|           | When the LEC bit shows this value, no CAN bus event was detected since this value was written to the LEC field.                                                                                                                                                                     |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

**Register 3: CAN Error Counter (CANERR), offset 0x008**

This register contains the error counter values, which can be used to analyze the cause of an error.

**CAN Error Counter (CANERR)**

CAN0 base: 0x4004.0000

CAN1 base: 0x4004.1000

Offset 0x008

Type RO, reset 0x0000.0000

**Register 4: CAN Bit Timing (CANBIT), offset 0x00C**

This register is used to program the bit width and bit quantum. Values are programmed to the system clock frequency. This register is write-enabled by setting the CCE and INIT bits in the **CANCTL** register. See “Bit Time and Bit Rate” on page 897 for more information.

The bit time quanta is defined by the BRP field.                                                                                                                                                                  |
| 11:8      | TSEG1    | R/W  | 0x3    | Time Segment Before Sample Point<br>0x00-0x0F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>So, for example, the reset value of 0x3 means that 4 (3+1) bit time quanta are defined for Phase1 (see Figure 18-4 on page 898). The bit time quanta is defined by the BRP field.                                                                                                                                                                 |
| 7:6       | SJW      | R/W  | 0x0    | (Re)Synchronization Jump Width<br>0x00-0x03: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>During the start of frame (SOF), if the CAN controller detects a phase error (misalignment), it can adjust the length of TSEG2 or TSEG1 by the value in SJW. So the reset value of 0 adjusts the length by 1 bit time quanta.                                                                                                                       |
| 5:0       | BRP      | R/W  | 0x1    | Baud Rate Prescaler<br>The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quantum.<br>0x00-0x03F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>BRP defines the number of CAN clock periods that make up 1 bit time quanta, so the reset value is 2 bit time quanta (1+1).<br>The <b>CANBRPE</b> register can be used to further divide the bit time. |

**Register 5: CAN Interrupt (CANINT), offset 0x010**

This register indicates the source of the interrupt.

If several interrupts are pending, the **CAN Interrupt (CANINT)** register points to the pending interrupt with the highest priority, disregarding the order in which the interrupts occurred. An interrupt remains pending until the CPU has cleared it. If the INTID field is not 0x0000 (the default) and the IE bit in the **CANCTL** register is set, the interrupt is active. The interrupt line remains active until the INTID field is cleared by reading the **CANSTS** register, or until the IE bit in the **CANCTL** register is cleared.

**Note:** Reading the **CAN Status (CANSTS)** register clears the **CAN Interrupt (CANINT)** register, if it is pending.

**Register 6: CAN Test (CANTST), offset 0x014**

This register is used for self-test and external pin access. It is write-enabled by setting the TEST bit in the **CANCTL** register. Different test functions may be combined, however, CAN transfers are affected if the TX bits in this register are not zero.

**CAN Test (CANTST)**

To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                  |       |             |   |                            |   |                                                                                                                                                                         |

**Register 7: CAN Baud Rate Prescaler Extension (CANBRPE), offset 0x018**

This register is used to further divide the bit time set with the BRP bit in the **CANBIT** register. It is write-enabled by setting the CCE bit in the **CANCTL** register.

**CAN Baud Rate Prescaler Extension (CANBRPE)**

CAN0 base: 0x4004.0000

CAN1 base: 0x4004.1000

Offset 0x018

Type R/W, reset 0x0000.0000

| 3:0       | BRPE     | R/W  | 0x0        | Baud Rate Prescaler Extension<br>0x00-0x0F: Extend the BRP bit in the <b>CANBIT</b> register to values up to 1023. The actual interpretation by the hardware is one more than the value programmed by BRPE (MSBs) and BRP (LSBs). |

**Register 8: CAN IF1 Command Request (CANIF1CRQ), offset 0x020****Register 9: CAN IF2 Command Request (CANIF2CRQ), offset 0x080**

A message transfer is started as soon as there is a write of the message object number to the MNUM field when the TXRQST bit in the **CANIF1MCTL** register is set. With this write operation, the BUSY bit is automatically set to indicate that a transfer between the CAN Interface Registers and the internal message RAM is in progress. After a wait time of 3 to 6 CAN\_CLK periods, the transfer between the interface register and the message RAM completes, which then clears the BUSY bit.

**CAN IF1 Command Request (CANIF1CRQ)**

**Register 10: CAN IF1 Command Mask (CANIF1CMSK), offset 0x024****Register 11: CAN IF2 Command Mask (CANIF2CMSK), offset 0x084**

Reading the Command Mask registers provides status for various functions. Writing to the Command Mask registers specifies the transfer direction and selects which buffer registers are the source or target of the data transfer.

Note that when a read from the message object buffer occurs when the WRNRD bit is clear and the CLRINTPND and/or NEWDAT bits are set, the interrupt pending and/or new data flags in the message object buffer are cleared.

**CAN IF1 Command Mask (CANIF1CMSK)**

CAN0 base: 0x4004.0000

CAN1 base: 0x4004.1000

Offset 0x024

Type R/W, reset 0x0000.0000

| 1         | If WRNRD is clear, the new data status is cleared in the message buffer. Note the value of this bit that is transferred to the <b>CANIFnMCTL</b> register always reflects the status of the bits before clearing.<br>If WRNRD is set, a transmission is requested. Note that when this bit is set, the TXRQST bit in the <b>CANIFnMCTL</b> register is ignored. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |             |   |                                                                                                                                                                                                         |   |                                                                                                                                                                                                                                                                                                                                                                 |

**Register 12: CAN IF1 Mask 1 (CANIF1MSK1), offset 0x028****Register 13: CAN IF2 Mask 1 (CANIF2MSK1), offset 0x088**

The mask information provided in this register accompanies the data (**CANIFnDAn**), arbitration information (**CANIFnARBn**), and control information (**CANIFnMCTL**) to the message object in the message RAM. The mask is used with the ID bit in the **CANIFnARBn** register for acceptance filtering. Additional mask information is contained in the **CANIFnMSK2** register.

**CAN IF1 Mask 1 (CANIF1MSK1)**

CAN0 base: 0x4004.0000

CAN1 base: 0x4004.1000

Offset 0x028

| 0     | The message object is ignored by the message handler.                                                         |
| 1     | The message object is configured and ready to be considered by the message handler within the CAN controller. |

All unused message objects should have this bit cleared during initialization and before clearing the INIT bit in the **CANCTL** register. The MSGVAL bit must also be cleared before any of the following bits are modified or if the message object is no longer required: the ID fields in the **CANIFnARBn** registers, the XTD and DIR bits in the **CANIFnARB2** register, or the DLC field in the **CANIFnMCTL** register.

**Register 29: CAN IF2 Data B2 (CANIF2DB2), offset 0x0A8**

These registers contain the data to be sent or that has been received. In a CAN data frame, data byte 0 is the first byte to be transmitted or received and data byte 7 is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte is transmitted first.

**Register 30: CAN Transmission Request 1 (CANTXRQ1), offset 0x100****Register 31: CAN Transmission Request 2 (CANTXRQ2), offset 0x104**

The **CANTXRQ1** and **CANTXRQ2** registers hold the TXRQST bits of the 32 message objects. By reading out these bits, the CPU can check which message object has a transmission request pending. The TXRQST bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a remote frame, or (3) the message handler state machine after a successful transmission.

The **CANTXRQ1** register contains the TXRQST bits of the first 16 message objects in the message RAM; the **CANTXRQ2** register contains the TXRQST bits of the second 16 message objects.

**CAN Transmission Request 1 (CANTXRQ1)**

**Register 32: CAN New Data 1 (CANNWDA1), offset 0x120****Register 33: CAN New Data 2 (CANNWDA2), offset 0x124**

The **CANNWDA1** and **CANNWDA2** registers hold the NEWDAT bits of the 32 message objects. By reading these bits, the CPU can check which message object has its data portion updated. The NEWDAT bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a data frame, or (3) the message handler state machine after a successful transmission.

The **CANNWDA1** register contains the NEWDAT bits of the first 16 message objects in the message RAM; the **CANNWDA2** register contains the NEWDAT bits of the second 16 message objects.

**CAN New Data 1 (CANNWDA1)**

| 1      The message handler or the CPU has written new data into the data portion of the corresponding message object.                                                      |          |      |        |                                                                                                                                                                                               |

**Register 34: CAN Message 1 Interrupt Pending (CANMSG1INT), offset 0x140****Register 35: CAN Message 2 Interrupt Pending (CANMSG2INT), offset 0x144**

The **CANMSG1INT** and **CANMSG2INT** registers hold the INTPND bits of the 32 message objects. By reading these bits, the CPU can check which message object has an interrupt pending. The INTPND bit of a specific message object can be changed through two sources: (1) the CPU via the **CANIFnMCTL** register, or (2) the message handler state machine after the reception or transmission of a frame.

This field is also encoded in the **CANINT** register.

The **CANMSG1INT** register contains the INTPND bits of the first 16 message objects in the message RAM; the **CANMSG2INT** register contains the INTPND bits of the second 16 message objects.

**CAN Message 1 Interrupt Pending (CANMSG1INT)**

## 19 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 935 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The Stellaris<sup>®</sup> LM3S2U93 microcontroller provides three independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 19.1 Block Diagram

Figure 19-1. Analog Comparator Module Block Diagram

## 19.2 Signal Description

The following table lists the external signals of the Analog Comparators and describes the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 442) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 460) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 419.

Table 19-1. Analog Comparators Signals (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                         |
|----------|------------|--------------------------|----------|--------------------------|-------------------------------------|
| C0+      | 90         | PB6                      | I        | Analog                   | Analog comparator 0 positive input. |
| C0-      | 92         | PB4                      | I        | Analog                   | Analog comparator 0 negative input. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 19.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

VIN- < VIN+, VOUT = 1

VIN- > VIN+, VOUT = 0

As shown in Figure 19-2 on page 937, the input source for VIN- is an external input, Cn-. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference, V<sub>IREF</sub>.

**Figure 19-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive an external pin, Co or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 19.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 19-3 on page 937. The internal reference is controlled by a single configuration register (**ACREFCTL**).

**Figure 19-3. Comparator Internal Reference Structure**

The internal reference can be programmed in one of two modes (low range or high range) depending on the RNG bit in the **ACREFCTL** register. When RNG is clear, the internal reference is in high-range mode, and when RNG is set the internal reference is in low-range mode.

In each range, the internal reference,  $V_{IREF}$ , has 16 pre-programmed thresholds or step values. The threshold to be used to compare the external input voltage against is selected using the VREF field in the **ACREFCTL** register.

In the high-range mode, the  $V_{IREF}$  threshold voltages start at the ideal high-range starting voltage of  $V_{DDA}/3.875$  and increase in ideal constant voltage steps of  $V_{DDA}/31$ .

In the low-range mode, the  $V_{IREF}$  threshold voltages start at 0V and increase in ideal constant voltage steps of  $V_{DDA}/23$ . The ideal  $V_{IREF}$  step voltages for each mode and their dependence on the RNG and VREF fields are summarized in Table 19-3 on page 938.

**Table 19-3. Internal Reference Voltage and ACREFTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                       |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                          |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF. It is recommended that RNG=1 and VREF=0 to minimize noise on the reference ground.                                                                                                                                      |
| EN=1              | RNG=0         | <p>Total resistance in ladder is 31 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{(VREF + 8)}{31}$ $V_{IREF} = 0.85 + 0.106 \times VREF$ <p>The range of internal reference in this mode is 0.85-2.448 V.</p> |
|                   | RNG=1         | <p>Total resistance in ladder is 23 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{VREF}{23}$ $V_{IREF} = 0.143 \times VREF$ <p>The range of internal reference for this mode is 0-2.152 V.</p>                |

## 19.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module (see page 262).
2. Enable the clock to the appropriate GPIO modules via the **RCGC2** register (see page 274). To find out which GPIO ports to enable, refer to Table 23-5 on page 1082.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 23-4 on page 1074.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the analog comparator output signals to the appropriate pins (see page 460 and Table 23-5 on page 1082).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu$ s.
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 19.5 Register Map

Table 19-4 on page 939 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 262). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 19-4. Analog Comparators Register Map**

| Offset | Name     | Type  | Reset       | Description                                 | See page |
|--------|----------|-------|-------------|---------------------------------------------|----------|

**Register 3: Analog Comparator Interrupt Enable (ACINTEN), offset 0x008**

This register provides the interrupt enable for the comparators.

