

UltraLogic™ 32-Macrocell ISR™ CPLD

Features

- 32 macrocells in two logic blocks
- In-System Reprogrammable™ (ISR™)
 - JTAG-compliant on-board programming
 - Design changes don't cause pinout changes
 - Design changes don't cause timing changes
- Up to 32 I/Os
 - Plus 5 dedicated inputs including 4 clock inputs
- High speed
 - $f_{MAX} = 222$ MHz
 - $t_{PD} = 5.0$ ns

- $t_S = 3.0$ ns
- $t_{CO} = 4.0$ ns
- Product-term clocking
- IEEE 1149.1 JTAG boundary scan
- Programmable slew rate control on individual I/Os
- Low power option on individual logic block basis
- 5V and 3.3V I/O capability
- User-Programmable Bus Hold capabilities on all I/Os
- Simple Timing Model
- PCI compliant
- Available in 44-pin TQFP and 44-pin PLCC
- Pinout compatible with the CY37032V, CY37064/CY37064V, CY7C371i

Functional Description

The CY37032 is an In-System Reprogrammable (ISR) Complex Programmable Logic Device (CPLD) and is part of the Ultra37000™ family of high-density, high-speed CPLDs. Like all members of the Ultra37000 family, the CY37032 is designed to bring the ease of use and high performance of the 22V10 to high-density PLDs.

The CY37032 is rich in I/O resources. Each macrocell in the device features an associated I/O pin, resulting in 32 I/O pins on the CY37032.

For a more detailed description of the architecture and features of the CY37032 see the Ultra37000 family data sheet.

Fully Routable with 100% Logic Utilization

The CY37032 is designed with a robust routing architecture which allows utilization of the entire device with a fixed pinout. This makes Ultra37000 optimal for implementing on board design changes using ISR without changing pinouts.

Simple Timing Model

The CY37032 features a very simple timing model with predictable delays. Unlike other high-density CPLD architectures, there are no hidden speed delays such as fanout effects, interconnect delays, or expander delays. The timing model allows for design changes with ISR without causing changes to system performance.

Low-Power Operation

Each Logic Block of the CY37032 can be configured as either High-Speed (default) or Low-Power. In the Low-Power Mode, the logic block consumes approximately 50% less power and slows down by t_{LP} .

Output Slew Rate Control

Each output can be configured with either a fast edge rate (default) for high performance, or a slow edge rate for added noise reduction. In the fast edge rate mode, outputs switch at 3V/ns max. and in the slow edge rate mode, outputs switch at 1V/ns max. There is a nominal delay for I/Os using the slow edge rate mode.

3.3V or 5V I/O operation

The CY37032 operates with a 5V supply, and can support 5V or 3.3V I/O levels. V_{CCO} connections provide the capability of interfacing to either a 5V or 3.3V bus. By connecting the V_{CCO} pins to 5V the user insures 5V TTL levels on the outputs. If V_{CCO} is connected to 3.3V the output levels meet 3.3V JEDEC

Operating Range^[1]

Range	Ambient Temperature ^[1]	Junction Temperature	Output Condition	V_{CC}	V_{CCO}
Commercial	0°C to +70°C	0°C to +90°C	5.0V	5V ± 0.25V	5V ± 0.25V
			3.3V	5V ± 0.25V	3.3V ± 0.3V
Industrial	-40°C to +85°C	-40°C to +125°C	5.0V	5V ± 0.50V	5V ± 0.50V
			3.3V	5V ± 0.50V	3.3V ± 0.3V

Note:

1. Normal Programming Conditions apply across Ambient Temperature Range for specified programming methods. For more information on programming the Ultra37000 family devices see the Ultra37000 Family data sheet.

standard CMOS levels and are 5V tolerant. A nominal timing delay is incurred on output buffers when V_{CCO} is set to 3.3V. This device requires 5V ISR programming.

In System Reprogramming

The CY37032 can be programmed in system using IEEE 1149.1 compliant JTAG programming protocol. The CY37032 can also be programmed on a number of traditional parallel programmers. For an overview of ISR programming, refer to the Ultra37000 Family data sheet and for UltraISR cable and software specifications, refer to the Ultra 37000 ISR Programming Kit data sheet (CY3700i).

User-Programmable Bus Hold

All outputs of the CY37032 can either be configured into bus hold mode or left floating. When in bus hold mode, the undriven outputs retain their last value with a weak latch. This feature allows the designer the flexibility of either eliminating or including external pull-up/pull-down resistors. Enabling this feature affects all I/Os simultaneously.

Design Tools

Development software for the CY37032 is available from Cypress's *Warp*™ or third-party bolt-in software packages as well as a number of third-party development packages. Please refer to the *Warp* or third-party tool support data sheets for further information.

Notes:

2. $I_{OH} = -2$ mA, $I_{OL} = 2$ mA for TDO.
3. When the I/O is output disabled, the bus-hold circuit can weakly pull the I/O to a maximum of 4.0V if no leakage current is allowed. This voltage is lowered significantly by a small leakage current. Note that all I/Os are output disabled during ISR programming. Refer to the application note "Understanding Bus Hold" for additional information.
4. These are absolute values with respect to device ground. All overshoots due to system or tester noise are included.
5. Not more than one output should be tested at a time. Duration of the short circuit should not exceed 1 second. $V_{OUT} = 0.5$ V has been chosen to avoid test problems caused by tester ground degradation.
6. Tested initially and after any design or process changes that may affect these parameters.
