	$I_{OH} = -2.0 \text{ mA}$	1.4	–	V
V_{OH2}	Output HIGH voltage	$I_{OH} = -100 \text{ } \mu\text{A}$	1.6	–	V
V_{OL1}	Output LOW voltage	$I_{OL} = 2.0 \text{ mA}$	–	0.4	V
V_{OL2}	Output LOW voltage	$I_{OL} = 100 \text{ } \mu\text{A}$	–	0.2	V
V_{IH}	Input HIGH voltage		$0.65 \times V_{DD}$	$V_{DD} + 0.3$	V
V_{IL}	Input LOW voltage		–0.3	$0.35 \times V_{DD}$	V
I_X	Input and output load current	$GND \leq V_I \leq V_{DD}$	–5	5	μA

Notes

12. These characteristics pertain to the TAP inputs (TMS, TCK, TDI and TDO). Parallel load levels are specified in the [Electrical Characteristics on page 22](#).

13. Overshoot: $V_{IH(AC)} < V_{DDQ} + 0.85 \text{ V}$ (Pulse width less than $t_{CYC}/2$), Undershoot: $V_{IL(AC)} > -1.5 \text{ V}$ (Pulse width less than $t_{CYC}/2$).

14. All voltage referenced to Ground.

TAP AC Switching Characteristics

Over the Operating Range

Parameter ^[15, 16]	Description	Min	Max	Unit
t_{TCYC}	TCK clock cycle time	50	–	ns
t_{TF}	TCK clock frequency	–	20	MHz
t_{TH}	TCK clock HIGH	20	–	ns
t_{TL}	TCK clock LOW	20	–	ns
Setup Times				
t_{TMSS}	TMS setup to TCK clock rise	5	–	ns
t_{TDIS}	TDI setup to TCK clock rise	5	–	ns
t_{CS}	Capture setup to TCK rise	5	–	ns
Hold Times				
t_{TMSH}	TMS hold after TCK clock rise	5	–	ns
t_{TDIH}	TDI hold after clock rise	5	–	ns
t_{CH}	Capture hold after clock rise	5	–	ns
Output Times				
t_{TDOV}	TCK clock LOW to TDO valid	–	10	ns
t_{TDOX}	TCK clock LOW to TDO invalid	0	–	ns

