

# System Reset (with built-in watchdog timer) Monolithic IC MM1095

## Outline

This IC functions in a variety of CPU systems and other logic systems to generate a reset signal and reset the system accurately during momentary interruption or lowering of power supply voltage.  
 It also has a built-in watchdog timer for operation diagnosis. This prevents the system from running wild by generating an intermittent reset pulse during system mis-operation.

## Features

1. Built-in watchdog timer
2. Low minimum operating voltage 100 $\mu$ A typ.
3. Low operating limit voltage  $V_{CC}=0.8V$
4. Watchdog stop function (RCT pin)
5. Few external parts

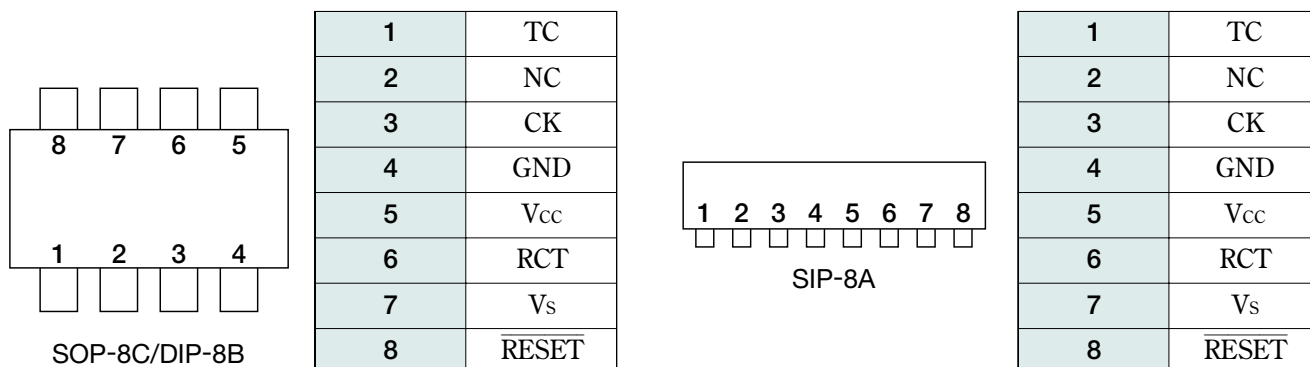

## Package

DIP-8B (MM1095AD, MM1095BD)  
 SOP-8C (MM1095AF, MM1095BF)  
 SIP-8A (MM1095AS, MM1095BS)

## Applications

1. Reset circuits in microcomputers, CPUs and MPUs
2. Logic circuit reset circuits
3. Microcomputer system monitoring, etc.

## Pin Assignment

## Pin Description

Pin No.	Name	Function
1	TC	$T_{WD}$ , $T_{WR}$ , $T_{PR}$ variable pins ( $T_{WD}$ , $T_{WR}$ and $T_{PR}$ times are determined by the external capacitor.) $T_{PR}$ (ms)=5000 $\times$ $C_T$ ( $\mu$ F) $T_{WD}$ (ms)=500 $\times$ $C_T$ ( $\mu$ F) $T_{WR}$ (ms)=100 $\times$ $C_T$ ( $\mu$ F)
2	N.C	
3	CK	Clock input pin, inputs clock from logic system
4	GND	GND pin
5	V <sub>CC</sub>	Voltage detection MM1095A $\rightarrow$ 3.2V, MM1095B $\rightarrow$ 4.2V
6	RCT	Watchdog timer stop pin Operation modes : Operation $\rightarrow$ OPEN, Stop $\rightarrow$ connect to GND
7	V <sub>s</sub>	Detection voltage variable pin
8	$\overline{\text{RESET}}$	Reset output pin (low output)

## Notes:

- \*1 Monitoring time is the time from the last pulse (negative edge) of the timer clear clock pulse until reset pulse output. In other words, reset output is output if a clock pulse is not input during this time.
- \*2 Reset time means reset pulse width. However, this does not apply to power ON reset.
- \*3 Reset hold time is the time from when V<sub>CC</sub> exceeds detection voltage (V<sub>SH</sub>) during power ON reset until reset release (RESET output high).
- \*4 Output delay time is the time from when power supply voltage drops below detection voltage (V<sub>SL</sub>) until reset (RESET output low).
- \*5 Voltage range when measuring output rise and fall is 10~90%.
- \*6 Watchdog timer monitoring time (T<sub>WD</sub>), watchdog timer reset time (T<sub>WR</sub>) and reset hold time (T<sub>PR</sub>) during power supply rise can be changed by varying C<sub>T</sub> capacitance. The times are expressed by the following formulae.