**Analog Comparator Interrupt Enable (ACINTEN)**

Base 0x4003.C000

Offset 0x008

Type R/W, reset 0x0000.0000

| 0         | A comparator 0 interrupt does not affect the interrupt status.             |      |       |                                                                                                                                                                                                                                                                                             |       |             |   |                                                                            |   |                                                                |

## Register 4: Analog Comparator Reference Voltage Control (ACREFCTL), offset 0x010

This register specifies whether the resistor ladder is powered on as well as the range and tap.

### Analog Comparator Reference Voltage Control (ACREFCTL)

Base 0x4003.C000

Offset 0x010

Type R/W, reset 0x0000.0000

To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                            |       |             |     |                                                            |     |                                                                                |     |             |     |             |

## 20 Pulse Width Modulator (PWM)

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

The Stellaris<sup>®</sup> microcontroller contains one PWM module, with four PWM generator blocks and a control block, for a total of 8 PWM outputs. The control block determines the polarity of the PWM signals, and which signals are passed through to the pins.

Each PWM generator block produces two PWM signals that share the same timer and frequency and can either be programmed with independent actions or as a single pair of complementary signals with dead-band delays inserted. The output signals, pwmA' and pwmB', of the PWM generation blocks are managed by the output control block before being passed to the device pins as PWM0 and PWM1 or PWM2 and PWM3, and so on.

The Stellaris PWM module provides a great deal of flexibility and can generate simple PWM signals, such as those required by a simple charge pump as well as paired PWM signals with dead-band delays, such as those required by a half-H bridge driver. Three generator blocks can also generate the full six channels of gate controls required by a 3-phase inverter bridge.

Each PWM generator block has the following features:

- Four fault-condition handling inputs to quickly provide low-latency shutdown and prevent damage to the motor being controlled
- One 16-bit counter
  - Runs in Down or Up/Down mode
  - Output frequency controlled by a 16-bit load value
  - Load value updates can be synchronized
  - Produces output signals at zero and load value
- Two PWM comparators
  - Comparator value updates can be synchronized
  - Produces output signals on match
- PWM signal generator
  - Output PWM signal is constructed based on actions taken as a result of the counter and PWM comparator output signals
  - Produces two independent PWM signals
- Dead-band generator
  - Produces two PWM signals with programmable dead-band delays suitable for driving a half-H bridge
  - Can be bypassed, leaving input PWM signals unmodified

- Can initiate an ADC sample sequence

The control block determines the polarity of the PWM signals and which signals are passed through to the pins. The output of the PWM generation blocks are managed by the output control block before being passed to the device pins. The PWM control block has the following options:

- PWM output enable of each PWM signal
- Optional output inversion of each PWM signal (polarity control)
- Optional fault handling for each PWM signal
- Synchronization of timers in the PWM generator blocks
- Synchronization of timer/comparator updates across the PWM generator blocks
- Extended PWM synchronization of timer/comparator updates across the PWM generator blocks
- Interrupt status summary of the PWM generator blocks
- Extended PWM fault handling, with multiple fault signals, programmable polarities, and filtering
- PWM generators can be operated independently or synchronized with other generators

## 20.1 Block Diagram

Figure 20-1 on page 950 provides the Stellaris PWM module diagram and Figure 20-2 on page 950 provides a more detailed diagram of a Stellaris PWM generator. The LM3S2U93 controller contains four generator blocks that generate eight independent PWM signals or four paired PWM signals with dead-band delays inserted.

Figure 20-2. PWM Generator Block Diagram

## 20.2 Signal Description

The following table lists the external signals of the PWM module and describes the function of each. The PWM controller signals are alternate functions for some GPIO signals and default to be GPIO

signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these PWM signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 442) should be set to choose the PWM function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 460) to assign the PWM signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 419.

**Table 20-1. PWM Signals (100LQFP)**

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                          |
|----------|------------|--------------------------|----------|--------------------------|------------------------------------------------------|
| Fault0   | 6          | PE4 (4)                  | I        | TTL                      | PWM Fault 0.                                         |

|          | 35         | PA7 (5)                  |          |                          |                                                      |
|          | 59         | PF3 (2)                  |          |                          |                                                      |
|          | 75         | PE1 (1)                  |          |                          |                                                      |
|          | 85         | PH1 (9)                  |          |                          |                                                      |
| PWM6     | 25         | PC4 (4)                  | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3. |
|          | 30         | PA4 (4)                  |          |                          |                                                      |
|          | 37         | PG6 (4)                  |          |                          |                                                      |
|          | 41         | PG4 (9)                  |          |                          |                                                      |
| PWM7     | 23         | PC6 (4)                  | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3. |
|          | 31         | PA5 (4)                  |          |                          |                                                      |
|          | 36         | PG7 (4)                  |          |                          |                                                      |
|          | 40         | PG5 (8)                  |          |                          |                                                      |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 20-2. PWM Signals (108BGA)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description  |
|----------|------------|--------------------------|----------|--------------------------|--------------|
| Fault0   | B2         | PE4 (4)                  | I        | TTL                      | PWM Fault 0. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Functional Description

### 20.3.1 PWM Timer

The timer in each PWM generator runs in one of two modes: Count-Down mode or Count-Up/Down mode. In Count-Down mode, the timer counts from the load value to zero, goes back to the load value, and continues counting down. In Count-Up/Down mode, the timer counts from zero up to the load value, back down to zero, back up to the load value, and so on. Generally, Count-Down mode

is used for generating left- or right-aligned PWM signals, while the Count-Up/Down mode is used for generating center-aligned PWM signals.

The timers output three signals that are used in the PWM generation process: the direction signal (this is always Low in Count-Down mode, but alternates between Low and High in Count-Up/Down mode), a single-clock-cycle-width High pulse when the counter is zero, and a single-clock-cycle-width High pulse when the counter is equal to the load value. Note that in Count-Down mode, the zero pulse is immediately followed by the load pulse. In the figures in this chapter, these signals are labelled "dir," "zero," and "load."

### 20.3.2 PWM Comparators

Each PWM generator has two comparators that monitor the value of the counter; when either comparator matches the counter, they output a single-clock-cycle-width High pulse, labelled "cmpA" and "cmpB" in the figures in this chapter. When in Count-Up/Down mode, these comparators match both when counting up and when counting down, and thus are qualified by the counter direction signal. These qualified pulses are used in the PWM generation process. If either comparator match value is greater than the counter load value, then that comparator never outputs a High pulse.

Figure 20-3 on page 955 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Down mode. Figure 20-4 on page 955 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Up/Down mode. In these figures, the following definitions apply:

- LOAD is the value in the **PWMnLOAD** register
- COMPA is the value in the **PWMnCMPA** register
- COMPB is the value in the **PWMnCMPB** register
- 0 is the value zero
- load is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to the load value
- zero is the internal signal that has a single-clock-cycle-width High pulse when the counter is zero
- cmpA is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPA
- cmpB is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPB
- dir is the internal signal that indicates the count direction

**Figure 20-3. PWM Count-Down Mode****Figure 20-4. PWM Count-Up/Down Mode**

### 20.3.3 PWM Signal Generator

Each PWM generator takes the load, zero, cmpA, and cmpB pulses (qualified by the dir signal) and generates two internal PWM signals, pwmA and pwmB. In Count-Down mode, there are four events that can affect these signals: zero, load, match A down, and match B down. In Count-Up/Down mode, there are six events that can affect these signals: zero, load, match A down, match A up, match B down, and match B up. The match A or match B events are ignored when they coincide with the zero or load events. If the match A and match B events coincide, the first signal, pwmA, is generated based only on the match A event, and the second signal, pwmB, is generated based only on the match B event.

For each event, the effect on each output PWM signal is programmable: it can be left alone (ignoring the event), it can be toggled, it can be driven Low, or it can be driven High. These actions can be used to generate a pair of PWM signals of various positions and duty cycles, which do or do not overlap. Figure 20-5 on page 956 shows the use of Count-Up/Down mode to generate a pair of

center-aligned, overlapped PWM signals that have different duty cycles. This figure shows the pwmA and pwmB signals before they have passed through the dead-band generator.

**Figure 20-5. PWM Generation Example In Count-Up/Down Mode**

In this example, the first generator is set to drive High on match A up, drive Low on match A down, and ignore the other four events. The second generator is set to drive High on match B up, drive Low on match B down, and ignore the other four events. Changing the value of comparator A changes the duty cycle of the pwmA signal, and changing the value of comparator B changes the duty cycle of the pwmB signal.

### 20.3.4 Dead-Band Generator

The pwmA and pwmB signals produced by each PWM generator are passed to the dead-band generator. If the dead-band generator is disabled, the PWM signals simply pass through to the pwmA' and pwmB' signals unmodified. If the dead-band generator is enabled, the pwmB signal is lost and two PWM signals are generated based on the pwmA signal. The first output PWM signal, pwmA' is the pwmA signal with the rising edge delayed by a programmable amount. The second output PWM signal, pwmB', is the inversion of the pwmA signal with a programmable delay added between the falling edge of the pwmA signal and the rising edge of the pwmB' signal.

The resulting signals are a pair of active High signals where one is always High, except for a programmable amount of time at transitions where both are Low. These signals are therefore suitable for driving a half-H bridge, with the dead-band delays preventing shoot-through current from damaging the power electronics. Figure 20-6 on page 956 shows the effect of the dead-band generator on the pwmA signal and the resulting pwmA' and pwmB' signals that are transmitted to the output control block.

**Figure 20-6. PWM Dead-Band Generator**

### 20.3.5 Interrupt/ADC-Trigger Selector

Each PWM generator also takes the same four (or six) counter events and uses them to generate an interrupt or an ADC trigger. Any of these events or a set of these events can be selected as a source for an interrupt; when any of the selected events occur, an interrupt is generated. Additionally, the same event, a different event, the same set of events, or a different set of events can be selected as a source for an ADC trigger; when any of these selected events occur, an ADC trigger pulse is generated. The selection of events allows the interrupt or ADC trigger to occur at a specific position

within the pwmA or pwmB signal. Note that interrupts and ADC triggers are based on the raw events; delays in the PWM signal edges caused by the dead-band generator are not taken into account.

### 20.3.6 Synchronization Methods

The PWM module provides four PWM generators, each providing two PWM outputs that may be used in a wide variety of applications. Generally speaking, the PWM is used in one of two categories of operation:

- **Unsynchronized.** The PWM generator and its two output signals are used alone, independent of other PWM generators.
- **Synchronized.** The PWM generator and its two outputs signals are used in conjunction with other PWM generators using a common, unified time base. If multiple PWM generators are configured with the same counter load value, synchronization can be used to guarantee that they also have the same count value (the PWM generators must be configured before they are synchronized). With this feature, more than two PWMn signals can be produced with a known relationship between the edges of those signals because the counters always have the same values. Other states in the module provide mechanisms to maintain the common time base and mutual synchronization.

The counter in a PWM generator can be reset to zero by writing the **PWM Time Base Sync (PWMSYNC)** register and setting the SYNCn bit associated with the generator. Multiple PWM generators can be synchronized together by setting all necessary SYNCn bits in one access. For example, setting the SYNC0 and SYNC1 bits in the **PWMSYNC** register causes the counters in PWM generators 0 and 1 to reset together.

Additional synchronization can occur between multiple PWM generators by updating register contents in one of the following three ways:

- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 20.3.7 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the PWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM generator can use the following inputs to generate a fault condition, including:

- FAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (FAULT0-FAULT3) are available. These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A FAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the input or a combination of FAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 20.3.8 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the PWMn signals. Via a single register, the **PWM Output Enable** (**PWENABLE**) register, the set of PWM signals that are actually enabled to the pins can be modified.

This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWMENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUPD)** register.