Notes

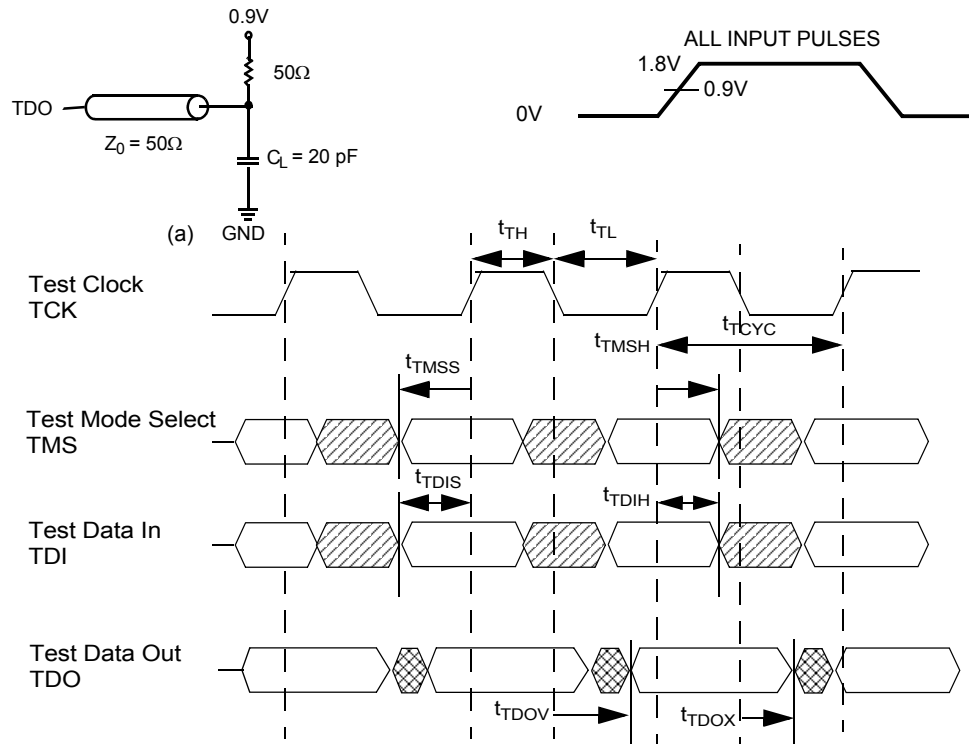

15. t_{CS} and t_{CH} refer to the setup and hold time requirements of latching data from the boundary scan register.

16. Test conditions are specified using the load in TAP AC Test Conditions. $t_R/t_F = 1$ ns.

TAP Timing and Test Conditions

Figure 3 shows the TAP timing and test conditions. [17]

Figure 3. TAP Timing and Test Conditions

Note

17. Test conditions are specified using the load in TAP AC Test Conditions. $t_R/t_F = 1\text{ ns}$.

Power Up Sequence in QDR II SRAM

QDR II SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

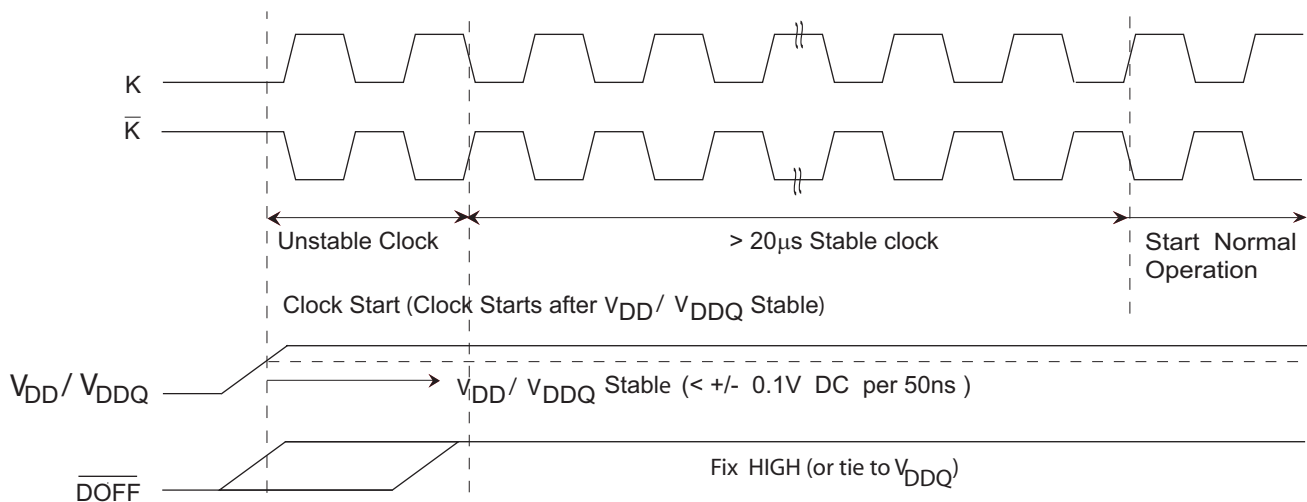

Power Up Sequence

- Apply power and drive $\overline{\text{DOFF}}$ either HIGH or LOW (All other inputs can be HIGH or LOW).
 - Apply V_{DD} before V_{DDQ} .
 - Apply V_{DDQ} before V_{REF} or at the same time as V_{REF} .
 - Drive $\overline{\text{DOFF}}$ HIGH.
- Provide stable $\overline{\text{DOFF}}$ (HIGH), power and clock (K, \bar{K}) for 20 μs to lock the PLL.

