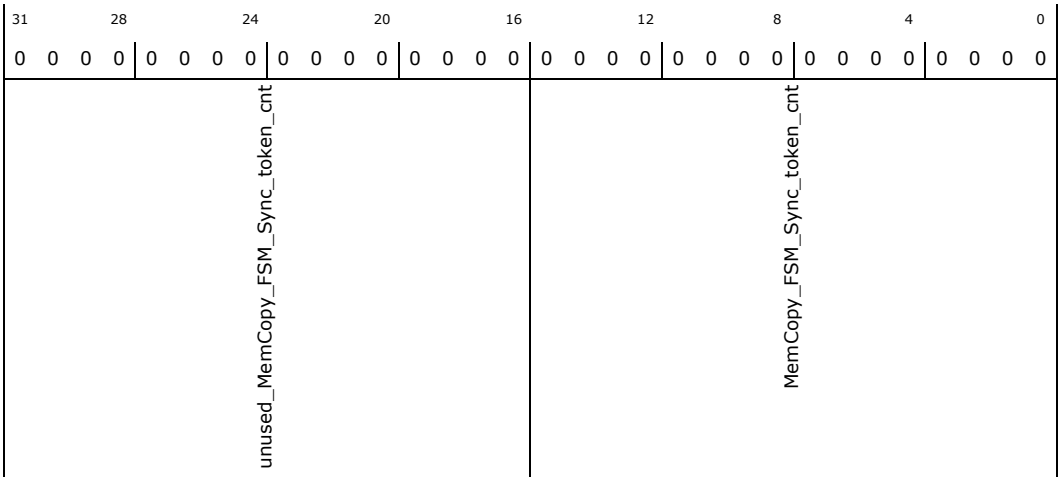
ifmt_mem_cpy_MemCopy_FSM_Sync_token_cnt: [ISPMMADR] + 3070Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_MemCopy_FSM_Sync_token_cnt:** Unused
15:0	0h RO	**MemCopy_FSM_Sync_token_cnt:** FSM Synchronization token amount: counts the number of token processed

15.8.222 reg_ifmt_mem_cpy_MemCopy_FSM_Pack_idx_cnt_type (ifmt_mem_cpy_MemCopy_FSM_Pack_idx_cnt)—Offset 30710h

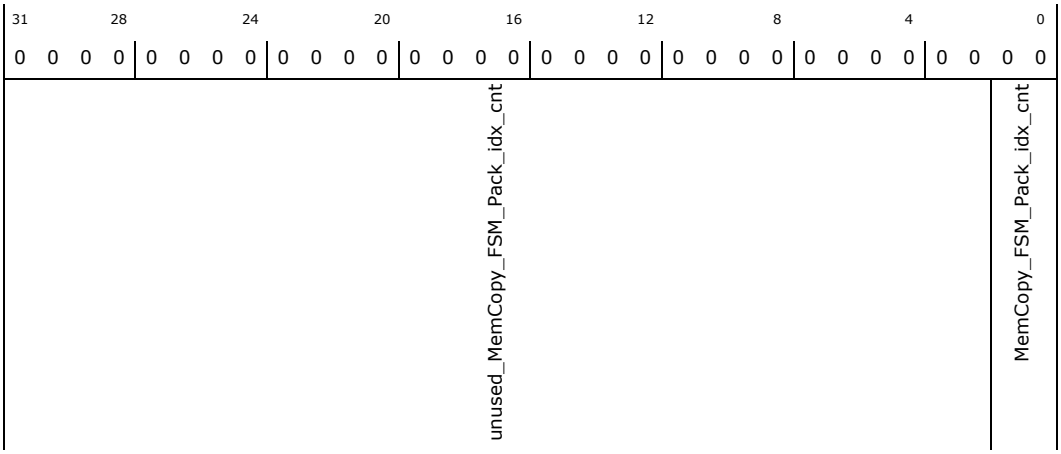
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_mem_cpy_MemCopy_FSM_Pack_idx_cnt: [ISPMMADR] + 30710h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_MemCopy_FSM_Pack_idx_cnt:** Unused
1:0	0h RO	**MemCopy_FSM_Pack_idx_cnt:** FSM Pack idx counter: element index

15.8.223 reg_ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_status_type (ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_status)—Offset 30714h

Buffer Full and mask

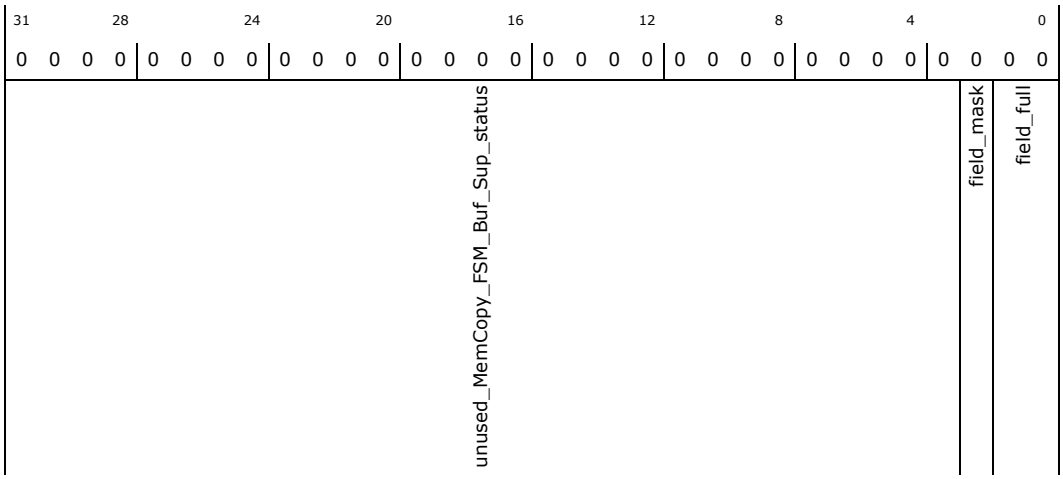
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_status: [ISPMMADR] + 30714h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:3	0h RW	**unused_MemCopy_FSM_Buf_Sup_status:** Unused
2	0h RO	**field_mask:** FSM Buffer support mask buffers full to the FSM CioWr
1:0	0h RO	**field_full:** FSM Buffer support one-hot encoding flagging when the buffer are full

15.8.224 reg_ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_cnt_type (ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_cnt)—Offset 30718h

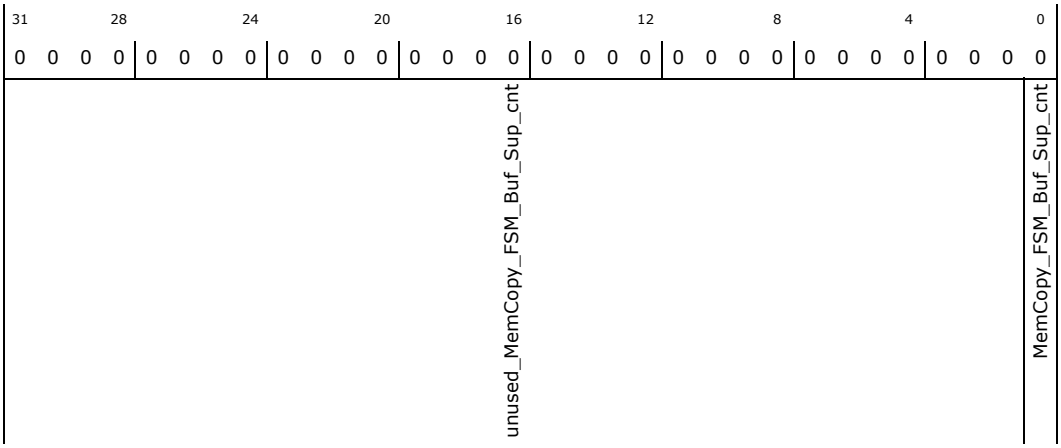
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_mem_cpy_MemCopy_FSM_Buf_Sup_cnt: [ISPMMADR] + 30718h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_MemCopy_FSM_Buf_Sup_cnt:** Unused
0	0h RO	**MemCopy_FSM_Buf_Sup_cnt:** FSM Buffer support: counter for buffer index

15.8.225 reg_ifmt_mem_cpy_MemCopy_FSM_CioWr_status_type (ifmt_mem_cpy_MemCopy_FSM_CioWr_status)—Offset 3071Ch

FSM CioWr Status

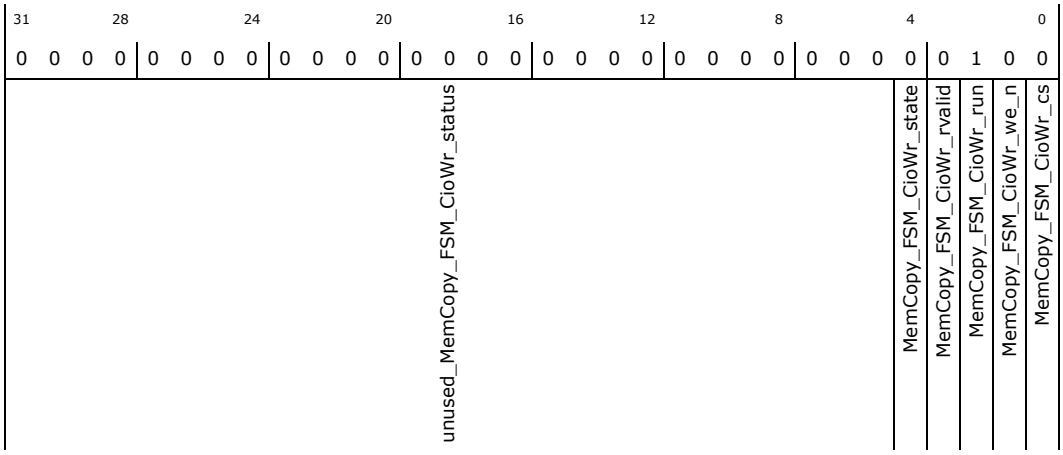
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_mem_cpy_MemCopy_FSM_CioWr_status: [ISPMMADR] + 3071Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_MemCopy_FSM_CioWr_status:** Unused
4	0h RO	**MemCopy_FSM_CioWr_state:** 0)Idle - 1)Writing
3	0h RO	**MemCopy_FSM_CioWr_rvalid:** Read valid flag
2	1h RO	**MemCopy_FSM_CioWr_run:** Run flag
1	0h RO	**MemCopy_FSM_CioWr_we_n:** Write enable flag, active low
0	0h RO	**MemCopy_FSM_CioWr_cs:** CS flag

15.8.226 reg_ifmt_mem_cpy_MemCopy_FSM_CioWr_addr_type (ifmt_mem_cpy_MemCopy_FSM_CioWr_addr)—Offset 30720h

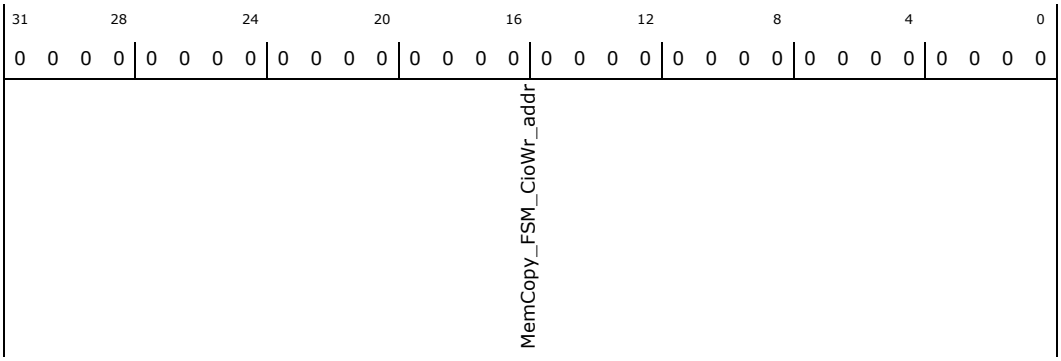
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_mem_cpy_MemCopy_FSM_CioWr_addr: [ISPMMADR] + 30720h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**MemCopy_FSM_CioWr_addr:** FSM CioWr: write address in byte

15.8.227 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg0_type (ifmt_gp_reg_IFMT_input_switch_lut_reg0)—Offset 30800h

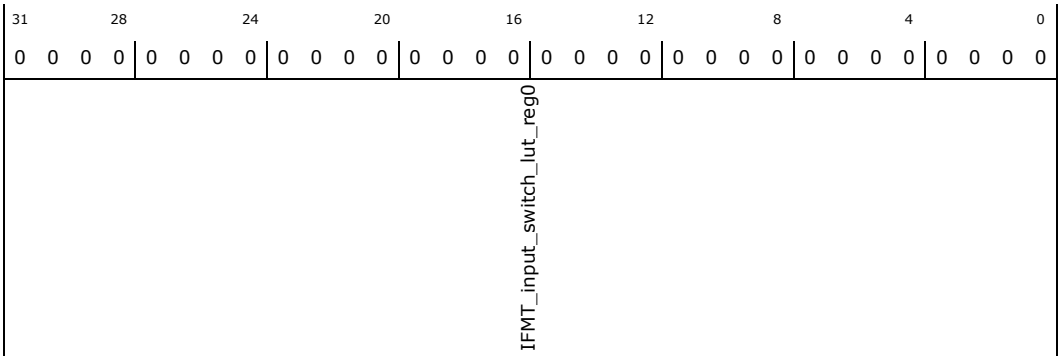
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg0: [ISPMMADR] + 30800h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg0:** GP reg input switch data and hsync look-up table Register 0

15.8.228 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg1_type (ifmt_gp_reg_IFMT_input_switch_lut_reg1)—Offset 30804h

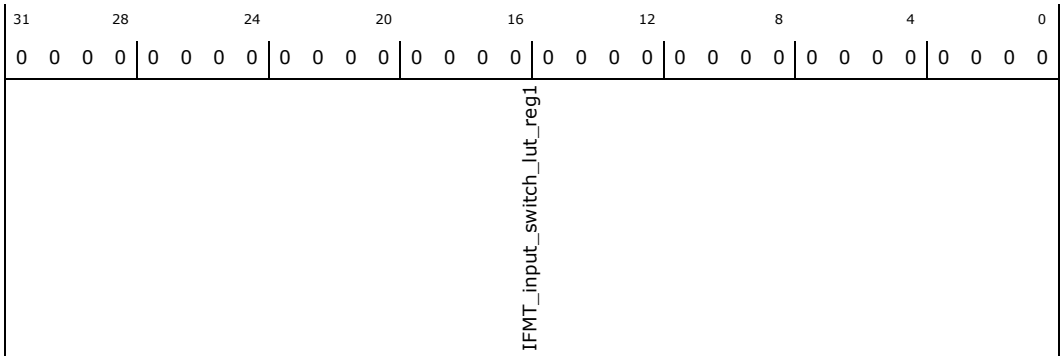
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg1: [ISPMMADR] + 30804h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg1:** GP reg input switch data and hsync look-up table Register 1

15.8.229 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg2_type (ifmt_gp_reg_IFMT_input_switch_lut_reg2)—Offset 30808h

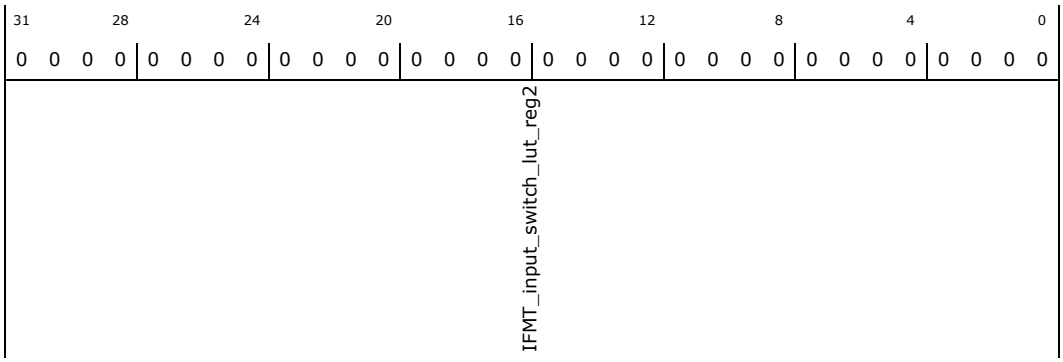
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg2: [ISPMMADR] + 30808h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg2:** GP reg input switch data and hsync look-up table Register 2

15.8.230 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg3_type (ifmt_gp_reg_IFMT_input_switch_lut_reg3)—Offset 3080Ch

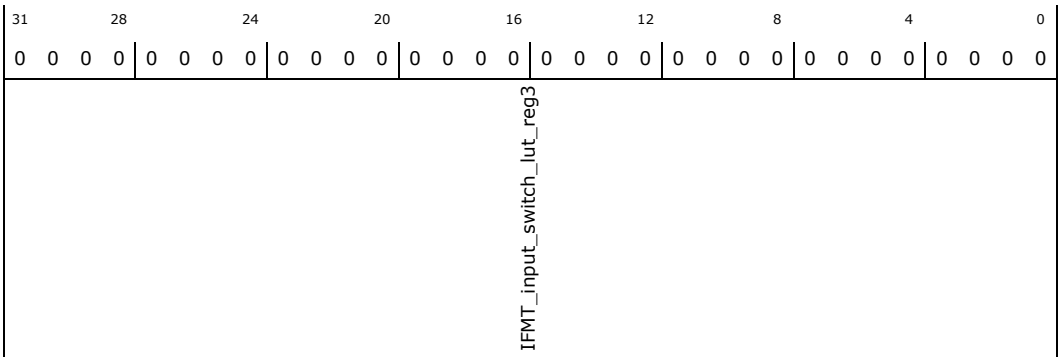
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg3: [ISPMMADR] + 3080Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg3:** GP reg input switch data and hsync look-up table Register 3

15.8.231 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg4_type (ifmt_gp_reg_IFMT_input_switch_lut_reg4)—Offset 30810h

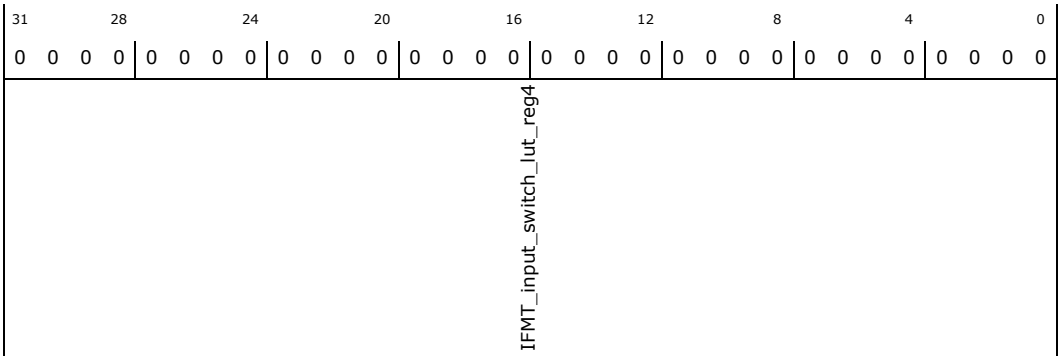
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg4: [ISPMMADR] + 30810h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg4:** GP reg input switch data and hsync look-up table Register 4

15.8.232 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg5_type (ifmt_gp_reg_IFMT_input_switch_lut_reg5)—Offset 30814h

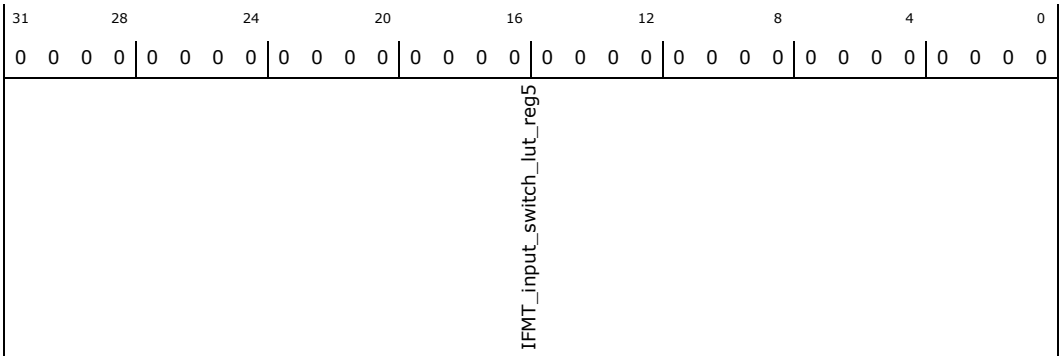
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg5: [ISPMMADR] + 30814h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg5:** GP reg input switch data and hsync look-up table Register 5

15.8.233 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg6_type (ifmt_gp_reg_IFMT_input_switch_lut_reg6)—Offset 30818h

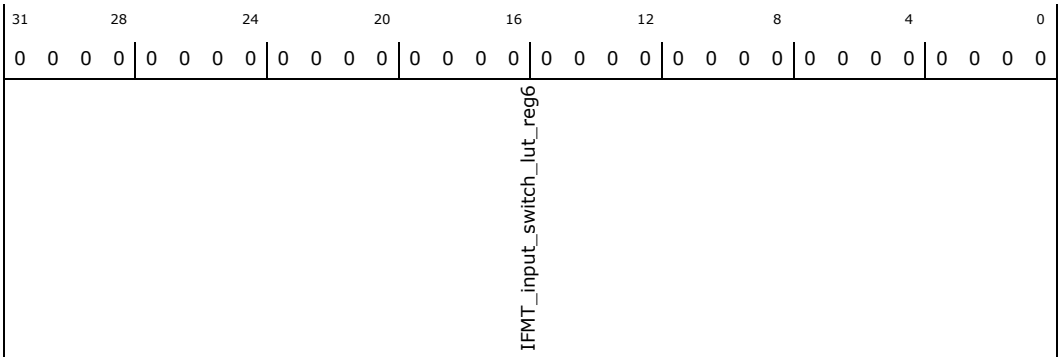
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg6: [ISPMMADR] + 30818h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg6:** GP reg input switch data and hsync look-up table Register 6

15.8.234 reg_ifmt_gp_reg_IFMT_input_switch_lut_reg7_type (ifmt_gp_reg_IFMT_input_switch_lut_reg7)—Offset 3081Ch

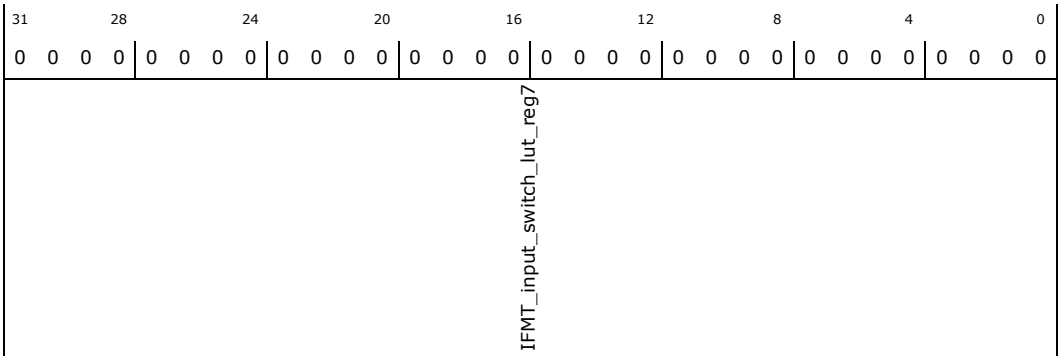
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_lut_reg7: [ISPMMADR] + 3081Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**IFMT_input_switch_lut_reg7:** GP reg input switch data and hsync look-up table Register 7

15.8.235 reg_ifmt_gp_reg_IFMT_input_switch_fsync_lut_type (ifmt_gp_reg_IFMT_input_switch_fsync_lut)—Offset 30820h

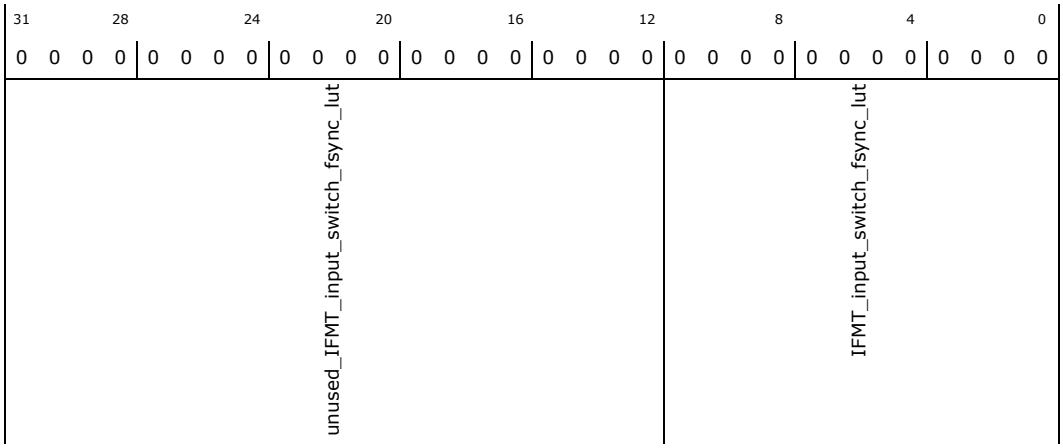
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_fsync_lut: [ISPMMADR] + 30820h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_IFMT_input_switch_fsync_lut:** Unused
11:0	0h RW	**IFMT_input_switch_fsync_lut:** GP reg input switch frame synchronization signal look-up table register

15.8.236 reg_ifmt_gp_reg_IFMT_srst_type (ifmt_gp_reg_IFMT_srst)—Offset 30824h

GP reg soft reset

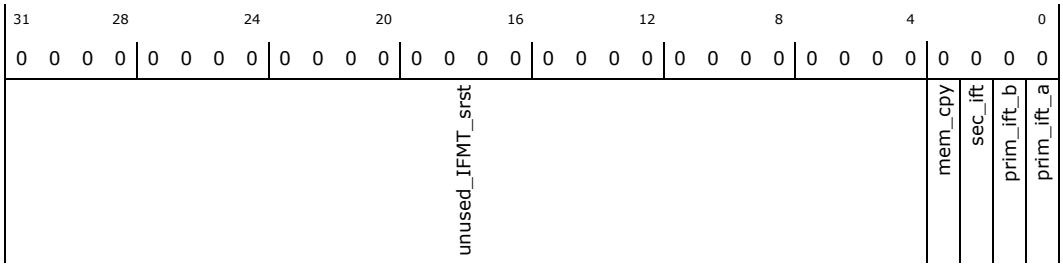
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_srst: [ISPMMADR] + 30824h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_IFMT_srst:** Unused
3	0h RW	**mem_cpy:** Soft resets mem copy
2	0h RW	**sec_ift:** Soft resets secondary input formatter
1	0h RW	**prim_ift_b:** Soft resets primary input formatter B
0	0h RW	**prim_ift_a:** Soft resets primary input formatter A

15.8.237 reg_ifmt_gp_reg_IFMT_slv_reg_srst_type (ifmt_gp_reg_IFMT_slv_reg_srst)—Offset 30828h

GP reg slave register soft reset

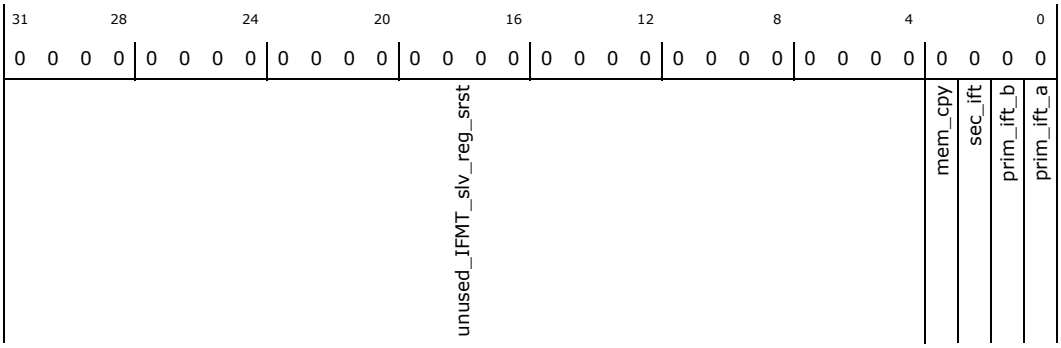
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_slv_reg_srst: [ISPMMADR] + 30828h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_IFMT_slv_reg_srst:** Unused
3	0h RW	**mem_cpy:** Soft resets slave registers of mem copy
2	0h RW	**sec_ift:** Soft resets slave registers of secondary input formatter
1	0h RW	**prim_ift_b:** Soft resets slave registers of primary input formatter B
0	0h RW	**prim_ift_a:** Soft resets slave registers of primary input formatter A

15.8.238 reg_ifmt_gp_reg_IFMT_input_switch_ch_id_fmt_type_type (ifmt_gp_reg_IFMT_input_switch_ch_id_fmt_type)—Offset 3082Ch

GP reg input switch status register

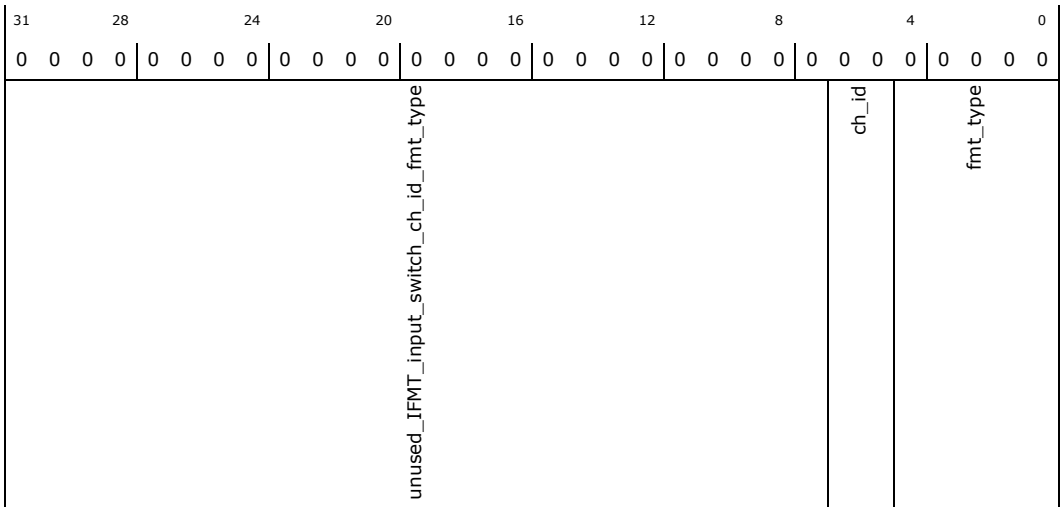
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_gp_reg_IFMT_input_switch_ch_id_fmt_type: [ISPMMADR] + 3082Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:7	0h RW	**unused_IFMT_input_switch_ch_id_fmt_type:** Unused
6:5	0h RO	**ch_id:** Returns the channel id as it arrives at the input of the input switch
4:0	0h RO	**fmt_type:** Returns the format type as it arrives at the input of the input switch

15.8.239 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge)—Offset 30A00h

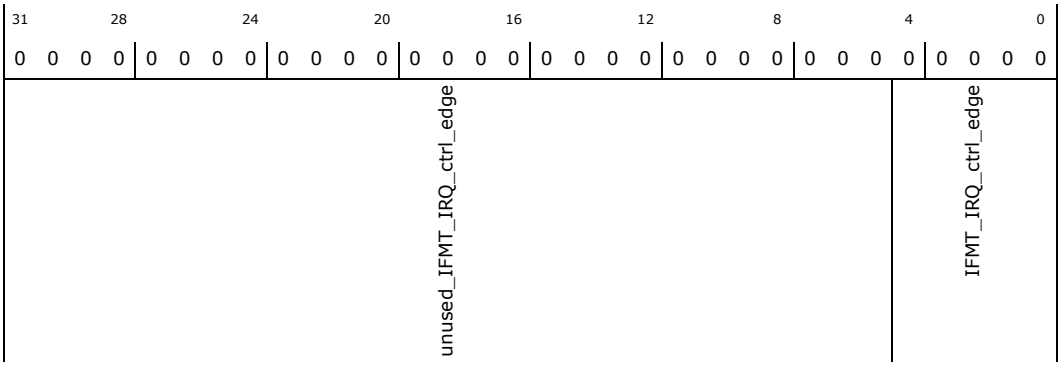
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge: [ISPMMADR] + 30A00h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_edge:** Unused
4:0	0h RW	**IFMT_IRQ_ctrl_edge:** indicates for each irq bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

15.8.240 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_mask_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_mask)—Offset 30A04h

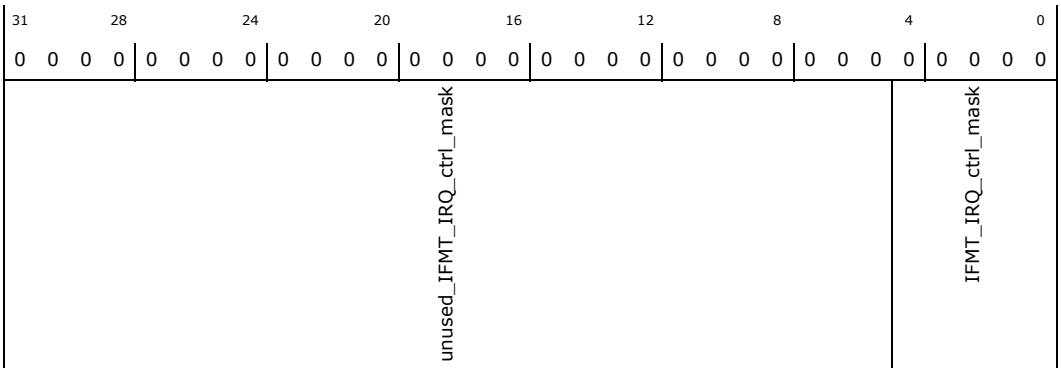
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_mask: [ISPMMADR] + 30A04h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_mask:** Unused
4:0	0h RW	**IFMT_IRQ_ctrl_mask:** indicates for each irq bit whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

15.8.241 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_status_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_status)—Offset 30A08h

IRQ controller STATUS

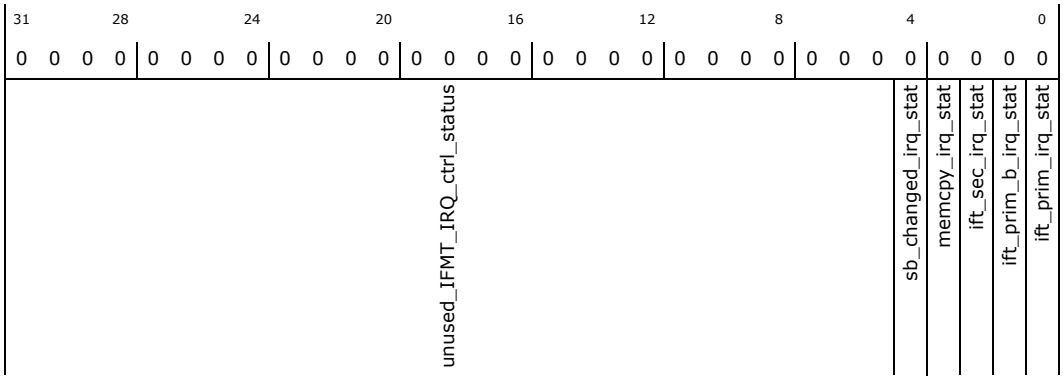
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_status: [ISPMMADR] + 30A08h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_status:** Unused
4	0h RO	**sb_changed_irq_stat:** Returns the status of the irq signal indicating a change in either the channel id or the format type
3	0h RO	**memcpy_irq_stat:** Returns the status of the irq generated by the stream to memory device
2	0h RO	**ift_sec_irq_stat:** Returns the status of the irq generated by the secondary input formatter
1	0h RO	**ift_prim_b_irq_stat:** Returns the status of the irq generated by the primary input formatter b
0	0h RO	**ift_prim_irq_stat:** Returns the status of the irq generated by the primary input formatter

15.8.242 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_clear_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_clear)—Offset 30A0Ch

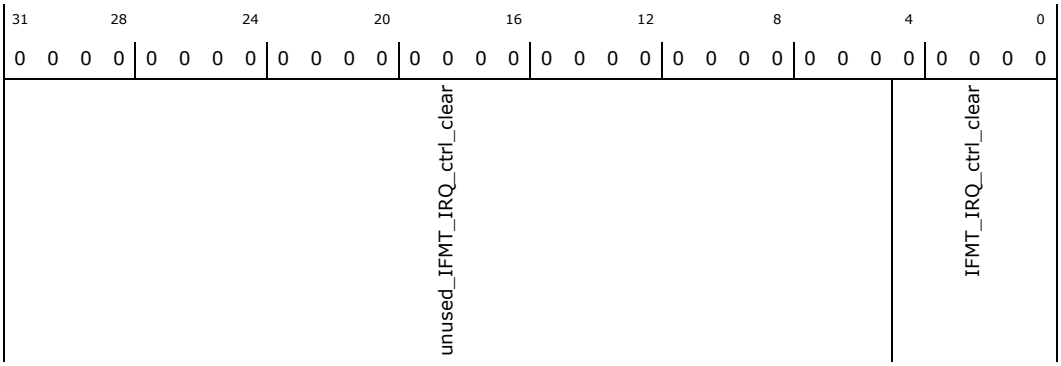
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_clear: [ISPMMADR] + 30A0Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_clear:** Unused
4:0	0h WO	**IFMT_IRQ_ctrl_clear:** Clears (set to '0') bits in IFMT_IRQ_ctrl_status. When writing a '1' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is not affected.