During fault conditions, the PWM output signals, PWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the PWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the PWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 20.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the PWM0 pin, and a 75% duty cycle on the PWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by writing a value of 0x0010.0000 to the **RCGC0** register in the System Control module (see page 254).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 274).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 23-4 on page 1074.
4. Configure the PMCN fields in the **GPIOCTL** register to assign the PWM signals to the appropriate pins (see page 460 and Table 23-5 on page 1082).
5. Configure the **Run-Mode Clock Configuration (RCC)** register in the System Control module to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (000).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period. Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.
  - Write the **PWM0LOAD** register with a value of 0x0000.018F.
8. Set the pulse width of the PWM0 pin for a 25% duty cycle.
  - Write the **PWM0CMPA** register with a value of 0x0000.012B.

9. Set the pulse width of the PWM1 pin for a 75% duty cycle.
  - Write the **PWM0CMPB** register with a value of 0x0000.0063.
10. Start the timers in PWM generator 0.
  - Write the **PWM0CTL** register with a value of 0x0000.0001.
11. Enable PWM outputs.
  - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 20.5 Register Map

Table 20-3 on page 960 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM module's base address:

- PWM0: 0x4002.8000

Note that the PWM module clock must be enabled before the registers can be programmed (see page 254). There must be a delay of 3 system clocks after the PWM module clock is enabled before any PWM module registers are accessed.

**Table 20-3. PWM Register Map**

| Offset | Name        | Type  | Reset       | Description                       | See page |
|--------|-------------|-------|-------------|-----------------------------------|----------|
| 0x000  | PWMCTL      | R/W   | 0x0000.0000 | PWM Master Control                | 964      |

## 20.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

**Register 1: PWM Master Control (PWMCTL), offset 0x000**

This register provides master control over the PWM generation blocks.

**PWM Master Control (PWMCTL)**

PWM0 base: 0x4002.8000

Offset 0x000

Type R/W, reset 0x0000.0000

|       | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19          | 18          | 17          | 16          |

**Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004**

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

**PWM Time Base Sync (PWMSYNC)**

PWM0 base: 0x4002.8000

Offset 0x004

Type R/W, reset 0x0000.0000

**Register 3: PWM Output Enable (PWMENTABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the PWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the PWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the PWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the PWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**PWM Output Inversion (PWMINVERT)**

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the PWMn outputs in the presence of fault conditions. Both the fault inputs (FAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**Register 6: PWM Interrupt Enable (PWMINTEN), offset 0x014**

This register controls the global interrupt generation capabilities of the PWM module. The events that can cause an interrupt are the fault input and the individual interrupts from the PWM generators.

**Note:** The "n" in the INTFAULTn and INTPWMn bits in this register correspond to the PWM generators, not to the FAULTn signals.

**Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018**

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the FAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

|---|--------------------------------------------------|

|   |                                                            |
|---|------------------------------------------------------------|
| 0 | The PWM generator 0 block interrupt has not been asserted. |
|---|------------------------------------------------------------|

The **PWM0RIS** register shows the source of this interrupt. This bit is cleared by writing a 1 to the corresponding bit in the **PWM0ISC** register.

**Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C**

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding FAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the PWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEN bit in the **PWMENABLE** register are performed. The PWMnEN bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

PWM0 base: 0x4002.8000

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0****Register 15: PWM3 Control (PWM3CTL), offset 0x100**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the PWM0 and PWM1 outputs, the PWM1 block produces the PWM2 and PWM3 outputs, the PWM2 block produces the PWM4 and PWM5 outputs, and the PWM3 block produces the PWM6 and PWM7 outputs.

|-----------|-----------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17        | MINFLTPER | R/W  | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> |
| 16        | FLTSRC    | R/W  | 0     | <p>Fault Condition Source</p> <p>Value Description</p> <p>0 The Fault condition is determined by the Fault0 input.</p> <p>1 The Fault condition is determined by the configuration of the <b>PWMnFLTSRC0</b> and <b>PWMnFLTSRC1</b> registers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 1         | MODE   | R/W  | 0     | Counter Mode<br><br>Value Description<br>0 The counter counts down from the load value to 0 and then wraps back to the load value (Count-Down mode).<br>1 The counter counts up from 0 to the load value, back down to 0, and then repeats (Count-Up/Down mode). |
| 0         | ENABLE | R/W  | 0     | PWM Block Enable<br><br>Value Description<br>0 The entire PWM generation block is disabled and not clocked.<br>1 The PWM generation block is enabled and produces PWM signals.                                                                                   |

**Register 16: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 17: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 18: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

**Register 19: PWM3 Interrupt and Trigger Enable (PWM3INTEN), offset 0x104**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt, or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMB** register while counting up
- The counter being equal to the **PWMnCMB** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

#### PWM0 Interrupt and Trigger Enable (PWM0INTEN)

PWM0 base: 0x4002.8000  
Offset 0x044  
Type R/W, reset 0x0000.0000

**Register 20: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 21: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 22: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8****Register 23: PWM3 Raw Interrupt Status (PWM3RIS), offset 0x108**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**Register 24: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 25: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 26: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC****Register 27: PWM3 Interrupt Status and Clear (PWM3ISC), offset 0x10C**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are R/W1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**Register 28: PWM0 Load (PWM0LOAD), offset 0x050****Register 29: PWM1 Load (PWM1LOAD), offset 0x090****Register 30: PWM2 Load (PWM2LOAD), offset 0x0D0****Register 31: PWM3 Load (PWM3LOAD), offset 0x110**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

**PWM0 Load (PWM0LOAD)**

| 15:0      | COMPB    | R/W  | 0x0000 | Comparator B Value<br>The value to be compared against the counter.                                                                                                                           |

**Register 44: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 45: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 46: PWM2 Generator A Control (PWM2GENA), offset 0x0E0****Register 47: PWM3 Generator A Control (PWM3GENA), offset 0x120**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; **PWM2GENA**, the pwm2A signal; and **PWM3GENA**, the pwm3A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 48: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 49: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 50: PWM2 Generator B Control (PWM2GENB), offset 0x0E4****Register 51: PWM3 Generator B Control (PWM3GENB), offset 0x124**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; **PWM2GENB**, the pwm2B signal; and **PWM3GENB**, the pwm3B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 52: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 53: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 54: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8****Register 55: PWM3 Dead-Band Control (PWM3DBCTL), offset 0x128**

The **PWMnDBCTL** register controls the dead-band generator, which produces the PWMn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1012), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1013). The Output Control block outputs the pwm0A' signal on the PWM0 signal and the pwm0B' signal on the PWM1 signal. In a similar manner, PWM2 and PWM3 are produced from the pwm1A' and pwm1B' signals, PWM4 and PWM5 are produced from the pwm2A' and pwm2B' signals, and PWM6 and PWM7 are produced from the pwm3A' and pwm3B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

## Value Description

|   |                                                                                                            |
|---|------------------------------------------------------------------------------------------------------------|
| 1 | The dead-band generator modifies the pwmA signal by inserting dead bands into the pwmA' and pwmB' signals. |
| 0 | The pwmA and pwmB signals pass through to the pwmA' and pwmB' signals unmodified.                          |

**Register 56: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C**

**Register 57: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC**

**Register 58: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

**Register 59: PWM3 Dead-Band Rising-Edge Delay (PWM3DBRISE), offset 0x12C**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 31:12     | reserved  | RO   | 0x0000.0 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 11:0      | RISEDELAY | R/W  | 0x000    | Dead-Band Rise Delay<br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                           |

**Register 60: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070**

**Register 61: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0**

**Register 62: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

**Register 63: PWM3 Dead-Band Falling-Edge-Delay (PWM3DBFALL), offset 0x130**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 964). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 64: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 65: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 66: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4****Register 67: PWM3 Fault Source 0 (PWM3FLTSRC0), offset 0x134**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 989) is clear, only the **Fault0** signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**Register 72: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C**

**Register 73: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC**

**Register 74: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

**Register 75: PWM3 Minimum Fault Period (PWM3MINFLTPER), offset 0x13C**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 80: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 81: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 82: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904****Register 83: PWM3 Fault Status 0 (PWM3FLTSTAT0), offset 0x984**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the FAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (R/W1C) and provide a latched version of the FAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The FAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

## 21 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The LM3S2U93 microcontroller includes two quadrature encoder interface (QEI) modules. Each QEI module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The Stellaris<sup>®</sup> LM3S2U93 microcontroller includes two QEI modules providing control of two motors at the same time with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- The input frequency of the QEI inputs may be as high as 1/4 of the processor frequency (for example, 12.5 MHz for a 50-MHz system)
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 21.1 Block Diagram

Figure 21-1 on page 1027 provides a block diagram of a Stellaris QEI module.

Figure 21-1. QEI Block Diagram

## 21.2 Signal Description

The following table lists the external signals of the QEI module and describes the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 442) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 460) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 419.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 21.3 Functional Description

The QEI module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals, PhA and PhB, can be swapped before being interpreted by the QEI module to change the meaning of forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for a specified number of consecutive clock cycles before updating the edge detector. The filter is enabled by the **FILTEN** bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the **FILTCNT** bit field in the **QEICTL** register.

The QEI module supports two modes of signal operation: quadrature phase mode and clock/direction mode. In quadrature phase mode, the encoder produces two clocks that are 90 degrees out of phase; the edge relationship is used to determine the direction of rotation. In clock/direction mode, the encoder produces a clock signal to indicate steps and a direction signal to indicate the direction of rotation. This mode is determined by the **SIGMODE** bit of the **QEICTL** register (see page 1033).

When the QEI module is set to use the quadrature phase mode (**SIGMODE** bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the PhA signal or to update on every edge of both PhA and PhB. Updating the position counter on every PhA and PhB edge provides more positional resolution at the cost of less range in the positional counter.

When edges on PhA lead edges on PhB, the position counter is incremented. When edges on PhB lead edges on PhA, the position counter is decremented. When a rising and falling edge pair is seen on one of the phases without any edges on the other, the direction of rotation has changed.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the **RESMODE** bit of the **QEICTL** register.

When **RESMODE** is set, the positional counter is reset when the index pulse is sensed. This mode limits the positional counter to the values [0:N-1], where N is the number of phase edges in a full revolution of the encoder wheel. The **QEI Maximum Position (QEIMAXPOS)** register must be programmed with N-1 so that the reverse direction from position 0 can move the position counter to N-1. In this mode, the position register contains the absolute position of the encoder relative to the index (or home) position once an index pulse has been seen.

When **RESMODE** is clear, the positional counter is constrained to the range [0:M], where M is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Velocity capture uses a configurable timer and a count register. The timer counts the number of phase edges (using the same configuration as for the position integrator) in a given time period. The edge count from the previous time period is available to the controller via the **QEI Velocity (QEISPEED)** register, while the edge count for the current time period is being accumulated in the **QEI Velocity Counter (QEICOUNT)** register. As soon as the current time period is complete, the total number of edges counted in that time period is made available in the **QEISPEED** register (overwriting the previous value), the **QEICOUNT** register is cleared, and counting commences on a new time period. The number of edges counted in a given time period is directly proportional to the velocity of the encoder.

Figure 21-2 on page 1030 shows how the Stellaris quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

Figure 21-2. Quadrature Encoder and Velocity Predivider Operation

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 \wedge \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of  $\div 1$  (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 ( $\frac{1}{4}$  of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every  $\frac{1}{4}$  of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divider is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the  $\div 4$  for the edge-count factor.

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder

could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 21.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock by writing a value of 0x0000.0100 to the **RCGC1** register in the System Control module (see page 262).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 274).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 23-4 on page 1074.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the QEI signals to the appropriate pins (see page 460 and Table 23-5 on page 1082).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

## 21.5 Register Map

Table 21-3 on page 1032 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000
- QEI1: 0x4002.D000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 262). There must be a delay of 3 system clocks after the QEI module clock is enabled before any QEI module registers are accessed.

Table 21-3. QEI Register Map

| Offset | Name      | Type  | Reset       | Description                    | See page |

## 21.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

**Register 1: QEI Control (QEICTL), offset 0x000**

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

Register 3: QEI Position (QEIPOS), offset 0x008

This register contains the current value of the position integrator. The value is updated by the status of the QEI phase inputs and can be set to a specific value by writing to it.