PLL Constraints

- PLL uses K clock as its synchronizing input. The input must have low phase jitter, which is specified as $t_{\text{KC Var}}$.
- The PLL functions at frequencies down to 120 MHz.
- If the input clock is unstable and the PLL is enabled, then the PLL may lock onto an incorrect frequency, causing unstable SRAM behavior. To avoid this, provide 20 μs of stable clock to relock to the desired clock frequency.

Figure 4. Power Up Waveforms

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature -65 °C to +150 °C

Ambient temperature
with power applied -55 °C to +125 °C

Supply voltage on V_{DD} relative to GND -0.5 V to +2.9 V

Supply voltage on V_{DDQ} relative to GND -0.5 V to + V_{DD}

DC applied to outputs in high Z -0.5 V to $V_{DDQ} + 0.5$ V

DC input voltage ^[18] -0.5 V to $V_{DD} + 0.5$ V

Current into outputs (LOW) 20 mA

Static discharge voltage
(MIL-STD-883, M. 3015) > 2001 V

Latch-up current > 200 mA

Operating Range

Range	Ambient Temperature (T_A)	V_{DD} ^[19]	V_{DDQ} ^[19]
Commercial	0 °C to +70 °C	1.8 ± 0.1 V	1.4 V to V_{DD}
Industrial	-40 °C to +85 °C		

Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU	Logical single-bit upsets	25 °C	197	216	FIT/Mb
LMBU	Logical Multi-Bit upsets	25 °C	0	0.01	FIT/Mb
SEL	Single event latchup	85 °C	0	0.1	FIT/Dev

* No LMBU or SEL events occurred during testing; this column represents a statistical χ^2 , 95% confidence limit calculation. For more details refer to Application Note AN54908 "Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates".

Electrical Characteristics

			300 MHz	(× 9)	–	–	270	mA
				(× 18)	–	–	270	
				(× 36)	–	–	270	
			250 MHz	(× 9)	–	–	260	mA
				(× 18)	–	–	260	
				(× 36)	–	–	260	

Note

24. The operation current is calculated with 50% read cycle and 50% write cycle.

AC Electrical Characteristics

Over the Operating Range

Parameter ^[25]	Description	Test Conditions	Min	Typ	Max	Unit
V_{IH}	Input HIGH voltage		$V_{REF} + 0.2$	–	–	V
V_{IL}	Input LOW voltage		–	–	$V_{REF} - 0.2$	V

Capacitance

Parameter ^[26]	Description	Test Conditions	Max	Unit
C_{IN}	Input capacitance	$T_A = 25^\circ\text{C}$, $f = 1\text{ MHz}$, $V_{DD} = 1.8\text{ V}$, $V_{DDQ} = 1.5\text{ V}$	4	pF
C_O	Output capacitance		4	pF

Thermal Resistance

Parameter ^[26]	Description	Test Conditions	165-ball FBGA Package	Unit
Θ_{JA} (0 m/s)	Thermal resistance (junction to ambient)	Socketed on a $170 \times 220 \times 2.35\text{ mm}$, eight-layer printed circuit board	16.72	$^\circ\text{C/W}$
Θ_{JA} (1 m/s)			15.67	$^\circ\text{C/W}$
Θ_{JA} (3 m/s)			14.92	$^\circ\text{C/W}$
Θ_{JB}	Thermal resistance (junction to board)		13.67	$^\circ\text{C/W}$
Θ_{JC}	Thermal resistance (junction to case)		4.54	$^\circ\text{C/W}$

AC Test Loads and Waveforms

Figure 5. AC Test Loads and Waveforms

Notes

25. Overshoot: $V_{IH(AC)} < V_{DDQ} + 0.85\text{ V}$ (Pulse width less than $t_{CYC}/2$). Undershoot: $V_{IL(AC)} > -1.5\text{ V}$ (Pulse width less than $t_{CYC}/2$).