15.8.243 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable)—Offset 30A10h

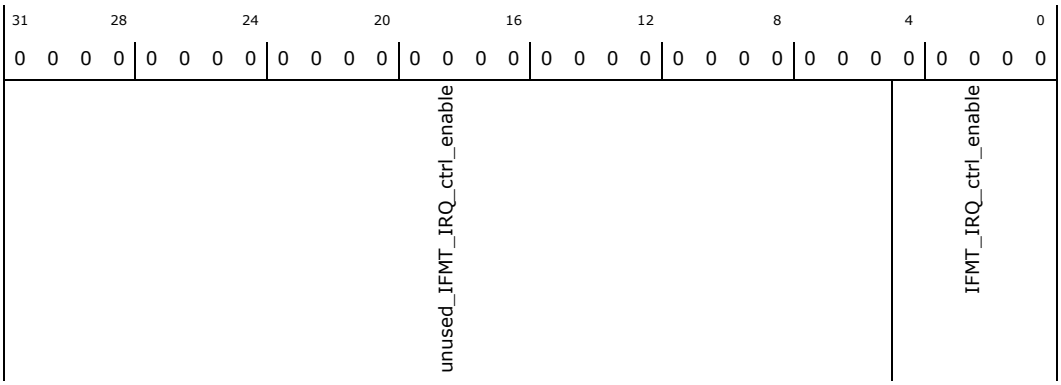
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable: [ISPMMADR] + 30A10h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_enable:** Unused
4:0	0h RW	**IFMT_IRQ_ctrl_enable:** Indicates for each bit whether an interrupt cause as monitored by the IFMT_IRQ_ctrl_status register also affects the IRQ pin (value='1') or not (value='0')

15.8.244 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse)—Offset 30A14h

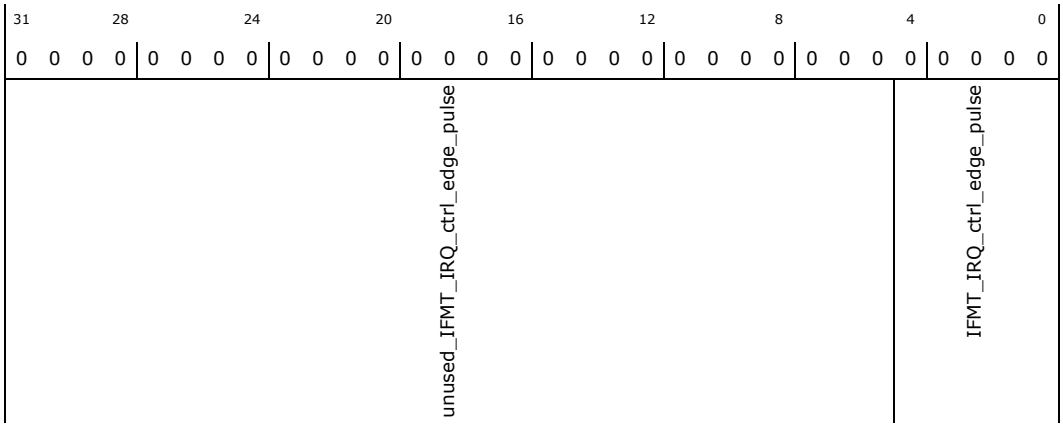
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse: [ISPMMADR] + 30A14h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_edge_pulse:** Unused
4:0	0h RW	**IFMT_IRQ_ctrl_edge_pulse:** Indicates for each bit whether an interrupt cause is translated into a pulse (value='0') or into a constant level '1' (value='1') on the IRQ pin

15.8.245 reg_isp_dma_DMA_FSM_Command_type (isp_dma_DMA_FSM_Command)—Offset 40000h

FSM Command: Last command and State

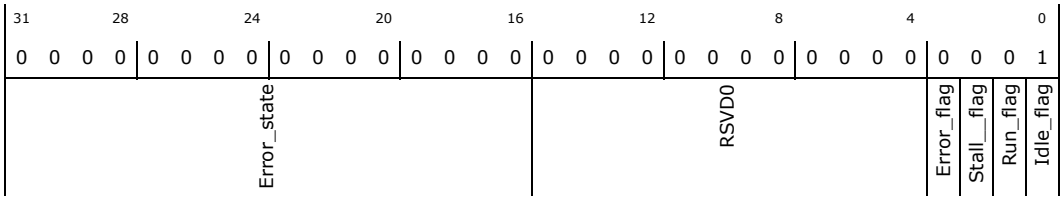
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_FSM_Command: [ISPMMADR] + 40000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0h RO	**Error_state:** Lower 16 bits of the last command received and processed
15:4	0b RO	**RSVD0:** Reserved
3	0h RO	**Error_flag:** Error flag
2	0h RO	**Stall__flag:** Stall flag
1	0h RO	**Run_flag:** Run flag
0	1h RO	**Idle_flag:** Idle flag

15.8.246 reg_isp_dma_DMA_CH0_Packing_setup_type (isp_dma_DMA_CH0_Packing_setup)—Offset 41000h

DMA CH 0 PARAM 0: Packing setup

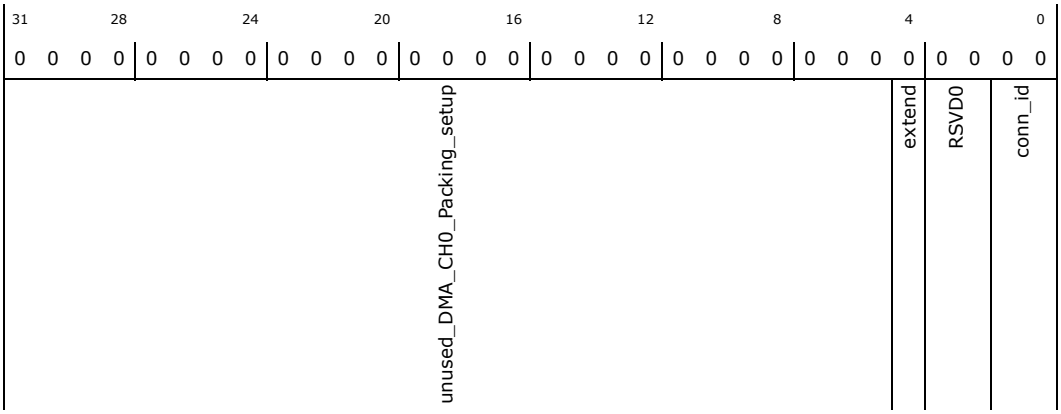
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH0_Packing_setup: [ISPMMADR] + 41000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH0_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
1:0	0h RO	**conn_id:** Connection ID

15.8.247 reg_isp_dma_DMA_CH1_Packing_setup_type (isp_dma_DMA_CH1_Packing_setup)—Offset 41004h

DMA CH 1 PARAM 0: Packing setup

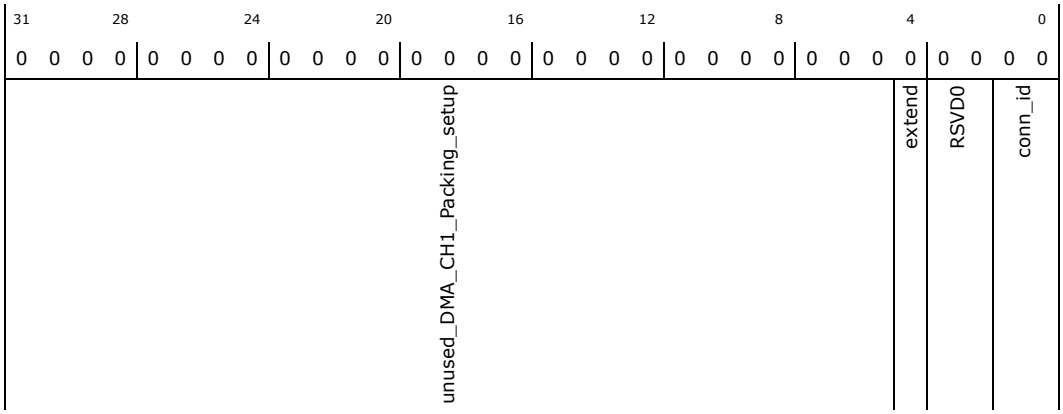
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH1_Packing_setup: [ISPMMADR] + 41004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH1_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.248 reg_isp_dma_DMA_CH2_Packing_setup_type (isp_dma_DMA_CH2_Packing_setup)—Offset 41008h

DMA CH 2 PARAM 0: Packing setup

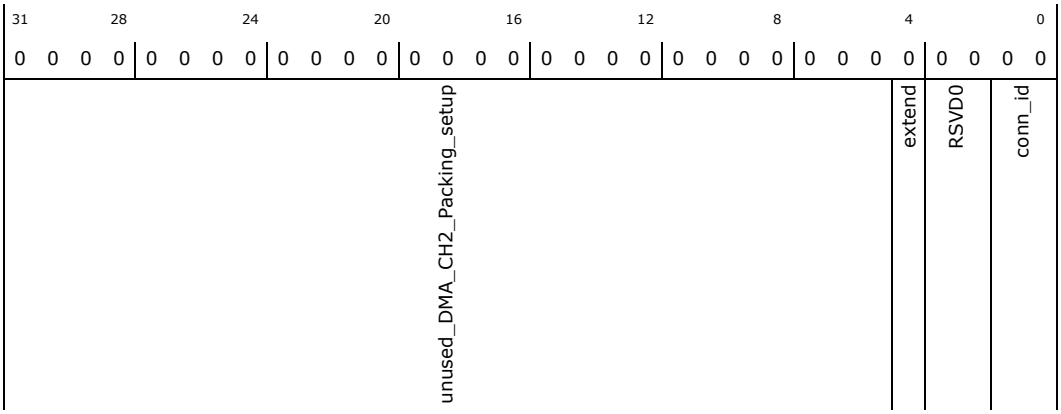
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH2_Packing_setup: [ISPMMADR] + 41008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH2_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.249 reg_isp_dma_DMA_CH3_Packing_setup_type (isp_dma_DMA_CH3_Packing_setup)—Offset 4100Ch

DMA CH 3 PARAM 0: Packing setup

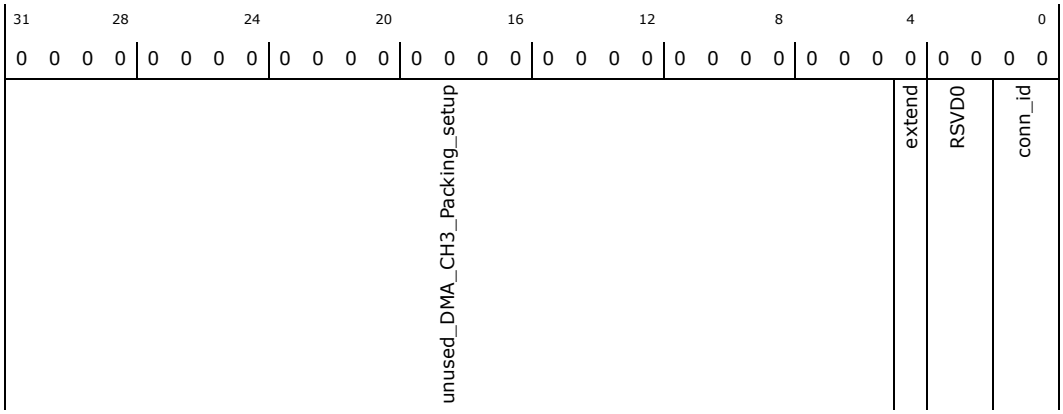
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH3_Packing_setup: [ISPMMADR] + 4100Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH3_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.250 reg_isp_dma_DMA_CH4_Packing_setup_type (isp_dma_DMA_CH4_Packing_setup)—Offset 41010h

DMA CH 4 PARAM 0: Packing setup

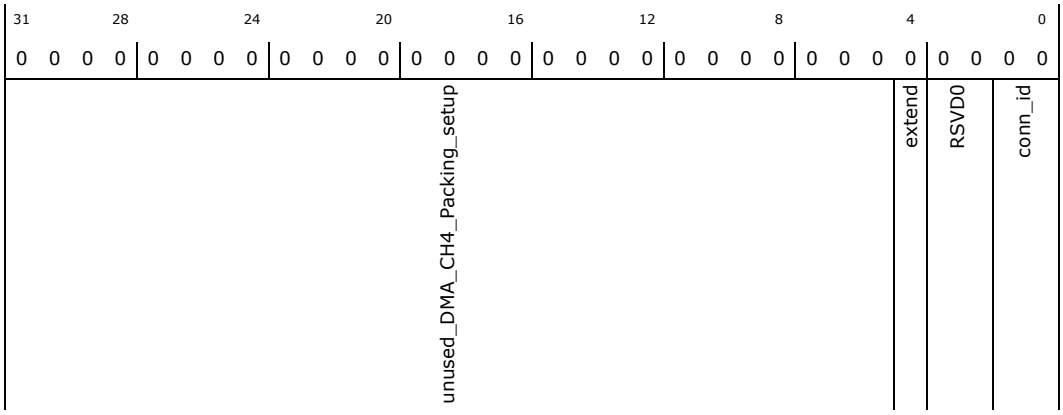
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH4_Packing_setup: [ISPMMADR] + 41010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH4_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.251 reg_isp_dma_DMA_CH5_Packing_setup_type (isp_dma_DMA_CH5_Packing_setup)—Offset 41014h

DMA CH 5 PARAM 0: Packing setup

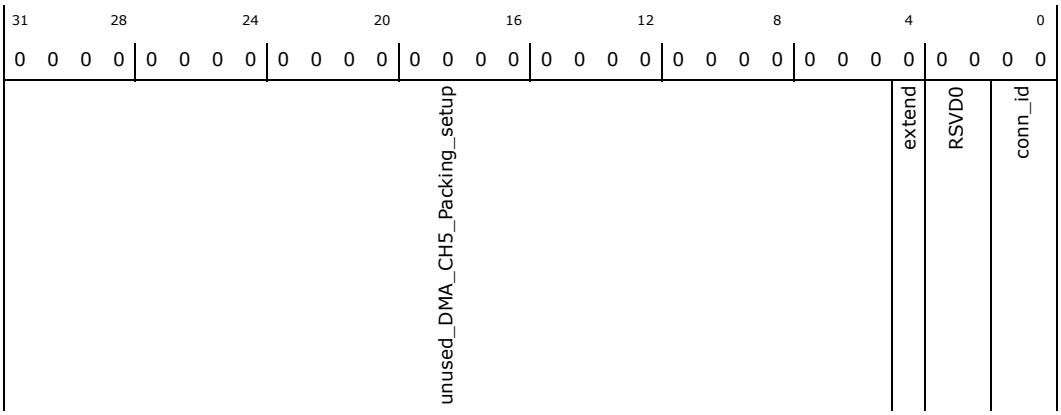
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH5_Packing_setup: [ISPMMADR] + 41014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH5_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.252 reg_isp_dma_DMA_CH6_Packing_setup_type (isp_dma_DMA_CH6_Packing_setup)—Offset 41018h

DMA CH 6 PARAM 0: Packing setup

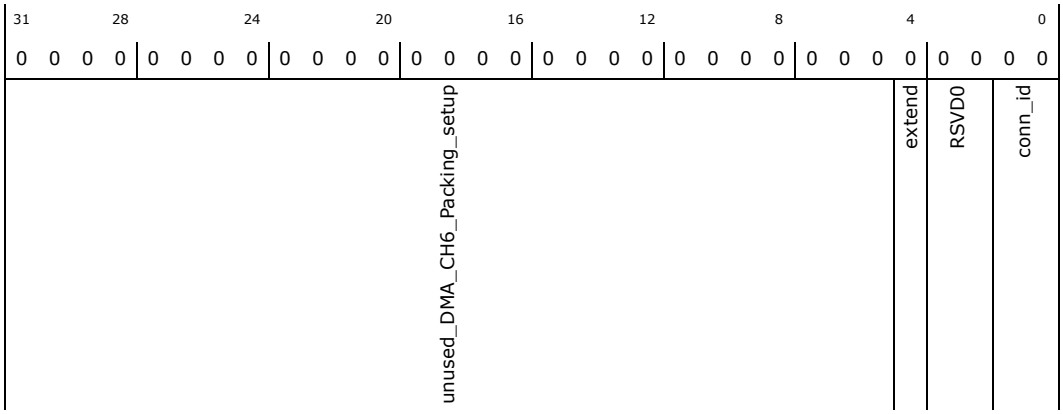
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH6_Packing_setup: [ISPMMADR] + 41018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH6_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.253 reg_isp_dma_DMA_CH7_Packing_setup_type (isp_dma_DMA_CH7_Packing_setup)—Offset 4101Ch

DMA CH 7 PARAM 0: Packing setup

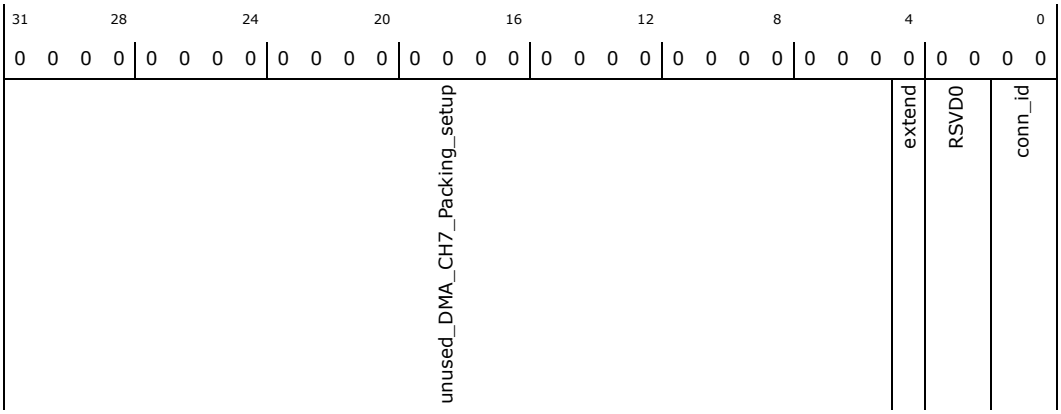
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH7_Packing_setup: [ISPMMADR] + 4101Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH7_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.254 reg_isp_dma_DMA_CH8_Packing_setup_type (isp_dma_DMA_CH8_Packing_setup)—Offset 41020h

DMA CH 8 PARAM 0: Packing setup

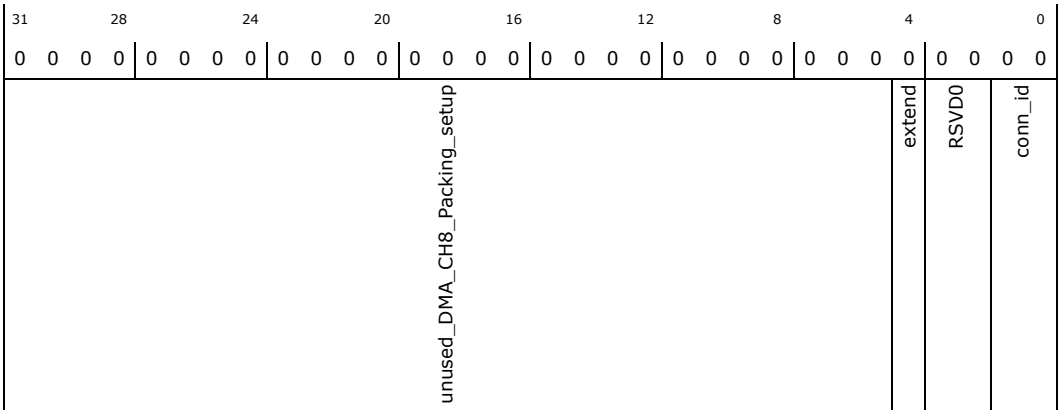
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH8_Packing_setup: [ISPMMADR] + 41020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH8_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.255 reg_isp_dma_DMA_CH9_Packing_setup_type (isp_dma_DMA_CH9_Packing_setup)—Offset 41024h

DMA CH 9 PARAM 0: Packing setup

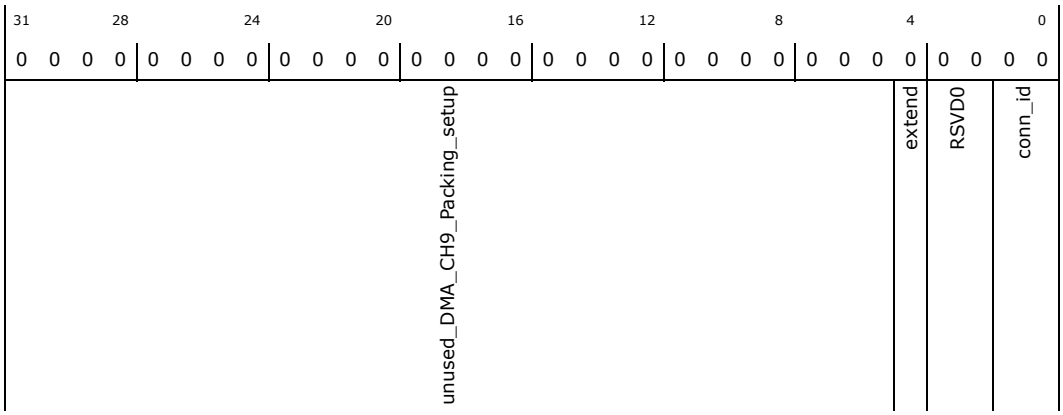
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH9_Packing_setup: [ISPMMADR] + 41024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH9_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.256 reg_isp_dma_DMA_CH10_Packing_setup_type (isp_dma_DMA_CH10_Packing_setup)—Offset 41028h

DMA CH 10 PARAM 0: Packing setup

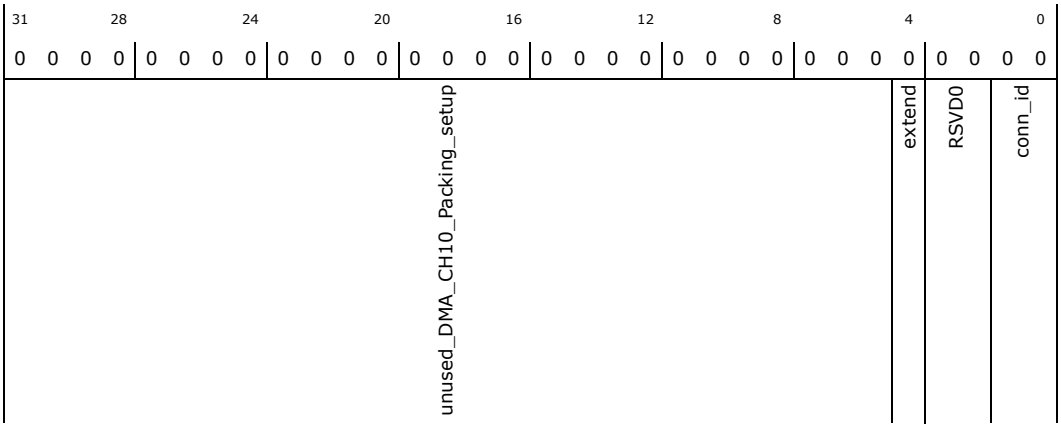
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH10_Packing_setup: [ISPMMADR] + 41028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH10_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.257 reg_isp_dma_DMA_CH11_Packing_setup_type (isp_dma_DMA_CH11_Packing_setup)—Offset 4102Ch

DMA CH 11 PARAM 0: Packing setup

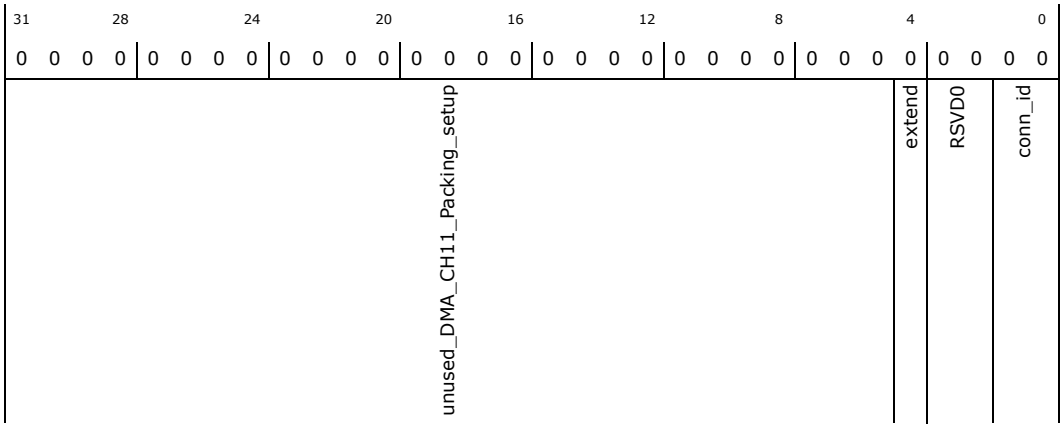
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH11_Packing_setup: [ISPMMADR] + 4102Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH11_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved

15.8.258 reg_isp_dma_DMA_CH12_Packing_setup_type (isp_dma_DMA_CH12_Packing_setup)—Offset 41030h

DMA CH 12 PARAM 0: Packing setup

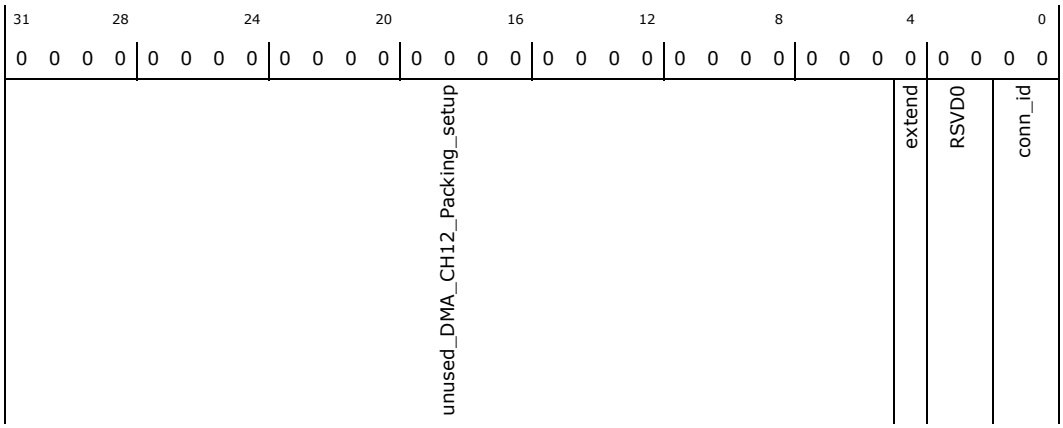
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH12_Packing_setup: [ISPMMADR] + 41030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH12_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.259 reg_isp_dma_DMA_CH13_Packing_setup_type (isp_dma_DMA_CH13_Packing_setup)—Offset 41034h

DMA CH 13 PARAM 0: Packing setup

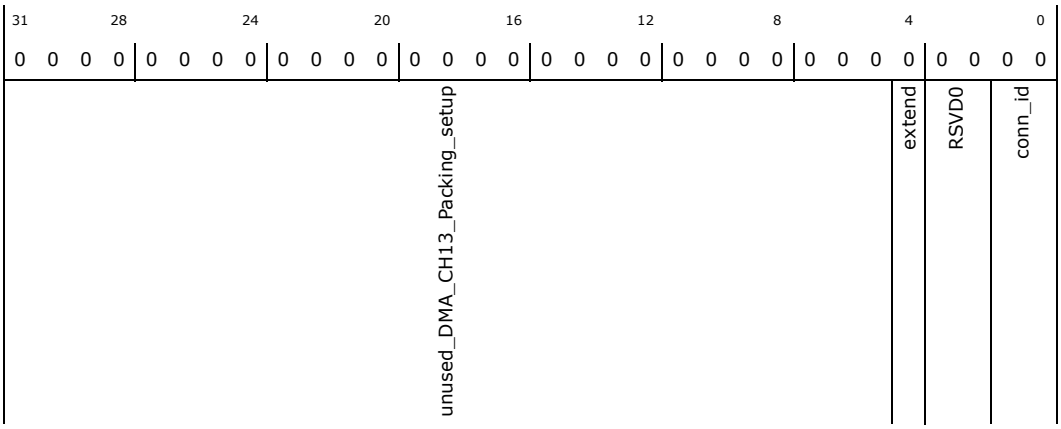
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH13_Packing_setup: [ISPMMADR] + 41034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH13_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.260 reg_isp_dma_DMA_CH14_Packing_setup_type (isp_dma_DMA_CH14_Packing_setup)—Offset 41038h

DMA CH 14 PARAM 0: Packing setup

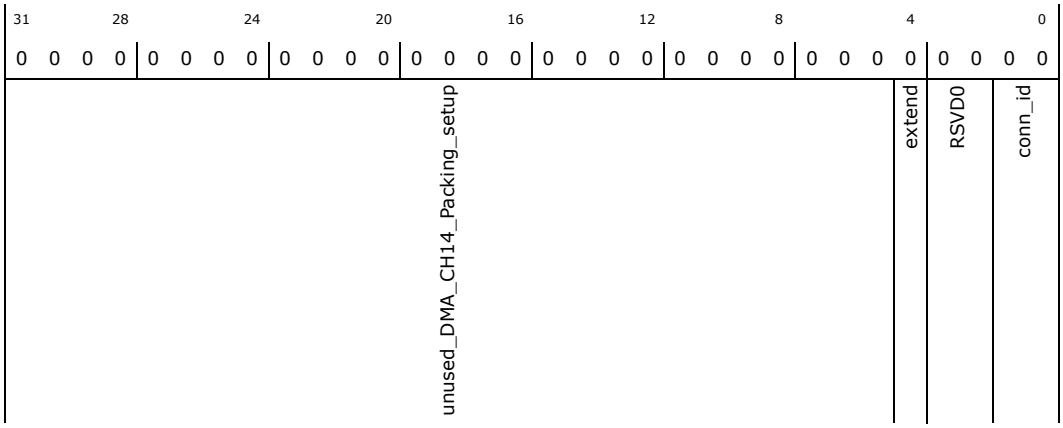
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH14_Packing_setup: [ISPMMADR] + 41038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH14_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.261 reg_isp_dma_DMA_CH15_Packing_setup_type (isp_dma_DMA_CH15_Packing_setup)—Offset 4103Ch

DMA CH 15 PARAM 0: Packing setup

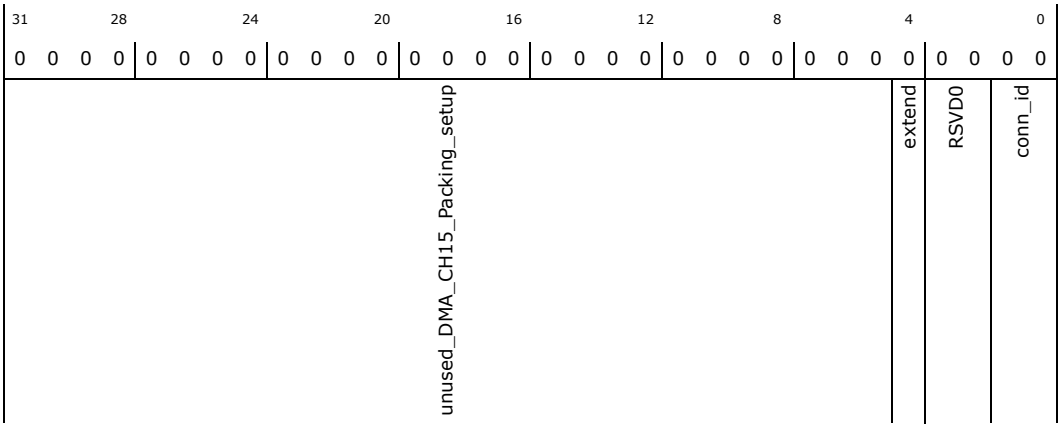
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH15_Packing_setup: [ISPMMADR] + 4103Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH15_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension
3:2	0b RO	**RSVD0:** Reserved
1:0	0h RO	**conn_id:** Connection ID

15.8.262 reg_isp_dma_DMA_CH16_Packing_setup_type (isp_dma_DMA_CH16_Packing_setup)—Offset 41040h

DMA CH 16 PARAM 0: Packing setup

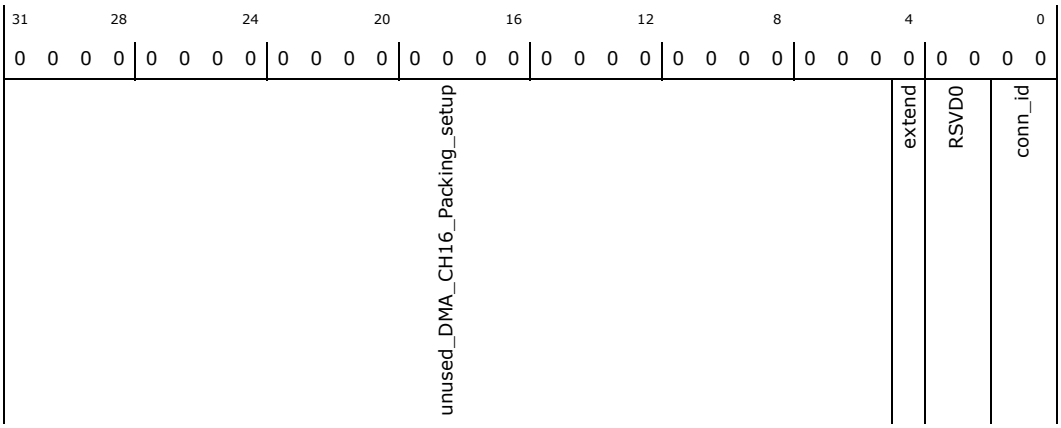
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH16_Packing_setup: [ISPMMADR] + 41040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH16_Packing_setup:** Unused
4	0h RO	**extend:** Zero(0)/Sign(1) extension