QEI Position (QEIPOS)

QEIO base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x008

Register 5: QEI Timer Load (QEILOAD), offset 0x010

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

QEI Timer Load (QEILOAD)

QEIO base: 0x4002.C000  
QEII base: 0x4002.D000  
Offset 0x010  
Type R/W, reset 0x0000.0000

| 31:0      | LOAD | R/W  | 0x0000.0000 | Velocity Timer Load Value<br>The load value for the velocity timer. |

**Register 6: QEI Timer (QEITIME), offset 0x014**

This register contains the current value of the velocity timer. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

**QEI Timer (QEITIME)**

QEI0 base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x014

Type RO, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                              |
|-----------|------|------|-------------|--------------------------------------------------------------------------|
| 31:0      | TIME | RO   | 0x0000.0000 | Velocity Timer Current Value<br>The current value of the velocity timer. |

**Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018**

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QEISPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

**Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024**

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

**Register 11: QEI Interrupt Status and Clear (QEISC), offset 0x028**

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is R/W1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

|           |          |       |       | Value Description                                                                                                                               |
|           |          |       |       | 1 The INTINDEX bits in the <b>QEIRIS</b> register and the <b>QEINTEN</b> registers are set, providing an interrupt to the interrupt controller. |
|           |          |       |       | 0 No interrupt has occurred or the interrupt is masked.                                                                                         |
|           |          |       |       | This bit is cleared by writing a 1. Clearing this bit also clears the INTINDEX bit in the <b>QEIRIS</b> register.                               |

## 22 Pin Diagram

The LM3S2U93 microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 23-5 on page 1082.

Figure 22-1. 100-Pin LQFP Package Pin Diagram

Figure 22-2. 108-Ball BGA Package Pin Diagram (Top View)

## 23 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 458) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 442) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 460), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 23-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 0             | 0x1                     |
| PA[5:2]  | SSI0              | 0             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 0             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 23-2 on page 1052 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 23-3 on page 1063 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 23-4 on page 1074 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 23-5 on page 1082 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFA analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, C2-, C2+). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 23-6 on page 1085 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Stellaris® Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

## 23.1 100-Pin LQFP Package Pin Tables

### 23.1.1 Signals by Pin Number

Table 23-2. Signals by Pin Number

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                              |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                                                                                                                                                                                                                                                                                       |

|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                                             |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                                                          |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                                              |
| 7          | LD0      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. The LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s).                                                                                       |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                 |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 14         | PJ0        | I/O      | TTL                      | GPIO port J bit 0.                                                          |
|            | EPI0S16    | I/O      | TTL                      | EPI module 0 signal 16.                                                     |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| 15         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                          |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                     |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                      |
| 16         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
| 17         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| 18         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                          |
|            | EPI0S14    | I/O      | TTL                      | EPI module 0 signal 14.                                                     |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 19         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                          |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                     |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 20         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 21         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 22         | PC7      | I/O      | TTL                      | GPIO port C bit 7.                                                          |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | C2-      | I        | Analog                   | Analog comparator 2 negative input.                                         |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S5   | I/O      | TTL                      | EPI module 0 signal 5.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                          |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                         |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                 |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                      |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                        |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 24         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                          |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                         |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                      |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                |
| 25         | PC4      | I/O      | TTL                      | GPIO port C bit 4.                                                          |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | EPI0S2   | I/O      | TTL                      | EPI module 0 signal 2.                                                      |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                       |
| 26         | PA0      | I/O      | TTL                      | GPIO port A bit 0.                                                          |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | U0Rx     | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 27         | PA1        | I/O      | TTL                      | GPIO port A bit 1.                                                          |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | U0Tx       | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 28         | PA2        | I/O      | TTL                      | GPIO port A bit 2.                                                          |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI0Clk    | I/O      | TTL                      | SSI module 0 clock                                                          |
| 29         | PA3        | I/O      | TTL                      | GPIO port A bit 3.                                                          |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI0Fss    | I/O      | TTL                      | SSI module 0 frame signal                                                   |
| 30         | PA4        | I/O      | TTL                      | GPIO port A bit 4.                                                          |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                       |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | PWM6       | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | SSI0Rx     | I        | TTL                      | SSI module 0 receive                                                        |
| 31         | PA5        | I/O      | TTL                      | GPIO port A bit 5.                                                          |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                        |
|            | SSI0Tx     | O        | TTL                      | SSI module 0 transmit                                                       |
| 32         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 33         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 34         | PA6        | I/O      | TTL                      | GPIO port A bit 6.                                                          |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
| 35         | PA7        | I/O      | TTL                      | GPIO port A bit 7.                                                          |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U1DCD      | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                               |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 36         | PG7       | I/O      | TTL                      | GPIO port G bit 7.                                                                                                                                                                                                                                                        |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                                                                                                                                                                                    |
|            | EPI0S31   | I/O      | TTL                      | EPI module 0 signal 31.                                                                                                                                                                                                                                                   |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                      |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                                                                                                                                                                                                                     |
| 37         | PG6       | I/O      | TTL                      | GPIO port G bit 6.                                                                                                                                                                                                                                                        |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                                                                                                                                                                                              |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                                                                                                                                                                                            |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                      |
|            | PhA1      | I        | TTL                      | QEI module 1 phase A.                                                                                                                                                                                                                                                     |
|            | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                                                                                                                                                                                   |
| 38         | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in . |
| 39         | PJ2       | I/O      | TTL                      | GPIO port J bit 2.                                                                                                                                                                                                                                                        |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                                    |
|            | EPI0S18   | I/O      | TTL                      | EPI module 0 signal 18.                                                                                                                                                                                                                                                   |

|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                          |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 59         | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                          |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame signal.                                                  |
| 60         | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                          |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                         |
| 61         | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                          |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                            |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.               |
| 62         | PH6        | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26    | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                                       |
| 63         | PH5        | I/O      | TTL                      | GPIO port H bit 5.                                                          |
|            | EPI0S11    | I/O      | TTL                      | EPI module 0 signal 11.                                                     |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame signal.                                                  |
| 64         | RST        | I        | TTL                      | System reset input.                                                         |
| 65         | PB3        | I/O      | TTL                      | GPIO port B bit 3.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | Fault3     | I        | TTL                      | PWM Fault 3.                                                                |
|            | I2C0SDA    | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                             |
| 66         | PB0        | I/O      | TTL                      | GPIO port B bit 0. This pin is not 5-V tolerant.                            |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 67         | PB1        | I/O      | TTL                      | GPIO port B bit 1. This pin is not 5-V tolerant.                            |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 68         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 69         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 70         | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                  |
|------------|----------|----------|--------------------------|--------------------------------------------------------------|
| 71         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated. |
| 72         | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                           |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                       |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                       |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                             |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                          |
| 73         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated. |
| 74         | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                       |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                                       |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                          |
| 75         | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                           |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                       |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                       |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                       |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                 |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.         |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame signal.                                   |
| 76         | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                           |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                                      |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                          |
| 77         | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                           |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                            |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                            |
| 78         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                           |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                    |
| 79         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                           |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                          |
|            | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                          |
| 80         | PC0      | I/O      | TTL                      | GPIO port C bit 0.                                           |
|            | SWCLK    | I        | TTL                      | JTAG/SWD CLK.                                                |
|            | TCK      | I        | TTL                      | JTAG/SWD CLK.                                                |
| 81         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                      |
| 82         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                     |
| 83         | PH3      | I/O      | TTL                      | GPIO port H bit 3.                                           |
|            | EPI0S0   | I/O      | TTL                      | EPI module 0 signal 0.                                       |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                 |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                        |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 84         | PH2       | I/O      | TTL                      | GPIO port H bit 2.                                                                                                                                                                                                                                                                                                          |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                                                                                                 |
|            | EPI0S1    | I/O      | TTL                      | EPI module 0 signal 1.                                                                                                                                                                                                                                                                                                      |
|            | Fault3    | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                                                                                                |
|            | IDX1      | I        | TTL                      | QEI module 1 index.                                                                                                                                                                                                                                                                                                         |
| 85         | PH1       | I/O      | TTL                      | GPIO port H bit 1.                                                                                                                                                                                                                                                                                                          |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                                                                                                                                                                                                                                      |
|            | EPI0S7    | I/O      | TTL                      | EPI module 0 signal 7.                                                                                                                                                                                                                                                                                                      |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                                        |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                                        |
| 86         | PH0       | I/O      | TTL                      | GPIO port H bit 0.                                                                                                                                                                                                                                                                                                          |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                                                                      |
|            | EPI0S6    | I/O      | TTL                      | EPI module 0 signal 6.                                                                                                                                                                                                                                                                                                      |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                                        |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                                        |
| 87         | PJ1       | I/O      | TTL                      | GPIO port J bit 1.                                                                                                                                                                                                                                                                                                          |
|            | EPI0S17   | I/O      | TTL                      | EPI module 0 signal 17.                                                                                                                                                                                                                                                                                                     |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                                                                                                                                                                                             |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                                                                                                                                                                                                                                        |
| 88         | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in .                                                   |
| 89         | PB7       | I/O      | TTL                      | GPIO port B bit 7.                                                                                                                                                                                                                                                                                                          |
|            | NMI       | I        | TTL                      | Non-maskable interrupt.                                                                                                                                                                                                                                                                                                     |

|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                                                                                                                                                                                                                                                   |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                         |
|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 . |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 91         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                         |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S22  | I/O      | TTL                      | EPI module 0 signal 22.                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 92         | PB4      | I/O      | TTL                      | GPIO port B bit 4.                                                          |
|            | AIN10    | I        | Analog                   | Analog-to-digital converter input 10.                                       |
|            | C0-      | I        | Analog                   | Analog comparator 0 negative input.                                         |
|            | CAN0Rx   | I        | TTL                      | CAN module 0 receive.                                                       |
|            | EPI0S23  | I/O      | TTL                      | EPI module 0 signal 23.                                                     |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 93         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 94         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 95         | PE2      | I/O      | TTL                      | GPIO port E bit 2.                                                          |
|            | AIN9     | I        | Analog                   | Analog-to-digital converter input 9.                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S24  | I/O      | TTL                      | EPI module 0 signal 24.                                                     |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1     | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                       |
| 96         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                          |

Table 23-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 97         | PD4        | I/O      | TTL                      | GPIO port D bit 4.                                                          |
|            | AIN7       | I        | Analog                   | Analog-to-digital converter input 7.                                        |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI       | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
| 98         | PD5        | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6       | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6        | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5       | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29    | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7        | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4       | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C0o        | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30    | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

### 23.1.2 Signals by Signal Name

Table 23-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                          |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0. |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1. |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2. |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3. |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4. |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5. |

Table 23-3. Signals by Signal Name (continued)

| Pin Name | Pin Number                                         | Pin Mux / Pin Assignment                                                                        | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|----------------------------------------------------|-------------------------------------------------------------------------------------------------|----------|--------------------------|---------------------------------------|
| AIN6     | 98                                                 | PD5                                                                                             | I        | Analog                   | Analog-to-digital converter input 6.  |

It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                                          |
| VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                                                          | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                   |
| VDDA     | 3                                           | fixed                                                          | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 25-2 on page 1127 , regardless of system implementation. |

Table 23-3. Signals by Signal Name (*continued*)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                 |
|----------|------------|--------------------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VDDC     | 38<br>88   | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LDO pin and an external capacitor as specified in .                                                   |
| VREFA    | 90         | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 . |
| WAKE     | 50         | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                            |
| XOSC0    | 52         | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                              |
| XOSC1    | 53         | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                     |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

### 23.1.3 Signals by Function, Except for GPIO

Table 23-4. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                 |
|--------------------|----------|-----------------------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC                | AIN0     | 1                           | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                        |
|                    | AIN1     | 2                           | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                                        |
|                    | AIN2     | 5                           | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                                        |
|                    | AIN3     | 6                           | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                                        |

|                    | AIN15    | 10                          | I        | Analog                   | Analog-to-digital converter input 15.                                                                                                                                                                                                                                                                                       |
|                    | VREFA    | 90                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 . |

This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                                                     |
| Power    | GND      | 9<br>21<br>33<br>45<br>54<br>57<br>69<br>82<br>94 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                 |
|          | GNDA     | 4                                                 | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                        |
|          | LDO      | 7                                                 | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. The LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s).                                                                                       |
|          | VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
|          | VDDA     | 3                                                 | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 25-2 on page 1127, regardless of system implementation. |
|          | VDDC     | 38<br>88                                          | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LDO pin and an external capacitor as specified in .                                                                |