26. Tested initially and after any design or process change that may affect these parameters.

27. Unless otherwise noted, test conditions are based on signal transition time of 2 V/ns, timing reference levels of 0.75 V, $V_{ref} = 0.75\text{ V}$, $R_Q = 250\ \Omega$, $V_{DDQ} = 1.5\text{ V}$, input pulse levels of 0.25 V to 1.25 V, and output loading of the specified I_{OL}/I_{OH} and load capacitance shown in (a) of Figure 5.

Switching Characteristics

Over the Operating Range

Parameters [28, 29]		Description	333 MHz		300 MHz		250 MHz		Unit
Cypress Parameter	Consortium Parameter		Min	Max	Min	Max	Min	Max	
t_{POWER}		V_{DD} (typical) to the first access ^[30]	1	–	1	–	1	–	ms
t_{CYC}	t_{KHKH}	K clock and C clock cycle time	3.0	8.4	3.3	8.4	4.0	8.4	ns
t_{KH}	t_{KHKL}	Input clock (K/\bar{K} ; C/\bar{C}) HIGH	1.20	–	1.32	–	1.6	–	ns
t_{KL}	t_{KLKH}	Input clock (K/\bar{K} ; C/\bar{C}) LOW	1.20	–	1.32	–	1.6	–	ns
$t_{KH\bar{K}H}$	$t_{KH\bar{K}H}$	K clock rise to \bar{K} clock rise and C to C rise (rising edge to rising edge)	1.35	–	1.49	–	1.8	–	ns
t_{KHCH}	t_{KHCH}	K/\bar{K} clock rise to C/\bar{C} clock rise (rising edge to rising edge)	0	1.30	0	1.45	0	1.8	ns
Setup Times									
t_{SA}	t_{AVKH}	Address set-up to K clock rise	0.3	–	0.3	–	0.35	–	ns
t_{SC}	t_{IVKH}	Control set-up to K clock rise (RPS, WPS)	0.3	–	0.3	–	0.35	–	ns
t_{SCDDR}	t_{IVKH}	DDR control set-up to clock (K/\bar{K}) rise (BWS ₀ , BWS ₁ , BWS ₂ , BWS ₃)	0.3	–	0.3	–	0.35	–	ns
t_{SD}	t_{DVKH}	D _[X:0] set-up to clock (K/\bar{K}) rise	0.3	–	0.3	–	0.35	–	ns
Hold Times									
t_{HA}	t_{KHAX}	Address hold after K clock rise	0.3	–	0.3	–	0.35	–	ns
t_{HC}	t_{KHIX}	Control hold after K clock rise (RPS, WPS)	0.3	–	0.3	–	0.35	–	ns
t_{HCDDR}	t_{KHIX}	DDR control hold after clock (K/\bar{K}) rise (BWS ₀ , BWS ₁ , BWS ₂ , BWS ₃)	0.3	–	0.3	–	0.35	–	ns
t_{HD}	t_{KHDX}	D _[X:0] hold after clock (K/\bar{K}) rise	0.3	–	0.3	–	0.35	–	ns

Notes

28. Unless otherwise noted, test conditions are based on signal transition time of 2 V/ns, timing reference levels of 0.75 V, Vref = 0.75 V, RQ = 250 Ω , V_{DDQ} = 1.5 V, input pulse levels of 0.25 V to 1.25 V, and output loading of the specified I_{OL}/I_{OH} and load capacitance shown in (a) of Figure 5 on page 24.

29. When a part with a maximum frequency above 250 MHz is operating at a lower clock frequency, it requires the input timings of the frequency range in which it is operated and outputs data with the output timings of that frequency range.

30. This part has a voltage regulator internally; t_{POWER} is the time that the power must be supplied above V_{DD(minimum)} initially before initiating a read or write operation.