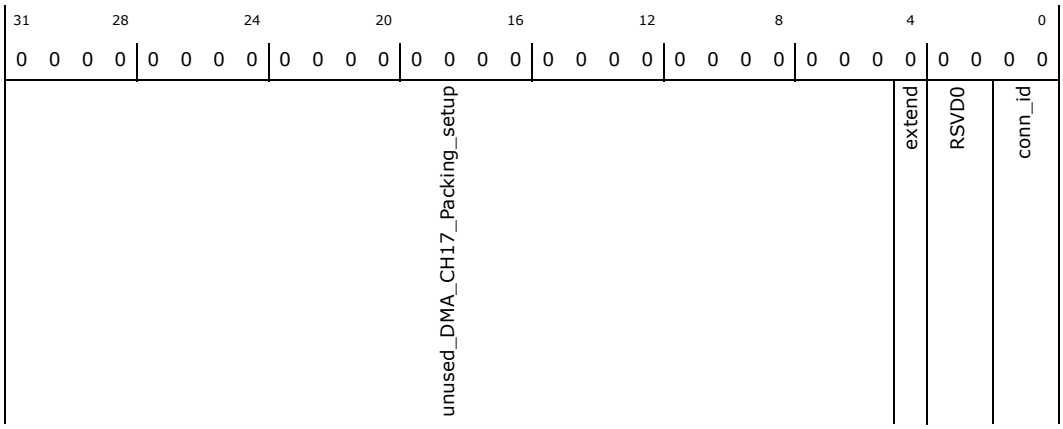
Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH4_dev_stride_A:** DMA CH 4 PARAM 1: Device A stride

15.8.282 reg_isp_dma_DMA_CH5_dev_stride_A_type (isp_dma_DMA_CH5_dev_stride_A)—Offset 41114h

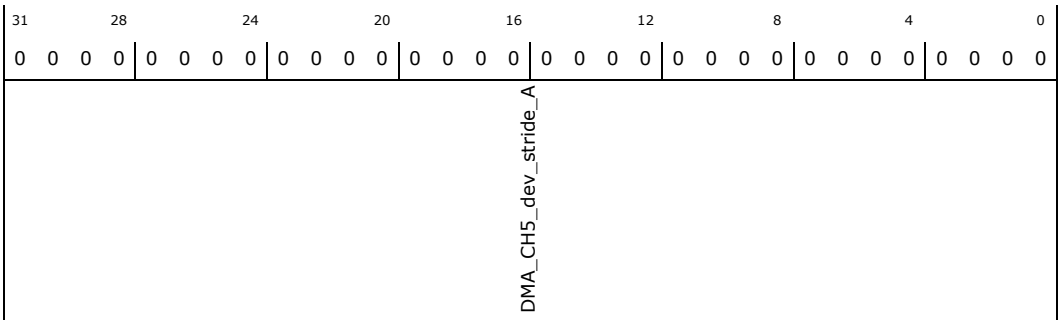
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH5_dev_stride_A: [ISPMMADR] + 41114h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH5_dev_stride_A:** DMA CH 5 PARAM 1: Device A stride

15.8.283 reg_isp_dma_DMA_CH6_dev_stride_A_type (isp_dma_DMA_CH6_dev_stride_A)—Offset 41118h

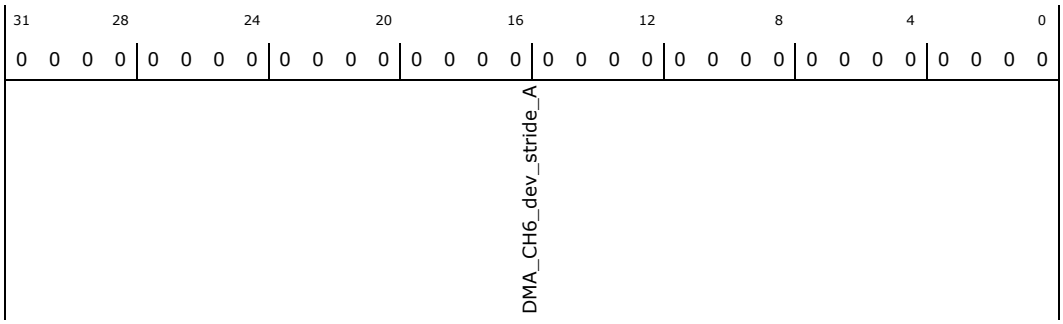
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH6_dev_stride_A: [ISPMMADR] + 41118h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH6_dev_stride_A:** DMA CH 6 PARAM 1: Device A stride

15.8.284 reg_isp_dma_DMA_CH7_dev_stride_A_type (isp_dma_DMA_CH7_dev_stride_A)—Offset 4111Ch

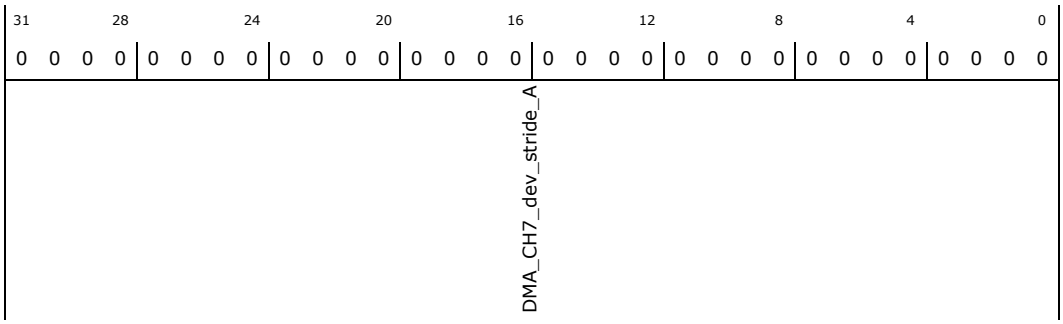
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH7_dev_stride_A: [ISPMMADR] + 4111Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH7_dev_stride_A:** DMA CH 7 PARAM 1: Device A stride

15.8.285 reg_isp_dma_DMA_CH8_dev_stride_A_type (isp_dma_DMA_CH8_dev_stride_A)—Offset 41120h

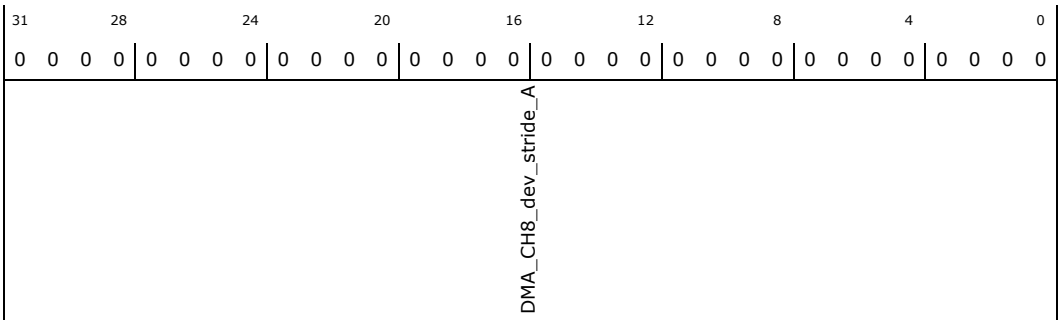
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH8_dev_stride_A: [ISPMMADR] + 41120h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH8_dev_stride_A:** DMA CH 8 PARAM 1: Device A stride

15.8.286 reg_isp_dma_DMA_CH9_dev_stride_A_type (isp_dma_DMA_CH9_dev_stride_A)—Offset 41124h

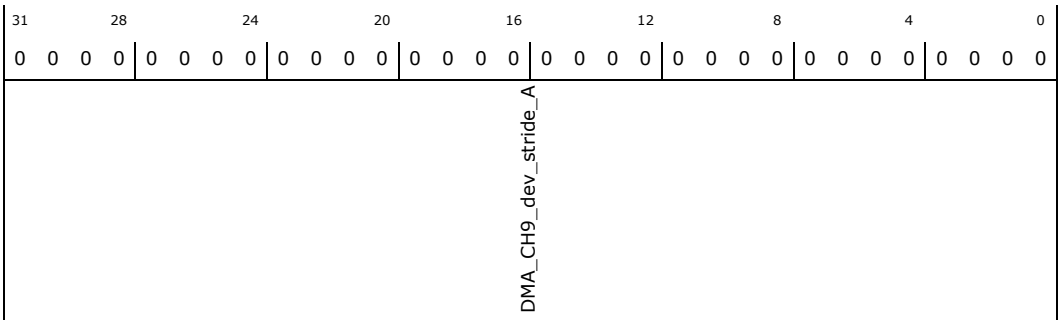
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH9_dev_stride_A: [ISPMMADR] + 41124h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH9_dev_stride_A:** DMA CH 9 PARAM 1: Device A stride

15.8.287 reg_isp_dma_DMA_CH10_dev_stride_A_type (isp_dma_DMA_CH10_dev_stride_A)—Offset 41128h

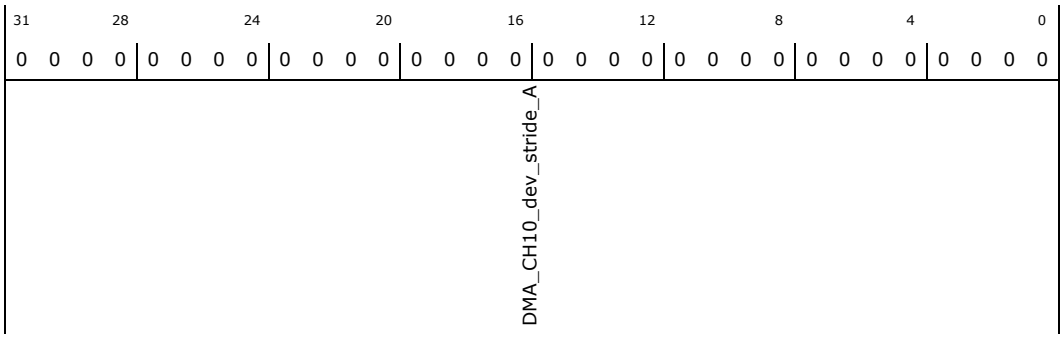
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH10_dev_stride_A: [ISPMMADR] + 41128h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH10_dev_stride_A:** DMA CH 10 PARAM 1: Device A stride

15.8.288 reg_isp_dma_DMA_CH11_dev_stride_A_type (isp_dma_DMA_CH11_dev_stride_A)—Offset 4112Ch

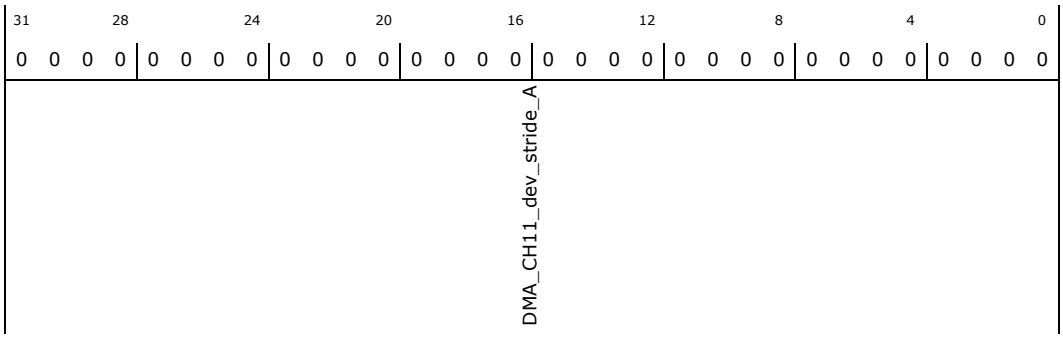
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH11_dev_stride_A: [ISPMMADR] + 4112Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH11_dev_stride_A:** DMA CH 11 PARAM 1: Device A stride

15.8.289 reg_isp_dma_DMA_CH12_dev_stride_A_type (isp_dma_DMA_CH12_dev_stride_A)—Offset 41130h

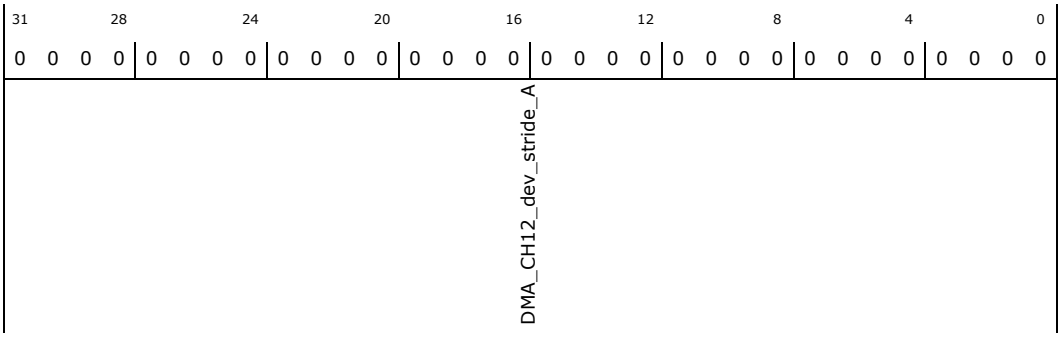
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH12_dev_stride_A: [ISPMMADR] + 41130h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH12_dev_stride_A:** DMA CH 12 PARAM 1: Device A stride

15.8.290 reg_isp_dma_DMA_CH13_dev_stride_A_type (isp_dma_DMA_CH13_dev_stride_A)—Offset 41134h

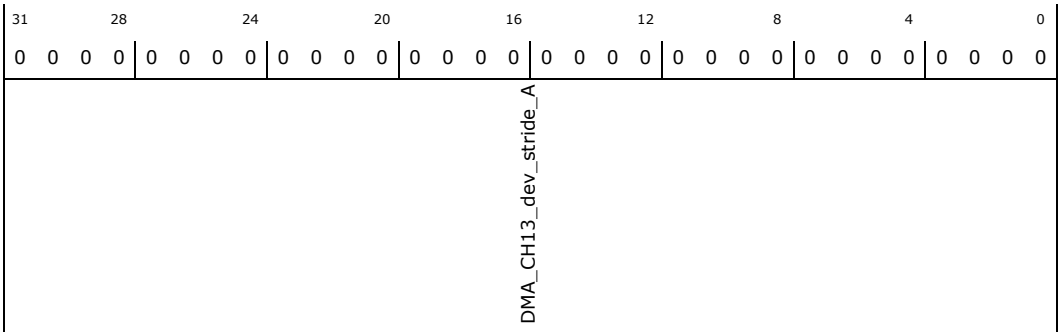
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH13_dev_stride_A: [ISPMMADR] + 41134h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH13_dev_stride_A:** DMA CH 13 PARAM 1: Device A stride

15.8.291 reg_isp_dma_DMA_CH14_dev_stride_A_type (isp_dma_DMA_CH14_dev_stride_A)—Offset 41138h

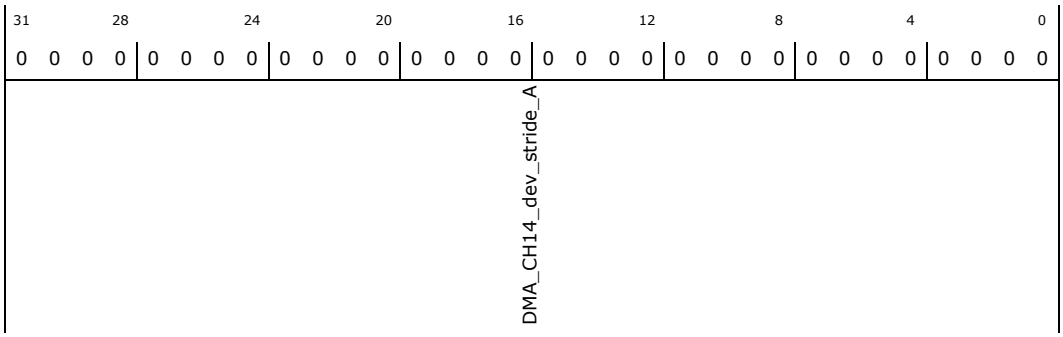
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_dma_DMA_CH14_dev_stride_A: [ISPMMADR] + 41138h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description

Default: 0000007Fh

Bit Range	Default & Access	Description
31:8	0h RW	**unused_Dev_Interf_2_Max_burst_Size:** Unused
7:0	7Fh RW	**Dev_Interf_2_Max_burst_Size:** DMA Device interface 2 max burst size

15.8.577 reg_gdc1_reg0_type (gdc1_reg0)—Offset 50000h

Status register: Current opx, opy, top-level FSM state

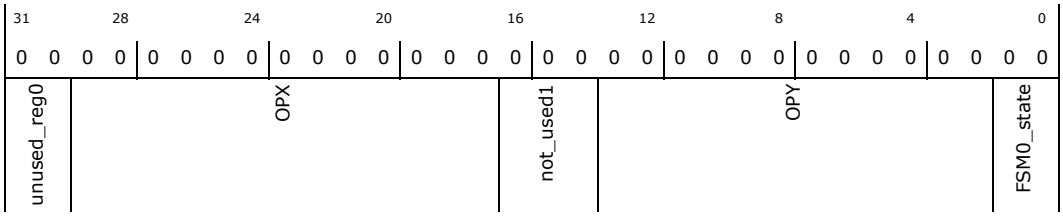
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_reg0: [ISPMMADR] + 50000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**unused_reg0:** Unused
29:17	0h RO	**OPX:** OPX value
16:14	0h RO	**not_used1:** N/A

Bit Range	Default & Access	Description
13:2	0h RO	**OPY:** OPY value
1:0	0h RO	**FSM0_state:** FSM0 state: 00=Idle ; 01=Busy-receiving data needed to kick the device ; 10=Busy-wait state ; 11=Busy-run state

15.8.578 reg_gdc1_woi_x_type (gdc1_woi_x)—Offset 50004h

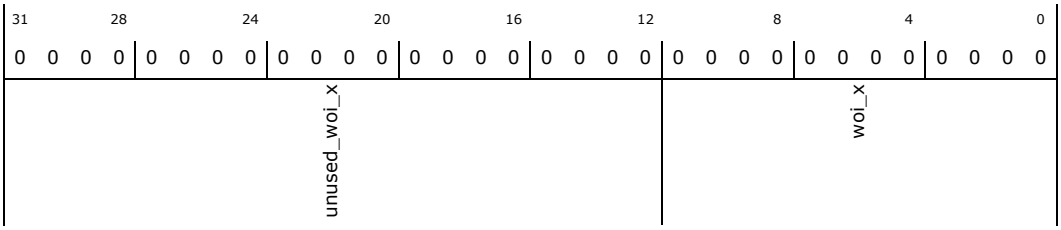
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_woi_x: [ISPMMADR] + 50004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_woi_x:** Unused
11:0	0h RO	**woi_x:** Configured X dimension of the internal window-of-interest (local memory)

15.8.579 reg_gdc1_woi_y_type (gdc1_woi_y)—Offset 50008h

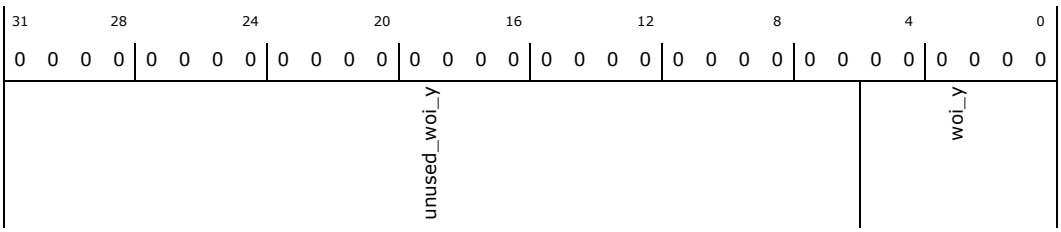
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_woi_y: [ISPMMADR] + 50008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0h RW	**unused_woi_y:** Unused
5:0	0h RO	**woi_y:** Configured Y dimension of the internal window-of-interest (local memory)

15.8.580 reg_gdc1_bpp_type (gdc1_bpp)—Offset 5000Ch

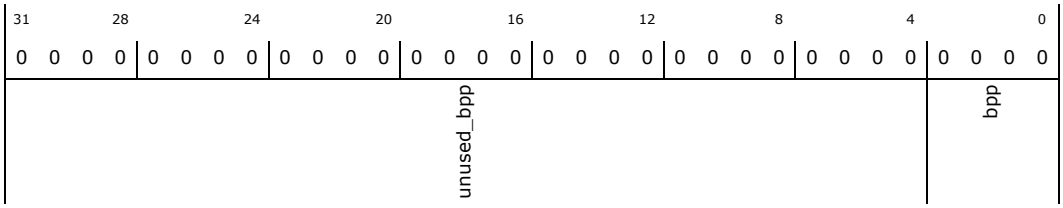
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_bpp: [ISPMMADR] + 5000Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_bpp:** Unused
3:0	0h RW	**bpp:** Bits per input/output pixel, allowed: 8, 10, 12, 14

15.8.581 reg_gdc1_fryipxfrx_start_type (gdc1_fryipxfrx_start)—Offset 50010h

Fractional component of the starting X and Y position for scaling given in fixed point notation

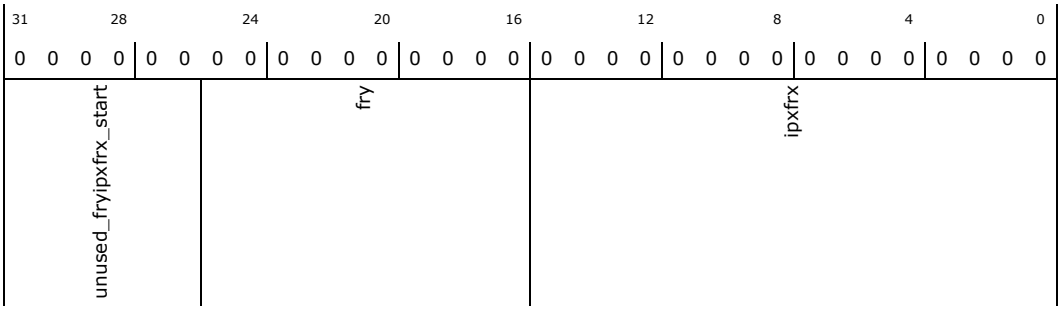
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_fryipxfrx_start: [ISPMMADR] + 50010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:26	0h RW	**unused_fryipxfrx_start:** Unused
25:16	0h RW	**fry:** Fractional component of the Y start
15:0	0h RW	**ipxfrx:** Integer (6) and Fractional (10) component of the X start

15.8.582 reg_gdc1_oxdim_type (gdc1_oxdim)—Offset 50014h

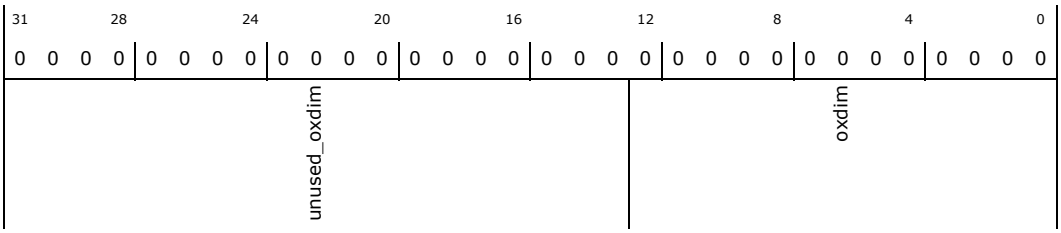
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_oxdim: [ISPMMADR] + 50014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:13	0h RW	**unused_oxdim:** Unused
12:0	0h RW	**oxdim:** Output X dimension of the produced block of pixels

15.8.583 reg_gdc1_oydim_type (gdc1_oydim)—Offset 50018h

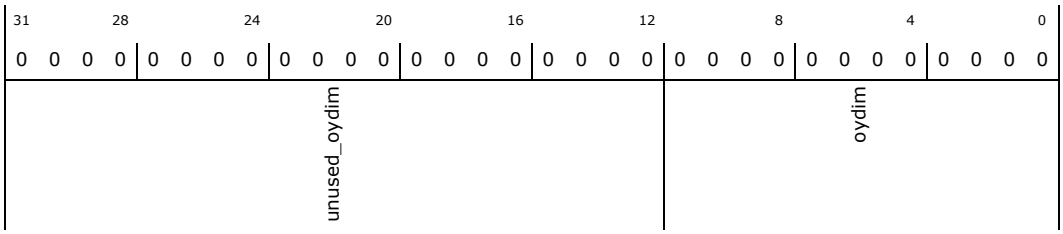
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_oydim: [ISPMMADR] + 50018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_oydim:** Unused
11:0	0h RW	**oydim:** Output Y dimension of the produced block of pixels

15.8.584 reg_gdc1_src_addr_type (gdc1_src_addr)—Offset 5001Ch

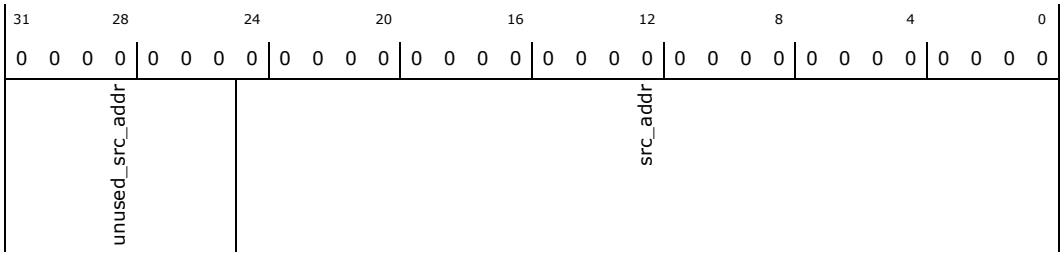
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_addr: [ISPMMADR] + 5001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_addr:** Unused
24:0	0h RW	**src_addr:** Source (input) pixel base address [byte-based]

15.8.585 reg_gdc1_src_end_type (gdc1_src_end)—Offset 50020h

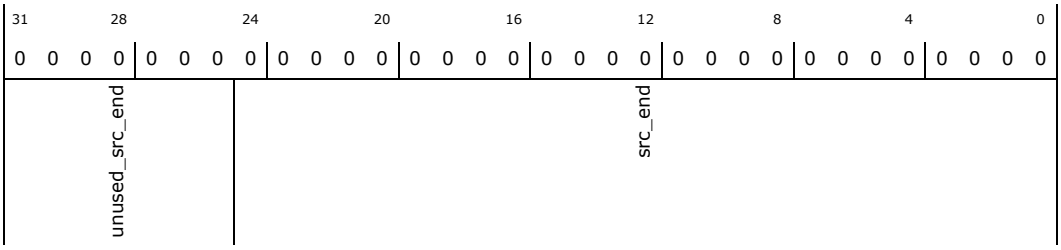
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_end: [ISPMMADR] + 50020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_end:** Unused
24:0	0h RW	**src_end:** End address. When reached wrap around. [byte-based]

15.8.586 reg_gdc1_src_wrap_type (gdc1_src_wrap)—Offset 50024h

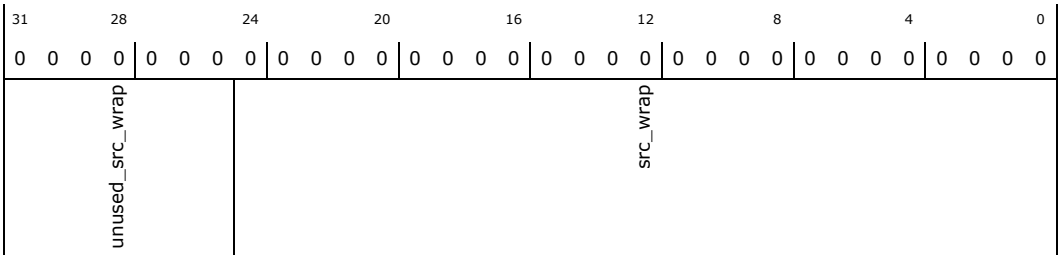
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_wrap: [ISPMMADR] + 50024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_wrap:** Unused
24:0	0h RW	**src_wrap:** Wrap addr. Wrap here when src_end reached [byte-based]

15.8.587 reg_gdc1_src_stride_type (gdc1_src_stride)—Offset 50028h

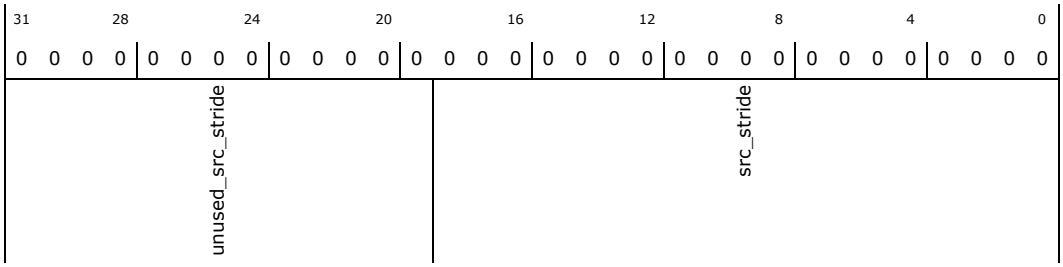
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_stride: [ISPMMADR] + 50028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_src_stride:** Unused
18:0	0h RW	**src_stride:** Source (input) pixel stride [byte-based]

15.8.588 reg_gdc1_dst_addr_type (gdc1_dst_addr)—Offset 5002Ch

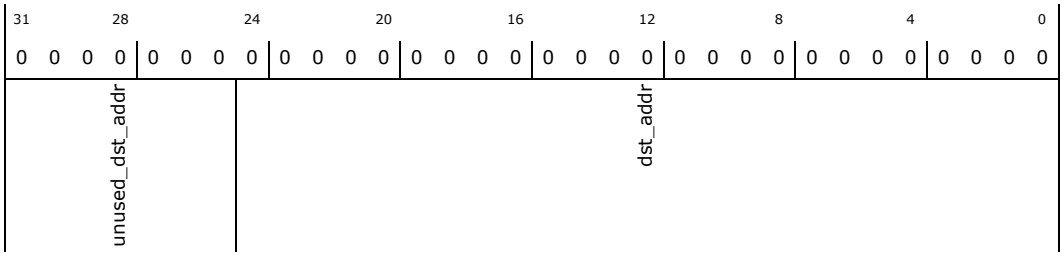
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dst_addr: [ISPMMADR] + 5002Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_dst_addr:** Unused
24:0	0h RW	**dst_addr:** Destination (output) pixel base address [byte-based]

15.8.589 reg_gdc1_dst_stride_type (gdc1_dst_stride)—Offset 50030h

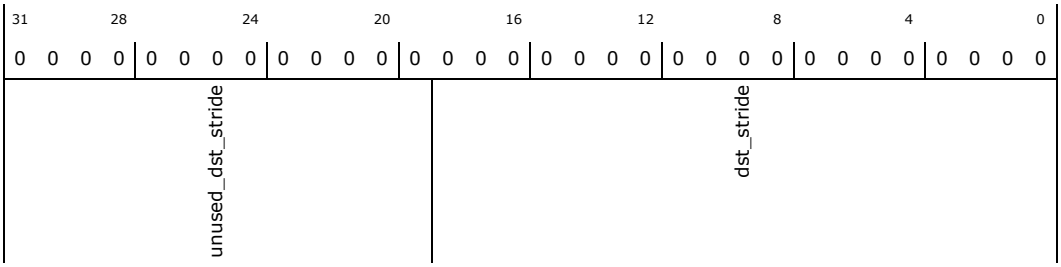
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dst_stride: [ISPMMADR] + 50030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_dst_stride:** Unused
18:0	0h RW	**dst_stride:** Destination (output) pixel stride [byte-based]

15.8.590 reg_gdc1_dx_type (gdc1_dx)—Offset 50034h

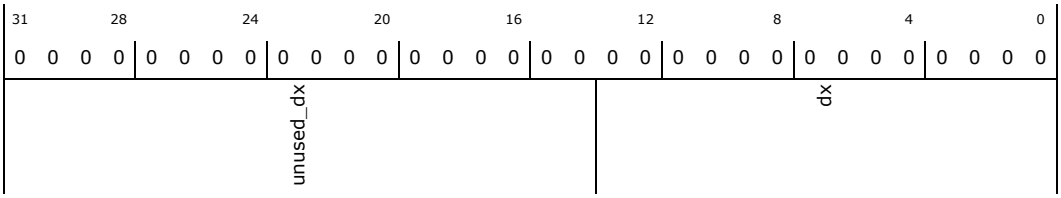
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dx: [ISPMMADR] + 50034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_dx:** Unused
13:0	0h RW	**dx:** Scaling only: Horizontal scaling factor

15.8.591 reg_gdc1_dy_type (gdc1_dy)—Offset 50038h

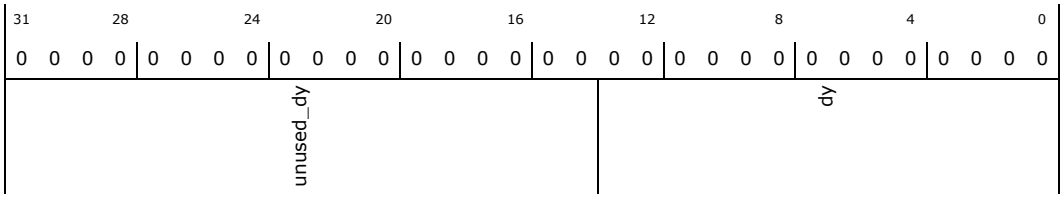
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dy: [ISPMMADR] + 50038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_dy:** Unused
13:0	0h RW	**dy:** Scaling only: Vertical scaling factor

15.8.592 reg_gdc1_P0_primX_ixdim_type (gdc1_P0_primX_ixdim)—Offset 5003Ch

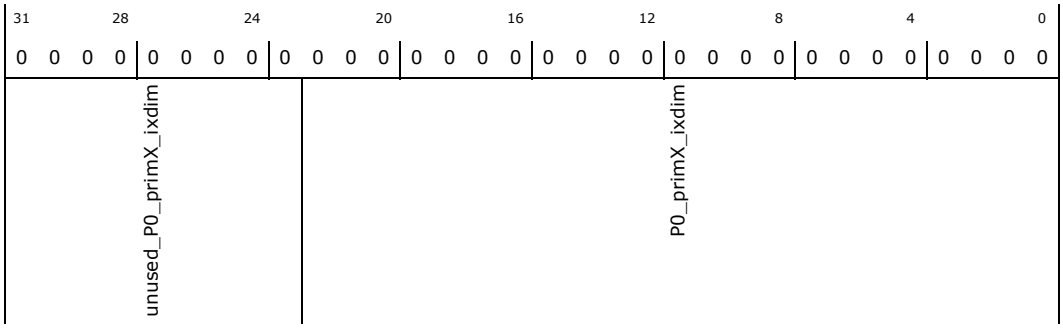
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P0_primX_ixdim: [ISPMMADR] + 5003Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P0_primX_ixdim:** Unused
22:0	0h RW	**P0_primX_ixdim:** P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

15.8.593 reg_gdc1_P0_primY_iydim_type (gdc1_P0_primY_iydim)—Offset 50040h

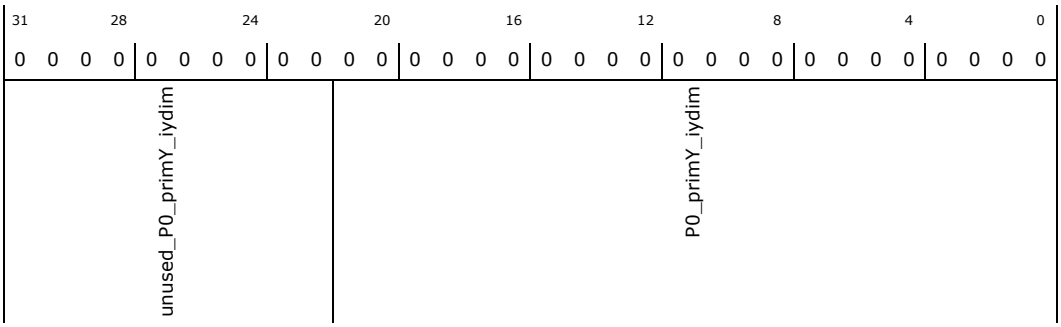
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P0_primY_iydim: [ISPMMADR] + 50040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P0_primY_iydim:** Unused
21:0	0h RW	**P0_primY_iydim:** P0(Y) Tetragon mode: top-left coordinate (Y), Scaling mode: dimension of the input region (Y), fixed point notation, 12.10

