Typical Application

DESCRIPTION

The DS25BR204 is a 3.125 Gbps 1:4 LVDS repeater optimized for high-speed signal routing and switching over lossy FR-4 printed circuit board backplanes and balanced cables. Fully differential signal paths ensure exceptional signal integrity and noise immunity.

The device has two different LVDS input channels and a select line determines which input is active. Both inputs have programmable equalization providing maximum signal strength. A loss-of-signal (LOS) circuit monitors both input channels and a unique LOS pin reports when no signal is detected at that input.

Wide input common mode range allows the switch to accept signals with LVDS, CML and LVPECL levels; the output levels are LVDS. A very small package footprint requires a minimal space on the board while the flow-through pinout allows easy board layout. Each differential input and output is internally terminated with a 100Ω resistor to lower device return losses, reduce component count and further minimize board space.

Functional Description

The DS25BR204 is a 3.125 Gbps 1:4 LVDS repeater optimized for high-speed signal routing and switching over lossy FR-4 printed circuit board backplanes and balanced cables.

The DS25BR204 SEL_in pin selects one out of two available LVDS inputs. The following is the input select truth tables.

Table 1. Input Select Truth Table

CONTROL Pin (SEL_in) State	Input Selected
0	IN1
1	IN2

The DS25BR204 has a pre-emphasis control pin for each output for switching the transmit pre-emphasis to ON and OFF setting and an equalization control pin for each input for switching the receive equalization to ON and OFF setting. The following are the transmit pre-emphasis and receive equalization truth tables.

Input Interfacing

The DS25BR204 accepts differential signals and allows simple AC or DC coupling. With a wide common mode range, the DS25BR204 can be DC-coupled with all common differential drivers (i.e. LVPECL, LVDS, CML). The following three figures illustrate typical DC-coupled interface to common differential drivers. Note that the DS25BR204 inputs are internally terminated with a 100Ω resistor.

Figure 11. Typical CML Driver DC-Coupled Interface to an DS25BR204 Input

Figure 12. Typical LVPECL Driver DC-Coupled Interface to an DS25BR204 Input

Output Interfacing

The DS25BR204 outputs signals are compliant to the LVDS standard. Its outputs can be DC-coupled to most common differential receivers. The following figure illustrates typical DC-coupled interface to common differential receivers and assumes that the receivers have high impedance inputs. While most differential receivers have a common mode input range that can accommodate LVDS compliant signals, it is recommended to check the respective receiver's data sheet prior to implementing the suggested interface implementation.