Switching Characteristics *(continued)*

Over the Operating Range

Parameters ^[28, 29]		Description	333 MHz		300 MHz		250 MHz		Unit
Cypress Parameter	Consortium Parameter		Min	Max	Min	Max	Min	Max	
Output Times									
t _{CO}	t _{CHQV}	C/ \overline{C} clock rise (or K/ \overline{K} in single clock mode) to data valid	–	0.45	–	0.45	–	0.45	ns
t _{DOH}	t _{CHQX}	Data output hold after output C/ \overline{C} clock rise (active to active)	–0.45	–	–0.45	–	–0.45	–	ns
t _{CCQO}	t _{CHCQV}	C/ \overline{C} clock rise to echo clock valid	–	0.45	–	0.45	–	0.45	ns
t _{CQOH}	t _{CHCQX}	Echo clock hold after C/ \overline{C} clock rise	–0.45	–	–0.45	–	–0.45	–	ns
t _{CQD}	t _{CQHQV}	Echo clock high to data valid		0.25		0.27	–	0.30	ns
t _{CQDOH}	t _{CQHQX}	Echo clock high to data invalid	–0.25	–	–0.27	–	–0.30	–	ns
t _{CQH}	t _{CQHCQL}	Output clock (CQ/ \overline{CQ}) HIGH ^[31]	1.25	–	1.40	–	1.75	–	ns
t _{CQH\overline{CQ}}	t _{CQH\overline{CQ}}	CQ clock rise to \overline{CQ} clock rise (rising edge to rising edge) ^[31]	1.25	–	1.40	–	1.75	–	ns
t _{CHZ}	t _{CHQZ}	Clock (C/ \overline{C}) rise to high Z (active to high Z) ^[32, 33]	–	0.45	–	0.45	–	0.45	ns
t _{CLZ}	t _{CHQX1}	Clock (C/ \overline{C}) rise to low Z ^[32, 33]	–0.45	–	–0.45	–	–0.45	–	ns
PLL Timing									
t _{KC Var}	t _{KC Var}	Clock phase jitter	–	0.20	–	0.20	–	0.20	ns
t _{KC lock}	t _{KC lock}	PLL lock time (K, C) ^[34]	20	–	20	–	20	–	μs
t _{KC Reset}	t _{KC Reset}	K static to PLL reset	30	–	30	–	30	–	ns

Notes

31. These parameters are extrapolated from the input timing parameters ($t_{CYC}/2 - 250$ ps, where 250 ps is the internal jitter). These parameters are only guaranteed by design and are not tested in production.

32. t_{CHZ} , t_{CLZ} , are specified with a load capacitance of 5 pF as in part (b) of [Figure 5 on page 24](#). Transition is measured ± 100 mV from steady state voltage.

33. At any voltage and temperature t_{CHZ} is less than t_{CLZ} and t_{CHZ} less than t_{CO} .

34. For frequencies 300 MHz or below, the Cypress QDR II devices surpass the QDR consortium specification for PLL lock time ($t_{KC\ lock}$) of 20 μs (min. spec.) and will lock after 1024 clock cycles (min. spec.), after a stable clock is presented, per the previous 90 nm version.

Switching Waveforms

Figure 6. Read/Write/Deselect Sequence [35, 36, 37]

Notes

35. Q00 refers to output from address A0. Q01 refers to output from the next internal burst address following A0, that is, A0 + 1.

36. Outputs are disabled (high Z) one clock cycle after a NOP.

37. In this example, if address A0 = A1, then data Q00 = D10 and Q01 = D11. Write data is forwarded immediately as read results. This note applies to the whole diagram.

