ABSOLUTE MAXIMUM RATINGS*

($T_A = 25^\circ\text{C}$, unless otherwise noted.)

Supply Voltage	-0.3 V to +4.0 V
Input Voltage to Digital Inputs	-0.3 V to +4.0 V
Output Short Circuit Duration to GND	10 sec
Output Voltage	
+5.1 V Output	-0.3 V to +6 V
-10.2 V Output	-12 V to +0.3 V
+15.3 V Output	-0.3 V to +17 V
Operating Temperature Range	-40°C to +85°C
Power Dissipation	3.55 W
(Derate 33 mW/°C above 25°C)	
Storage Temperature Range	-65°C to +150°C
ESD	Class I

*This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

THERMAL CHARACTERISTICS

20-Lead TSSOP Package:

$$\theta_{JA} = 72^\circ\text{C/W}$$

20-Lead LFCSP Package:

$$\theta_{JA} = 31^\circ\text{C/W}$$

ORDERING GUIDE

Model	Temperature Range	Package Description	Package Option
ADM8830ACP	-40°C to +85°C	Lead Frame Chip Scale Package	CP-20
ADM8830ARU	-40°C to +85°C	Thin Shrink Small Outline Package	RU-20

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADM8830 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS

PIN FUNCTION DESCRIPTIONS

Pin No.		Mnemonic	Function
TSSOP	LFCSP		
1, 2	19, 20	C1-, C1+	External capacitor C1 is connected between these pins. A 2.2 μ F capacitor is recommended.
3	1	V _{CC}	Positive Supply Voltage Input. Connect this pin to 3 V supply with a 2.2 μ F decoupling capacitor.
4	2	V _{OUT}	Voltage Doubler Output. This is derived by doubling the 3 V supply. A 2.2 μ F capacitor to ground is required on this pin.
5	3	LDO_IN	Voltage Regulator Input. The user has the option to bypass this circuit using the LDO_ON/OFF pin.
6	4	+5V _{OUT}	+5.1 V Output Pin. This is derived by doubling and regulating the +3 V supply. A 2.2 μ F capacitor to ground is required on this pin to stabilize the regulator.
7	5	+5V _{IN}	+5.1 V Input Pin. This is the input to the voltage tripler and doubler inverter charge pump circuits.
8	6	LDO_ON/OFF	Control Logic Input. 3 V CMOS logic. A logic high selects the internal LDO for regulation of the 5 V voltage doubler output. A logic low isolates the internal LDO from the rest of the charge pump circuits. This allows the use of an external LDO to regulate the 5 V voltage doubler output. The output of this LDO is then fed back into the voltage tripler and doubler/inverter circuits of the ADM8830.
9	7	SHDN	Digital Input. 3 V CMOS logic. Active low shutdown control. This shuts down the timing generator and enables the discharge circuit to dissipate the charge on the voltage outputs, thus driving them to 0 V.
10	8	SCAN/BLANK	Drive Mode Input. 3 V CMOS logic. A logic high places the part in scan (high current) mode and the charge pump is driven by the internal oscillator. A logic low places the part in blanking (low current) mode and the charge pump is driven by the (slower) external oscillator. This is a power saving feature on the ADM8830.
11	9	CLKIN	External CLOCK Input. During a blanking period, the oscillator circuit selects this pin to drive the charge pump circuit. This is at a lower frequency than the internal oscillator, resulting in lower quiescent current consumption, thus saving power.
12	10	+15V _{OUT}	+15.3 V Output Pin. This is derived by tripling the +5.1 V regulated output. A 1 μ F capacitor is required on this pin.
13, 14	11, 12	C3-, C3+	External capacitor C3 is connected between these pins. A 1 μ F capacitor is recommended.
15, 16	13, 14	C2-, C2+	External capacitor C2 is connected between these pins. A 1 μ F capacitor is recommended.
17, 18	15, 16	C4-, C4+	External capacitor C4 is connected between these pins. A 1 μ F capacitor is recommended.
19	17	-10V _{OUT}	-10.2 V Output Pin. This is derived by doubling and inverting the +5.1 V regulated output. A 1 μ F capacitor is required on this pin.
20	18	GND	Device Ground Pin.