Table 23-4. Signals by Function, Except for GPIO (continued)

| Function                | Pin Name | Pin Number                        | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

### 23.1.4 GPIO Pins and Alternate Functions

Table 23-5. GPIO Pins and Alternate Functions

## 23.2 108-Ball BGA Package Pin Tables

### 23.2.1 Signals by Pin Number

Table 23-7. Signals by Pin Number

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| A1         | PE6       | I/O      | TTL                      | GPIO port E bit 6.                                                          |
|            | AIN1      | I        | Analog                   | Analog-to-digital converter input 1.                                        |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
| A2         | PD7       | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4      | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C00       | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30   | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |
| A3         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29   | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                 |

|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                                                                                                                                                                                                                                                   |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                         |
|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 . |
| A8         | PB7       | I/O      | TTL                      | GPIO port B bit 7.                                                                                                                                                                                                                                                                                                          |

|            | TCK       | I        | TTL                      | JTAG/SWD CLK.                                                                                                                                                                                                                                                                                                               |
| A10        | PC3       | I/O      | TTL                      | GPIO port C bit 3.                                                                                                                                                                                                                                                                                                          |
|            | SW0       | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                                                                                                                                                                                           |
|            | TD0       | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                                                                                                                                                                                           |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| A11        | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                                          |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                            |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                         |
| A12        | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                          |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                      |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame signal.                                                  |
| B1         | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                          |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                        |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                 |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
| B2         | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                          |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| B3         | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                          |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                        |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                    |
| B4         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                          |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                        |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S25  | I/O      | TTL                      | EPI module 0 signal 25.                                                     |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                       |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                      |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| B5         | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                          |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                        |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
| B6         | PJ1      | I/O      | TTL                      | GPIO port J bit 1.                                                          |
|            | EPI0S17  | I/O      | TTL                      | EPI module 0 signal 17.                                                     |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
| B7         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                         |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S22  | I/O      | TTL                      | EPI module 0 signal 22.                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| B8         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                          |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                                   |
| B9         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                          |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                                         |
|            | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                                         |
| B10        | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                                          |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                                                     |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                         |
| B11        | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                                          |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                                                      |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                         |
| B12        | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                |
| C1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                |
| C2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                               |
|------------|------------|----------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C3         | VDDC       | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in .                                                                 |
| C4         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                  |
| C5         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                  |
| C6         | PD5        | I/O      | TTL                      | GPIO port D bit 5.                                                                                                                                                                                                                                                                                                                        |
|            | AIN6       | I        | Analog                   | Analog-to-digital converter input 6.                                                                                                                                                                                                                                                                                                      |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                                                    |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                                                                                                                    |

Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                                              |
| D2         | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                                              |
| D3         | VDDC       | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in .                                                                 |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                   |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| D10        | PH3      | I/O      | TTL                      | GPIO port H bit 3.                                                                                                                                                                                                                            |
|            | EPI0S0   | I/O      | TTL                      | EPI module 0 signal 0.                                                                                                                                                                                                                        |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                  |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                                                                                         |
| D11        | PH2      | I/O      | TTL                      | GPIO port H bit 2.                                                                                                                                                                                                                            |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                   |
|            | EPI0S1   | I/O      | TTL                      | EPI module 0 signal 1.                                                                                                                                                                                                                        |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                  |
|            | IDX1     | I        | TTL                      | QEI module 1 index.                                                                                                                                                                                                                           |
| D12        | PB1      | I/O      | TTL                      | GPIO port B bit 1. This pin is not 5-V tolerant.                                                                                                                                                                                              |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                                                                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                        |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                          |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                   |
| E1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                  |
| E2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                  |
| E3         | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 µF or greater. The LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| E10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                       |
| E11        | PB3      | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                            |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                  |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                  |
|            | I2C0SDA  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                               |
| E12        | PB0      | I/O      | TTL                      | GPIO port B bit 0. This pin is not 5-V tolerant.                                                                                                                                                                                              |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                        |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                          |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                    |
| F1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                  |
| F2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                  |
| F3         | PJ0      | I/O      | TTL                      | GPIO port J bit 0.                                                                                                                                                                                                                            |
|            | EPI0S16  | I/O      | TTL                      | EPI module 0 signal 16.                                                                                                                                                                                                                       |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                                                                              |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                          |
| F10        | PH5      | I/O      | TTL                      | GPIO port H bit 5.                                                                                                                                                                                                                            |
|            | EPI0S11  | I/O      | TTL                      | EPI module 0 signal 11.                                                                                                                                                                                                                       |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                                                                                                                                                                  |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame signal.                                                                                                                                                                                                                    |
| F11        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                      |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| G1         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| G2         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| G3         | PH6       | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26   | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                       |
| G10        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G11        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G12        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H1         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                |
|------------|------------|----------|--------------------------|----------------------------------------------------------------------------|
| H2         | PD2        | I/O      | TTL                      | GPIO port D bit 2.                                                         |
|            | AIN13      | I        | Analog                   | Analog-to-digital converter input 13.                                      |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                     |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                     |
|            | EPI0S20    | I/O      | TTL                      | EPI module 0 signal 20.                                                    |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                       |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation. |
| H3         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                         |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                    |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                     |
| H10        | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                    |
| H11        | RST        | I        | TTL                      | System reset input.                                                        |
| H12        | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                         |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                     |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                     |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                           |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                        |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                       |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.              |
| J1         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                         |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                               |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                    |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                        |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                       |
| J2         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                         |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                               |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                               |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                            |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                       |
| J3         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                   |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                   |
| J11        | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                         |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                       |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                        |
| J12        | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                         |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                       |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame signal.                                                 |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| K1         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                                                                                                                                                                             |
|            | EPI0S13  | I/O      | TTL                      | EPI module 0 signal 13.                                                                                                                                                                                                                        |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                                                                               |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                     |
| K2         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                                                                                                                                                                             |
|            | EPI0S14  | I/O      | TTL                      | EPI module 0 signal 14.                                                                                                                                                                                                                        |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                                                                                                                |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                    |
| K3         | PG4      | I/O      | TTL                      | GPIO port G bit 4.                                                                                                                                                                                                                             |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                         |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                                                                                                                                                        |

|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                   |
| K7         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K8         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K9         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K10        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| K11        | XOSC0    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register. |
| K12        | XOSC1    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                        |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| L1         | PC4       | I/O      | TTL                      | GPIO port C bit 4.                                                          |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | EPI0S2    | I/O      | TTL                      | EPI module 0 signal 2.                                                      |
|            | PwM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
| L2         | PC7       | I/O      | TTL                      | GPIO port C bit 7.                                                          |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | C2-       | I        | Analog                   | Analog comparator 2 negative input.                                         |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S5    | I/O      | TTL                      | EPI module 0 signal 5.                                                      |
|            | PhB0      | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| L3         | PA0       | I/O      | TTL                      | GPIO port A bit 0.                                                          |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | U0Rx      | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| L4         | PA3       | I/O      | TTL                      | GPIO port A bit 3.                                                          |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | PwM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI0Fss   | I/O      | TTL                      | SSI module 0 frame signal                                                   |
| L5         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                                          |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | PwM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive                                                        |
| L6         | PA6       | I/O      | TTL                      | GPIO port A bit 6.                                                          |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PwM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | PwM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                      |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L7         | PG6      | I/O      | TTL                      | GPIO port G bit 6.                                                                                                                                                               |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                                                                                                     |
|            | I2S0RXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                                                                                                   |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                                                                                             |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                                                                                                            |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                                                                                          |
| L8         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                                                                                                               |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                           |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                                                                                          |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                                                                                           |
| L9         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                                                                                                          |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                     |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                                                                                                            |
| L10        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                         |
| L11        | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                              |
| L12        | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply. |
| M1         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                                                                                              |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                                                                                           |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                                                                                                     |
| M2         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                                                                                               |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                                                                                              |
|            | C20      | O        | TTL                      | Analog comparator 2 output.                                                                                                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                                                                                           |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                                                                                             |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                            |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                       |

Table 23-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| M3         | PA1        | I/O      | TTL                      | GPIO port A bit 1.                                                          |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | U0Tx       | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| M4         | PA2        | I/O      | TTL                      | GPIO port A bit 2.                                                          |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI0Clk    | I/O      | TTL                      | SSI module 0 clock                                                          |
| M5         | PA5        | I/O      | TTL                      | GPIO port A bit 5.                                                          |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                        |
|            | SSI0Tx     | O        | TTL                      | SSI module 0 transmit                                                       |
| M6         | PA7        | I/O      | TTL                      | GPIO port A bit 7.                                                          |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U1DCD      | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
| M7         | PG5        | I/O      | TTL                      | GPIO port G bit 5.                                                          |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                |
|            | I2S0RXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                        |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |
| M8         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                          |
|            | C20        | O        | TTL                      | Analog comparator 2 output.                                                 |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                            |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.               |
| M9         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                          |
|            | CAN1Rx     | I        | TTL                      | CAN module 1 receive.                                                       |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                    |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                     |

Table 23-7. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|------------|----------|----------|--------------------------|-------------------------------------------------------------------------------------------|
| M10        | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.          |
| M11        | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source. |
| M12        | HIB      | O        | OD                       | An output that indicates the processor is in Hibernate mode.                              |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 23.2.2 Signals by Signal Name

Table 23-8. Signals by Signal Name

| Pin Name | Pin Number                  | Pin Mux / Pin Assignment                            | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|-----------------------------|-----------------------------------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | B1                          | PE7                                                 | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | A1                          | PE6                                                 | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | B3                          | PE5                                                 | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | B2                          | PE4                                                 | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | A2                          | PD7                                                 | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | A3                          | PD6                                                 | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | C6                          | PD5                                                 | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | B5                          | PD4                                                 | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | B4                          | PE3                                                 | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | A4                          | PE2                                                 | I        | Analog                   | Analog-to-digital converter input 9.  |

| VBAT     | L12                                               | fixed                                    | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                                         |
| VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | fixed                                    | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
| VDDA     | C7                                                | fixed                                    | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 25-2 on page 1127, regardless of system implementation. |
| VDDC     | D3<br>C3                                          | fixed                                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in .                                                                |
| VREFA    | A7                                                | PB6                                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 .              |
| WAKE     | M10                                               | fixed                                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                                         |
| XOSC0    | K11                                               | fixed                                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the HIBCTL register.                                                                                                  |
| XOSC1    | K12                                               | fixed                                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                                  |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

### 23.2.3 Signals by Function, Except for GPIO

Table 23-9. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                 |
|--------------------|----------|-----------------------------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC                | AIN0     | B1                          | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                        |

|                    | VREFA    | A7                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 4095. The VREFA input is limited to the range specified in Table 25-26 on page 1144 . |

This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                                                     |
|          | PWM7     | M2<br>M5<br>C10<br>M7                                   | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                                                     |
| Power    | GND      | C4<br>C5<br>J3<br>K5<br>L10<br>K10<br>J10<br>F11<br>F12 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                 |
|          | GNDA     | A5                                                      | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                        |
|          | LD0      | E3                                                      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. The LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s).                                                                                       |
|          | VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
|          | VDDA     | C7                                                      | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 25-2 on page 1127, regardless of system implementation. |
|          | VDDC     | D3<br>C3                                                | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.3 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to the LD0 pin and an external capacitor as specified in .                                                                |

Table 23-9. Signals by Function, Except for GPIO (continued)

| Function                | Pin Name | Pin Number                        | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 23.2.4 GPIO Pins and Alternate Functions

Table 23-10. GPIO Pins and Alternate Functions

## 23.3 Connections for Unused Signals

Table 23-12 on page 1124 shows how to handle signals for functions that are not used in a particular system implementation for devices that are in a 100-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 23-12. Connections for Unused Signals (100-Pin LQFP)

| Function       | Signal Name      | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|------------------|------------|--------------------------------------------|----------------------------------------------------------------|
| GPIO           | All unused GPIOs | -          | NC                                         | GND                                                            |
| Hibernate      | HIB              | 51         | NC                                         | NC                                                             |

|                | RST              | H11        | Pull up as shown in Figure 5-1 on page 184 | Connect through a capacitor to GND as close to pin as possible |

## 24 Operating Characteristics

**Table 24-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 24-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                         | Unit |
|-------------------------------------------------------|---------------|-------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 33 (100LQFP)<br>31 (108BGA)   | °C/W |
| Junction temperature, -40 to +125 <sup>b</sup>        | $T_J$         | $T_A + (P \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 24-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 500 | V    |

a. All Stellaris<sup>®</sup> parts are ESD tested following the JEDEC standard.