The following table contains only the parts that are currently available. If you do not see what you are looking for, contact your local sales representative. CY 7 C 14XX K V18 - XXX BZ X X

Temperature Range: X = C or I
C = Commercial = 0 °C to +70 °C; I = Industrial = -40 °C to +85 °C
X = Pb-free; X Absent = Lead
Package Type: BZ = 165-ball FBGA
Speed Grade: XXX = 333 MHz or 300 MHz or 250 MHz
 $V_{18} = 1.8 \text{ V } V_{DD}$
Process Technology K = 65 nm
Part Identifier: 14XX = 1412 or 1414 or 1425
Technology Code: C = CMOS
Marketing Code: 7 = SRAM
Company ID: CY = Cypress

Acronyms

Acronym	Description
DDR	Double Data Rate
FBGA	Fine-Pitch Ball Grid Array
HSTL	High-Speed Transceiver Logic
I/O	Input/Output
JTAG	Joint Test Action Group
LSB	Least Significant Bit
MSB	Most Significant Bit
PLL	Phase Locked Loop
QDR	Quad Data Rate
SRAM	Static Random Access Memory
TAP	Test Access Port
TCK	Test Clock
TDI	Test Data-In
TDO	Test Data-Out
TMS	Test Mode Select

Document Title: CY7C1425KV18/CY7C1412KV18/CY7C1414KV18, 36-Mbit QDR® II SRAM Two-Word Burst Architecture Document Number: 001-57825				
Rev.	ECN No.	Orig. of Change	Submission Date	Description of Change
**	2816620	VKN / AESA	11/27/2009	New data sheet.
*A	2884865	VKN	02/26/2010	Updated Switching Characteristics (Changed the minimum value of t_{SA} and t_{SC} parameters from 0.7 ns to 0.5 ns for 167 MHz, from 0.6 ns to 0.4 ns for 200 MHz, from 0.5 ns to 0.35 ns for 250 MHz, and from 0.4 ns to 0.3 ns for 333 MHz and 300 MHz).
*B	3018546	NJY	10/21/2010	Changed status from Preliminary to Final. Added Ordering Code Definitions . Minor edits. Updated to new template.
*C	3155124	VIDB	01/27/2011	Updated Switching Characteristics : Added Note 34 and referred the same note in description of $t_{KC\ lock}$ parameter.
*D	3165654	NJY	02/08/2011	Updated Switching Characteristics : Updated Note 34. Updated Ordering Information (Updated part numbers). Added Acronyms and Units of Measure .
*E	3436284	PRIT	11/11/2011	Updated Ordering Information (Updated part numbers).
*F	3549927	PRIT	03/13/2012	Updated Features (Removed CY7C1410KV18 part related information). Updated Configurations (Removed CY7C1410KV18 part related information). Updated Functional Description (Removed CY7C1410KV18 part related information). Updated Selection Guide (Removed 167 MHz and 200 MHz frequencies related information). Removed Logic Block Diagram – CY7C1410KV18. Updated Pin Configurations (Removed CY7C1410KV18 part related information). Updated Pin Definitions (Removed CY7C1410KV18 part related information). Updated Functional Overview (Removed CY7C1410KV18 part related information). Updated Truth Table (Removed CY7C1410KV18 part related information). Updated Write Cycle Descriptions (Removed CY7C1410KV18 part related information). Updated Identification Register Definitions (Removed CY7C1410KV18 part related information). Updated Electrical Characteristics (Updated DC Electrical Characteristics (Removed 167 MHz and 200 MHz frequencies related information)). Updated Switching Characteristics (Removed 167 MHz and 200 MHz frequencies related information, updated Note 29). Updated Ordering Information (Updated part numbers). Updated Package Diagram .
*G	3789642	PRIT	10/22/2012	Updated Package Diagram (spec 51-85180 (Changed revision from *E to *F)).
*H	3860026	PRIT	01/10/2013	Updated Ordering Information (Updated part numbers).
*I	3905088	PRIT	03/20/2013	Updated Ordering Information : Updated part numbers.
*J	4373734	PRIT	05/08/2014	Updated Application Example : Updated Figure 2 . Updated Thermal Resistance : Updated values of Θ_{JA} parameter. Included Θ_{JB} parameter and its details. Updated to new template.