15.8.594 reg_gdc1_P1_primX_type (gdc1_P1_primX)—Offset 50044h

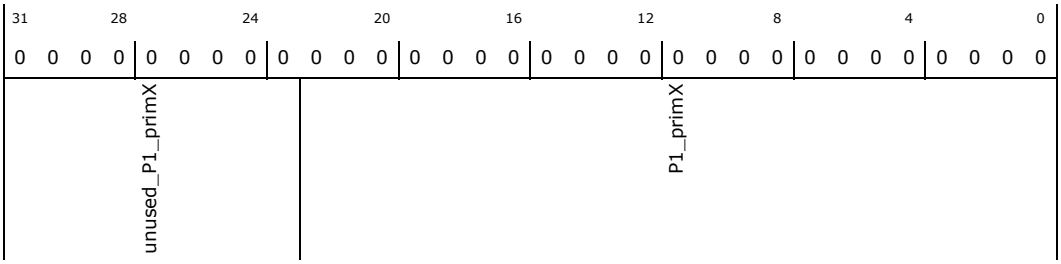
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P1_primX: [ISPMMADR] + 50044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P1_primX:** Unused
22:0	0h RW	**P1_primX:** P1(X) Tetragon mode only: top-right coordinate (X), fixed point notation, 13.10

15.8.595 reg_gdc1_P1_primY_type (gdc1_P1_primY)—Offset 50048h

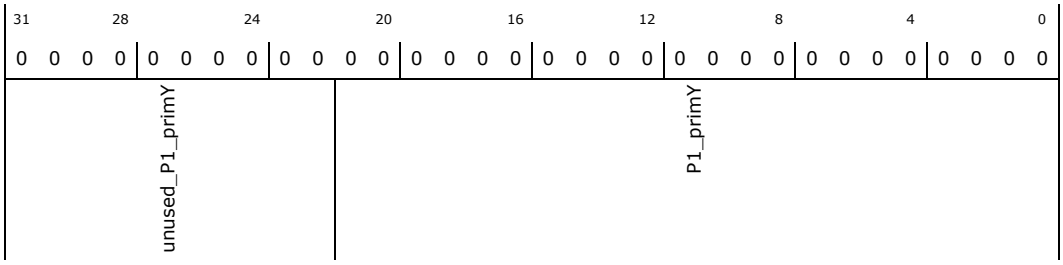
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P1_primY: [ISPMMADR] + 50048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P1_primY:** Unused
21:0	0h RW	**P1_primY:** P1(Y) Tetragon mode only: top-right coordinate (Y), fixed point notation, 12.10

15.8.596 reg_gdc1_P2_primX_type (gdc1_P2_primX)—Offset 5004Ch

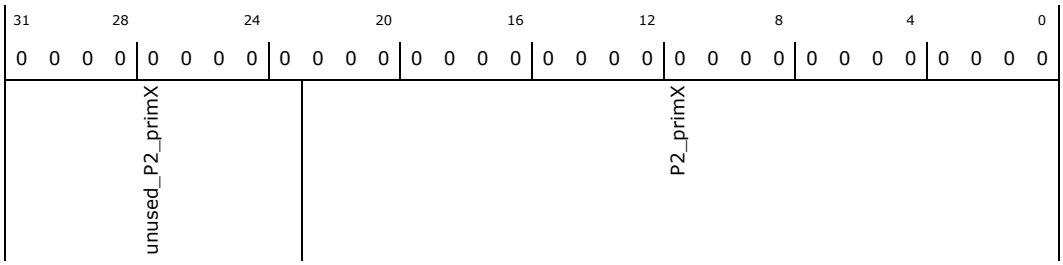
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P2_primX: [ISPMMADR] + 5004Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P2_primX:** Unused
22:0	0h RW	**P2_primX:** P2(X) Tetragon mode only: bottom-left coordinate (X), fixed point notation, 13.10

15.8.597 reg_gdc1_P2_primY_type (gdc1_P2_primY)—Offset 50050h

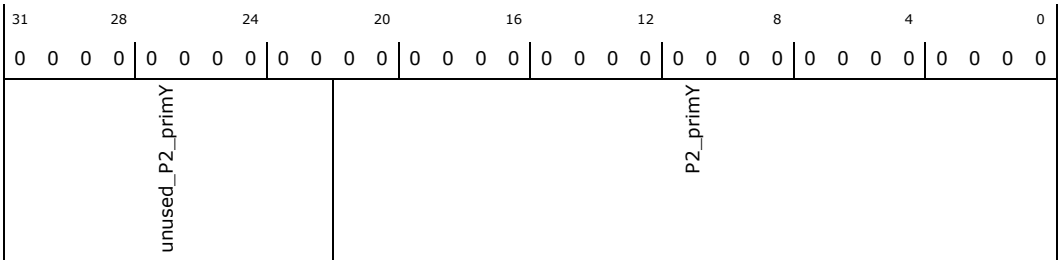
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P2_primY: [ISPMMADR] + 50050h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P2_primY:** Unused
21:0	0h RW	**P2_primY:** P2(Y) Tetragon mode only: bottom-left coordinate (Y), fixed point notation, 12.10

15.8.598 reg_gdc1_P3_primX_type (gdc1_P3_primX)—Offset 50054h

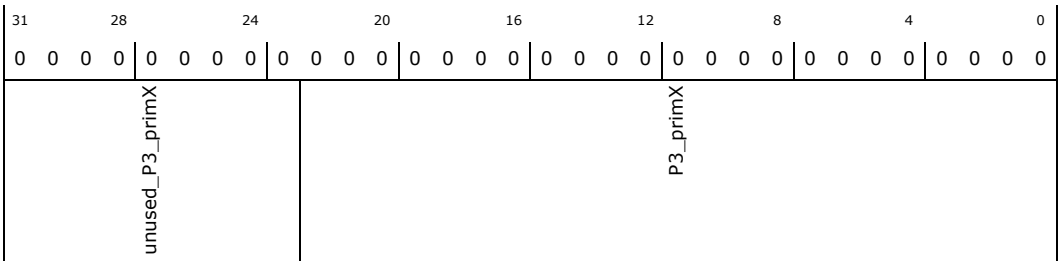
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P3_primX: [ISPMMADR] + 50054h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P3_primX:** Unused
22:0	0h RW	**P3_primX:** P3(X) Tetragon mode only: bottom-right coordinate (X), fixed point notation, 13.10

15.8.599 reg_gdc1_P3_primY_type (gdc1_P3_primY)—Offset 50058h

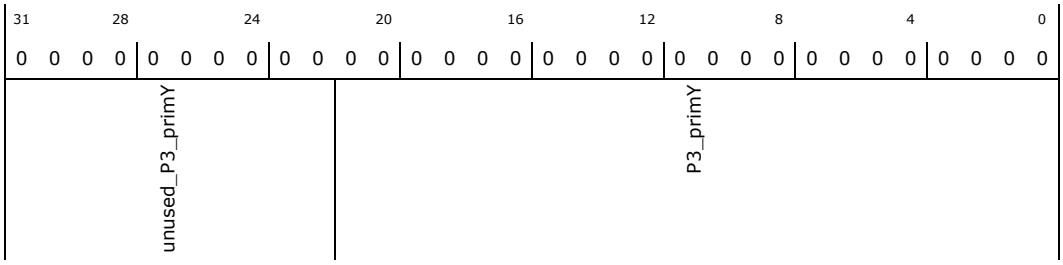
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_P3_primY: [ISPMMADR] + 50058h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P3_primY:** Unused
21:0	0h RW	**P3_primY:** P3(Y) Tetragon mode only: bottom-right coordinate (Y), fixed point notation, 12.10

15.8.600 reg_gdc1_perf_mode_type (gdc1_perf_mode)—Offset 5005Ch

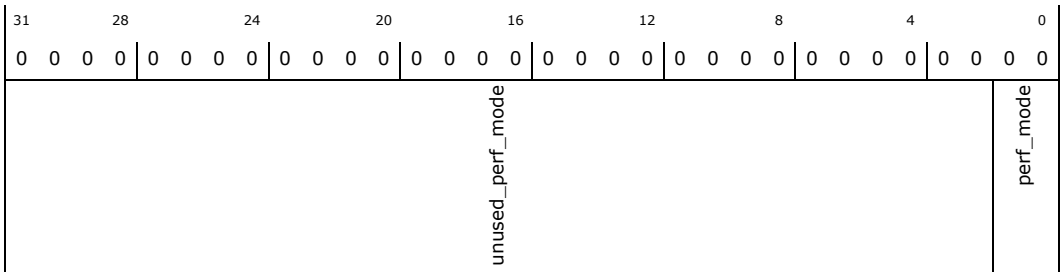
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_perf_mode: [ISPMMADR] + 5005Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_perf_mode:** Unused
1:0	0h RW	**perf_mode:** Number and location of pixels produced per clock cycle: 00=1x1 pixels ; 01=2x1 pixels ; 10=1x2 pixels ; 11=2x2 pixels

15.8.601 reg_gdc1_interp_type_type (gdc1_interp_type)—Offset 50060h

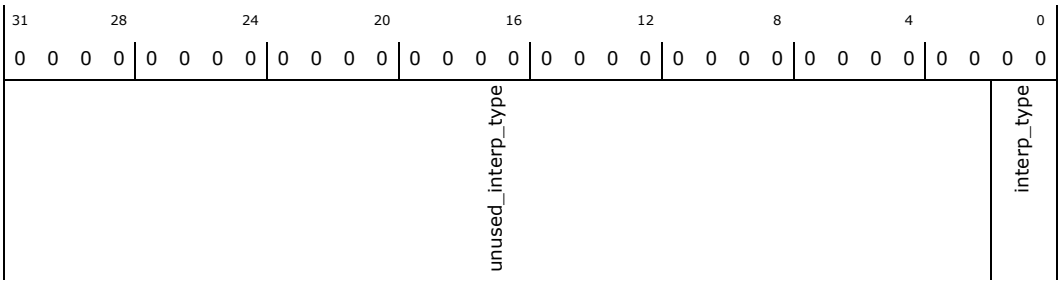
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_interp_type: [ISPMMADR] + 50060h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_interp_type:** Unused
1:0	0h RW	**interp_type:** Type of interpolation: 00=NND ; 01=BLI ; 10=BCI ; 11=LUT

15.8.602 reg_gdc1_scan_mode_type (gdc1_scan_mode)—Offset 50064h

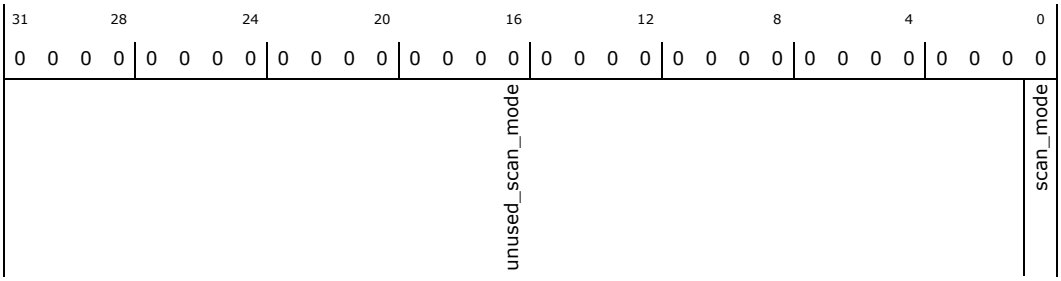
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_scan_mode: [ISPMMADR] + 50064h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_scan_mode:** Unused
0	0h RW	**scan_mode:** Scanning mode: 0 = STB (Slide To Bottom) ; 1 = STR (Slide To Right)

15.8.603 reg_gdc1_proc_mode_type (gdc1_proc_mode)—Offset 50068h

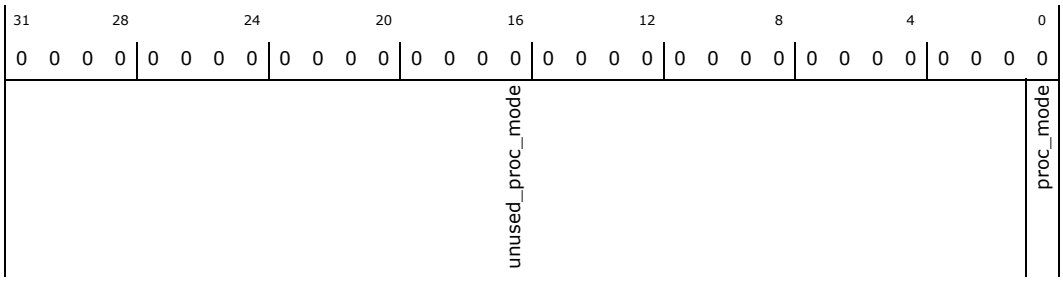
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_proc_mode: [ISPMMADR] + 50068h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_proc_mode:** Unused
0	0h RW	**proc_mode:** Processing mode: 0 = Rectangular-based scaling ; 1 = Tetragon-based scaling

15.8.604 reg_gdc2_reg0_type (gdc2_reg0)—Offset 60000h

Status register: Current opx, opy, top-level FSM state

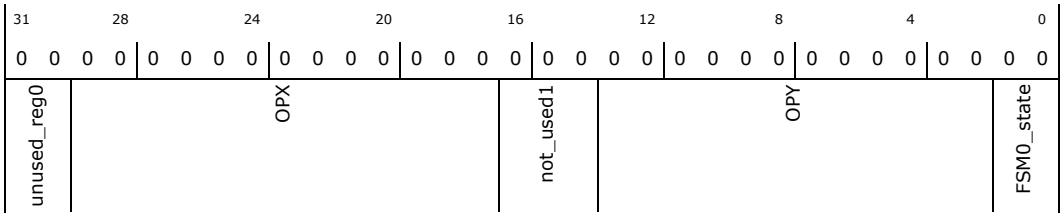
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_reg0: [ISPMMADR] + 60000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**unused_reg0:** Unused
29:17	0h RO	**OPX:** OPX value

Bit Range	Default & Access	Description
16:14	0h RO	**not_used1:** N/A
13:2	0h RO	**OPY:** OPY value
1:0	0h RO	**FSM0_state:** FSM0 state: 00=Idle ; 01=Busy-receiving data needed to kick the device ; 10=Busy-wait state ; 11=Busy-run state

15.8.605 reg_gdc2_woi_x_type (gdc2_woi_x)—Offset 60004h

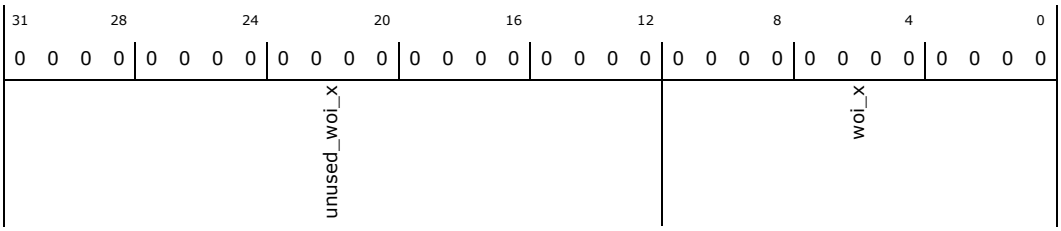
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_woi_x: [ISPMMADR] + 60004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_woi_x:** Unused
11:0	0h RO	**woi_x:** Configured X dimension of the internal window-of-interest (local memory)

15.8.606 reg_gdc2_woi_y_type (gdc2_woi_y)—Offset 60008h

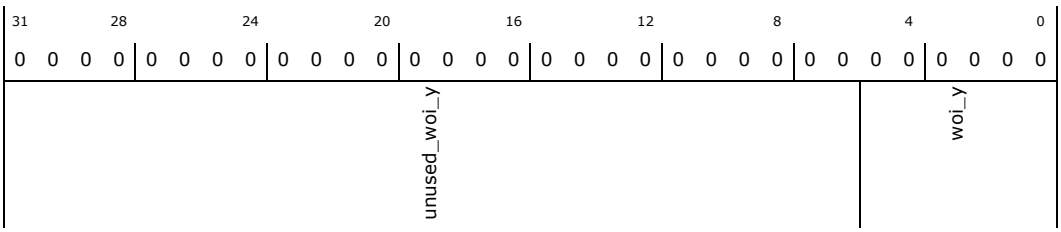
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_woi_y: [ISPMMADR] + 60008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0h RW	**unused_woi_y:** Unused
5:0	0h RO	**woi_y:** Configured Y dimension of the internal window-of-interest (local memory)

15.8.607 reg_gdc2_bpp_type (gdc2_bpp)—Offset 6000Ch

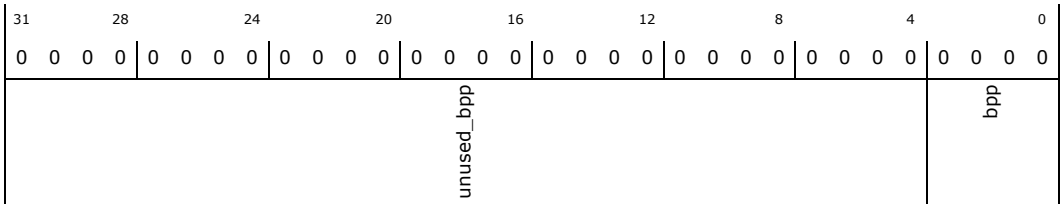
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_bpp: [ISPMMADR] + 6000Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_bpp:** Unused
3:0	0h RW	**bpp:** Bits per input/output pixel, allowed: 8, 10, 12, 14

15.8.608 reg_gdc2_fryipxfrx_start_type (gdc2_fryipxfrx_start)—Offset 60010h

Fractional component of the starting X and Y position for scaling given in fixed point notation

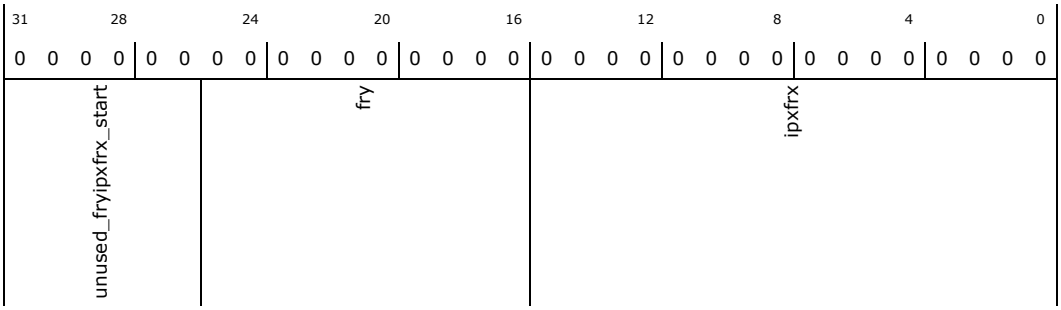
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_fryipxfrx_start: [ISPMMADR] + 60010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:26	0h RW	**unused_fryipxfrx_start:** Unused
25:16	0h RW	**fry:** Fractional component of the Y start
15:0	0h RW	**ipxfrx:** Integer (6) and Fractional (10) component of the X start

15.8.609 reg_gdc2_oxdim_type (gdc2_oxdim)—Offset 60014h

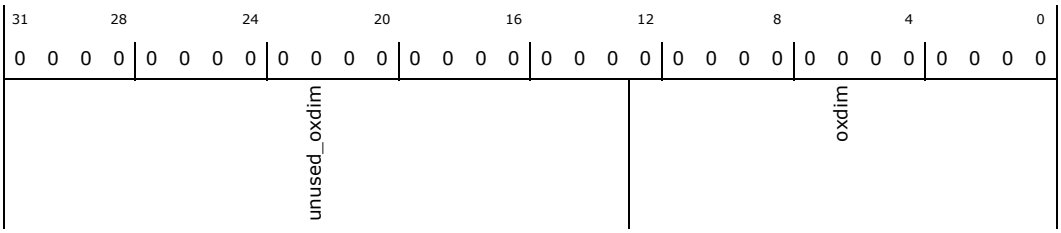
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_oxdim: [ISPMMADR] + 60014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:13	0h RW	**unused_oxdim:** Unused
12:0	0h RW	**oxdim:** Output X dimension of the produced block of pixels

15.8.610 reg_gdc2_oydim_type (gdc2_oydim)—Offset 60018h

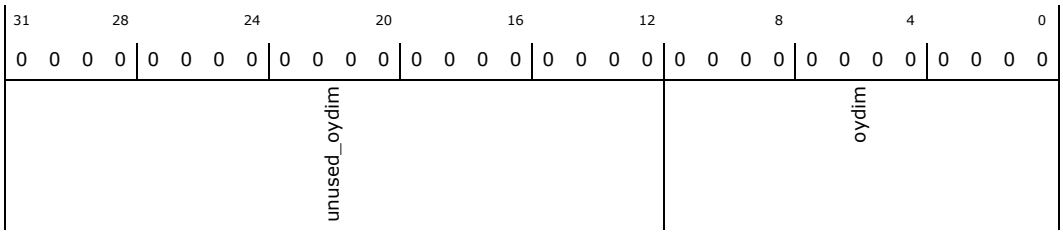
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_oydim: [ISPMMADR] + 60018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_oydim:** Unused
11:0	0h RW	**oydim:** Output Y dimension of the produced block of pixels

15.8.611 reg_gdc2_src_addr_type (gdc2_src_addr)—Offset 6001Ch

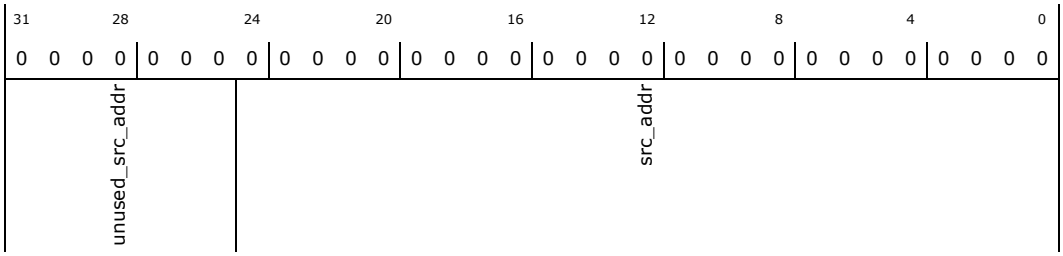
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_src_addr: [ISPMMADR] + 6001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_addr:** Unused
24:0	0h RW	**src_addr:** Source (input) pixel base address [byte-based]

15.8.612 reg_gdc2_src_end_type (gdc2_src_end)—Offset 60020h

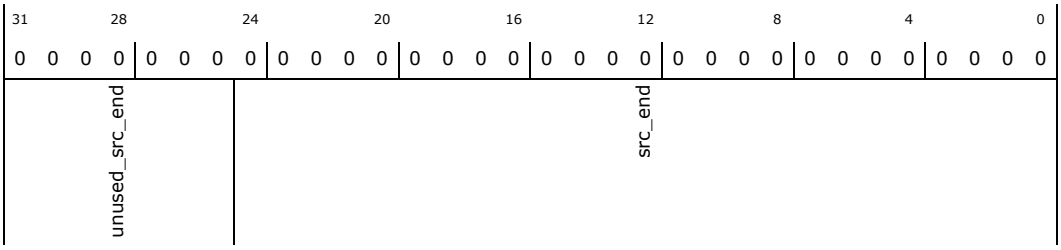
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_src_end: [ISPMMADR] + 60020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_end:** Unused
24:0	0h RW	**src_end:** End address. When reached wrap around. [byte-based]

15.8.613 reg_gdc2_src_wrap_type (gdc2_src_wrap)—Offset 60024h

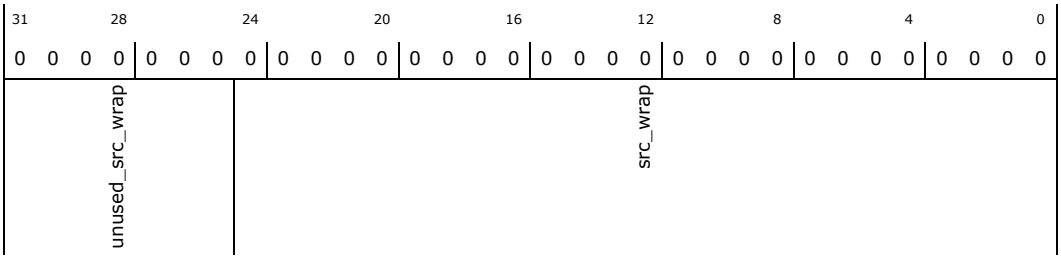
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_src_wrap: [ISPMMADR] + 60024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_wrap:** Unused
24:0	0h RW	**src_wrap:** Wrap addr. Wrap here when src_end reached [byte-based]

15.8.614 reg_gdc2_src_stride_type (gdc2_src_stride)—Offset 60028h

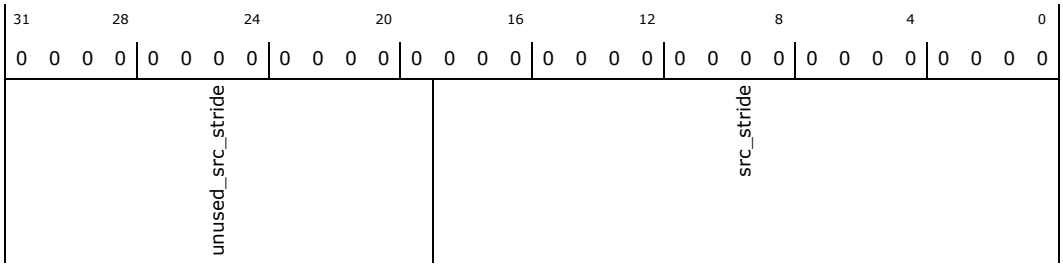
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_src_stride: [ISPMMADR] + 60028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_src_stride:** Unused
18:0	0h RW	**src_stride:** Source (input) pixel stride [byte-based]

15.8.615 reg_gdc2_dst_addr_type (gdc2_dst_addr)—Offset 6002Ch

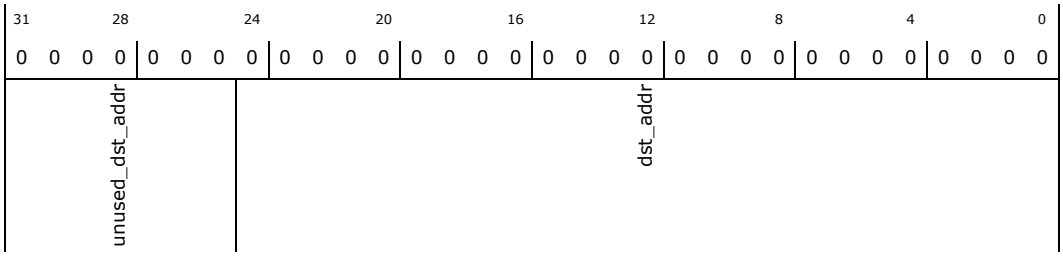
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dst_addr: [ISPMMADR] + 6002Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_dst_addr:** Unused
24:0	0h RW	**dst_addr:** Destination (output) pixel base address [byte-based]

15.8.616 reg_gdc2_dst_stride_type (gdc2_dst_stride)—Offset 60030h

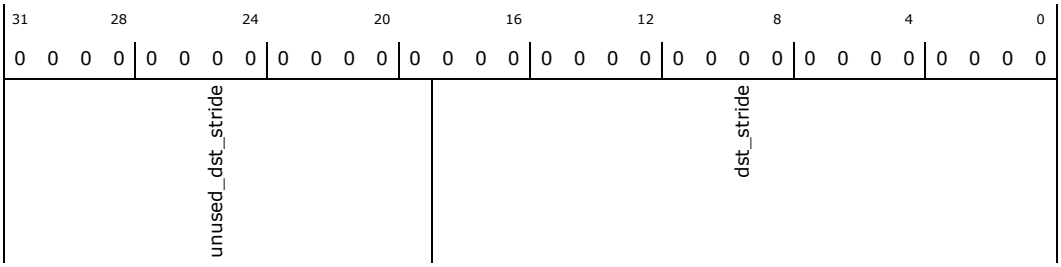
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dst_stride: [ISPMMADR] + 60030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_dst_stride:** Unused
18:0	0h RW	**dst_stride:** Destination (output) pixel stride [byte-based]

15.8.617 reg_gdc2_dx_type (gdc2_dx)—Offset 60034h

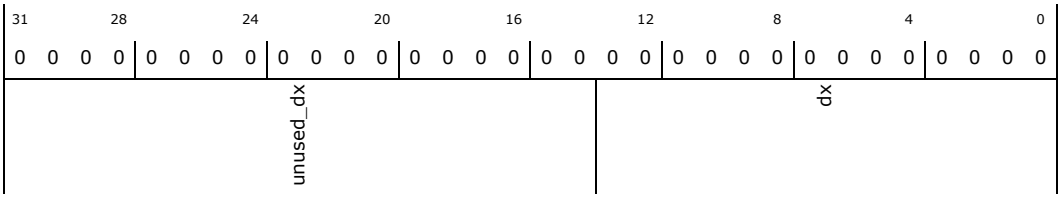
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dx: [ISPMMADR] + 60034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_dx:** Unused
13:0	0h RW	**dx:** Scaling only: Horizontal scaling factor

15.8.618 reg_gdc2_dy_type (gdc2_dy)—Offset 60038h

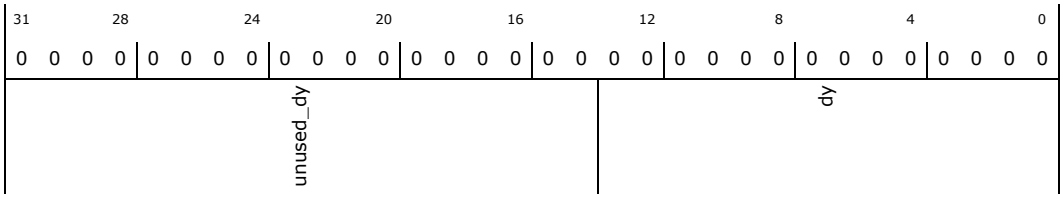
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dy: [ISPMMADR] + 60038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_dy:** Unused
13:0	0h RW	**dy:** Scaling only: Vertical scaling factor

15.8.619 reg_gdc2_P0_primX_ixdim_type (gdc2_P0_primX_ixdim)—Offset 6003Ch

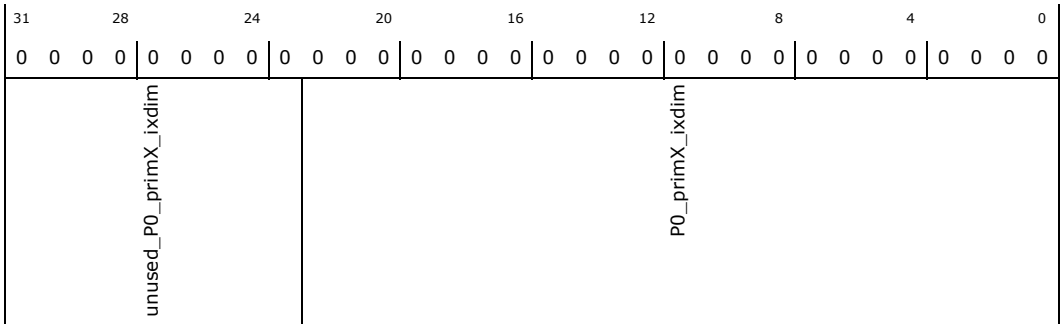
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P0_primX_ixdim: [ISPMMADR] + 6003Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P0_primX_ixdim:** Unused
22:0	0h RW	**P0_primX_ixdim:** P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

15.8.620 reg_gdc2_P0_primY_iydim_type (gdc2_P0_primY_iydim)—Offset 60040h

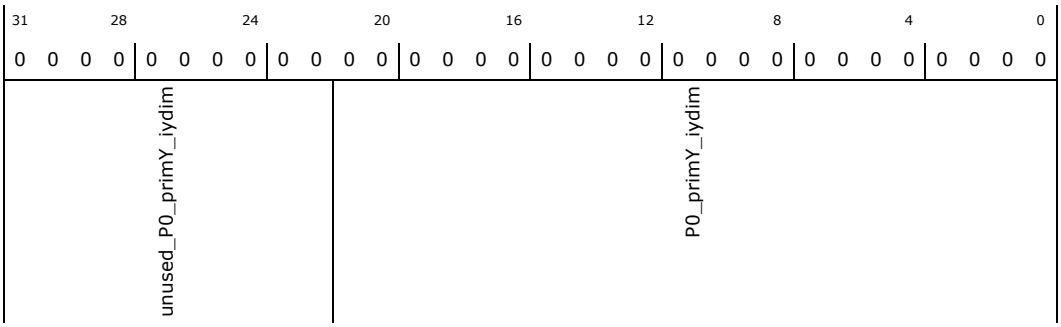
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P0_primY_iydim: [ISPMMADR] + 60040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P0_primY_iydim:** Unused
21:0	0h RW	**P0_primY_iydim:** P0(Y) Tetragon mode: top-left coordinate (Y), Scaling mode: dimension of the input region (Y), fixed point notation, 12.10

15.8.621 reg_gdc2_P1_primX_type (gdc2_P1_primX)—Offset 60044h

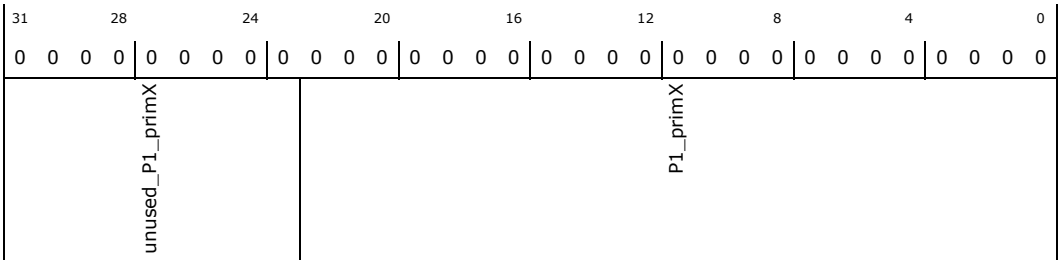
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P1_primX: [ISPMMADR] + 60044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P1_primX:** Unused
22:0	0h RW	**P1_primX:** P1(X) Tetragon mode only: top-right coordinate (X), fixed point notation, 13.10

15.8.622 reg_gdc2_P1_primY_type (gdc2_P1_primY)—Offset 60048h

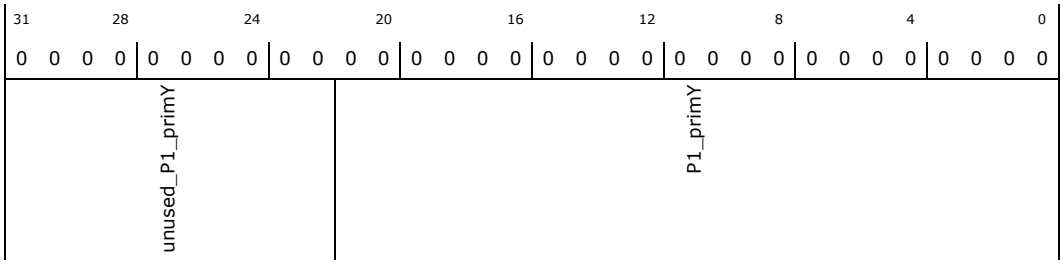
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P1_primY: [ISPMMADR] + 60048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P1_primY:** Unused
21:0	0h RW	**P1_primY:** P1(Y) Tetragon mode only: top-right coordinate (Y), fixed point notation, 12.10