Typical Performance Characteristics—ADM8830

TPC 1. LDO Efficiency in Blanking Mode with $V_{CC} = 3\text{ V}$

TPC 2. LDO Output Voltage (Unloaded) vs. Blanking Mode Frequency

TPC 3. LDO O/P Voltage vs. Load Current in Scanning Mode, $V_{CC} = 3.3\text{ V}$

TPC 4. LDO Efficiency in Scanning Mode with $V_{CC} = 3\text{ V}$

TPC 5. +15 V/-10 V Efficiency vs. Output Current in Blanking Mode, $V_{CC} = 3\text{ V}$

TPC 6. +15 V/-10 V Efficiency vs. Output Current in Scanning Mode, $V_{CC} = 3\text{ V}$

TPC 7. LDO Variation over Supply and Temperature

TPC 8. Supply Current vs. Voltage

TPC 9. Output Ripple on LDO (5 V Output)

ADM8830

TPC 10. 5 V Output Transient Response for Max Load Current

TPC 11. 5 V Output Transient Response, Load Disconnected

TPC 12. +15 V and -10 V Outputs at Power-Up

TPC 13. +15 V and -10 V Outputs at Power-Down (Unloaded)

TPC 14. Power Dissipation over Temperature, $V_{CC} = 3.6$ V, Scanning Mode with All O/Ps at Maximum Load

SCANNING AND BLANKING

A TFT LCD panel is essentially made up of a bank of capacitors, each representing a pixel in the display. These capacitors store different levels of charge, depending on the amount of luminescence required for a given pixel. When a picture is being displayed on the panel, a scan of all the pixel capacitors is performed, placing different levels of charge on each in order to create the image. The process of updating the display like this is called “scanning.” Once scanned, an image will be held by pixel capacitance and the controller and source line drivers can be put into a low power mode. This low power mode is referred to as the blanking mode on the ADM8830. Over a finite period of time, this pixel charge will leak and the capacitors will have to be refreshed in order to maintain the image.

The ADM8830 caters to the two modes of operation described above as follows. When the TFT LCD panel is in scanning mode, a logic high on the SCAN/BLANK input places the device in high current power mode, providing extra power (extra current) to the LCD controller and the source line drivers. If the panel continues to be updated (as when a moving picture is being displayed), then the ADM8830 can be continually operated in scanning mode. If the same image is kept on the panel, a logic low is applied to the SCAN/BLANK input and the ADM8830 enters blanking (low current) mode. Depending on how often the image is being updated, the ADM8830 can be operated with a variable SCAN/BLANK duty cycle. This helps to maximize power efficiency and therefore extends the battery life.

POWER SEQUENCING

The gate drive supplies must be sequenced such that the -10 V supply is up before the +15 V supply for the TFT panel to power up correctly. The ADM8830 controls this sequence. When the device is turned on (a logic high on SHDN), the ADM8830 allows the -10 V output to ramp immediately but holds off the +15 V output. It continues to do this until the negative output has reached -3 V. At this point, the positive output is enabled and allowed to ramp up to +15 V. This sequence is highlighted in Figure 2.

Figure 1. Duty Cycle of External Clock

Figure 2. Power Sequence

TRANSIENT RESPONSE

The ADM8830 features extremely fast transient response, making it very suitable for fast image updates on TFT LCD panels. This means that even under changing load conditions there is still very effective regulation of the 5 V output. TPCs 10 and 11 show how the 5.1 V output responds when a maximum load is dynamically connected and disconnected. Note that the output settles within 5 μ s to less than 1% of the output level.

EXTERNAL CLOCK

The ADM8830 has an internal 100 kHz oscillator, but an external clock source can also be used to clock the part. This clock source must be applied to the CLKIN pin. Power is saved during blanking periods by disabling the internal oscillator and switching to the lower frequency external clock source. To achieve optimum performance of the charge pump circuitry, it is important that the duty cycle of the external clock source be 50% and that the rise and fall times be less than 20 ns.
