

Features

- Overcurrent/lightning protection to TELCORDIA GR-1089 Issue 3
- Typical application is secondary protection on telecom line cards
- UL497A recognition
- Thermal fuse links
- Must be used in conjunction with a solid state primary protector, or a GDT primary protector

4A12P-1AH-12R5 - Surge Line Protection Module

Electrical Characteristics

| | |
|---------------------------|--|
| Resistance Value..... | 12.5 Ω |
| Resistance Tolerance..... | $\pm 5\%$ |
| TCR..... | 100 ppm/ $^{\circ}\text{C}$ |
| Ratio Tolerance..... | $\pm 0.5\%$ |
| Temperature Range..... | -40 $^{\circ}\text{C}$ to +85 $^{\circ}\text{C}$ |

Physical Characteristics

| | |
|--------------------------|---|
| Body Style | Dual In Line SMD - Twin Pack |
| Substrate Material | 96 % Alumina |
| Lead Frame Material..... | Copper, solder coated |
| Flammability | Conforms to UL94V-0 |
| Processability..... | Unit is only suitable for no-clean processing |
| Convection Reflow..... | Unit will withstand 260 $^{\circ}$, 20 seconds |
| Packaging | 16 inch diameter reels, 44 mm tape, 250 pcs./reel |

Functional Characteristics @ 25 $^{\circ}\text{C}$ (per Telcordia GR-1089 Issue 3)

First Level Lightning Surge -

Resistors will remain within tolerance after testing.

1000 Volts Peak, 100 Amp Peak Current,
Max. Rise/Min. Decay Time 10x1000 μs ,
60 Seconds Between Pulses:
Number of Pulses25 each resistor each polarity

2500 Volts Peak, 500 Amp Peak Current,
Max. Rise/Min. Decay Time 2x10 μs ,
60 Seconds Between Pulses:
Number of Pulses10 simultaneous each polarity

Meets Protection Coordination as defined in Telcordia Section
4.6.7.1, Condition A.

First Level AC Power Fault -

Resistors will remain within tolerance after testing.

50 Vrms, 0.33 Amp Short Circuit Current:
Duration.....15 minutes

100 Vrms, 0.17 Amp Short Circuit Current:
Duration.....15 minutes

600 Vrms, 1.00 Amp Short Circuit Current:
Duration.....Sixty 1-second pulses

440 Vrms, 2.2 Amp Short Circuit Current:
DurationFive 2-second pulses,
cooling to ambient between pulses

600 Vrms, 3.00 Amp Short Circuit Current:
DurationFive 1.1-second pulses,
cooling to ambient between pulses

Functional Characteristics @ 25 $^{\circ}\text{C}$ (Continued)

Second Level Lightning Surge -

Resistor package must fail safely causing no fire, electrical, or fragmentation hazard.

5000 Volts Peak, 500 Amp Peak Current,
Max. Rise/Min. Decay Time 2x10 μs :
Number of Pulses1 simultaneous each polarity

Second Level AC Power Fault -

Resistor package must fail safely causing no fire, electrical, or fragmentation hazard. Device will fail prior to Bussman MDQ 1-6/10 A fuse in series.

100 Vrms, 2.2 Amp Short Circuit Current:
Duration.....15 minutes

600 Vrms, 7 Amp Short Circuit Current:
Duration.....5 seconds

250 Vrms, 25 Amp Short Circuit Current:
Duration.....15 minutes

600 Vrms, 60 Amp Short Circuit Current:
Duration.....5 seconds

DIMENSIONS: $\frac{\text{MM}}{(\text{INCHES})}$

4A12P-1AH-12R5 - Surge Line Protection Module

BOURNS®

How To Order

4A 12 P - 1AH - 12R5Model _____
(4A = Surface Mount)

Number of Pins _____

Physical Configuration _____

Electrical Configuration _____
1AH = CustomResistance Code _____
12R5 = 12.5 Ohms

Electrical Schematic

NOTES:

R1A + R1B + F1 = 12.5 OHMS $\pm 5\%$.R3A + R3B = 12.5 OHMS $\pm 5\%$.R2A + R2B + F2 = 12.5 OHMS $\pm 5\%$.R4A + R4B = 12.5 OHMS $\pm 5\%$.RATIO MATCH: R1 / R2 = $1 \pm 2.5\%$.RATIO MATCH: R3 / R4 = $1 \pm 2.5\%$.