15.8.623 reg_gdc2_P2_primX_type (gdc2_P2_primX)—Offset 6004Ch

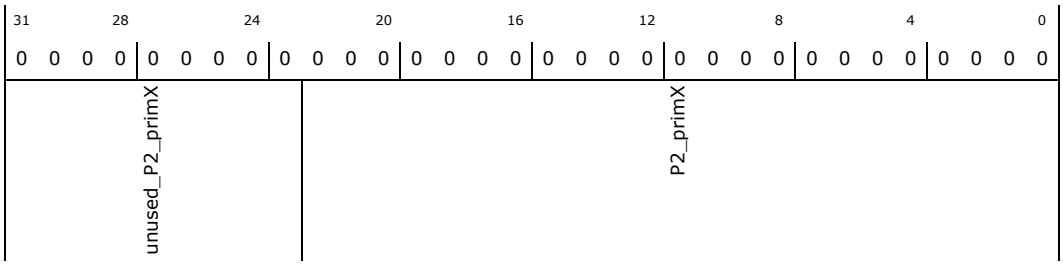
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P2_primX: [ISPMMADR] + 6004Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P2_primX:** Unused
22:0	0h RW	**P2_primX:** P2(X) Tetragon mode only: bottom-left coordinate (X), fixed point notation, 13.10

15.8.624 reg_gdc2_P2_primY_type (gdc2_P2_primY)—Offset 60050h

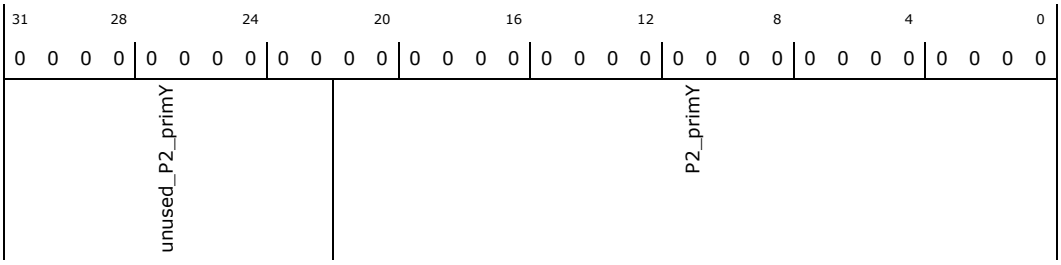
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P2_primY: [ISPMMADR] + 60050h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P2_primY:** Unused
21:0	0h RW	**P2_primY:** P2(Y) Tetragon mode only: bottom-left coordinate (Y), fixed point notation, 12.10

15.8.625 reg_gdc2_P3_primX_type (gdc2_P3_primX)—Offset 60054h

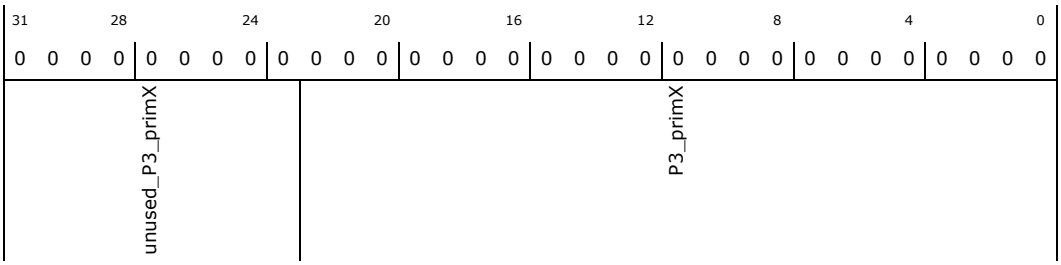
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P3_primX: [ISPMMADR] + 60054h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P3_primX:** Unused
22:0	0h RW	**P3_primX:** P3(X) Tetragon mode only: bottom-right coordinate (X), fixed point notation, 13.10

15.8.626 reg_gdc2_P3_primY_type (gdc2_P3_primY)—Offset 60058h

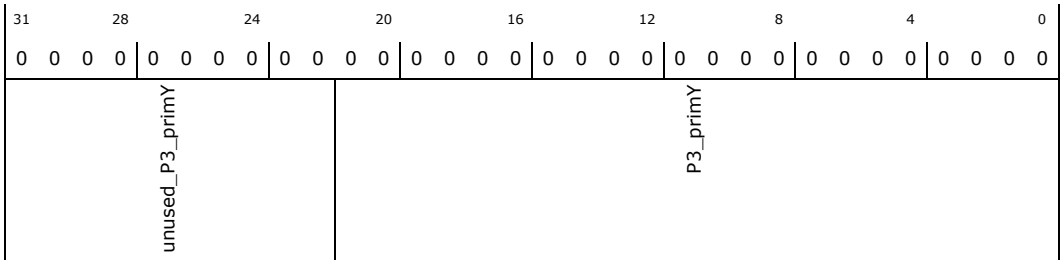
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P3_primY: [ISPMMADR] + 60058h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P3_primY:** Unused
21:0	0h RW	**P3_primY:** P3(Y) Tetragon mode only: bottom-right coordinate (Y), fixed point notation, 12.10

15.8.627 reg_gdc2_perf_mode_type (gdc2_perf_mode)—Offset 6005Ch

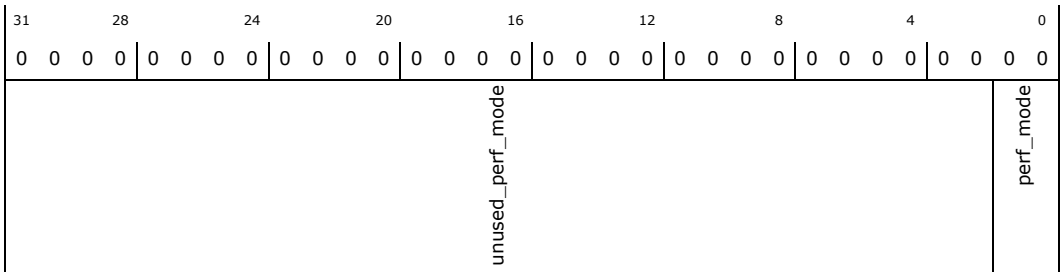
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_perf_mode: [ISPMMADR] + 6005Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_perf_mode:** Unused
1:0	0h RW	**perf_mode:** Number and location of pixels produced per clock cycle: 00=1x1 pixels ; 01=2x1 pixels ; 10=1x2 pixels ; 11=2x2 pixels

15.8.628 reg_gdc2_interp_type_type (gdc2_interp_type)—Offset 60060h

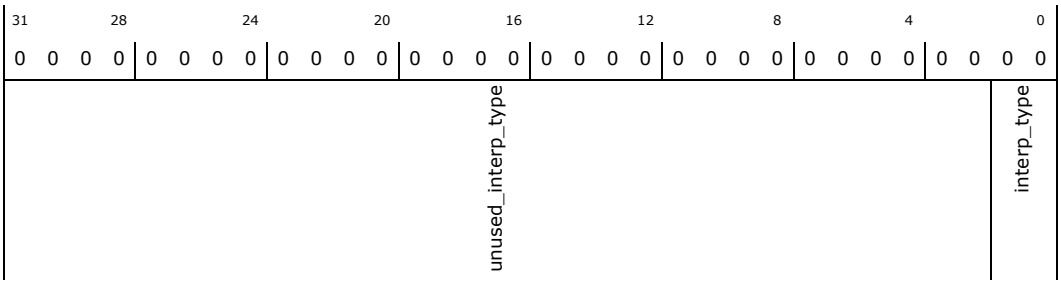
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_interp_type: [ISPMMADR] + 60060h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_interp_type:** Unused
1:0	0h RW	**interp_type:** Type of interpolation: 00=NND ; 01=BLI ; 10=BCI ; 11=LUT

15.8.629 reg_gdc2_scan_mode_type (gdc2_scan_mode)—Offset 60064h

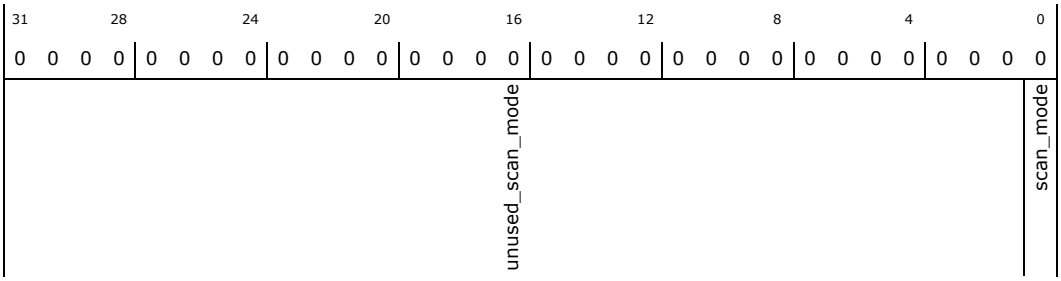
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_scan_mode: [ISPMMADR] + 60064h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_scan_mode:** Unused
0	0h RW	**scan_mode:** Scanning mode: 0 = STB (Slide To Bottom) ; 1 = STR (Slide To Right)

15.8.630 reg_gdc2_proc_mode_type (gdc2_proc_mode)—Offset 60068h

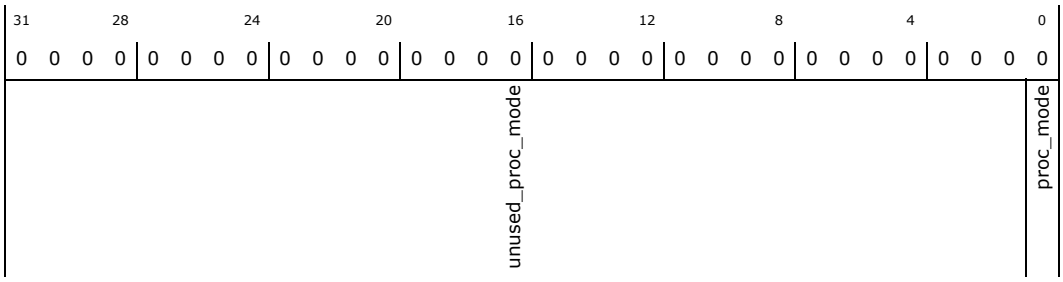
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_proc_mode: [ISPMMADR] + 60068h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_proc_mode:** Unused
0	0h RW	**proc_mode:** Processing mode: 0 = Rectangular-based scaling ; 1 = Tetragon-based scaling

15.8.631 reg_data_out_sys_c_mmu_MMU_invalidate_cache_type (data_out_sys_c_mmu_MMU_invalidate_cache)—Offset 70000h

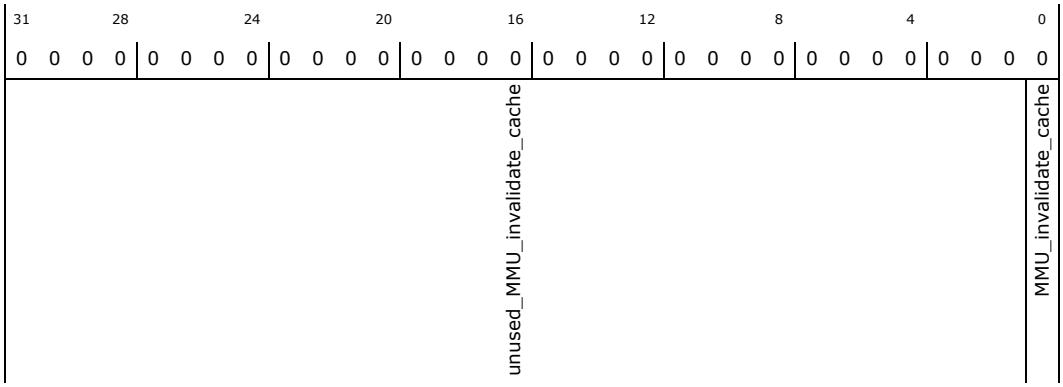
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

data_out_sys_c_mmu_MMU_invalidate_cache: [ISPMMADR] + 70000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_MMU_invalidate_cache:** Unused
0	0h WO	**MMU_invalidate_cache:** MMU invalidate cache. When '1', the MMUs TLB is invalidated.

15.8.632 reg_data_out_sys_c_mmu_MMU_page_table_base_type (data_out_sys_c_mmu_MMU_page_table_base)—Offset 70004h

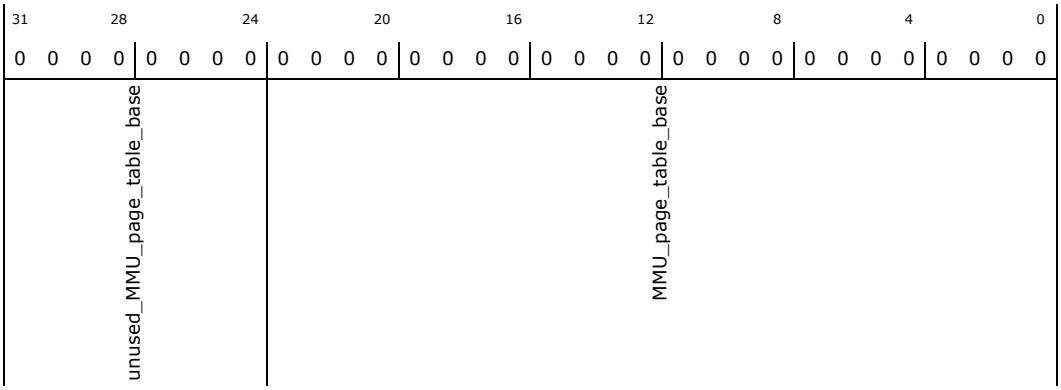
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

data_out_sys_c_mmu_MMU_page_table_base: [ISPMMADR] + 70004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_MMU_page_table_base:** Unused
23:0	0h RW	**MMU_page_table_base:** Defines the physical page number of the page tables

15.8.633 reg_inp_sys_csi_receiver_csi1_dev_ready_type (inp_sys_csi_receiver_csi1_dev_ready)—Offset 80100h

Set after programming operational registers to enable receiver

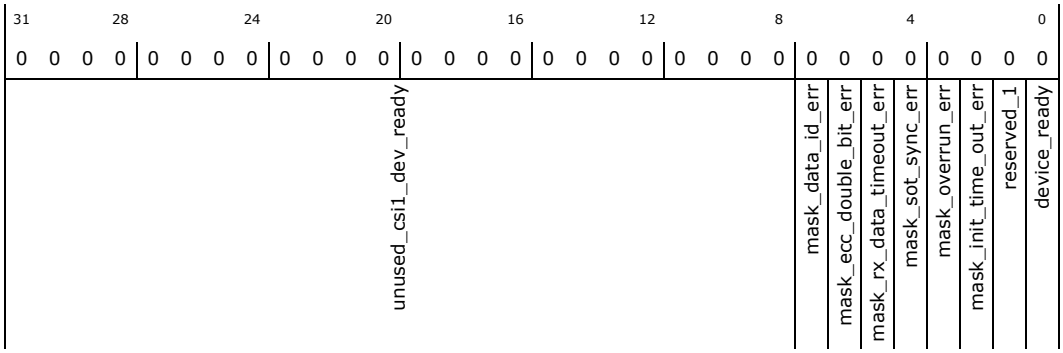
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_dev_ready: [ISPMMADR] + 80100h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi1_dev_ready:** Unused
7	0h RW	**mask_data_id_err:** Set to mask error recovery when data ID error is detected
6	0h RW	**mask_ecc_double_bit_err:** Set to mask error recovery when ECC double bit error is detected
5	0h RW	**mask_rx_data_timeout_err:** Set to mask error recovery when receive data time out error is detected
4	0h RW	**mask_sot_sync_err:** Set to mask error recovery when start of transmission sync error is detected
3	0h RW	**mask_overrun_err:** set to mask overrun: NOT used now, can be discarded
2	0h RW	**mask_init_time_out_err:** Set to mask error recovery when initialization time out error is detected
1	0h RO	**reserved_1:** Reserved
0	0h RW	**device_ready:** Set to indicate that device is ready for reception

15.8.634 reg_inp_sys_csi_receiver_csi1_int_status_type (inp_sys_csi_receiver_csi1_int_status)—Offset 80104h

Interrupt Status

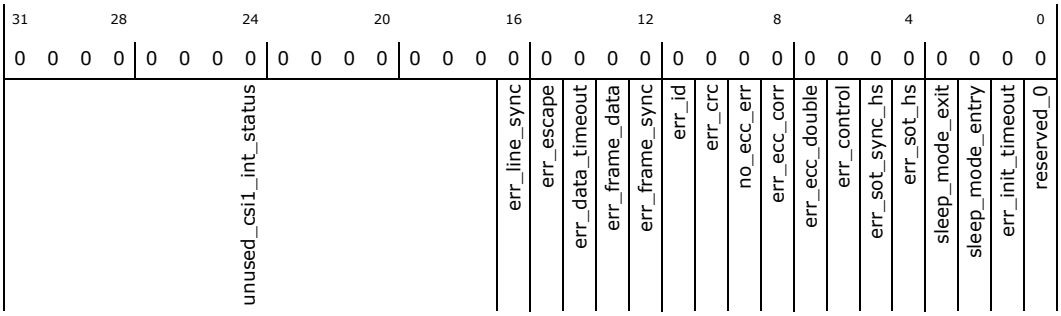
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_int_status: [ISPMMADR] + 80104h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi1_int_status:** Unused
16	0h RW/1C	**err_line_sync:** Set if line number for line start and line end packets do not match
15	0h RW/1C	**err_escape:** Set if an unrecognised escape entry command is received
14	0h RW/1C	**err_data_timeout:** Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	**err_frame_data:** Set if data packets within a frame has errors
12	0h RW/1C	**err_frame_sync:** Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	**err_id:** Set if packet header has a unrecognised data id
10	0h RW/1C	**err_crc:** Set if computed CRC differs from received value
9	0h RW/1C	**no_ecc_err:** Set if no ECC error detected in packet
8	0h RW/1C	**err_ecc_corr:** Set if ECC error detected and corrected for one bit
7	0h RW/1C	**err_ecc_double:** Set if ECC error detected for two or more bits
6	0h RW/1C	**err_control:** Set if DPHY flags a control error
5	0h RW/1C	**err_sot_sync_hs:** Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	**err_sot_hs:** Set if DPHY flags start of transmission error
3	0h RW/1C	**sleep_mode_exit:** Set if DPHY exits ultra low power state
2	0h RW/1C	**sleep_mode_entry:** Set if DPHY enters ultra low power state
1	0h RW/1C	**err_init_timeout:** Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	**reserved_0:** Always set to 0

15.8.635 reg_inp_sys_csi_receiver_csi1_int_enable_type (inp_sys_csi_receiver_csi1_int_enable)—Offset 80108h

Interrupt Enable

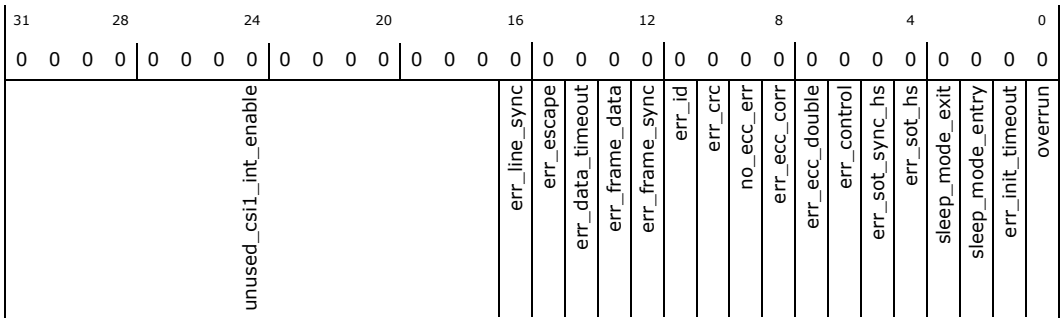
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_int_enable: [ISPMMADR] + 80108h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi1_int_enable:** Unused
16	0h RW	**err_line_sync:** Enable line sync error interrupt
15	0h RW	**err_escape:** Enable escape entry error interrupt
14	0h RW	**err_data_timeout:** Enable timeout error interrupt
13	0h RW	**err_frame_data:** Enable frame data error interrupt
12	0h RW	**err_frame_sync:** Enable frame sync error interrupt
11	0h RW	**err_id:** Enable data id error interrupt
10	0h RW	**err_crc:** Enable CRC error interrupt
9	0h RW	**no_ecc_err:** Enable no ECC error interrupt
8	0h RW	**err_ecc_corr:** Enable ECC error detected and corrected for one bit interrupt
7	0h RW	**err_ecc_double:** Enable ECC error detected for two or more bits interrupt
6	0h RW	**err_control:** Enable control error interrupt

Bit Range	Default & Access	Description
5	0h RW	**err_sot_sync_hs:** Enable start of transmission synchronisation error interrupt
4	0h RW	**err_sot_hs:** Enable start of transmission error interrupt
3	0h RW	**sleep_mode_exit:** Enable sleep mode exit interrupt
2	0h RW	**sleep_mode_entry:** Enable sleep mode entry interrupt
1	0h RW	**err_init_timeout:** Enable Initialization timeout error interrupt
0	0h RW	**overrun:** Enable FIFO overrun interrupt: NOT available now, can be discarded

15.8.636 reg_inp_sys_csi_receiver_csi1_func_prg_type (inp_sys_csi_receiver_csi1_func_prg)—Offset 8010Ch

Functional Programming

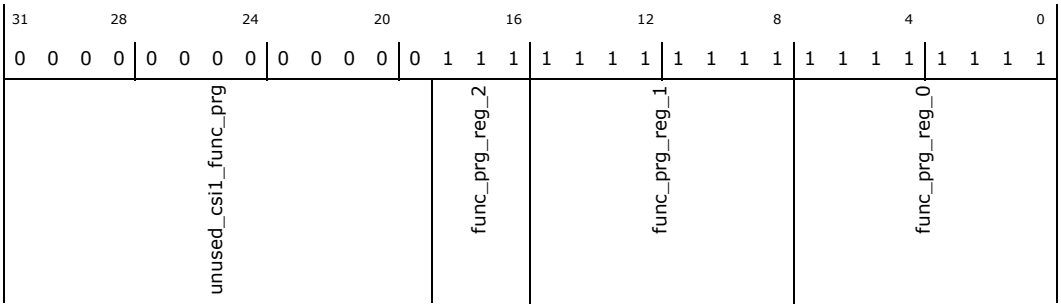
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_func_prg: [ISPMMADR] + 8010Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0007FFFFh



Bit Range	Default & Access	Description
31:19	0h RW	**unused_csi1_func_prg:** Unused
18:16	7h RW	**func_prg_reg_2:** Byte 2 for functional programming
15:8	FFh RW	**func_prg_reg_1:** Byte 1 for functional programming
7:0	FFh RW	**func_prg_reg_0:** Byte 0 for functional programming

15.8.637 reg_inp_sys_csi_receiver_csi1_init_cnt_type (inp_sys_csi_receiver_csi1_init_cnt)—Offset 80110h

Duration after power up when DPHY lanes will not be observed

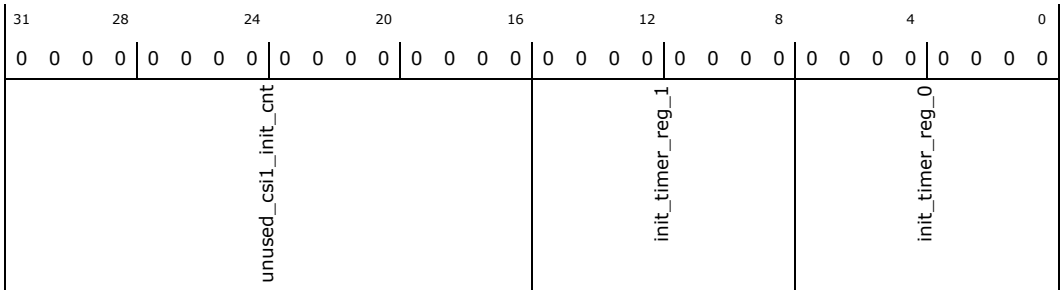
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_init_cnt: [ISPMMADR] + 80110h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi1_init_cnt:** Unused
15:8	0h RW	**init_timer_reg_1:** Byte 1 for power up timer
7:0	0h RW	**init_timer_reg_0:** Byte 0 for power up timer

15.8.638 reg_inp_sys_csi_receiver_csi_backend_fs_ls_type (inp_sys_csi_receiver_csi_backend_fs_ls)—Offset 8011Ch

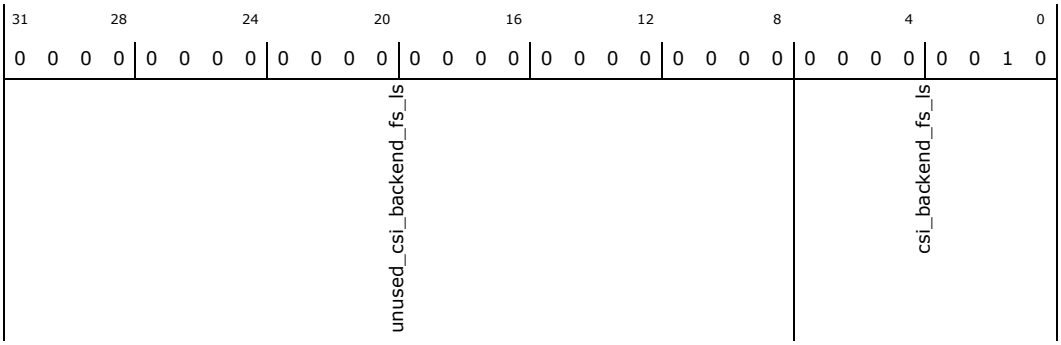
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_fs_ls: [ISPMMADR] + 8011Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_fs_ls:** Unused
7:0	02h RW	**csi_backend_fs_ls:** Minimum interval between frame start and line start syncs

15.8.639 reg_inp_sys_csi_receiver_csi_backend_ls_dvalid_type (inp_sys_csi_receiver_csi_backend_ls_dvalid)—Offset 80120h

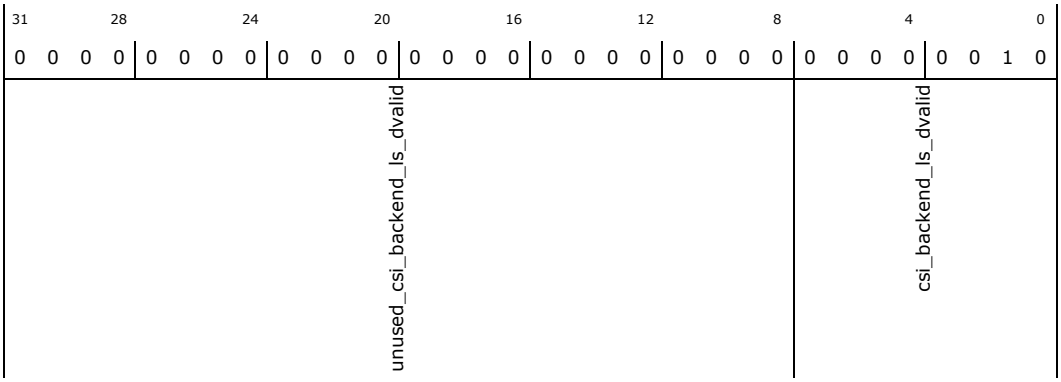
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_ls_dvalid: [ISPMMADR] + 80120h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_ls_dvalid:** Unused
7:0	02h RW	**csi_backend_ls_dvalid:** Minimum interval between line start sync and valid data

15.8.640 reg_inp_sys_csi_receiver_csi_backend_dvalid_le_type (inp_sys_csi_receiver_csi_backend_dvalid_le)—Offset 80124h

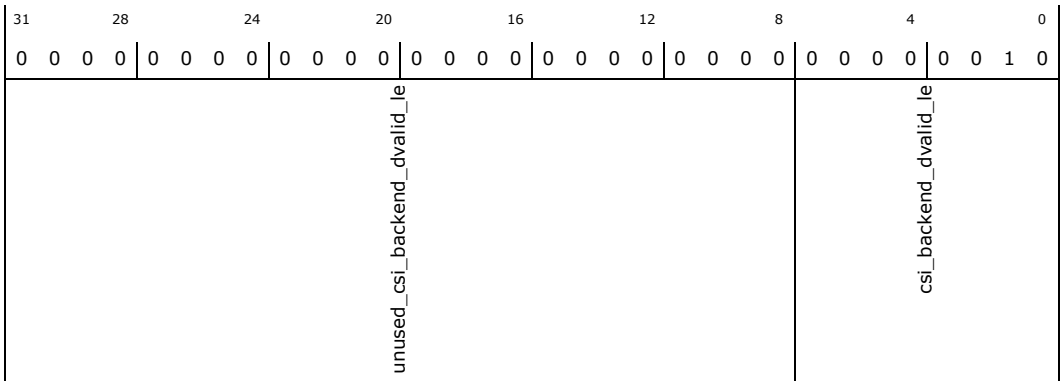
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_dvalid_le: [ISPMMADR] + 80124h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_dvalid_le:** Unused
7:0	02h RW	**csi_backend_dvalid_le:** Minimum interval between valid data and line end sync

15.8.641 reg_inp_sys_csi_receiver_csi_backend_le_fe_type (inp_sys_csi_receiver_csi_backend_le_fe)—Offset 80128h

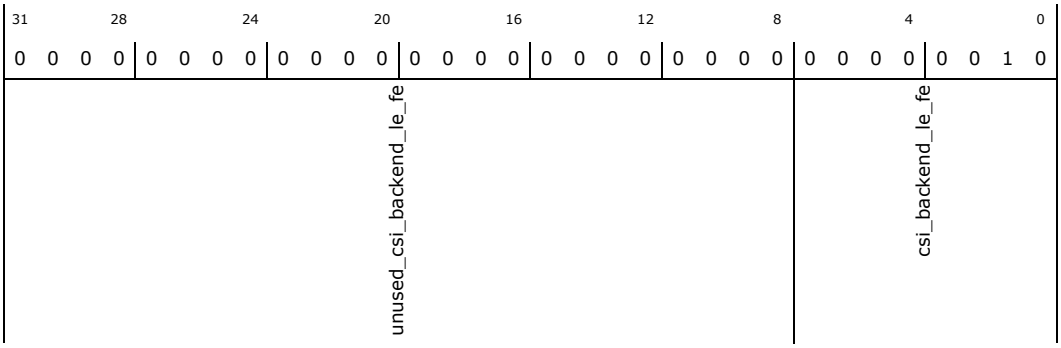
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_le_fe: [ISPMMADR] + 80128h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_le_fe:** Unused
7:0	02h RW	**csi_backend_le_fe:** Minimum interval between line end and frame end syncs

15.8.642 reg_inp_sys_csi_receiver_csi_backend_fe_fs_type (inp_sys_csi_receiver_csi_backend_fe_fs)—Offset 8012Ch

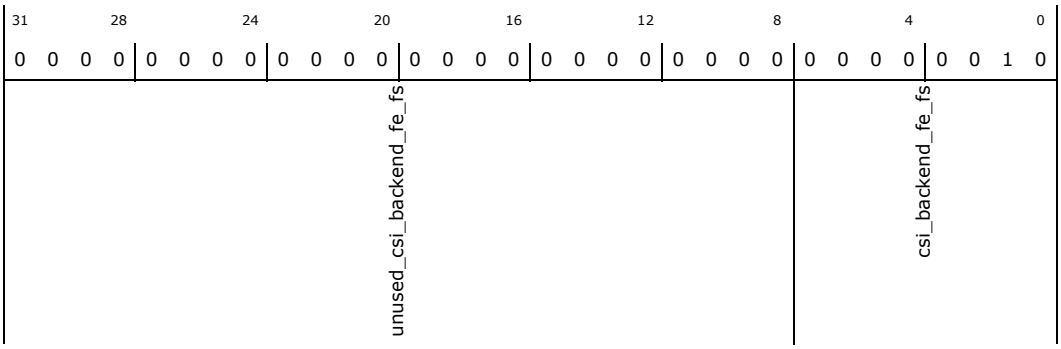
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_fe_fs: [ISPMMADR] + 8012Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_fe_fs:** Unused
7:0	02h RW	**csi_backend_fe_fs:** Minimum interval between frame end and frame start syncs

15.8.643 reg_inp_sys_csi_receiver_csi_backend_le_ls_type (inp_sys_csi_receiver_csi_backend_le_ls)—Offset 80130h

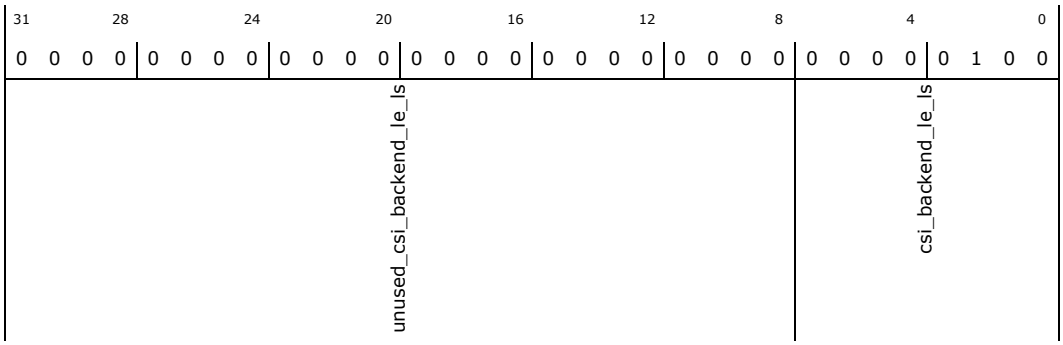
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_le_ls: [ISPMMADR] + 80130h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000004h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_backend_le_ls:** Unused
7:0	04h RW	**csi_backend_le_ls:** Minimum interval between line end and line start syncs

15.8.644 reg_inp_sys_csi_receiver_csi_backend_two_pixel_en_type (inp_sys_csi_receiver_csi_backend_two_pixel_en)—Offset 80134h

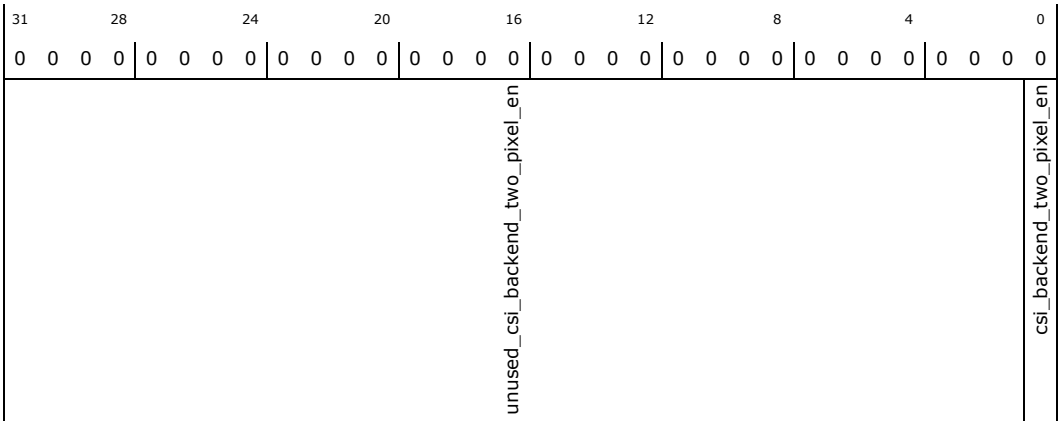
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_two_pixel_en: [ISPMMADR] + 80134h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_csi_backend_two_pixel_en:** Unused
0	0h RW	**csi_backend_two_pixel_en:** Enable two pixels per clock mode

15.8.645 reg_inp_sys_csi_receiver_csi1_raw16_18_data_id_type (inp_sys_csi_receiver_csi1_raw16_18_data_id)—Offset 80138h