## 25 Electrical Characteristics

### 25.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Device reliability may be adversely affected by exposure to absolute-maximum ratings for extended periods.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 25-1. Maximum Ratings**

| Parameter             | Parameter Name <sup>a</sup>                                                    | Value |                       | Unit |
|-----------------------|--------------------------------------------------------------------------------|-------|-----------------------|------|
|                       |                                                                                | Min   | Max                   |      |
| V <sub>DD</sub>       | V <sub>DD</sub> supply voltage                                                 | 0     | 4                     | V    |
| V <sub>DDA</sub>      | V <sub>DDA</sub> supply voltage                                                | 0     | 4                     | V    |
| V <sub>BAT</sub>      | V <sub>BAT</sub> battery supply voltage                                        | 0     | 4                     | V    |
| V <sub>IN_GPIO</sub>  | Input voltage <sup>b</sup>                                                     | -0.3  | 5.5                   | V    |
|                       | Input voltage for PB0 and PB1 when configured as GPIO                          | -0.3  | V <sub>DD</sub> + 0.3 | V    |
| I <sub>GPIO MAX</sub> | Maximum current per output pin                                                 | -     | 25                    | mA   |
| V <sub>NON</sub>      | Maximum input voltage on a non-power pin when the microcontroller is unpowered | -     | 300                   | mV   |

a. Voltages are measured with respect to GND.

b. Applies to static and dynamic signals including overshoot.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (see “Connections for Unused Signals” on page 1124).

### 25.2 Recommended Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the V<sub>OL</sub> value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 25-2. Recommended DC Operating Conditions**

| Parameter        | Parameter Name                            | Min   | Nom | Max   | Unit |
|------------------|-------------------------------------------|-------|-----|-------|------|
| V <sub>DD</sub>  | V <sub>DD</sub> supply voltage            | 3.0   | 3.3 | 3.6   | V    |
| V <sub>DDA</sub> | V <sub>DDA</sub> supply voltage           | 3.0   | 3.3 | 3.6   | V    |
| V <sub>DDC</sub> | V <sub>DDC</sub> supply voltage, run mode | 1.235 | 1.3 | 1.365 | V    |
| V <sub>IH</sub>  | High-level input voltage                  | 2.1   | -   | 5.0   | V    |
| V <sub>IL</sub>  | Low-level input voltage                   | -0.3  | -   | 1.2   | V    |

Table 25-2. Recommended DC Operating Conditions (continued)

| Parameter | Parameter Name                                     | Min  | Nom | Max | Unit |
|-----------|----------------------------------------------------|------|-----|-----|------|
| $V_{OH}$  | High-level output voltage                          | 2.4  | -   | -   | V    |
| $V_{OL}$  | Low-level output voltage                           | -    | -   | 0.4 | V    |
| $I_{OH}$  | High-level source current, $V_{OH}=2.4\text{ V}^a$ |      |     |     |      |
|           | 2-mA Drive                                         | -2.0 | -   | -   | mA   |
|           | 4-mA Drive                                         | -4.0 | -   | -   | mA   |
|           | 8-mA Drive                                         | -8.0 | -   | -   | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4\text{ V}^a$    |      |     |     |      |
|           | 2-mA Drive                                         | 2.0  | -   | -   | mA   |
|           | 4-mA Drive                                         | 4.0  | -   | -   | mA   |
|           | 8-mA Drive                                         | 8.0  | -   | -   | mA   |
|           | 8-mA Drive, $V_{OL}=1.2\text{ V}$                  | 18.0 | -   | -   | mA   |

a.  $I_O$  specifications reflect the maximum current where the corresponding output voltage meets the  $V_{OH}/V_{OL}$  thresholds.  $I_O$  current can exceed these limits (subject to absolute maximum ratings).

## 25.3 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

Figure 25-1. Load Conditions

## 25.4 JTAG and Boundary Scan

Table 25-3. JTAG Characteristics

| Parameter No. | Parameter       | Parameter Name                               | Min | Nom         | Max | Unit |
|---------------|-----------------|----------------------------------------------|-----|-------------|-----|------|
| J1            | $F_{TCK}$       | TCK operational clock frequency <sup>a</sup> | 0   | -           | 10  | MHz  |
| J2            | $T_{TCK}$       | TCK operational clock period                 | 100 | -           | -   | ns   |
| J3            | $T_{TCK\_LOW}$  | TCK clock Low time                           | -   | $t_{TCK}/2$ | -   | ns   |
| J4            | $T_{TCK\_HIGH}$ | TCK clock High time                          | -   | $t_{TCK}/2$ | -   | ns   |
| J5            | $T_{TCK\_R}$    | TCK rise time                                | 0   | -           | 10  | ns   |
| J6            | $T_{TCK\_F}$    | TCK fall time                                | 0   | -           | 10  | ns   |
| J7            | $T_{TMS\_SU}$   | TMS setup time to TCK rise                   | 20  | -           | -   | ns   |
| J8            | $T_{TMS\_HLD}$  | TMS hold time from TCK rise                  | 20  | -           | -   | ns   |
| J9            | $T_{TDI\_SU}$   | TDI setup time to TCK rise                   | 25  | -           | -   | ns   |
| J10           | $T_{TDI\_HLD}$  | TDI hold time from TCK rise                  | 25  | -           | -   | ns   |

Table 25-3. JTAG Characteristics (continued)

| Parameter No. | Parameter      | Parameter Name                                                            | Min | Nom | Max | Unit |
|---------------|----------------|---------------------------------------------------------------------------|-----|-----|-----|------|
| J11           | $T_{TDO\_ZDV}$ | TCK fall to Data Valid from High-Z, 2-mA drive                            | -   | 23  | 35  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 4-mA drive                            |     | 15  | 26  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 8-mA drive                            |     | 14  | 25  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 8-mA drive with slew rate control     |     | 18  | 29  | ns   |
| J12           | $T_{TDO\_DV}$  | TCK fall to Data Valid from Data Valid, 2-mA drive                        | -   | 21  | 35  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 4-mA drive                        |     | 14  | 25  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 8-mA drive                        |     | 13  | 24  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 8-mA drive with slew rate control |     | 18  | 28  | ns   |
| J13           | $T_{TDO\_DVZ}$ | TCK fall to High-Z from Data Valid, 2-mA drive                            | -   | 9   | 11  | ns   |
|               |                | TCK fall to High-Z from Data Valid, 4-mA drive                            |     | 7   | 9   | ns   |
|               |                | TCK fall to High-Z from Data Valid, 8-mA drive                            |     | 6   | 8   | ns   |
|               |                | TCK fall to High-Z from Data Valid, 8-mA drive with slew rate control     |     | 7   | 9   | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

## 25.7 On-Chip Low Drop-Out (LDO) Regulator

Table 25-6. LDO Regulator Characteristics

| Parameter | Parameter Name                                                        | Min   | Nom | Max   | Unit          |
|-----------|-----------------------------------------------------------------------|-------|-----|-------|---------------|
| $C_{LDO}$ | External filter capacitor size for internal power supply <sup>a</sup> | 1.0   | -   | 3.0   | $\mu\text{F}$ |
| $V_{LDO}$ | LDO output voltage                                                    | 1.235 | 1.3 | 1.365 | V             |

a. The capacitor should be connected as close as possible to pin 86.

## 25.8 Clocks

The following sections provide specifications on the various clock sources and mode.

### 25.8.1 PLL Specifications

The following tables provide specifications for using the PLL.

Table 25-7. Phase Locked Loop (PLL) Characteristics

| Parameter       | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------|---------------------------------------|--------------------|-----|-------------------|------|
| $F_{REF\_XTAL}$ | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| $F_{REF\_EXT}$  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| $F_{PLL}$       | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| $T_{READY}$     | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 25-8 on page 1133 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 25-8. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |
| 0x09 | 5.0                     | 400                 | -       |
| 0x0A | 5.12                    | 399.36              | 0.0016% |
| 0x0B | 6.0                     | 400                 | -       |
| 0x0C | 6.144                   | 399.36              | 0.0016% |
| 0x0D | 7.3728                  | 398.1312            | 0.0047% |
| 0x0E | 8.0                     | 400                 | -       |
| 0x0F | 8.192                   | 398.6773333         | 0.0033% |
| 0x10 | 10.0                    | 400                 | -       |
| 0x11 | 12.0                    | 400                 | -       |
| 0x12 | 12.288                  | 401.408             | 0.0035% |
| 0x13 | 13.56                   | 397.76              | 0.0056% |
| 0x14 | 14.318                  | 400.90904           | 0.0023% |
| 0x15 | 16.0                    | 400                 | -       |

## 25.8.2 PIOSC Specifications

**Table 25-9. PIOSC Clock Characteristics**

| Parameter              | Parameter Name                                                                                                           | Min | Nom    | Max | Unit |
|------------------------|--------------------------------------------------------------------------------------------------------------------------|-----|--------|-----|------|
| F <sub>PIOSC25</sub>   | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C                                     | -   | ±0.25% | ±1% | -    |
| F <sub>PIOSCT</sub>    | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C, across specified temperature range | -   | -      | ±3% | -    |
| F <sub>PIOSCUCAL</sub> | Internal 16-MHz precision oscillator frequency variance, user calibrated at a chosen temperature                         | -   | ±0.25% | ±1% | -    |

## 25.8.3 Internal 30-kHz Oscillator Specifications

**Table 25-10. 30-kHz Clock Characteristics**

| Parameter              | Parameter Name                       | Min | Nom | Max | Unit |
|------------------------|--------------------------------------|-----|-----|-----|------|
| F <sub>IOSC30KHZ</sub> | Internal 30-KHz oscillator frequency | 15  | 30  | 45  | KHz  |

## 25.8.4 Hibernation Clock Source Specifications

**Table 25-11. Hibernation Clock Characteristics**

| Parameter                 | Parameter Name                                   | Min | Nom      | Max | Unit |
|---------------------------|--------------------------------------------------|-----|----------|-----|------|
| F <sub>HIBOSC</sub>       | Hibernation module oscillator frequency          | -   | 4.194304 | -   | MHz  |
| F <sub>HIBOSC_XTAL</sub>  | Crystal reference for hibernation oscillator     | -   | 4.194304 | -   | MHz  |
| T <sub>HIBOSC_START</sub> | Hibernation oscillator startup time <sup>a</sup> | -   | -        | 10  | ms   |
| F <sub>HIBOSC_EXT</sub>   | External clock reference for hibernation module  | -   | 32.768   | -   | KHz  |
| DC <sub>HIBOSC_EXT</sub>  | External clock reference duty cycle              | 45  | -        | 55  | %    |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

**Table 25-12. HIB Oscillator Input Characteristics**

| Parameter             | Parameter Name                             | Min | Nom                                          | Max | Unit |
|-----------------------|--------------------------------------------|-----|----------------------------------------------|-----|------|
| F <sub>HIBOSC</sub>   | Hibernation module oscillator frequency    | -   | 4.194304                                     | -   | MHz  |
| TOL <sub>HIBOSC</sub> | Hibernation oscillator frequency tolerance | -   | Defined by customer application requirements | -   | PPM  |

## 25.8.5 Main Oscillator Specifications

**Table 25-13. Main Oscillator Clock Characteristics**

| Parameter                    | Parameter Name                                                                | Min  | Nom | Max    | Unit |
|------------------------------|-------------------------------------------------------------------------------|------|-----|--------|------|
| F <sub>MOSC</sub>            | Main oscillator frequency                                                     | 1    | -   | 16.384 | MHz  |
| T <sub>MOSC_PER</sub>        | Main oscillator period                                                        | 61   | -   | 1000   | ns   |
| T <sub>MOSC_SETTLE</sub>     | Main oscillator settling time <sup>a</sup>                                    | 17.5 | -   | 20     | ms   |
| F <sub>REF_XTAL_BYPASS</sub> | Crystal reference using the main oscillator (PLL in BYPASS mode) <sup>b</sup> | 1    | -   | 16.384 | MHz  |
| F <sub>REF_EXT_BYPASS</sub>  | External clock reference (PLL in BYPASS mode) <sup>b</sup>                    | 0    | -   | 50     | MHz  |
| DC <sub>MOSC_EXT</sub>       | External clock reference duty cycle                                           | 45   | -   | 55     | %    |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

b. If the ADC is used, the crystal reference must be 16 MHz ± .03% when the PLL is bypassed.