CO-PLANARITY = 0.004 INCHES.

4A12P-1AH-12R5 - Surge Line Protection Module

BOURNS®

Telcordia GR-1080-CORE Protection Coordination

Protection coordination (Telcordia Technologies Generic Requirements, GR-1089-CORE, Issue 3, October 2002, section 4.6.7.1 protection coordination, page 4-15) is a new test for GR-1089-CORE issue 3 that will be a requirement on January 1, 2006. The equipment using the 4A12P-1AH-12R5 overcurrent line feed resistor (LFR) must be used with either a solid state primary or a primary GDT (5-pin gas discharge tube) such as the Bourns® 2024-31-MSP Protector.

The equipment communication lines will initially be tested at the specified primary voltage protector type using a 10/1000 μ s generator. A solid state primary will start testing at 400 V where a GDT primary will start at 600 V. If condition A or B defined below is not achieved, the 10/1000 generator voltage, V_G is increased (in steps of 200 V or interpolated value) to a maximum of 2000 V or until one of the two following criteria is achieved:

- A. The communication lines are stressed to 600 V peak (V_P) across the equipment terminals with the GDT specified as a primary. V_P specification is reduced to 400 A for a solid state primary.

Note: Series resistance of the primary protector such as a heat coil resistance is connected between the generator and equipment. This resistance will be effectively added to R_{SERIES} value when calculating the generator open circuit test voltage.

- B. The peak current (I_{PP}) into the equipment terminals exceeds 100 A.

The coordination test requires ten repetitions per polarity. The communication lines will also be tested to metallic and longitudinal procedures to ensure conformance. The equipment fails the coordination requirement if neither A or B is achieved with a maximum generator voltage of 2000 V or the equipment is damaged and does not operate as intended. Figure 1 shows the setup and measurement points for the coordination test.

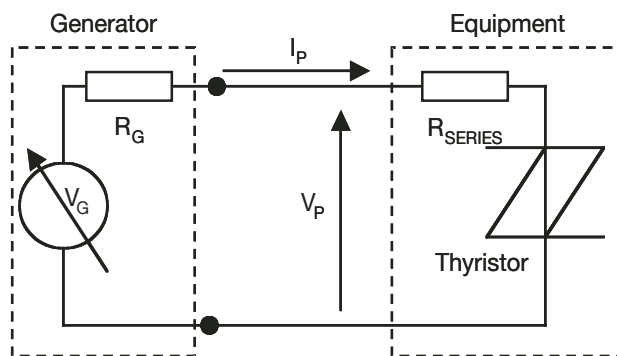

Figure 1 — Coordination Requirements

For example, a GDT is defined as the primary protector. The voltage, V_P will be 600 V and the current through R_{SERIES} (4A12P-1AH-12R5) will be 48 A (600/12.5). With a generator fictive resistance of 10 Ω , the generator V_G should be adjusted to 1080 V to achieve voltage coordination. The resistance of the 4A12P-1AH-12R5 ensures the equipment will voltage coordinate before 100A is achieved.

Note: Tolerances of the impulse generator, LFR, measurement, etc. will provide a variation on the actual impulse generator setting.

Overvoltage Thyristor Selection

The resistance tolerance of the LFR is $\pm 5\%$ and therefore the expected maximum current from the generator will be 51 A. To ensure reliable operation of the overvoltage protector, the thyristor should be specified to a 10/1000 μ s of at least 51 A.