RAW 16 and RAW 18 data ID register

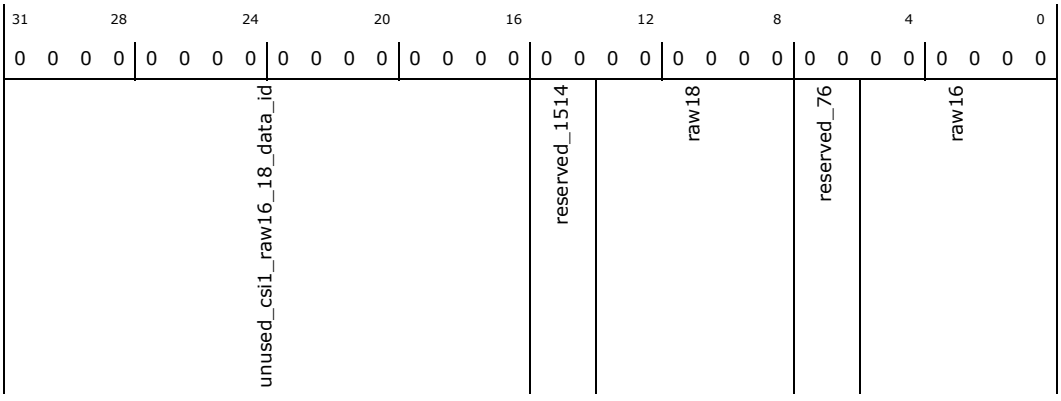
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_raw16_18_data_id: [ISPMMADR] + 80138h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi1_raw16_18_data_id:** Unused
15:14	0h RO	**reserved_1514:** Reserved
13:8	0h RW	**raw18:** RAW 18 data ID
7:6	0h RO	**reserved_76:** Reserved
5:0	0h RW	**raw16:** RAW 16 data ID

15.8.646 reg_inp_sys_csi_receiver_csi1_sync_cnt_type (inp_sys_csi_receiver_csi1_sync_cnt)—Offset 8013Ch

Synchronisation count value in terms of MIPI high speed byte clock

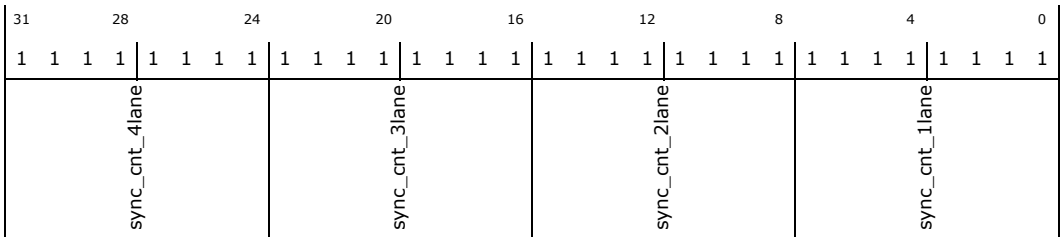
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_sync_cnt: [ISPMMADR] + 8013Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:24	FFh RW	**sync_cnt_4lane:** Synchronisation count value for 4 lane
23:16	FFh RW	**sync_cnt_3lane:** Synchronisation count value for 3 lane
15:8	FFh RW	**sync_cnt_2lane:** Synchronisation count value for 2 lane
7:0	FFh RW	**sync_cnt_1lane:** Synchronisation count value for 1 lane

15.8.647 reg_inp_sys_csi_receiver_csi1_rx_cnt_type (inp_sys_csi_receiver_csi1_rx_cnt)—Offset 80140h

Receive count value in terms of MIPI high speed byte clock

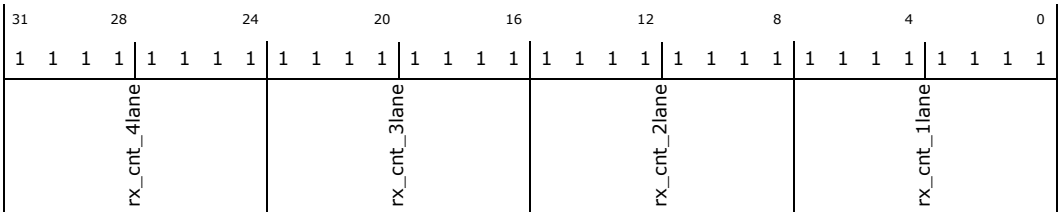
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_rx_cnt: [ISPMMADR] + 80140h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:24	FFh RW	**rx_cnt_4lane:** Receive count value for 4 lane
23:16	FFh RW	**rx_cnt_3lane:** Receive count value for 3 lane
15:8	FFh RW	**rx_cnt_2lane:** Receive count value for 2 lane
7:0	FFh RW	**rx_cnt_1lane:** Receive count value for 1 lane

15.8.648 reg_inp_sys_csi_receiver_csi_backend_rst_type (inp_sys_csi_receiver_csi_backend_rst)—Offset 80144h

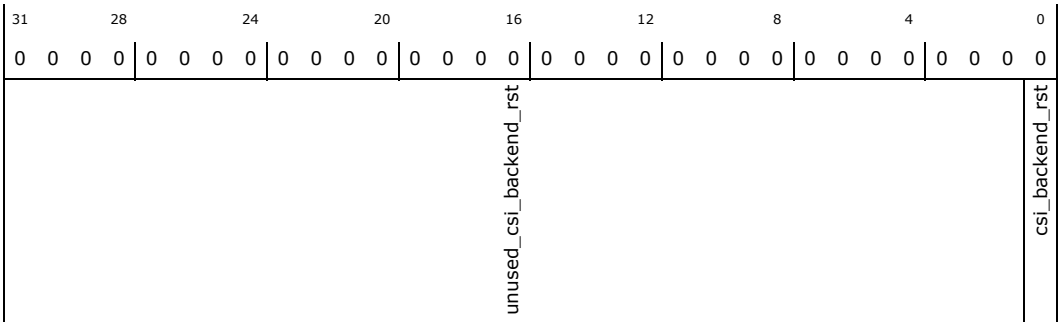
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_rst: [ISPMMADR] + 80144h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_csi_backend_rst:** Unused

Bit Range	Default & Access	Description
0	0h RW	**csi_backend_rst:** Reset CSI Rx backend block

15.8.649 reg_inp_sys_csi_receiver_csi_backend_comp_pred_reg0_vc0_type (inp_sys_csi_receiver_csi_backend_comp_pred_reg0_vc0)—Offset 80148h

Compression and Prediction scheme register 0 for virtual channel 0

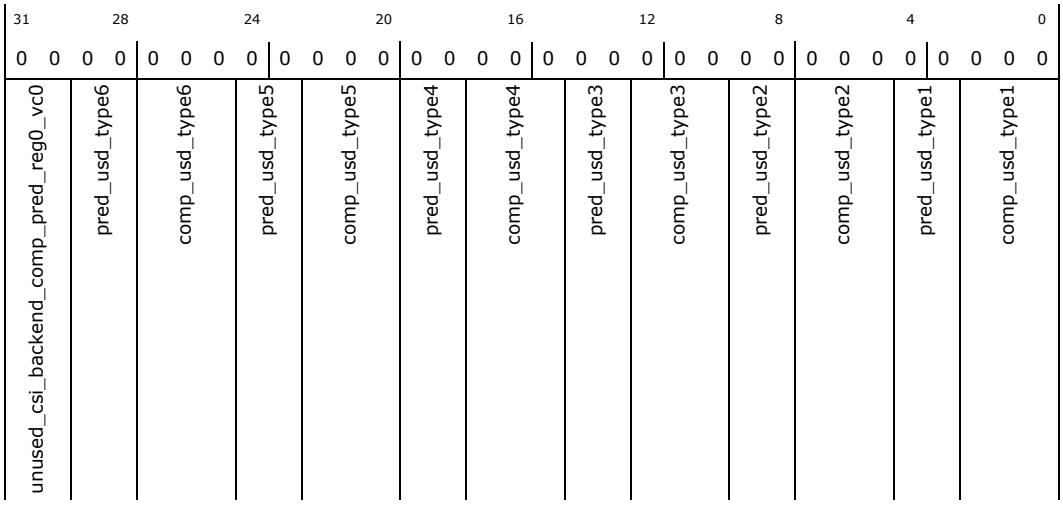
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_comp_pred_reg0_vc0: [ISPMMADR] + 80148h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**unused_csi_backend_comp_pred_reg0_vc0:** Unused
29:28	0h RW	**pred_usd_type6:** prediction algorithm for user defined type 6 data: 1 -) pred1, 2 -) pred2

15.8.657 reg_inp_sys_csi_receiver_csi_backend_raw18_reg_type (inp_sys_csi_receiver_csi_backend_raw18_reg)—Offset 80168h

Configuration register for RAW 18 data type decode

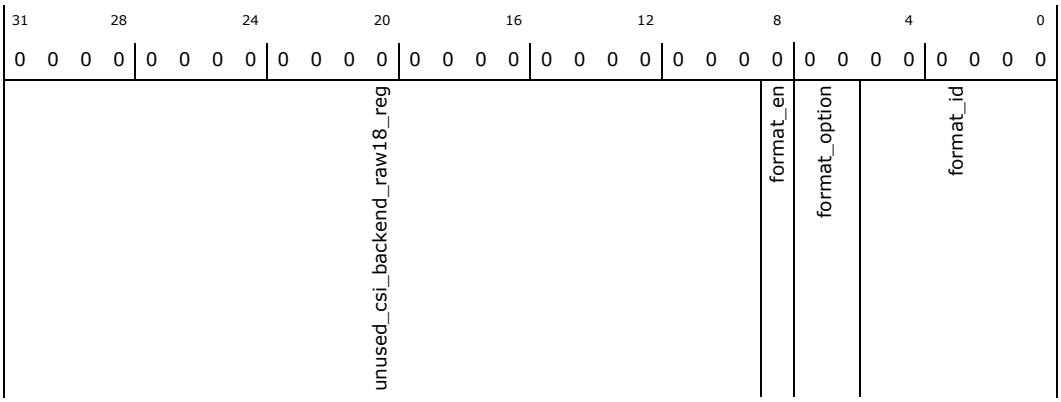
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_raw18_reg: [ISPMMADR] + 80168h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_csi_backend_raw18_reg:** Unused
8	0h RW	**format_en:** enable RAW 18 type decode
7:6	0h RW	**format_option:** format option for RAW 18 data type: 3 options possible (1,2,3)
5:0	0h RW	**format_id:** data id for RAW 18

15.8.658 reg_inp_sys_csi_receiver_csi_backend_force_raw8_reg_type (inp_sys_csi_receiver_csi_backend_force_raw8_reg)—Offset 8016Ch

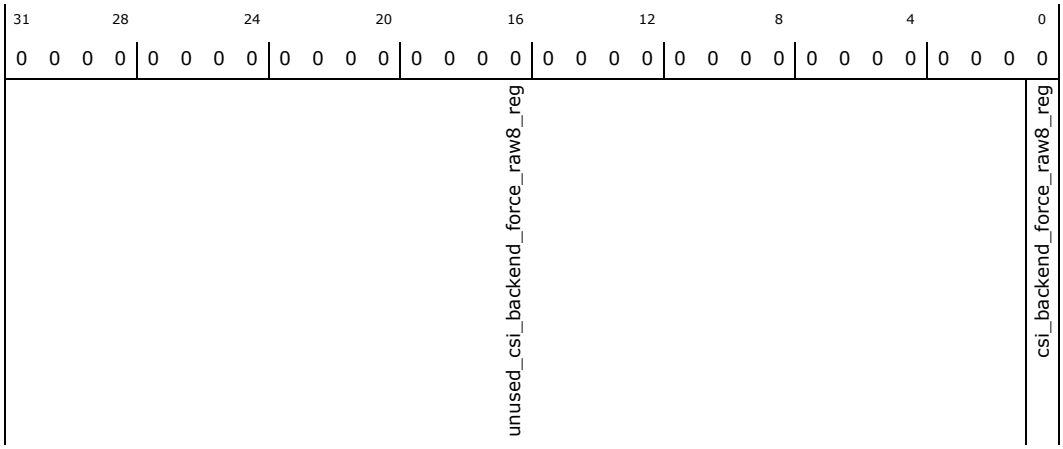
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_force_raw8_reg: [ISPMMADR] + 8016Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_csi_backend_force_raw8_reg:** Unused
0	0h RW	**csi_backend_force_raw8_reg:** Force RAW8(byte) decoding for LONG data packets

15.8.659 reg_inp_sys_csi_receiver_csi_backend_raw16_reg_type (inp_sys_csi_receiver_csi_backend_raw16_reg)—Offset 80170h

Configuration register for RAW 16 data type decode

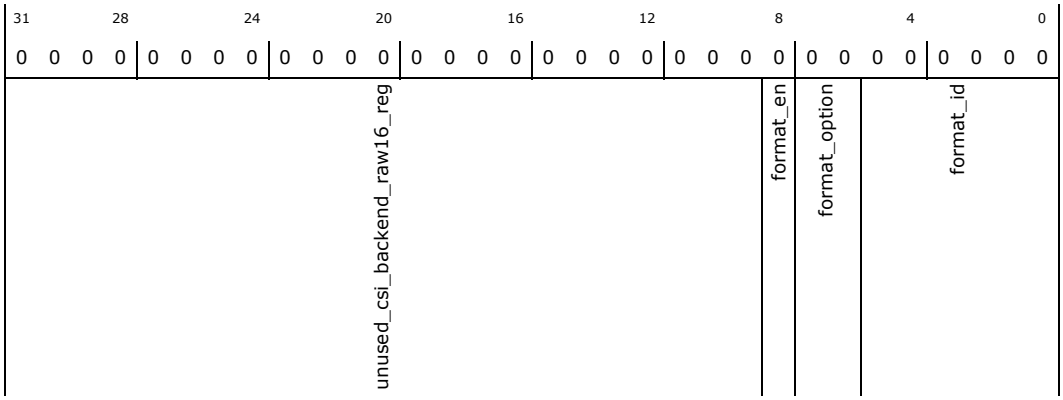
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_raw16_reg: [ISPMMADR] + 80170h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_csi_backend_raw16_reg:** Unused
8	0h RW	**format_en:** enable RAW 16 type decode
7:6	0h RW	**format_option:** format option for RAW 16 data type: ONLY 1 option possible (1)
5:0	0h RW	**format_id:** data id for RAW 16

15.8.660 reg_inp_sys_csi_receiver_csi2_dev_ready_type (inp_sys_csi_receiver_csi2_dev_ready)—Offset 80200h

Set after programming operational registers to enable receiver

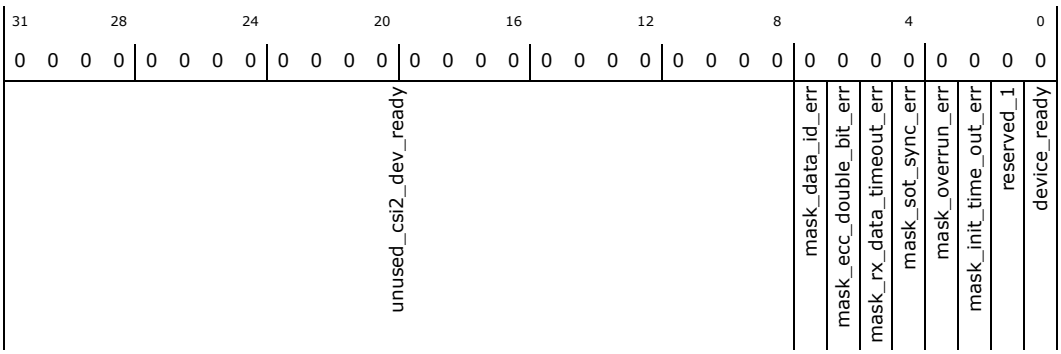
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_dev_ready: [ISPMMADR] + 80200h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi2_dev_ready:** Unused
7	0h RW	**mask_data_id_err:** Set to mask error recovery when data ID error is detected
6	0h RW	**mask_ecc_double_bit_err:** Set to mask error recovery when ECC double bit error is detected
5	0h RW	**mask_rx_data_timeout_err:** Set to mask error recovery when receive data time out error is detected
4	0h RW	**mask_sot_sync_err:** Set to mask error recovery when start of transmission sync error is detected
3	0h RW	**mask_overrun_err:** set to mask overrun: NOT used now, can be discarded

Bit Range	Default & Access	Description
2	0h RW	**mask_init_time_out_err:** Set to mask error recovery when initialization time out error is detected
1	0h RO	**reserved_1:** Reserved
0	0h RW	**device_ready:** Set to indicate that device is ready for reception

15.8.661 reg_inp_sys_csi_receiver_csi2_int_status_type (inp_sys_csi_receiver_csi2_int_status)—Offset 80204h

Interrupt Status

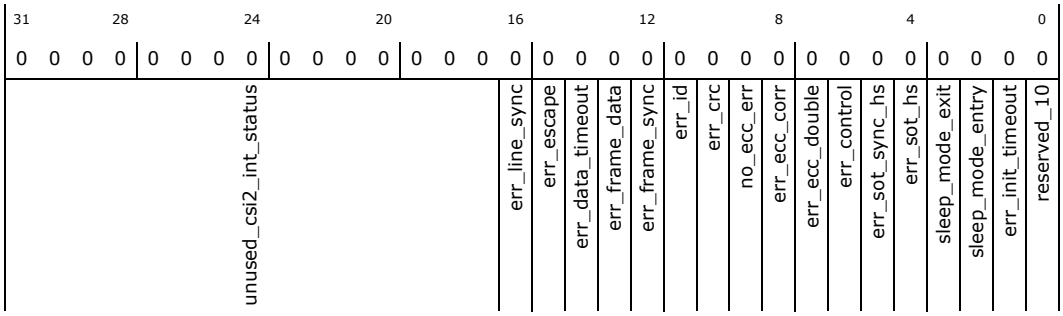
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_int_status: [ISPMMADR] + 80204h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi2_int_status:** Unused
16	0h RW/1C	**err_line_sync:** Set if line number for line start and line end packets do not match
15	0h RW/1C	**err_escape:** Set if an unrecognised escape entry command is received
14	0h RW/1C	**err_data_timeout:** Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	**err_frame_data:** Set if data packets within a frame has errors
12	0h RW/1C	**err_frame_sync:** Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	**err_id:** Set if packet header has a unrecognised data id
10	0h RW/1C	**err_crc:** Set if computed CRC differs from received value

Bit Range	Default & Access	Description
9	0h RW/1C	**no_ecc_err:** Set if no ECC error detected in packet
8	0h RW/1C	**err_ecc_corr:** Set if ECC error detected and corrected for one bit
7	0h RW/1C	**err_ecc_double:** Set if ECC error detected for two or more bits
6	0h RW/1C	**err_control:** Set if DPHY flags a control error
5	0h RW/1C	**err_sot_sync_hs:** Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	**err_sot_hs:** Set if DPHY flags start of transmission error
3	0h RW/1C	**sleep_mode_exit:** Set if DPHY exits ultra low power state
2	0h RW/1C	**sleep_mode_entry:** Set if DPHY enters ultra low power state
1	0h RW/1C	**err_init_timeout:** Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	**reserved_10:** Always set to 0

15.8.662 reg_inp_sys_csi_receiver_csi2_int_enable_type (inp_sys_csi_receiver_csi2_int_enable)—Offset 80208h

Interrupt Enable

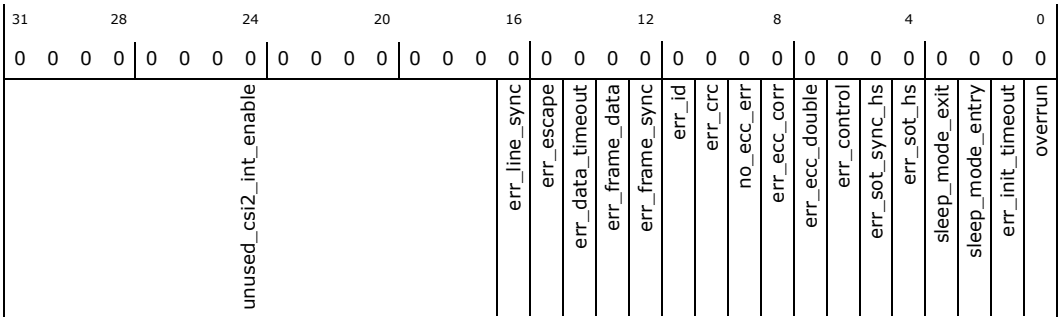
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_int_enable: [ISPMMADR] + 80208h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi2_int_enable:** Unused

Bit Range	Default & Access	Description
16	0h RW	**err_line_sync:** Enable line sync error interrupt
15	0h RW	**err_escape:** Enable escape entry error interrupt
14	0h RW	**err_data_timeout:** Enable timeout error interrupt
13	0h RW	**err_frame_data:** Enable frame data error interrupt
12	0h RW	**err_frame_sync:** Enable frame sync error interrupt
11	0h RW	**err_id:** Enable data id error interrupt
10	0h RW	**err_crc:** Enable CRC error interrupt
9	0h RW	**no_ecc_err:** Enable no ECC error interrupt
8	0h RW	**err_ecc_corr:** Enable ECC error detected and corrected for one bit interrupt
7	0h RW	**err_ecc_double:** Enable ECC error detected for two or more bits interrupt
6	0h RW	**err_control:** Enable control error interrupt
5	0h RW	**err_sot_sync_hs:** Enable start of transmission synchronisation error interrupt
4	0h RW	**err_sot_hs:** Enable start of transmission error interrupt
3	0h RW	**sleep_mode_exit:** Enable sleep mode exit interrupt
2	0h RW	**sleep_mode_entry:** Enable sleep mode entry interrupt
1	0h RW	**err_init_timeout:** Enable Initialization timeout error interrupt
0	0h RW	**overrun:** Enable FIFO overrun interrupt: NOT available now, can be discarded

15.8.663 reg_inp_sys_csi_receiver_csi2_func_prg_type (inp_sys_csi_receiver_csi2_func_prg)—Offset 8020Ch

Functional Programming

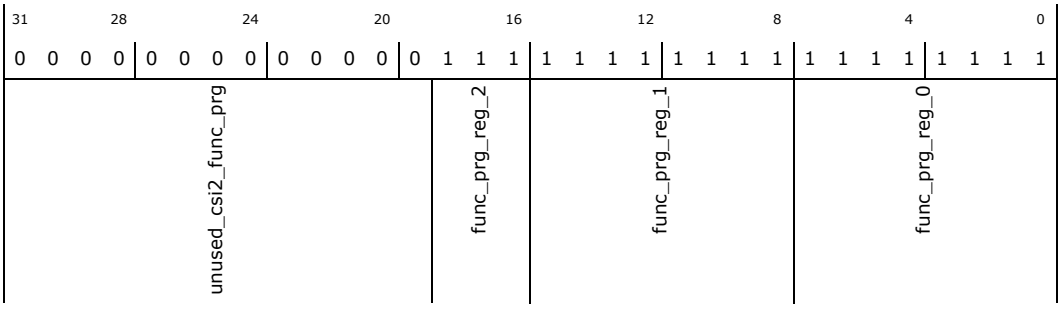
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_func_prg: [ISPMMADR] + 8020Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0007FFFFh



Bit Range	Default & Access	Description
31:19	0h RW	**unused_csi2_func_prg:** Unused
18:16	7h RW	**func_prg_reg_2:** Byte 2 for functional programming
15:8	FFh RW	**func_prg_reg_1:** Byte 1 for functional programming
7:0	FFh RW	**func_prg_reg_0:** Byte 0 for functional programming

15.8.664 reg_inp_sys_csi_receiver_csi2_init_cnt_type (inp_sys_csi_receiver_csi2_init_cnt)—Offset 80210h

Duration after power up when DPHY lanes will not be observed

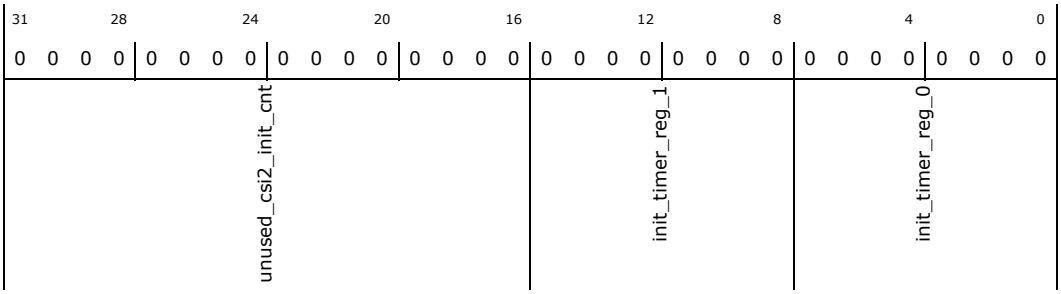
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_init_cnt: [ISPMMADR] + 80210h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi2_init_cnt:** Unused
15:8	0h RW	**init_timer_reg_1:** Byte 1 for power up timer

Bit Range	Default & Access	Description
7:0	0h RW	**init_timer_reg_0:** Byte 0 for power up timer

15.8.665 reg_inp_sys_csi_receiver_csi2_raw16_18_data_id_type (inp_sys_csi_receiver_csi2_raw16_18_data_id)—Offset 80238h

RAW 16 and RAW 18 data ID register

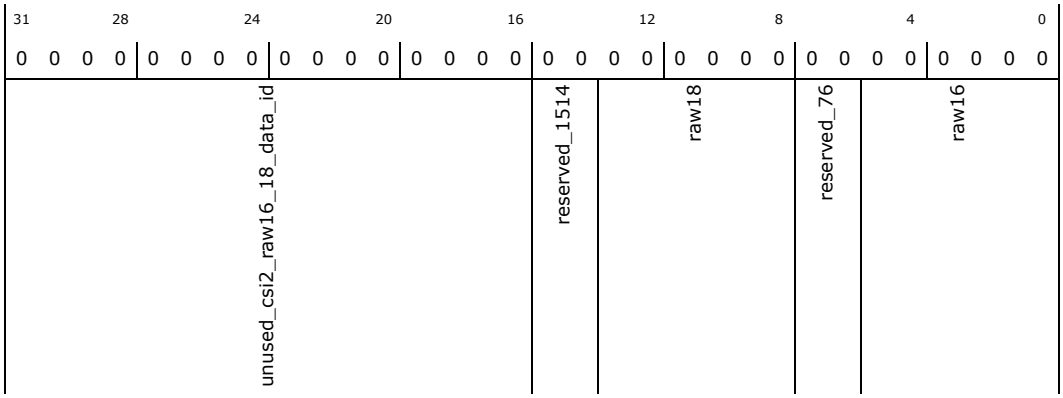
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_raw16_18_data_id: [ISPMMADR] + 80238h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi2_raw16_18_data_id:** Unused
15:14	0h RO	**reserved_1514:** Reserved
13:8	0h RW	**raw18:** RAW 18 data ID
7:6	0h RO	**reserved_76:** Reserved
5:0	0h RW	**raw16:** RAW 16 data ID

15.8.666 reg_inp_sys_csi_receiver_csi2_sync_cnt_type (inp_sys_csi_receiver_csi2_sync_cnt)—Offset 8023Ch

Synchronisation count value in terms of MIPI high speed byte clock

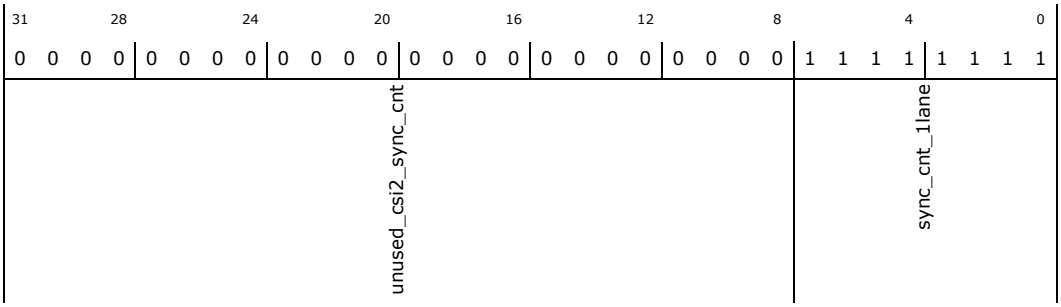
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_sync_cnt: [ISPMMADR] + 8023Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 000000FFh



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi2_sync_cnt:** Unused
7:0	FFh RW	**sync_cnt_1lane:** Synchronisation count value for 1 lane

15.8.667 reg_inp_sys_csi_receiver_csi2_rx_cnt_type (inp_sys_csi_receiver_csi2_rx_cnt)—Offset 80240h

Receive count value in terms of MIPI high speed byte clock

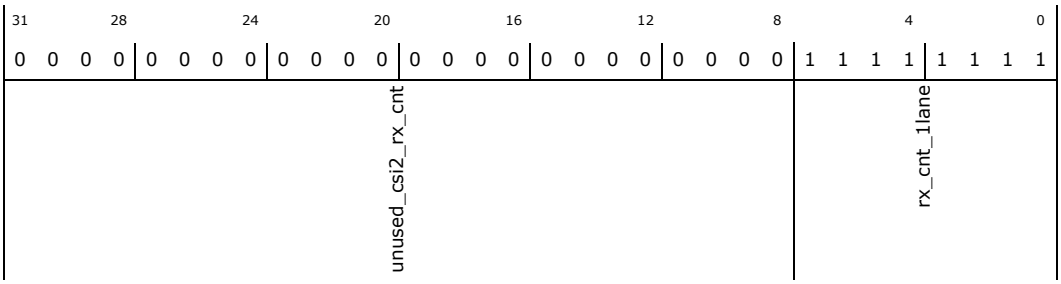
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi2_rx_cnt: [ISPMMADR] + 80240h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 000000FFh



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi2_rx_cnt:** Unused
7:0	FFh RW	**rx_cnt_1lane:** Receive count value for 1 lane

15.8.668 reg_inp_sys_csi_receiver_csi3_dev_ready_type (inp_sys_csi_receiver_csi3_dev_ready)—Offset 80300h

Set after programming operational registers to enable receiver

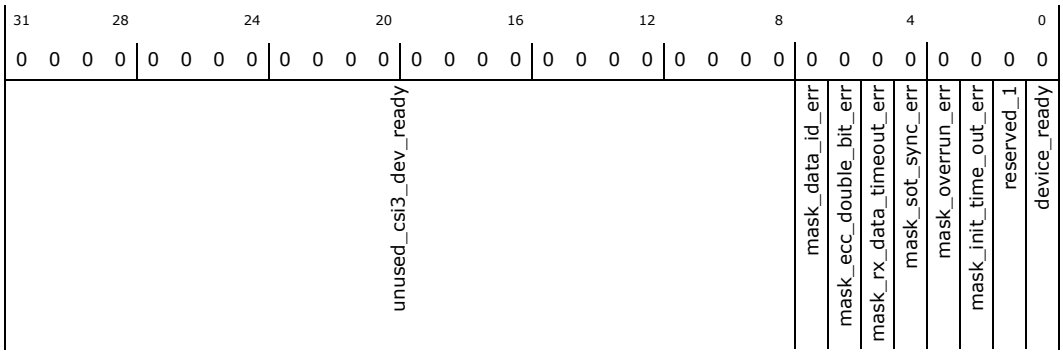
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_dev_ready: [ISPMMADR] + 80300h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi3_dev_ready:** Unused
7	0h RW	**mask_data_id_err:** Set to mask error recovery when data ID error is detected
6	0h RW	**mask_ecc_double_bit_err:** Set to mask error recovery when ECC double bit error is detected
5	0h RW	**mask_rx_data_timeout_err:** Set to mask error recovery when receive data time out error is detected
4	0h RW	**mask_sot_sync_err:** Set to mask error recovery when start of transmission sync error is detected
3	0h RW	**mask_overrun_err:** set to mask overrun: NOT used now, can be discarded
2	0h RW	**mask_init_time_out_err:** Set to mask error recovery when initialization time out error is detected
1	0h RO	**reserved_1:** Reserved
0	0h RW	**device_ready:** Set to indicate that device is ready for reception

15.8.669 reg_inp_sys_csi_receiver_csi3_int_status_type (inp_sys_csi_receiver_csi3_int_status)—Offset 80304h

Interrupt Status

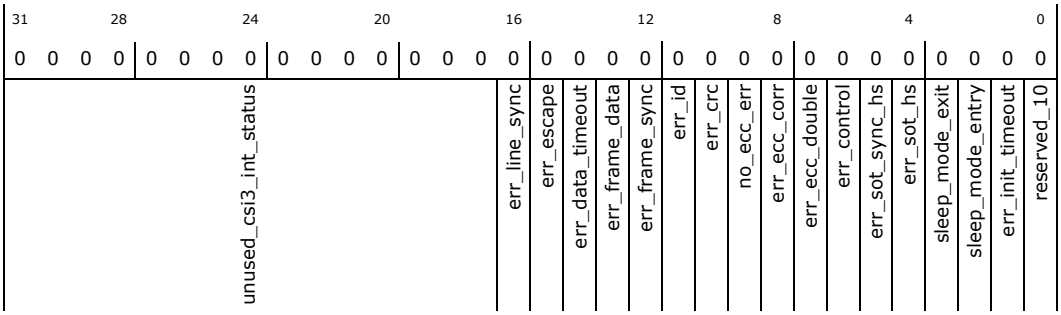
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_int_status: [ISPMMADR] + 80304h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi3_int_status:** Unused
16	0h RW/1C	**err_line_sync:** Set if line number for line start and line end packets do not match
15	0h RW/1C	**err_escape:** Set if an unrecognised escape entry command is received
14	0h RW/1C	**err_data_timeout:** Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	**err_frame_data:** Set if data packets within a frame has errors
12	0h RW/1C	**err_frame_sync:** Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	**err_id:** Set if packet header has a unrecognised data id
10	0h RW/1C	**err_crc:** Set if computed CRC differs from received value
9	0h RW/1C	**no_ecc_err:** Set if no ECC error detected in packet
8	0h RW/1C	**err_ecc_corr:** Set if ECC error detected and corrected for one bit
7	0h RW/1C	**err_ecc_double:** Set if ECC error detected for two or more bits
6	0h RW/1C	**err_control:** Set if DPHY flags a control error
5	0h RW/1C	**err_sot_sync_hs:** Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	**err_sot_hs:** Set if DPHY flags start of transmission error
3	0h RW/1C	**sleep_mode_exit:** Set if DPHY exits ultra low power state

Bit Range	Default & Access	Description
2	0h RW/1C	**sleep_mode_entry:** Set if DPHY enters ultra low power state
1	0h RW/1C	**err_init_timeout:** Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	**reserved_10:** Always set to 0

15.8.670 reg_inp_sys_csi_receiver_csi3_int_enable_type (inp_sys_csi_receiver_csi3_int_enable)—Offset 80308h

Interrupt Enable

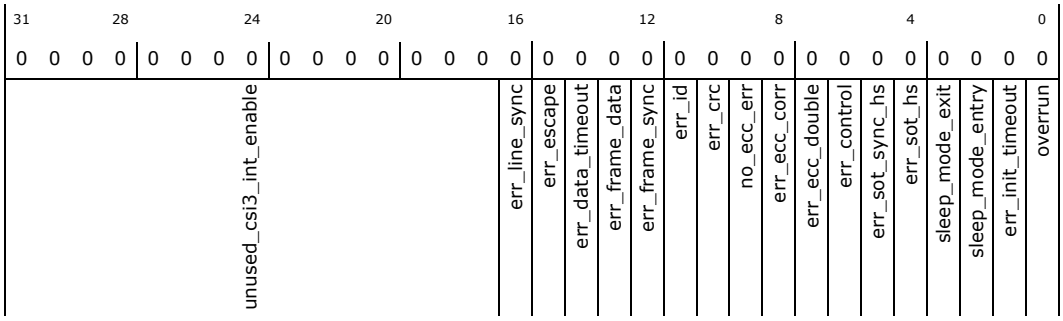
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_int_enable: [ISPMMADR] + 80308h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi3_int_enable:** Unused
16	0h RW	**err_line_sync:** Enable line sync error interrupt
15	0h RW	**err_escape:** Enable escape entry error interrupt
14	0h RW	**err_data_timeout:** Enable timeout error interrupt
13	0h RW	**err_frame_data:** Enable frame data error interrupt
12	0h RW	**err_frame_sync:** Enable frame sync error interrupt
11	0h RW	**err_id:** Enable data id error interrupt
10	0h RW	**err_crc:** Enable CRC error interrupt