**Table 25-14. Supported MOSC Crystal Frequencies**

| Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|-------------------------------------------|---------------------------------------|
| 1.000 MHz                                 | reserved                              |
| 1.8432 MHz                                | reserved                              |
| 2.000 MHz                                 | reserved                              |
| 2.4576 MHz                                | reserved                              |
| 3.579545 MHz                              |                                       |
| 3.6864 MHz                                |                                       |
| 4 MHz                                     |                                       |
| 4.096 MHz                                 |                                       |

Table 25-14. Supported MOSC Crystal Frequencies (continued)

| Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|-------------------------------------------|---------------------------------------|
| 4.9152 MHz                                |                                       |
| 5 MHz                                     |                                       |
| 5.12 MHz                                  |                                       |
| 6 MHz (reset value)                       |                                       |
| 6.144 MHz                                 |                                       |
| 7.3728 MHz                                |                                       |
| 8 MHz                                     |                                       |
| 8.192 MHz                                 |                                       |
| 10.0 MHz                                  |                                       |
| 12.0 MHz                                  |                                       |
| 12.288 MHz                                |                                       |
| 13.56 MHz                                 |                                       |
| 14.31818 MHz                              |                                       |
| 16.0 MHz                                  |                                       |
| 16.384 MHz                                |                                       |

## 25.8.6 System Clock Specification with ADC Operation

Table 25-15. System Clock Characteristics with ADC Operation

| Parameter           | Parameter Name                                                                               | Min     | Nom | Max     | Unit |
|---------------------|----------------------------------------------------------------------------------------------|---------|-----|---------|------|
| F <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed). <sup>a</sup> | 15.9952 | 16  | 16.0048 | MHz  |

a. Clock frequency (plus jitter) must be stable inside specified range. ADC can be clocked from the PLL or directly from an external clock source, as long as frequency absolute precision is inside specified range.

## 25.9 Sleep Modes

Table 25-16. Sleep Modes AC Characteristics<sup>a</sup>

| Parameter No | Parameter               | Parameter Name                                                                          | Min | Nom | Max                | Unit          |
|--------------|-------------------------|-----------------------------------------------------------------------------------------|-----|-----|--------------------|---------------|
| D1           | T <sub>WAKE_S</sub>     | Time to wake from interrupt in sleep mode, not using the PLL <sup>b</sup>               | -   | -   | 2                  | system clocks |
|              | T <sub>WAKE_DS</sub>    | Time to wake from interrupt deep-sleep mode, not using the PLL <sup>b</sup>             | -   | -   | 7                  | system clocks |
| D2           | T <sub>WAKE_PLL_S</sub> | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL <sup>b</sup> | -   | -   | T <sub>READY</sub> | ms            |
| D3           | T <sub>ENTER_DS</sub>   | Time to enter deep-sleep mode from sleep request                                        | -   | 0   | 35 <sup>c</sup>    | ms            |

a. Values in this table assume the IOSCS is the clock source during sleep or deep-sleep mode.

b. Specified from registering the interrupt to first instruction.

c. Nominal specification occurs 99.9995% of the time.

## 25.10 Hibernation Module

The Hibernation module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 287.

Table 25-17. Hibernation Module Battery Characteristics

| Parameter           | Parameter Name             | Min | Nominal | Max | Unit |
|---------------------|----------------------------|-----|---------|-----|------|
| V <sub>BAT</sub>    | Battery supply voltage     | 2.4 | 3.0     | 3.6 | V    |
| V <sub>LOWBAT</sub> | Low battery detect voltage | 1.8 | -       | 2.2 | V    |

Table 25-18. Hibernation Module AC Characteristics

| Parameter No | Parameter                   | Parameter Name                                                                                                       | Min | Nom | Max             | Unit |
|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------|-----|-----|-----------------|------|
| H1           | T <sub>HIB_LOW</sub>        | Internal 32.768 KHz clock reference rising edge to HIB asserted                                                      | 20  | -   | -               | μs   |
| H2           | T <sub>HIB_HIGH</sub>       | Internal 32.768 KHz clock reference rising edge to HIB deasserted                                                    | -   | 30  | -               | μs   |
| H3           | T <sub>WAKE_TO_HIB</sub>    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator running during hibernation <sup>a</sup> | 62  | -   | 124             | μs   |
| H4           | T <sub>WAKE_TO_HIB</sub>    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator stopped during hibernation <sup>a</sup> | -   | -   | 10              | ms   |
| H5           | T <sub>WAKE_CLOCK</sub>     | WAKE assertion time, internal Hibernation oscillator running during hibernation                                      | 62  | -   | -               | μs   |
| H6           | T <sub>WAKE_NOCLOCK</sub>   | WAKE assertion time, internal Hibernation oscillator stopped during hibernation <sup>b</sup>                         | 10  | -   | -               | ms   |
| H7           | T <sub>HIB_REG_ACCESS</sub> | Time required for a write to a non-volatile register in the HIB module to complete                                   | 92  | -   | -               | μs   |
| H8           | T <sub>HIB_TO_HIB</sub>     | HIB high time between assertions                                                                                     | 100 | -   | -               | ms   |
| H9           | T <sub>ENTER_HIB</sub>      | Time to enter Hibernate mode from hibernation request                                                                | -   | 0   | 35 <sup>c</sup> | ms   |

a. Code begins executing after the time period specified by T<sub>IRPOR</sub> following the deassertion of HIB.

b. This mode is used when the PINWEN bit is set and the RTCEN bit is clear in the HIBCTL register.

c. Nominal specification occurs 99.998% of the time.

Figure 25-11. Hibernation Module Timing with Internal Oscillator Running in Hibernation

**Figure 25-12. Hibernation Module Timing with Internal Oscillator Stopped in Hibernation**

## 25.11 Flash Memory

**Table 25-19. Flash Memory Characteristics**

| Parameter          | Parameter Name                                                        | Min    | Nom | Max | Unit   |
|--------------------|-----------------------------------------------------------------------|--------|-----|-----|--------|
| PE <sub>CYC</sub>  | Number of guaranteed program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| T <sub>RET</sub>   | Data retention, -40°C to +85°C                                        | 10     | -   | -   | years  |
| T <sub>PROG</sub>  | Word program time                                                     | -      | -   | 1   | ms     |
| T <sub>BPROG</sub> | Buffer program time                                                   | -      | -   | 1   | ms     |
| T <sub>ERASE</sub> | Page erase time                                                       | -      | -   | 12  | ms     |
| T <sub>ME</sub>    | Mass erase time                                                       | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

## 25.12 Input/Output Characteristics

**Note:** All GPIO signals are 5-V tolerant when configured as inputs except for PB0 and PB1, which are limited to 3.6 V. See “Signal Description” on page 419 for more information on GPIO configuration.

**Table 25-20. GPIO Module Characteristics<sup>a</sup>**

| Parameter           | Parameter Name                                                 | Min | Nom | Max | Unit |
|---------------------|----------------------------------------------------------------|-----|-----|-----|------|
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor                                 | 100 | -   | 300 | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor                               | 200 | -   | 500 | kΩ   |
| I <sub>LKG</sub>    | GPIO input leakage current <sup>b</sup>                        | -   | -   | 2   | μA   |
| T <sub>GPIOR</sub>  | GPIO rise time, 2-mA drive <sup>c</sup>                        | -   | 14  | 20  | ns   |
|                     | GPIO rise time, 4-mA drive <sup>c</sup>                        |     | 7   | 10  | ns   |
|                     | GPIO rise time, 8-mA drive <sup>c</sup>                        |     | 4   | 5   | ns   |
|                     | GPIO rise time, 8-mA drive with slew rate control <sup>c</sup> |     | 6   | 8   | ns   |
| T <sub>GPIOF</sub>  | GPIO fall time, 2-mA drive <sup>d</sup>                        | -   | 14  | 21  | ns   |
|                     | GPIO fall time, 4-mA drive <sup>d</sup>                        |     | 7   | 11  | ns   |
|                     | GPIO fall time, 8-mA drive <sup>d</sup>                        |     | 4   | 6   | ns   |
|                     | GPIO fall time, 8-mA drive with slew rate control <sup>d</sup> |     | 6   | 8   | ns   |

a. V<sub>DD</sub> must be within the range specified in Table 25-2 on page 1127.

b. The leakage current is measured with GND or V<sub>DD</sub> applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pullup/pulldown resistor is disabled.

c. Time measured from 20% to 80% of V<sub>DD</sub>.

d. Time measured from 80% to 20% of  $V_{DD}$ .

## 25.13 External Peripheral Interface (EPI)

When the EPI module is in SDRAM mode, the drive strength must be configured to 8 mA. Table 25-21 on page 1138 shows the rise and fall times in SDRAM mode with 16 pF load conditions. When the EPI module is in Host-Bus or General-Purpose mode, the values in “Input/Output Characteristics” on page 1137 should be used.

**Table 25-21. EPI SDRAM Characteristics**

| Parameter    | Parameter Name                               | Condition                 | Min | Nom | Max | Unit |
|--------------|----------------------------------------------|---------------------------|-----|-----|-----|------|
| $T_{SDRAMR}$ | EPI Rise Time (from 20% to 80% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |
| $T_{SDRAMF}$ | EPI Fall Time (from 80% to 20% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |

**Table 25-22. EPI SDRAM Interface Characteristics<sup>a</sup>**

| Parameter No | Parameter | Parameter Name         | Min | Nom | Max | Unit    |
|--------------|-----------|------------------------|-----|-----|-----|---------|
| E1           | $T_{CK}$  | SDRAM Clock period     | 20  | -   | -   | ns      |
| E2           | $T_{CH}$  | SDRAM Clock high time  | 10  | -   | -   | ns      |
| E3           | $T_{CL}$  | SDRAM Clock low time   | 10  | -   | -   | ns      |
| E4           | $T_{COV}$ | CLK to output valid    | -5  | -   | 5   | ns      |
| E5           | $T_{COI}$ | CLK to output invalid  | -5  | -   | 5   | ns      |
| E6           | $T_{COT}$ | CLK to output tristate | -5  | -   | 5   | ns      |
| E7           | $T_S$     | Input set up to CLK    | 10  | -   | -   | ns      |
| E8           | $T_H$     | CLK to input hold      | 0   | -   | -   | ns      |
| E9           | $T_{PU}$  | Power-up time          | 100 | -   | -   | $\mu$ s |
| E10          | $T_{RP}$  | Precharge all banks    | 20  | -   | -   | ns      |
| E11          | $T_{RFC}$ | Auto refresh           | 66  | -   | -   | ns      |
| E12          | $T_{MRD}$ | Program mode register  | 40  | -   | -   | ns      |

a. The EPI SDRAM interface must use 8-mA drive.