$$T_{PR} (ms) \approx 5000 \times C_T (\mu F)$$

$$T_{WD} (ms) \approx 500 \times C_T (\mu F)$$

$$T_{WR} (ms) \approx 100 \times C_T (\mu F)$$

Example: When C<sub>T</sub>=0.02 $\mu$ F

$$T_{PR} \approx 100ms$$

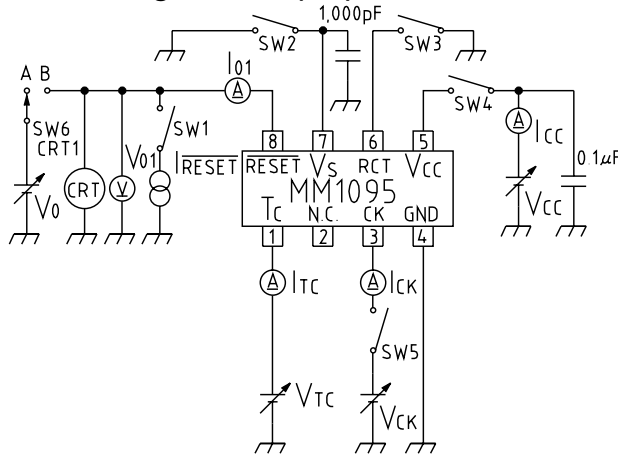

$$T_{WD} \approx 10ms$$

$$T_{WR} \approx 2ms$$

MM1095A	$\approx 305k$	$\approx 195k$
MM1095B	$\approx 350k$	$\approx 150k$

Note 1 :  $C_P=0.1\mu F$  approx.

Note 2 :  $C \geq 1000pF$

Note 3 : The watchdog timer can be stopped by connecting the RCT pin to GND.  
 (Then it functions as a voltage detection circuit.)

## Timing Chart

## Description of Operation

1.  $\overline{\text{RESET}}$  goes low when  $V_{CC}$  rises to approximately 0.8V.
2. Capacitor  $C_T$  charging starts when  $V_{CC}$  rises to  $V_{SH}$  (MM1095A  $\approx$  3.25V, MM1095B  $\approx$  4.3V). Output is in reset state at this time.
3. Output reset is released ( $\overline{\text{RESET}}$  goes high) after a certain time ( $T_{PR}$ ), from when  $C_T$  starts charging until discharge (the time from when  $C_T$  voltage reaches a certain threshold value 1 ( $\approx$  1.4V) until  $C_T$  voltage drops to a certain threshold value 2 ( $\approx$  0.2V). Approximately 1 $\mu$ A ( $V_{CC}$ =0.8V) of pull up current is output from RESET.  
Reset hold time :  $T_{PR}$  is as follows.  
 $T_{PR} \text{ (ms)} \approx 5000 \times C_T \text{ (}\mu\text{F)}$   
 $C_T$  charging starts again after reset release, and watchdog timer operation begins.
4. If a clock is input (negative edge trigger) to the CK pin during  $C_T$  charging, charging switches to discharge.
5. Discharge switches to charging when  $C_T$  voltage drops to a certain threshold value ( $\approx$  0.2V). Steps 4 and 5 are repeated while a normal clock is input from the logic system.
6. Output goes to reset state ( $\overline{\text{RESET}}$  goes low) when the clock ceases and  $C_T$  voltage reaches reset ON threshold value ( $\approx$  1.4V).  
The formula for  $C_T$  charging time ( $T_{WD}$ : watchdog timer monitoring time) until reset is output is as follows.  
 $T_{WD} \text{ (ms)} \approx 500 \times C_T \text{ (}\mu\text{F)}$
7. Watchdog timer reset time  $T_{WR}$  is the discharge time until  $C_T$  voltage drops to reset OFF threshold value ( $\approx$  0.2V). The formula is as follows.  
 $T_{WR} \text{ (ms)} \approx 100 \times C_T \text{ (}\mu\text{F)}$   
After reset OFF threshold value is reached, output reset is released and  $C_T$  starts charging. Thereafter, steps 4 and 5 are repeated if a normal clock is input, and when the clock ceases, 6 and 7 are repeated.
8. Reset is output when  $V_{CC}$  drops to  $V_{SL}$  (MM1095A  $\approx$  3.2V, MM1095B  $\approx$  4.2V).  $C_T$  is charged simultaneously.
9.  $C_T$  charging starts when  $V_{CC}$  rises to  $V_{SH}$ .  
When  $V_{CC}$  drops momentarily,  $C_T$  charging begins after the charge is first discharged, if the time from  $V_{CC}$  dropping below  $V_{SL}$  until it rises to  $V_{SH}$  is longer than the  $V_{CC}$  input pulse width standard value  $T_{PI}$ .
10. Output reset is released after  $V_{CC}$  goes above  $V_{SH}$  and after  $T_{PR}$ , and the watchdog timer starts. Thereafter, 8~10 are repeated when  $V_{CC}$  goes below  $V_{SL}$ .
11. When power is OFF, reset is output if  $V_{CC}$  goes below  $V_{SL}$ .
12. When  $V_{CC}$  drops to 0V, reset output is held until  $V_{CC}$  reaches 0.8V.