Bit Range	Default & Access	Description
9	0h RW	**no_ecc_err:** Enable no ECC error interrupt
8	0h RW	**err_ecc_corr:** Enable ECC error detected and corrected for one bit interrupt
7	0h RW	**err_ecc_double:** Enable ECC error detected for two or more bits interrupt
6	0h RW	**err_control:** Enable control error interrupt
5	0h RW	**err_sot_sync_hs:** Enable start of transmission synchronisation error interrupt
4	0h RW	**err_sot_hs:** Enable start of transmission error interrupt
3	0h RW	**sleep_mode_exit:** Enable sleep mode exit interrupt
2	0h RW	**sleep_mode_entry:** Enable sleep mode entry interrupt
1	0h RW	**err_init_timeout:** Enable Initialization timeout error interrupt
0	0h RW	**overrun:** Enable FIFO overrun interrupt: NOT available now, can be discarded

15.8.671 reg_inp_sys_csi_receiver_csi3_func_prg_type (inp_sys_csi_receiver_csi3_func_prg)—Offset 8030Ch

Functional Programming

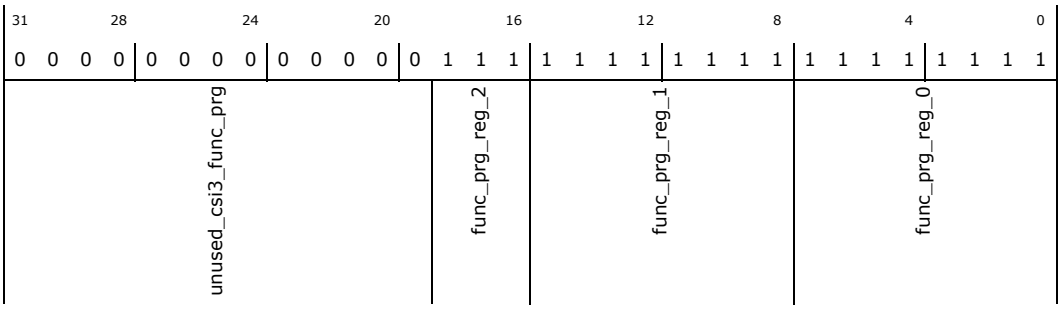
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_func_prg: [ISPMMADR] + 8030Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0007FFFFh



Bit Range	Default & Access	Description
31:19	0h RW	**unused_csi3_func_prg:** Unused

Bit Range	Default & Access	Description
18:16	7h RW	**func_prg_reg_2:** Byte 2 for functional programming
15:8	FFh RW	**func_prg_reg_1:** Byte 1 for functional programming
7:0	FFh RW	**func_prg_reg_0:** Byte 0 for functional programming

15.8.672 reg_inp_sys_csi_receiver_csi3_init_cnt_type (inp_sys_csi_receiver_csi3_init_cnt)—Offset 80310h

Duration after power up when DPHY lanes will not be observed

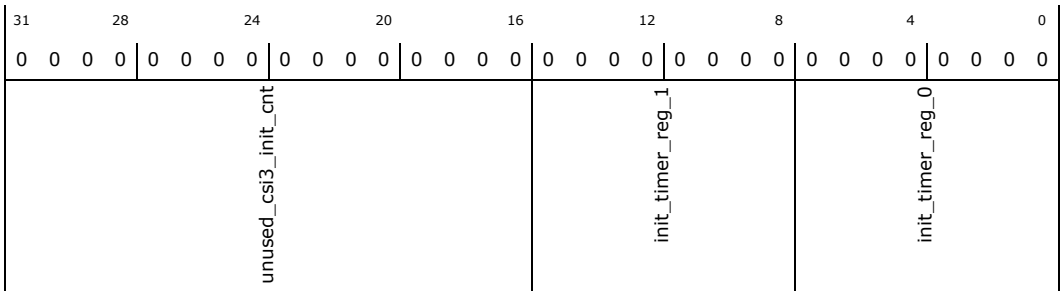
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_init_cnt: [ISPMMADR] + 80310h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi3_init_cnt:** Unused
15:8	0h RW	**init_timer_reg_1:** Byte 1 for power up timer
7:0	0h RW	**init_timer_reg_0:** Byte 0 for power up timer

15.8.673 reg_inp_sys_csi_receiver_csi3_raw16_18_data_id_type (inp_sys_csi_receiver_csi3_raw16_18_data_id)—Offset 80338h

RAW 16 and RAW 18 data ID register

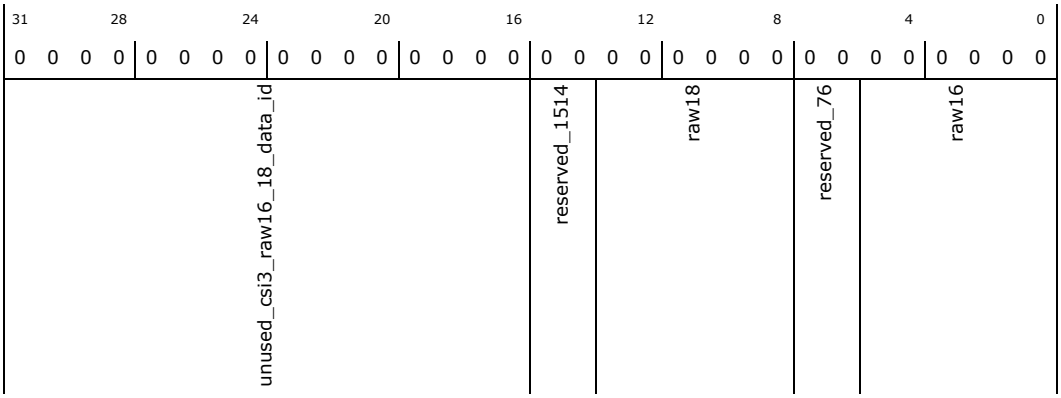
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_raw16_18_data_id: [ISPMMADR] + 80338h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi3_raw16_18_data_id:** Unused
15:14	0h RO	**reserved_1514:** Reserved
13:8	0h RW	**raw18:** RAW 18 data ID
7:6	0h RO	**reserved_76:** Reserved
5:0	0h RW	**raw16:** RAW 16 data ID

15.8.674 reg_inp_sys_csi_receiver_csi3_sync_cnt_type (inp_sys_csi_receiver_csi3_sync_cnt)—Offset 8033Ch

Synchronisation count value in terms of MIPI high speed byte clock

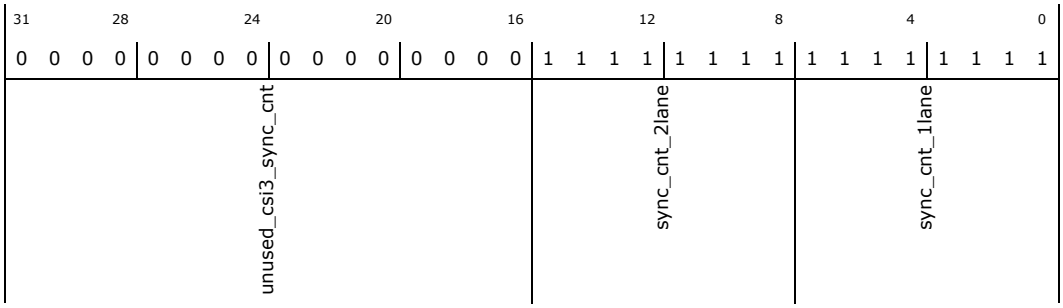
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_sync_cnt: [ISPMMADR] + 8033Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000FFFFh



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi3_sync_cnt:** Unused
15:8	FFh RW	**sync_cnt_2lane:** Synchronisation count value for 2 lane
7:0	FFh RW	**sync_cnt_1lane:** Synchronisation count value for 1 lane

15.8.675 reg_inp_sys_csi_receiver_csi3_rx_cnt_type (inp_sys_csi_receiver_csi3_rx_cnt)—Offset 80340h

Receive count value in terms of MIPI high speed byte clock

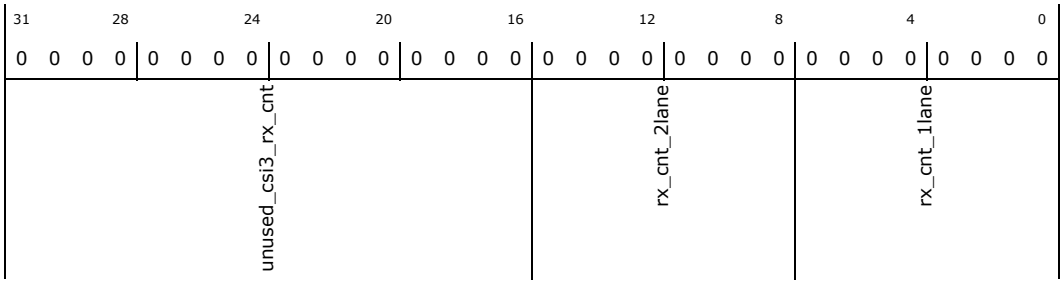
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi3_rx_cnt: [ISPMMADR] + 80340h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi3_rx_cnt:** Unused
15:8	0h RW	**rx_cnt_2lane:** Receive count value for 2 lane
7:0	0h RW	**rx_cnt_1lane:** Receive count value for 1 lane

15.8.676 reg_inp_sys_csi_receiver_csi_be_gen_sh_acc_ovl_type (inp_sys_csi_receiver_csi_be_gen_sh_acc_ovl)—Offset 80800h

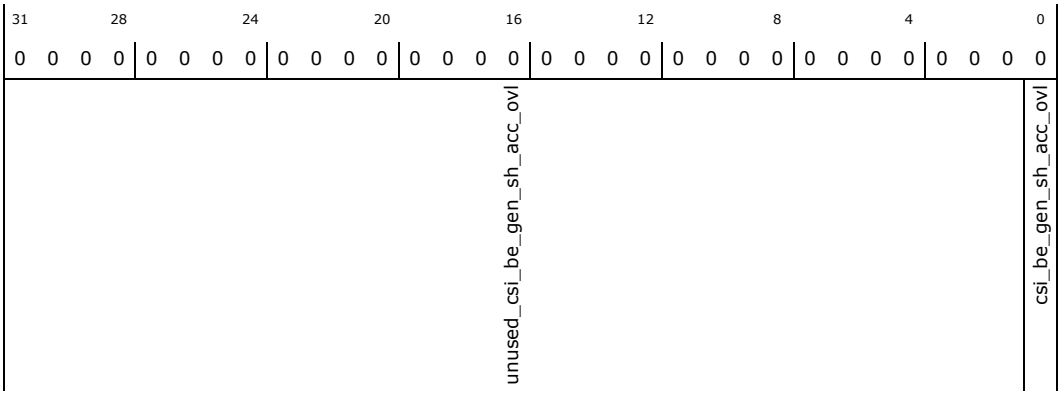
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_be_gen_sh_acc_ovl: [ISPMMADR] + 80800h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_csi_be_gen_sh_acc_ovl:** Unused
0	0h RW	**csi_be_gen_sh_acc_ovl:** Allows for overruling the accept signal generated by the generic short packet FIFO, going to the CSI receiver backend.

15.8.677 reg_inp_sys_csi_receiver_csi_sh_be_srst_type (inp_sys_csi_receiver_csi_sh_be_srst)—Offset 80804h

soft reset modules of the SH CSI receiver Back End

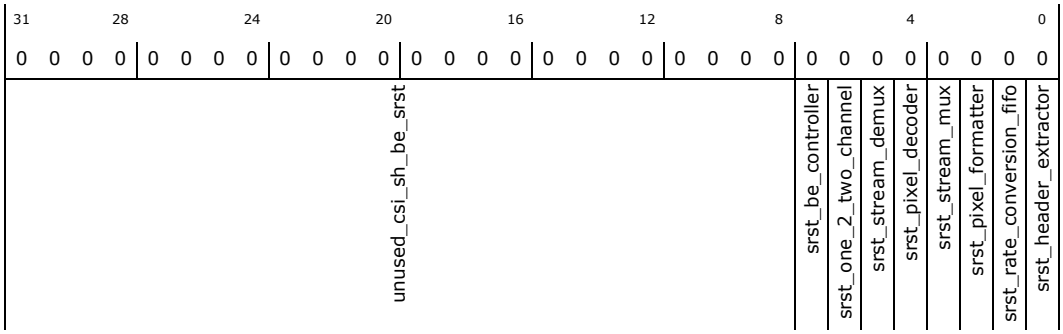
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_srst: [ISPMMADR] + 80804h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_sh_be_srst:** Unused
7	0h RW	**srst_be_controller:** Soft resets the backend controller module
6	0h RW	**srst_one_2_two_channel:** Soft resets the one 2 two channel module
5	0h RW	**srst_stream_demux:** Soft resets the stream demux module
4	0h RW	**srst_pixel_decoder:** Soft resets the pixel decoder module
3	0h RW	**srst_stream_mux:** Soft resets the stream mux module
2	0h RW	**srst_pixel_formatter:** Soft resets the pixel formatter module
1	0h RW	**srst_rate_conversion_fifo:** Soft resets the rate conversion FIFO module
0	0h RW	**srst_header_extractor:** Soft resets the header extractor module

15.8.678 reg_inp_sys_csi_receiver_csi_sh_be_two_ppc_type (inp_sys_csi_receiver_csi_sh_be_two_ppc)—Offset 80808h

Sets the output rate of the backend and the precision

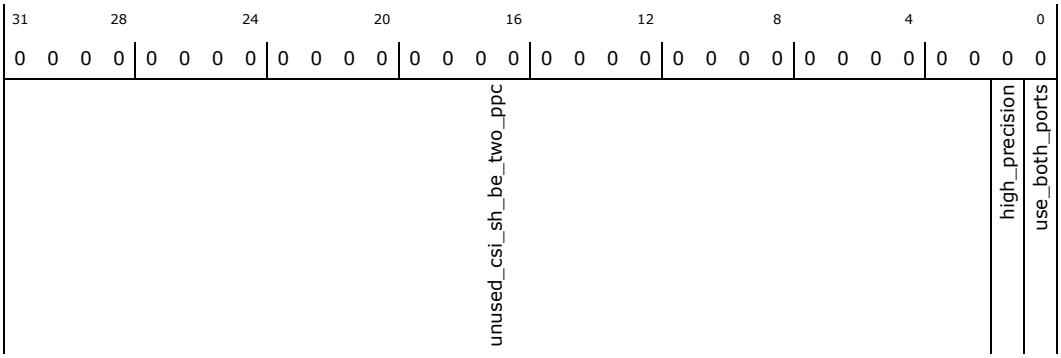
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_two_ppc: [ISPMMADR] + 80808h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_csi_sh_be_two_ppc:** Unused
1	0h RW	**high_precision:** When '1', (and use_both_ports='1' as well) both ports A and B are used to output one high precision pixel, when '0', high_precision pixels are saturated to fit on one port.
0	0h RW	**use_both_ports:** When '1', both ports A and B are active. When '0' only port A is active

15.8.679 reg_inp_sys_csi_receiver_csi_sh_be_comp_reg_vc0_type (inp_sys_csi_receiver_csi_sh_be_comp_reg_vc0)—Offset 8080Ch

Compression scheme register for virtual channel 0

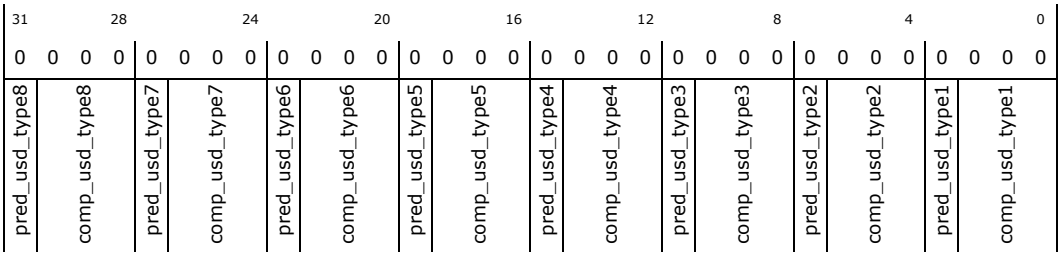
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_comp_reg_vc0: [ISPMMADR] + 8080Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**pred_usd_type8:** prediction algorithm for vc=0, user defined type 8 data: 0 -) pred1, 1 -) pred2
30:28	0h RW	**comp_usd_type8:** compression format for vc=0, user defined type 8 data: value between 0 to 6. 0-no compression

Bit Range	Default & Access	Description
27	0h RW	**pred_usd_type7:** prediction algorithm for vc=0, user defined type 7 data: 0 -) pred1, 1 -) pred2
26:24	0h RW	**comp_usd_type7:** compression format for vc=0, user defined type 7 data: value between 0 to 6. 0-no compression
23	0h RW	**pred_usd_type6:** prediction algorithm for vc=0, user defined type 6 data: 0 -) pred1, 1 -) pred2
22:20	0h RW	**comp_usd_type6:** compression format for vc=0, user defined type 6 data: value between 0 to 6. 0-no compression
19	0h RW	**pred_usd_type5:** prediction algorithm for vc=0, user defined type 5 data: 0 -) pred1, 1 -) pred2
18:16	0h RW	**comp_usd_type5:** compression format for vc=0, user defined type 5 data: value between 0 to 6. 0-no compression
15	0h RW	**pred_usd_type4:** prediction algorithm for vc=0, user defined type 4 data: 0 -) pred1, 1 -) pred2
14:12	0h RW	**comp_usd_type4:** compression format for vc=0, user defined type 4 data: value between 0 to 6. 0-no compression
11	0h RW	**pred_usd_type3:** prediction algorithm for vc=0, user defined type 3 data: 0 -) pred1, 1 -) pred2
10:8	0h RW	**comp_usd_type3:** compression format for vc=0, user defined type 3 data: value between 0 to 6. 0-no compression
7	0h RW	**pred_usd_type2:** prediction algorithm for vc=0, user defined type 2 data: 0 -) pred1, 1 -) pred2
6:4	0h RW	**comp_usd_type2:** compression format for vc=0, user defined type 2 data: value between 0 to 6. 0-no compression
3	0h RW	**pred_usd_type1:** prediction algorithm for vc=0, user defined type 1 data: 0 -) pred1, 1 -) pred2
2:0	0h RW	**comp_usd_type1:** compression format for vc=0, user defined type 1 data: value between 0 to 6. 0-no compression

15.8.680 reg_inp_sys_csi_receiver_csi_sh_be_comp_reg_vc1_type (inp_sys_csi_receiver_csi_sh_be_comp_reg_vc1)—Offset 80810h

Compression scheme register for virtual channel 1

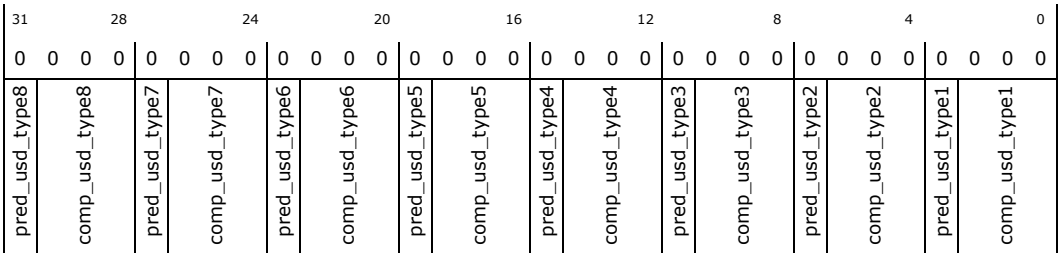
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_comp_reg_vc1: [ISPMMADR] + 80810h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**pred_usd_type8:** prediction algorithm for vc=1, user defined type 8 data: 0 -) pred1, 1 -) pred2
30:28	0h RW	**comp_usd_type8:** compression format for vc=1, user defined type 8 data: value between 0 to 6. 0-no compression
27	0h RW	**pred_usd_type7:** prediction algorithm for vc=1, user defined type 7 data: 0 -) pred1, 1 -) pred2
26:24	0h RW	**comp_usd_type7:** compression format for vc=1, user defined type 7 data: value between 0 to 6. 0-no compression
23	0h RW	**pred_usd_type6:** prediction algorithm for vc=1, user defined type 6 data: 0 -) pred1, 1 -) pred2
22:20	0h RW	**comp_usd_type6:** compression format for vc=1, user defined type 6 data: value between 0 to 6. 0-no compression
19	0h RW	**pred_usd_type5:** prediction algorithm for vc=1, user defined type 5 data: 0 -) pred1, 1 -) pred2
18:16	0h RW	**comp_usd_type5:** compression format for vc=1, user defined type 5 data: value between 0 to 6. 0-no compression
15	0h RW	**pred_usd_type4:** prediction algorithm for vc=1, user defined type 4 data: 0 -) pred1, 1 -) pred2
14:12	0h RW	**comp_usd_type4:** compression format for vc=1, user defined type 4 data: value between 0 to 6. 0-no compression
11	0h RW	**pred_usd_type3:** prediction algorithm for vc=1, user defined type 3 data: 0 -) pred1, 1 -) pred2
10:8	0h RW	**comp_usd_type3:** compression format for vc=1, user defined type 3 data: value between 0 to 6. 0-no compression
7	0h RW	**pred_usd_type2:** prediction algorithm for vc=1, user defined type 2 data: 0 -) pred1, 1 -) pred2
6:4	0h RW	**comp_usd_type2:** compression format for vc=1, user defined type 2 data: value between 0 to 6. 0-no compression
3	0h RW	**pred_usd_type1:** prediction algorithm for vc=1, user defined type 1 data: 0 -) pred1, 1 -) pred2
2:0	0h RW	**comp_usd_type1:** compression format for vc=1, user defined type 1 data: value between 0 to 6. 0-no compression

15.8.681 reg_inp_sys_csi_receiver_csi_sh_be_comp_reg_vc2_type (inp_sys_csi_receiver_csi_sh_be_comp_reg_vc2)—Offset 80814h

Compression scheme register for virtual channel 0

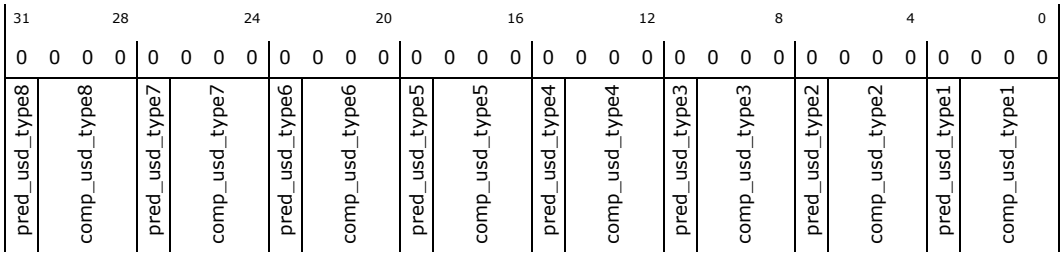
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_comp_reg_vc2: [ISPMMADR] + 80814h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**pred_usd_type8:** prediction algorithm for vc=2, user defined type 8 data: 0 -) pred1, 1 -) pred2
30:28	0h RW	**comp_usd_type8:** compression format for vc=2, user defined type 8 data: value between 0 to 6. 0-no compression
27	0h RW	**pred_usd_type7:** prediction algorithm for vc=2, user defined type 7 data: 0 -) pred1, 1 -) pred2
26:24	0h RW	**comp_usd_type7:** compression format for vc=2, user defined type 7 data: value between 0 to 6. 0-no compression
23	0h RW	**pred_usd_type6:** prediction algorithm for vc=2, user defined type 6 data: 0 -) pred1, 1 -) pred2
22:20	0h RW	**comp_usd_type6:** compression format for vc=2, user defined type 6 data: value between 0 to 6. 0-no compression
19	0h RW	**pred_usd_type5:** prediction algorithm for vc=2, user defined type 5 data: 0 -) pred1, 1 -) pred2
18:16	0h RW	**comp_usd_type5:** compression format for vc=2, user defined type 5 data: value between 0 to 6. 0-no compression
15	0h RW	**pred_usd_type4:** prediction algorithm for vc=2, user defined type 4 data: 0 -) pred1, 1 -) pred2
14:12	0h RW	**comp_usd_type4:** compression format for vc=2, user defined type 4 data: value between 0 to 6. 0-no compression
11	0h RW	**pred_usd_type3:** prediction algorithm for vc=2, user defined type 3 data: 0 -) pred1, 1 -) pred2
10:8	0h RW	**comp_usd_type3:** compression format for vc=2, user defined type 3 data: value between 0 to 6. 0-no compression
7	0h RW	**pred_usd_type2:** prediction algorithm for vc=2, user defined type 2 data: 0 -) pred1, 1 -) pred2
6:4	0h RW	**comp_usd_type2:** compression format for vc=2, user defined type 2 data: value between 0 to 6. 0-no compression
3	0h RW	**pred_usd_type1:** prediction algorithm for vc=2, user defined type 1 data: 0 -) pred1, 1 -) pred2

Bit Range	Default & Access	Description
2:0	0h RW	**comp_usd_type1:** compression format for vc=2, user defined type 1 data: value between 0 to 6. 0-no compression

15.8.682 reg_inp_sys_csi_receiver_csi_sh_be_comp_reg_vc3_type (inp_sys_csi_receiver_csi_sh_be_comp_reg_vc3)—Offset 80818h

Compression scheme register for virtual channel 0

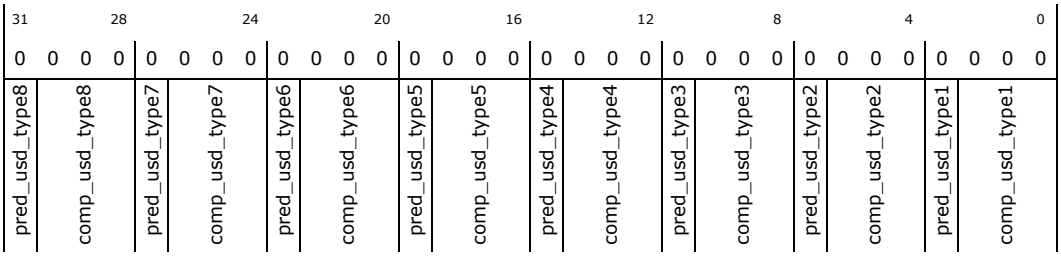
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_comp_reg_vc3: [ISPMMADR] + 80818h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**pred_usd_type8:** prediction algorithm for vc=3, user defined type 8 data: 0 -) pred1, 1 -) pred2
30:28	0h RW	**comp_usd_type8:** compression format for vc=3, user defined type 8 data: value between 0 to 6. 0-no compression
27	0h RW	**pred_usd_type7:** prediction algorithm for vc=3, user defined type 7 data: 0 -) pred1, 1 -) pred2
26:24	0h RW	**comp_usd_type7:** compression format for vc=3, user defined type 7 data: value between 0 to 6. 0-no compression
23	0h RW	**pred_usd_type6:** prediction algorithm for vc=3, user defined type 6 data: 0 -) pred1, 1 -) pred2
22:20	0h RW	**comp_usd_type6:** compression format for vc=3, user defined type 6 data: value between 0 to 6. 0-no compression
19	0h RW	**pred_usd_type5:** prediction algorithm for vc=3, user defined type 5 data: 0 -) pred1, 1 -) pred2
18:16	0h RW	**comp_usd_type5:** compression format for vc=3, user defined type 5 data: value between 0 to 6. 0-no compression
15	0h RW	**pred_usd_type4:** prediction algorithm for vc=3, user defined type 4 data: 0 -) pred1, 1 -) pred2
14:12	0h RW	**comp_usd_type4:** compression format for vc=3, user defined type 4 data: value between 0 to 6. 0-no compression

Bit Range	Default & Access	Description
11	0h RW	**pred_usd_type3:** prediction algorithm for vc=3, user defined type 3 data: 0 -) pred1, 1 -) pred2
10:8	0h RW	**comp_usd_type3:** compression format for vc=3, user defined type 3 data: value between 0 to 6. 0-no compression
7	0h RW	**pred_usd_type2:** prediction algorithm for vc=3, user defined type 2 data: 0 -) pred1, 1 -) pred2
6:4	0h RW	**comp_usd_type2:** compression format for vc=3, user defined type 2 data: value between 0 to 6. 0-no compression
3	0h RW	**pred_usd_type1:** prediction algorithm for vc=3, user defined type 1 data: 0 -) pred1, 1 -) pred2
2:0	0h RW	**comp_usd_type1:** compression format for vc=3, user defined type 1 data: value between 0 to 6. 0-no compression

15.8.683 reg_inp_sys_csi_receiver_csi_sh_be_sel_be_type (inp_sys_csi_receiver_csi_sh_be_sel_be)—Offset 8081Ch

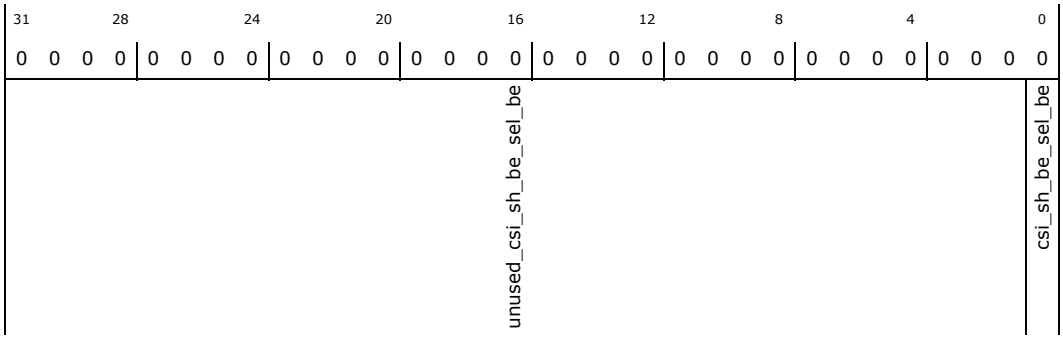
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_sel_be: [ISPMMADR] + 8081Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_csi_sh_be_sel_be:** Unused
0	0h RW	**csi_sh_be_sel_be:** Selects which CSI Receiver Backend to use 0-Arasan Backend, 1-Silicon Hive Backend

15.8.684 reg_inp_sys_csi_receiver_csi_sh_be_raw16_reg_type (inp_sys_csi_receiver_csi_sh_be_raw16_reg)—Offset 80820h

Configuration register for RAW 16 data type decode

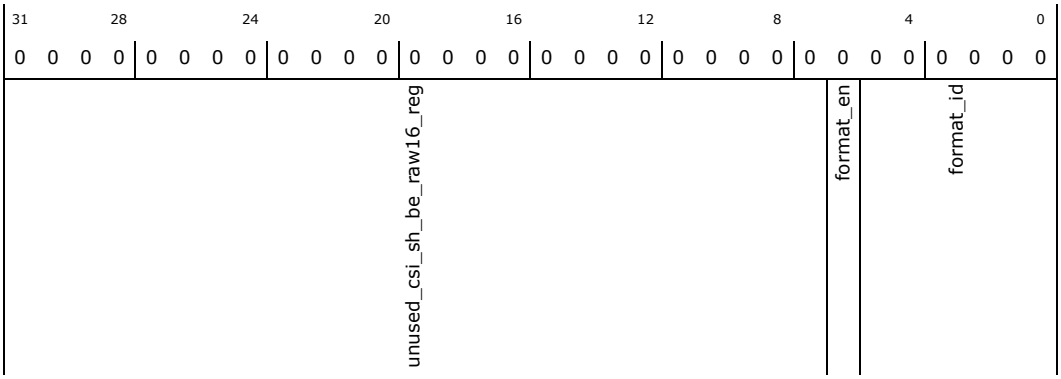
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_raw16_reg: [ISPMMADR] + 80820h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:7	0h RW	**unused_csi_sh_be_raw16_reg:** Unused
6	0h RW	**format_en:** enable RAW 16 type decode
5:0	0h RW	**format_id:** data id for RAW 16

15.8.685 reg_inp_sys_csi_receiver_csi_sh_be_raw18_reg_type (inp_sys_csi_receiver_csi_sh_be_raw18_reg)—Offset 80824h

Configuration register for RAW 18 data type decode

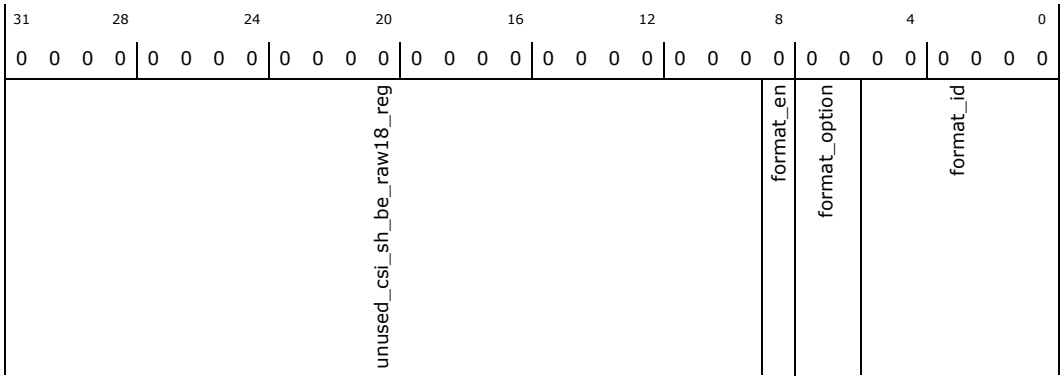
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_raw18_reg: [ISPMMADR] + 80824h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_csi_sh_be_raw18_reg:** Unused
8	0h RW	**format_en:** enable RAW 16 type decode
7:6	0h RW	**format_option:** format option for RAW 18 data type: 3 options possible (1,2,3)
5:0	0h RW	**format_id:** data id for RAW 16

15.8.686 reg_inp_sys_csi_receiver_csi_sh_be_force_raw8_reg_type (inp_sys_csi_receiver_csi_sh_be_force_raw8_reg)—Offset 80828h

Force RAW8(byte) decoding for LONG data packets

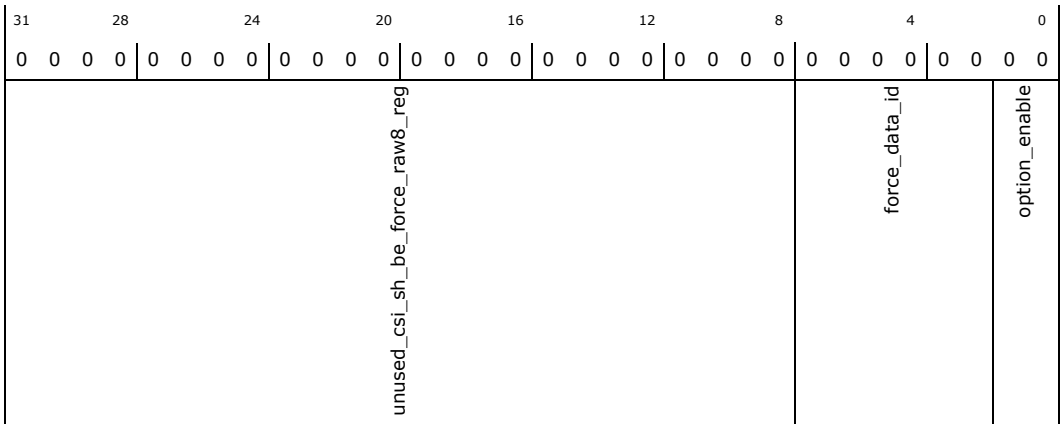
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_force_raw8_reg: [ISPMMADR] + 80828h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_sh_be_force_raw8_reg:** Unused
7:2	0h RW	**force_data_id:** Data_id that should be forced to RAW8
1:0	0h RW	**option_enable:** 00-Do not force anything in RAW8 mode. 01-force all data types in RAW8 mode, 11-force only packets with data_id force_data_id to RAW8 mode