## 25.14 Analog-to-Digital Converter (ADC)

**Table 25-25. ADC Characteristics<sup>a</sup>**

| Parameter            | Parameter Name                                                                  | Min     | Nom | Max                 | Unit          |
|----------------------|---------------------------------------------------------------------------------|---------|-----|---------------------|---------------|
| $V_{\text{ADCIN}}$   | Maximum single-ended, full-scale analog input voltage, using internal reference | -       | -   | 3.0                 | V             |
|                      | Maximum single-ended, full-scale analog input voltage, using external reference | -       | -   | $V_{\text{REFA}}$   | V             |
|                      | Minimum single-ended, full-scale analog input voltage                           | 0.0     | -   | -                   | V             |
|                      | Maximum differential, full-scale analog input voltage, using internal reference | -       | -   | 1.5                 | V             |
|                      | Maximum differential, full-scale analog input voltage, using external reference | -       | -   | $V_{\text{REFA}}/2$ | V             |
|                      | Minimum differential, full-scale analog input voltage                           | 0.0     | -   | -                   | V             |
| N                    | Resolution                                                                      | 12      |     |                     | bits          |
| $F_{\text{ADC}}$     | ADC internal clock frequency <sup>b</sup>                                       | 15.9952 | 16  | 16.0048             | MHz           |
| $T_{\text{ADCCONV}}$ | Conversion time <sup>c</sup>                                                    | 1       |     |                     | μs            |
| $F_{\text{ADCCONV}}$ | Conversion rate <sup>c</sup>                                                    | 1000    |     |                     | k samples/s   |
| $T_{\text{ADCSAMP}}$ | Sample time                                                                     | 125     | -   | -                   | ns            |
| $T_{\text{LT}}$      | Latency from trigger to start of conversion                                     | -       | 2   | -                   | system clocks |
| $I_{\text{L}}$       | ADC input leakage                                                               | -       | -   | 2.0                 | μA            |
| $R_{\text{ADC}}$     | ADC equivalent resistance                                                       | -       | -   | 10                  | kΩ            |
| $C_{\text{ADC}}$     | ADC equivalent capacitance                                                      | 0.9     | 1.0 | 1.1                 | pF            |
| $E_{\text{L}}$       | Integral nonlinearity (INL) error, 12-bit mode                                  | -       | -   | ±8                  | LSB           |
|                      | Integral nonlinearity (INL) error, 10-bit mode                                  | -       | -   | ±2                  | LSB           |
| $E_{\text{D}}$       | Differential nonlinearity (DNL) error, 12-bit mode                              | -       | -   | ±4                  | LSB           |
|                      | Differential nonlinearity (DNL) error, 10-bit mode                              | -       | -   | ±2                  | LSB           |
| $E_{\text{O}}$       | Offset error, 12-bit mode                                                       | -       | -   | ±40                 | LSB           |
|                      | Offset error, 10-bit mode                                                       | -       | -   | ±10                 | LSB           |
| $E_{\text{G}}$       | Full-scale gain error, 12-bit mode                                              | -       | -   | ±100                | LSB           |
|                      | Full-scale gain error, 10-bit mode                                              | -       | -   | ±25                 | LSB           |
| $E_{\text{TS}}$      | Temperature sensor accuracy <sup>d</sup>                                        | -       | -   | ±5                  | °C            |

a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 VDDA supply by a band gap circuit.

b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.

c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

d. Note that this parameter does not include ADC error.

Figure 25-22. ADC Input Equivalency Diagram

Table 25-26. ADC Module External Reference Characteristics<sup>a</sup>

| Parameter  | Parameter Name                                                                                            | Min  | Nom | Max  | Unit    |
|------------|-----------------------------------------------------------------------------------------------------------|------|-----|------|---------|
| $V_{REFA}$ | External voltage reference for ADC, when the VREF field in the <b>ADCCTL</b> register is 0x1 <sup>b</sup> | 2.97 | -   | 3.03 | V       |
|            | External voltage reference for ADC, when the VREF field in the <b>ADCCTL</b> register is 0x3 <sup>c</sup> | 0.99 | -   | 1.01 | V       |
| $I_L$      | External voltage reference leakage current                                                                | -    | -   | 2.0  | $\mu A$ |

a. Care must be taken to supply a reference voltage of acceptable quality.

b. Ground is always used as the reference level for the minimum conversion value.

c. Ground is always used as the reference level for the minimum conversion value.

Table 25-27. ADC Module Internal Reference Characteristics

| Parameter  | Parameter Name                     | Min | Nom | Max | Unit |
|------------|------------------------------------|-----|-----|-----|------|
| $V_{REFI}$ | Internal voltage reference for ADC | -   | 3.0 | -   | V    |

## 25.15 Synchronous Serial Interface (SSI)

Table 25-28. SSI Characteristics

| Parameter No. | Parameter       | Parameter Name                     | Min | Nom | Max | Unit          |
|---------------|-----------------|------------------------------------|-----|-----|-----|---------------|
| S1            | $T_{CLK\_PER}$  | SSIClk cycle time <sup>a</sup>     | 40  | -   | -   | ns            |
| S2            | $T_{CLK\_HIGH}$ | SSIClk high time                   | -   | 0.5 | -   | t clk_per     |
| S3            | $T_{CLK\_LOW}$  | SSIClk low time                    | -   | 0.5 | -   | t clk_per     |
| S4            | $T_{CLKRF}$     | SSIClk rise/fall time <sup>b</sup> | -   | 4   | 6   | ns            |
| S5            | $T_{DMD}$       | Data from master valid delay time  | 0   | -   | 1   | system clocks |
| S6            | $T_{DMS}$       | Data from master setup time        | 1   | -   | -   | system clocks |
| S7            | $T_{DMH}$       | Data from master hold time         | 2   | -   | -   | system clocks |

Table 25-28. SSI Characteristics (*continued*)

| Parameter No. | Parameter | Parameter Name             | Min | Nom | Max | Unit          |
|---------------|-----------|----------------------------|-----|-----|-----|---------------|
| S8            | $T_{DSS}$ | Data from slave setup time | 1   | -   | -   | system clocks |
| S9            | $T_{DSH}$ | Data from slave hold time  | 2   | -   | -   | system clocks |

a. In master mode, the system clock must be at least twice as fast as the SSIClk; in slave mode, the system clock must be at least 12 times faster than the SSIClk.

b. Note that the delays shown are using 8-mA drive strength.

Table 25-29. I<sup>2</sup>C Characteristics

| Parameter No.   | Parameter         | Parameter Name                                                               | Min | Nom | Max          | Unit          |
|-----------------|-------------------|------------------------------------------------------------------------------|-----|-----|--------------|---------------|
| 11 <sup>a</sup> | T <sub>SCH</sub>  | Start condition hold time                                                    | 36  | -   | -            | system clocks |
| 12 <sup>a</sup> | T <sub>LP</sub>   | Clock Low period                                                             | 36  | -   | -            | system clocks |
| 13 <sup>b</sup> | T <sub>SRT</sub>  | I2CSCL/I2CSDA rise time (V <sub>IL</sub> = 0.5 V to V <sub>IH</sub> = 2.4 V) | -   | -   | (see note b) | ns            |
| 14 <sup>a</sup> | T <sub>DH</sub>   | Data hold time                                                               | 2   | -   | -            | system clocks |
| 15 <sup>c</sup> | T <sub>SFT</sub>  | I2CSCL/I2CSDA fall time (V <sub>IH</sub> = 2.4 V to V <sub>IL</sub> = 0.5 V) | -   | 9   | 10           | ns            |
| 16 <sup>a</sup> | T <sub>HT</sub>   | Clock High time                                                              | 24  | -   | -            | system clocks |
| 17 <sup>a</sup> | T <sub>DS</sub>   | Data setup time                                                              | 18  | -   | -            | system clocks |
| 18 <sup>a</sup> | T <sub>SCSR</sub> | Start condition setup time (for repeated start condition only)               | 36  | -   | -            | system clocks |
| 19 <sup>a</sup> | T <sub>SCS</sub>  | Stop condition setup time                                                    | 24  | -   | -            | system clocks |

a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.

b. Because I2CSCL and I2CSDA operate as open-drain-type signals, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.

c. Specified at a nominal 50 pF load.

## 25.19 Current Consumption

This section provides information on typical and maximum power consumption under various conditions. Unless otherwise indicated, current consumption numbers include use of the on-chip LDO regulator and therefore include I<sub>DDC</sub>.

### 25.19.1 Nominal Power Consumption

The following table provides nominal figures for current consumption.

Table 25-36. Nominal Power Consumption

| Parameter                 | Parameter Name                                                              | Conditions                                                                                                                                             | Nom | Unit |
|---------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------|
| I <sub>DD_RUN</sub>       | Run mode 1 (Flash loop)                                                     | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed out of Flash<br>Peripherals = All ON<br>System Clock = 80 MHz (with PLL)<br>Temp = 25°C           | 90  | mA   |
| I <sub>DD_SLEEP</sub>     | Sleep mode                                                                  | V <sub>DD</sub> = 3.3 V<br>Peripherals = All clock gated<br>System Clock = 80 MHz (with PLL)<br>Temp = 25°C                                            | 20  | mA   |
| I <sub>DD_DEEPSLEEP</sub> | Deep-sleep mode                                                             | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                                     | 550 | µA   |
| I <sub>HIB_NORTC</sub>    | Hibernate mode (external wake, RTC disabled, I/O not powered <sup>a</sup> ) | V <sub>BAT</sub> = 3.0 V<br>V <sub>DD</sub> = 0 V<br>V <sub>DDA</sub> = 0 V<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 0 kHz | 30  | µA   |

Table 25-36. Nominal Power Consumption (*continued*)

| Parameter      | Parameter Name                                              | Conditions                                                                                                                                              | Nom | Unit          |
|----------------|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----|---------------|
| $I_{HIB\_RTC}$ | Hibernate mode (RTC enabled, I/O not powered <sup>a</sup> ) | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | 44  | $\mu\text{A}$ |

a. The VDD3ON mode must be disabled for the I/O ring to be unpowered.

## 25.19.2 Maximum Current Consumption

The current measurements specified in the table that follows are maximum values under the following conditions:

- $V_{DD} = 3.6\text{ V}$
- $V_{DDC} = 1.3\text{ V}$
- $V_{BAT} = 3.25\text{ V}$
- $V_{DDA} = 3.6\text{ V}$
- Temperature = 25°C
- Clock source (MOSC) = 16.348-MHz crystal oscillator

Table 25-37. Detailed Current Specifications

| Parameter           | Parameter Name          | Conditions                                                                                                                                          | Max | Unit |

## B Ordering and Contact Information

### B.1 Ordering Information

**Table B-1. Part Ordering Information<sup>a</sup>**

| Orderable Part Number | Description                                                                          |
|-----------------------|--------------------------------------------------------------------------------------|
| LM3S2U93-IQC80-A2     | Stellaris® LM3S2U93 Microcontroller Industrial Temperature 100-pin LQFP              |
| LM3S2U93-IBZ80-A2     | Stellaris LM3S2U93 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S2U93-IQC80-A2T    | Stellaris LM3S2U93 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S2U93-IBZ80-A2T    | Stellaris LM3S2U93 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

a. NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

### B.2 Part Markings

The Stellaris microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number, for example, LM3S9B90.
- In the second line, the first eight characters indicate the temperature, package, speed, revision, and product status. For example in the figure below, IQC80C0X indicates an Industrial temperature (I), 100-pin LQFP package (QC), 80-MHz (80), revision C0 (C0) device. The letter immediately following the revision indicates product status. An X indicates experimental and requires a waiver; an S indicates the part is fully qualified and released to production.
- The remaining characters contain internal tracking numbers.

## B.3 Kits

The Stellaris Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## B.4 Support Information

For support on Stellaris products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## C Package Information

### C.1 100-Pin LQFP Package

#### C.1.1 Package Dimensions

Figure C-1. Stellaris LM3S2U93 100-Pin LQFP Package Dimensions

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |
|---------------------------------------------------|-------------|---------------------|
| Symbols                                           | Leads       | 100L                |
| A                                                 | Max.        | 1.60                |
| A <sub>1</sub>                                    | -           | 0.05 Min./0.15 Max. |
| A <sub>2</sub>                                    | ±0.05       | 1.40                |
| D                                                 | ±0.20       | 16.00               |
| D <sub>1</sub>                                    | ±0.05       | 14.00               |
| E                                                 | ±0.20       | 16.00               |
| E <sub>1</sub>                                    | ±0.05       | 14.00               |
| L                                                 | +0.15/-0.10 | 0.60                |
| e                                                 | Basic       | 0.50                |
| b                                                 | +0.05       | 0.22                |
| θ                                                 | -           | 0°-7°               |
| ddd                                               | Max.        | 0.08                |
| ccc                                               | Max.        | 0.08                |
| JEDEC Reference Drawing                           |             | MS-026              |
| Variation Designator                              |             | BED                 |

Figure C-3. 100-Pin LQFP Tape and Reel Dimensions

## C.2 108-Ball BGA Package

### C.2.1 Package Dimensions

Figure C-4. Stellaris LM3S2U93 108-Ball BGA Package Dimensions

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

| Symbols            | MIN      | NOM   | MAX   |
|--------------------|----------|-------|-------|
| A                  | 1.22     | 1.36  | 1.50  |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