15.8.687 reg_inp_sys_csi_receiver_csi_sh_be_irq_stat_reg_type (inp_sys_csi_receiver_csi_sh_be_irq_stat_reg)—Offset 8082Ch

IRQ status register

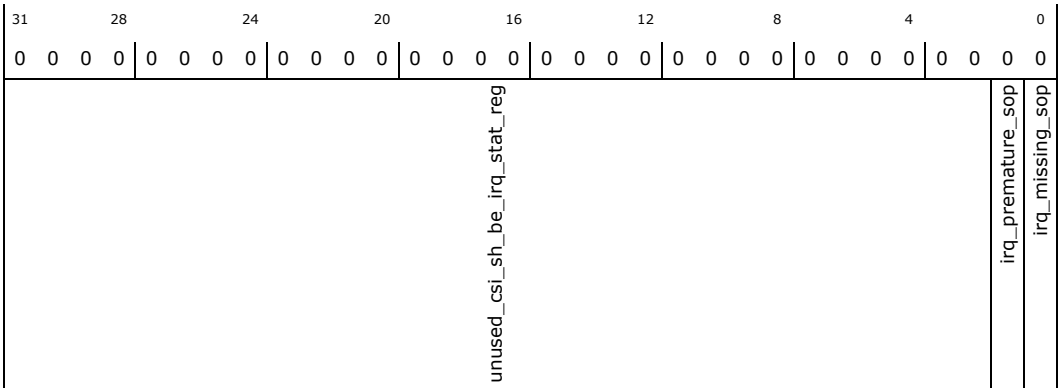
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_irq_stat_reg: [ISPMMADR] + 8082Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_csi_sh_be_irq_stat_reg:** Unused
1	0h RO	**irq_premature_sop:** If '1', sh_be has detected a premature sop
0	0h RO	**irq_missing_sop:** If '1', sh_be has detected a missing sop

15.8.688 reg_inp_sys_csi_receiver_csi_sh_be_irq_stat_clear_reg_type (inp_sys_csi_receiver_csi_sh_be_irq_stat_clear_reg)—Offset 80830h

IRQ status clear register

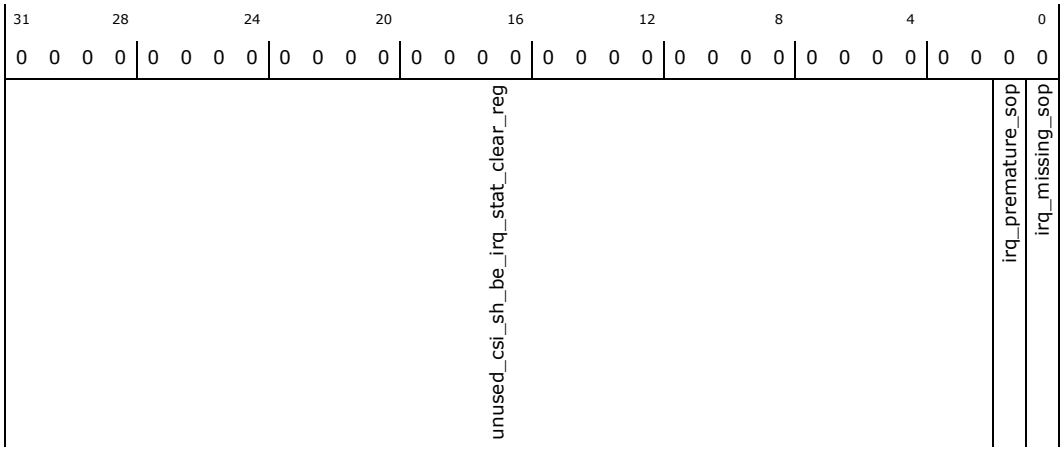
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_irq_stat_clear_reg: [ISPMMADR] + 80830h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_csi_sh_be_irq_stat_clear_reg:** Unused
1	0h WO	**irq_premature_sop:** A '1' written into this field, clears the premature_sop field to '0'
0	0h WO	**irq_missing_sop:** A '1' written into this field, clears the irq_missing_sop field to '0'

15.8.689 reg_inp_sys_csi_receiver_csi_sh_be_custom_enable_reg_type (inp_sys_csi_receiver_csi_sh_be_custom_enable_reg)—Offset 80834h

Enable custom mode decoding for LONG data packets

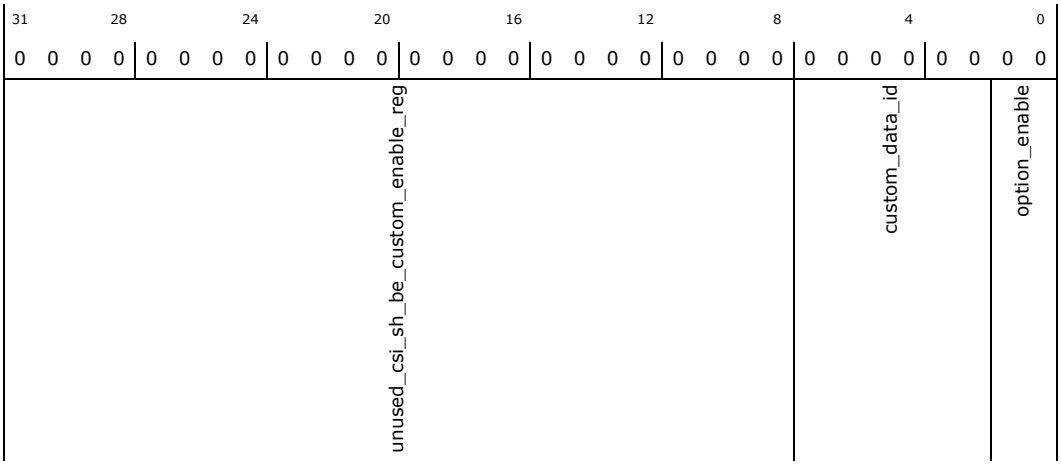
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_sh_be_custom_enable_reg: [ISPMMADR] + 80834h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi_sh_be_custom_enable_reg:** Unused
7:2	0h RW	**custom_data_id:** Data_id that should be processed in custom mode
1:0	0h RW	**option_enable:** 00-Custom mode switched off. 01-all data types in custom mode, 11-only packets with data id custom_data_id are processed in custom mode

15.8.690 reg_inp_sys_capt_unit_a_reg_CaptStartMode_type (inp_sys_capt_unit_a_reg_CaptStartMode)—Offset 81000h

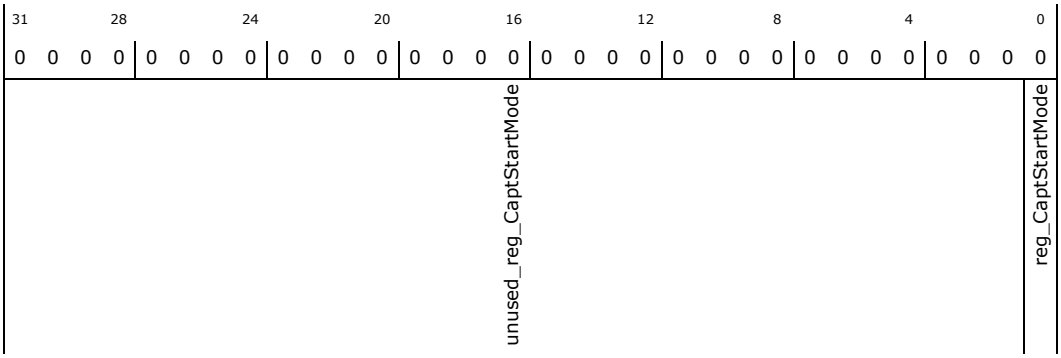
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_CaptStartMode: [ISPMMADR] + 81000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_CaptStartMode:** Unused
0	0h RW	**reg_CaptStartMode:** Synchronize on any packet header or on a frame start

15.8.691 reg_inp_sys_capt_unit_a_reg_Capt_Start_Addr_type (inp_sys_capt_unit_a_reg_Capt_Start_Addr)—Offset 81004h

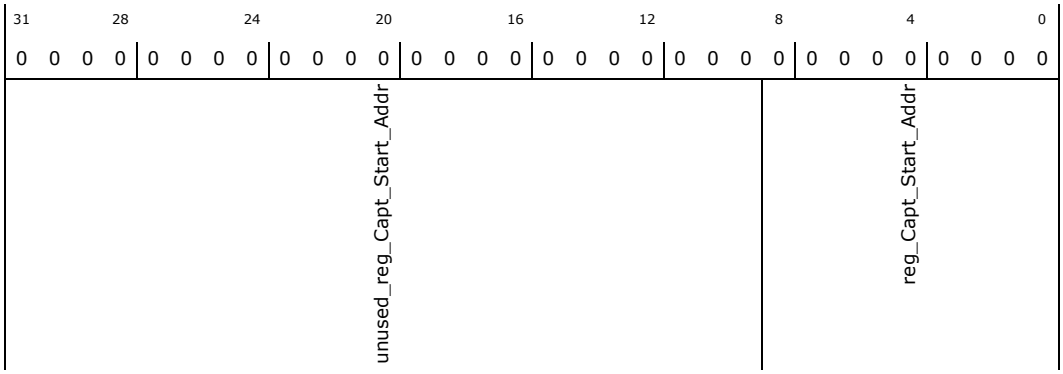
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_Capt_Start_Addr: [ISPMMADR] + 81004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_reg_Capt_Start_Addr:** Unused
8:0	0h RW	**reg_Capt_Start_Addr:** Start Address of first memory region

15.8.692 reg_inp_sys_capt_unit_a_reg_Capt_Mem_Region_Size_type (inp_sys_capt_unit_a_reg_Capt_Mem_Region_Size)—Offset 81008h

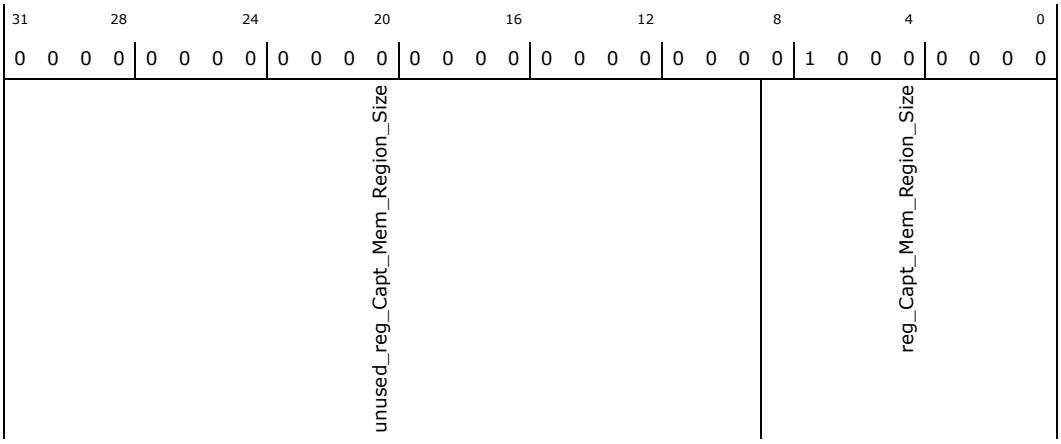
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_Capt_Mem_Region_Size: [ISPMMADR] + 81008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000080h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_reg_Capt_Mem_Region_Size:** Unused
8:0	080h RW	**reg_Capt_Mem_Region_Size:** Memory region size

15.8.693 reg_inp_sys_capt_unit_a_reg_Capt_Num_Mem_Regions_type (inp_sys_capt_unit_a_reg_Capt_Num_Mem_Regions)—Offset 8100Ch

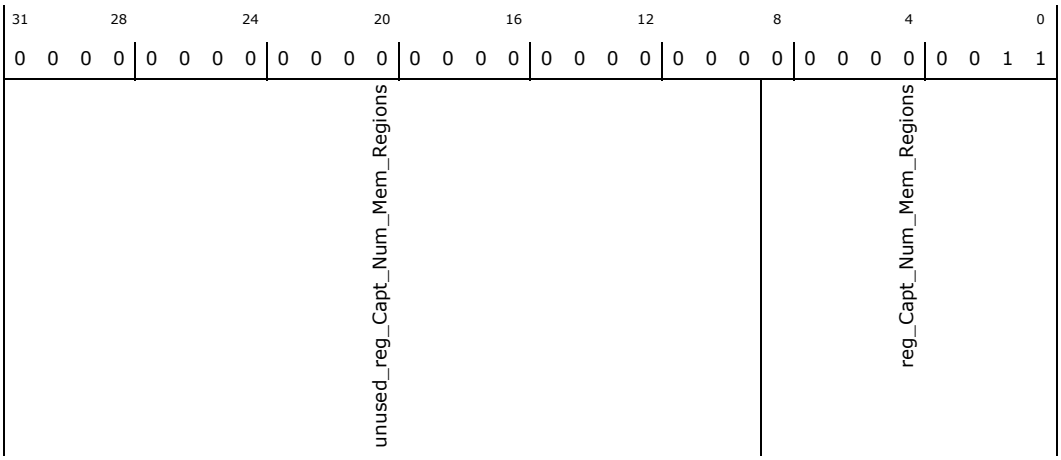
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_Capt_Num_Mem_Regions: [ISPMMADR] + 8100Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000003h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_reg_Capt_Num_Mem_Regions:** Unused
8:0	003h RW	**reg_Capt_Num_Mem_Regions:** Number of memory regions

15.8.694 reg_inp_sys_capt_unit_a_reg_Capt_Init_type (inp_sys_capt_unit_a_reg_Capt_Init)—Offset 81010h

Initialize Capture Unit

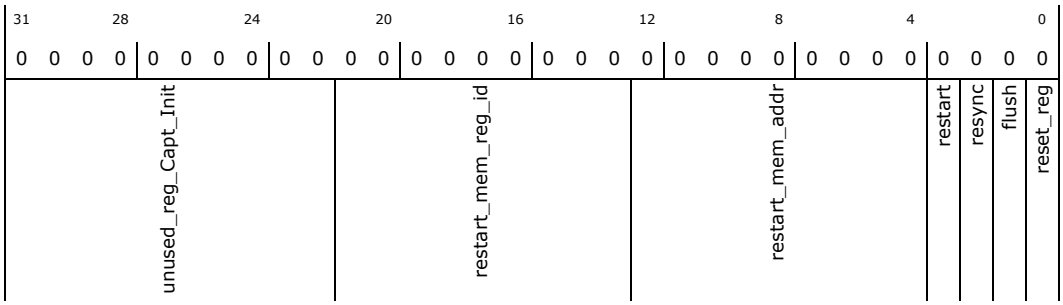
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_Capt_Init: [ISPMMADR] + 81010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_reg_Capt_Init:** Unused
21:13	0h WO	**restart_mem_reg_id:** Restart Memory Region ID
12:4	0h WO	**restart_mem_addr:** Restart Memory Address
3	0h WO	**restart:** Restart Capture Unit
2	0h WO	**resync:** Resynchronize Capture Unit
1	0h WO	**flush:** Flush Internal Buffers
0	0h WO	**reset_reg:** Reset Status Registers

15.8.695 reg_inp_sys_capt_unit_a_reg_Capt_Start_type (inp_sys_capt_unit_a_reg_Capt_Start)—Offset 81014h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_a_reg_Capt_Start: [ISPMMADR] + 81014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

15.8.711 reg_inp_sys_capt_unit_b_reg_Capt_Start_type (inp_sys_capt_unit_b_reg_Capt_Start)—Offset 82014h

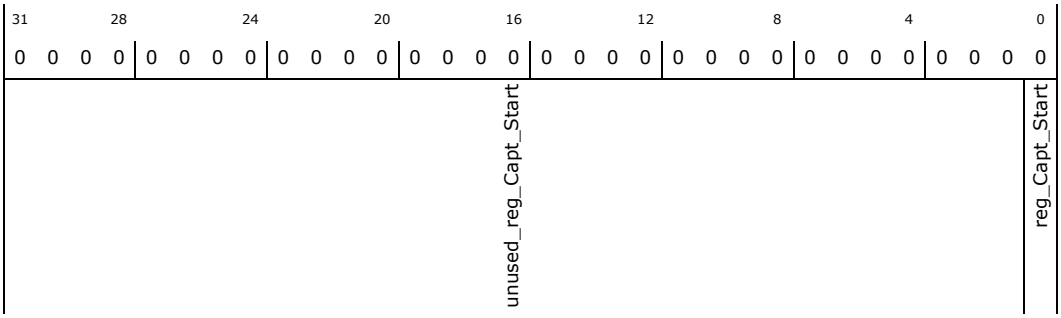
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Start: [ISPMMADR] + 82014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_Capt_Start:** Unused
0	0h WO	**reg_Capt_Start:** Start Capturing

15.8.712 reg_inp_sys_capt_unit_b_reg_Capt_Stop_type (inp_sys_capt_unit_b_reg_Capt_Stop)—Offset 82018h

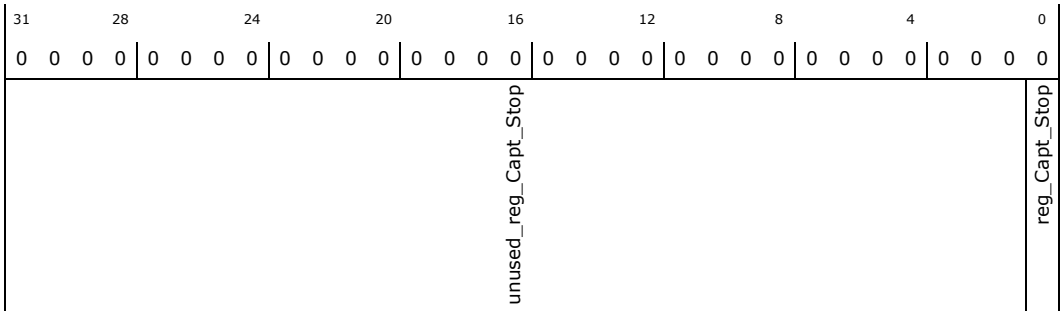
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Stop: [ISPMMADR] + 82018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_Capt_Stop:** Unused
0	0h WO	**reg_Capt_Stop:** Stop Capturing

15.8.713 reg_inp_sys_capt_unit_b_reg_Capt_Packet_Length_type (inp_sys_capt_unit_b_reg_Capt_Packet_Length)—Offset 8201Ch

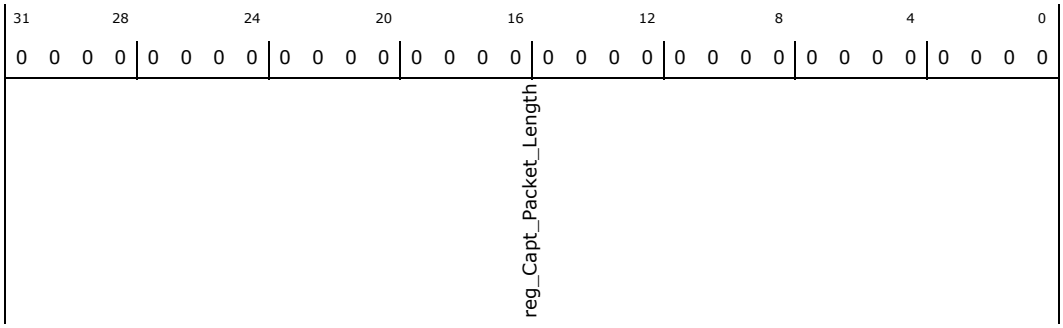
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Packet_Length: [ISPMMADR] + 8201Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**reg_Capt_Packet_Length:** Packet length of multi_word packet (MWP) as decoded from packet header

15.8.714 reg_inp_sys_capt_unit_b_reg_Capt_Received_Length_type (inp_sys_capt_unit_b_reg_Capt_Received_Length)—Offset 82020h

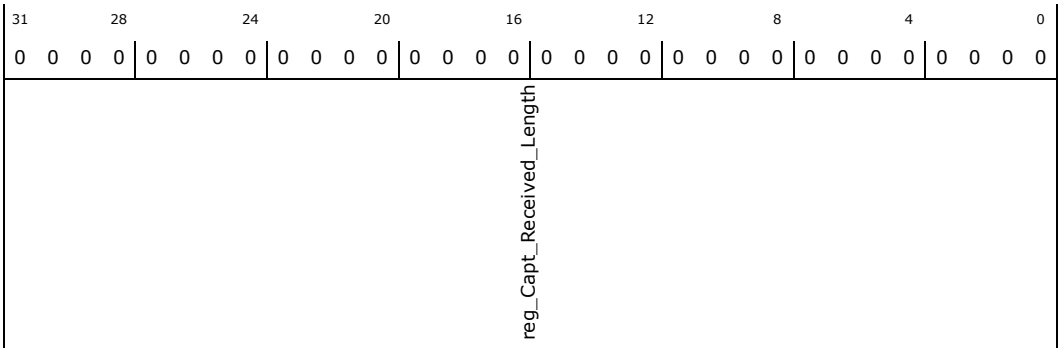
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Received_Length: [ISPMMADR] + 82020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**reg_Capt_Received_Length:** (Incremental) received packet length of current multi-word packet (MWP)

15.8.715 reg_inp_sys_capt_unit_b_reg_Capt_Received_Short_Packets_type (inp_sys_capt_unit_b_reg_Capt_Received_Short_Packets)—Offset 82024h

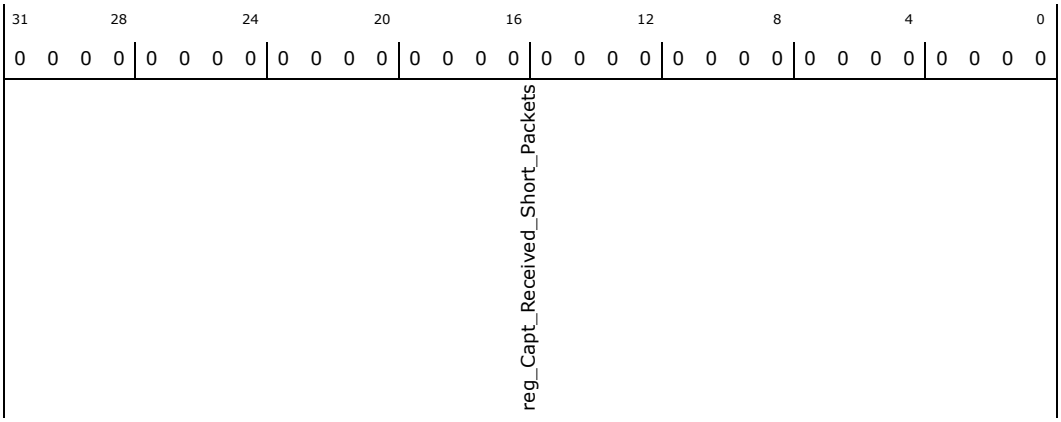
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Received_Short_Packets: [ISPMMADR] + 82024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**reg_Capt_Received_Short_Packets:** Number of received short packets

15.8.716 reg_inp_sys_capt_unit_b_reg_Capt_Received_Long_Packets_type (inp_sys_capt_unit_b_reg_Capt_Received_Long_Packets)—Offset 82028h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_capt_unit_b_reg_Capt_Received_Long_Packets: [ISPMMADR] + 82028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Description
31:0	0000000Fh RO	**reg_Acq_Last_Command:** Last command token accepted

15.8.745 reg_inp_sys_acq_unit_reg_Acq_Next_Command_type (inp_sys_acq_unit_reg_Acq_Next_Command)—Offset 8401Ch

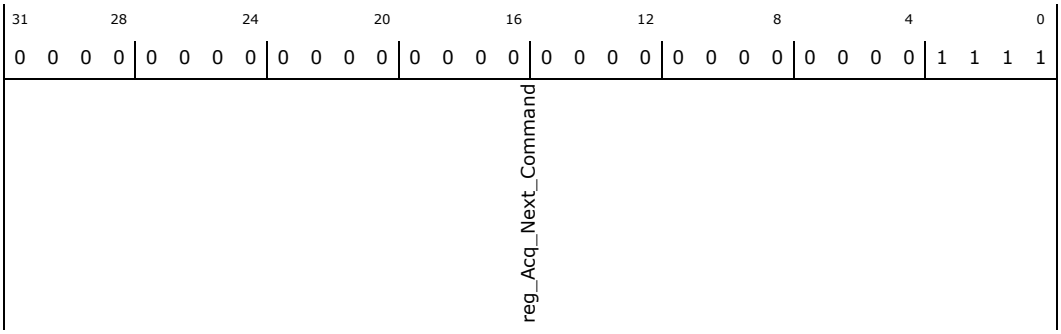
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_acq_unit_reg_Acq_Next_Command: [ISPMMADR] + 8401Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**reg_Acq_Next_Command:** Next command token to be accepted

15.8.746 reg_inp_sys_acq_unit_reg_Acq_Last_Acknowledge_type (inp_sys_acq_unit_reg_Acq_Last_Acknowledge)—Offset 84020h

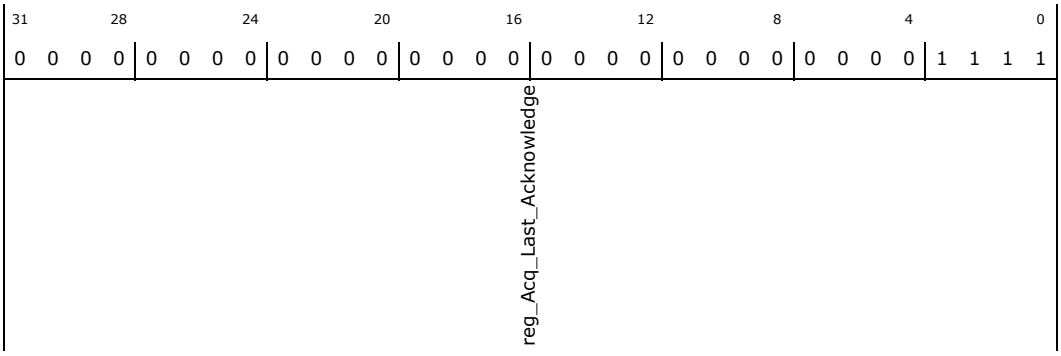
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_acq_unit_reg_Acq_Last_Acknowledge: [ISPMMADR] + 84020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**reg_Acq_Last_Acknowledge:** Last acknowledge token send

15.8.747 reg_inp_sys_acq_unit_reg_Acq_Next_Acknowledge_type (inp_sys_acq_unit_reg_Acq_Next_Acknowledge)—Offset 84024h

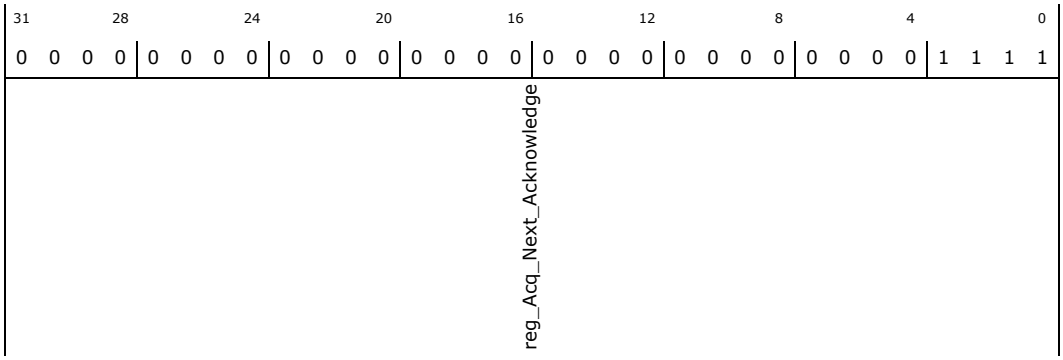
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_acq_unit_reg_Acq_Next_Acknowledge: [ISPMMADR] + 84024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**reg_Acq_Next_Acknowledge:** Next acknowledge token to be send

15.8.748 reg_inp_sys_acq_unit_reg_Acq_FSM_State_Info_type (inp_sys_acq_unit_reg_Acq_FSM_State_Info)—Offset 84028h

Acquisition unit State Machine information

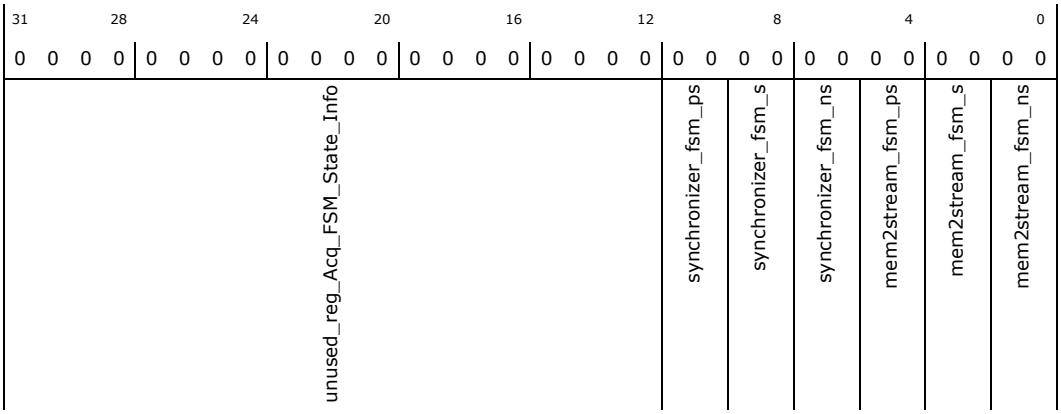
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_acq_unit_reg_Acq_FSM_State_Info: [ISPMMADR] + 84028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_Acq_FSM_State_Info:** Unused
11:10	0h RO	**synchronizer_fsm_ps:** Previous state of Synchronizer State Machine
9:8	0h RO	**synchronizer_fsm_s:** Current state of Synchronizer State Machine
7:6	0h RO	**synchronizer_fsm_ns:** Next state of Synchronizer State Machine
5:4	0h RO	**mem2stream_fsm_ps:** Previous state of Mem2Stream State Machine
3:2	0h RO	**mem2stream_fsm_s:** Current state of Mem2Stream State Machine
1:0	0h RO	**mem2stream_fsm_ns:** Next state of Mem2Stream State Machine

15.8.749 reg_inp_sys_acq_unit_reg_Acq_Int_Cntr_Info_type (inp_sys_acq_unit_reg_Acq_Int_Cntr_Info)—Offset 8402Ch

Acq_Int_Cntr_Info

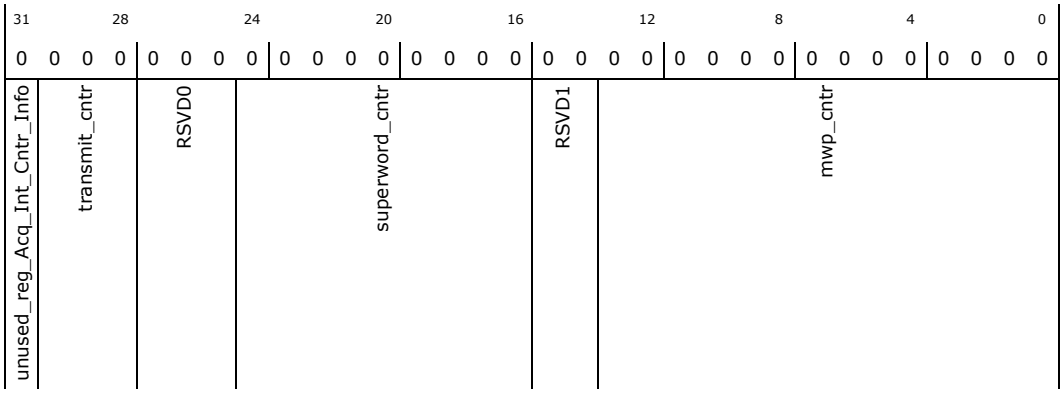
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_acq_unit_reg_Acq_Int_Cntr_Info: [ISPMMADR] + 8402Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**unused_reg_Acq_Int_Cntr_Info:** Unused
30:28	0h RO	**transmit_cntr:** Counter used for determining which word (part of a superword) to be send
27:25	0b RO	**RSVD0:** Reserved
24:16	0h RO	**superword_cntr:** Counts number of superwords read from wide bus (input buffer)
15:14	0b RO	**RSVD1:** Reserved
13:0	0h RO	**mwp_cntr:** Counts words in multi word packet

15.8.750 reg_inp_sys_dma_DMA_FSM_Command_type (inp_sys_dma_DMA_FSM_Command)—Offset 85000h

FSM Command: Last command and State

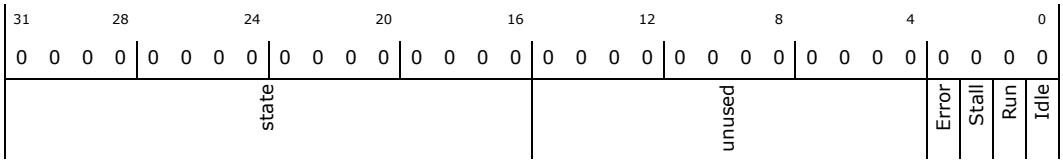
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_FSM_Command: [ISPMMADR] + 85000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RO	**state:** Lower 16 bits of the last command received and processed

Bit Range	Default & Access	Description
15:4	0h RO	**unused:** unused
3	0h RO	**Error:** Error flag
2	0h RO	**Stall:** Stall flag
1	0h RO	**Run:** Run flag
0	0h RO	**Idle:** Idle flag

15.8.751 reg_inp_sys_dma_DMA_CH0_Packing_setup_type (inp_sys_dma_DMA_CH0_Packing_setup)—Offset 86000h

DMA CH 0 PARAM 0: Packing setup

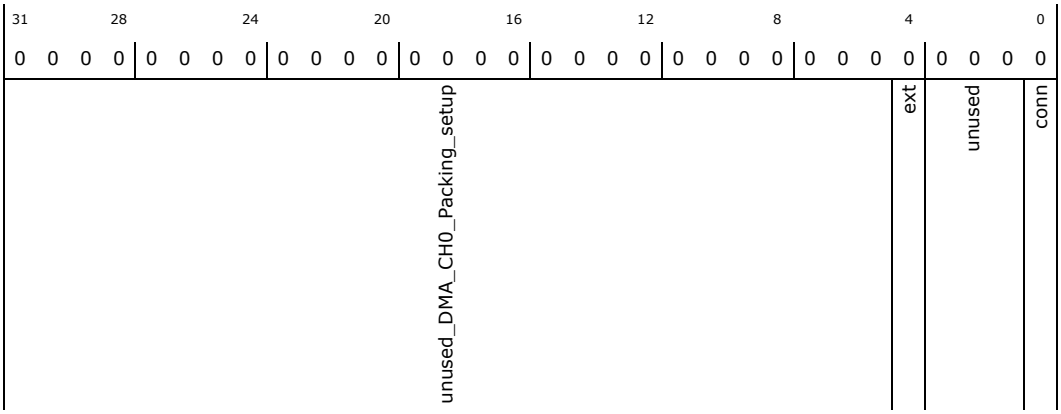
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_Packing_setup: [ISPMMADR] + 86000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_DMA_CH0_Packing_setup:** Unused
4	0h RO	**ext:** Zero(0)/Sign(1) extension
3:1	0h RO	**unused:** unused
0	0h RO	**conn:** Connection ID

15.8.752 reg_inp_sys_dma_DMA_CH0_dev_stride_A_type (inp_sys_dma_DMA_CH0_dev_stride_A)—Offset 86100h

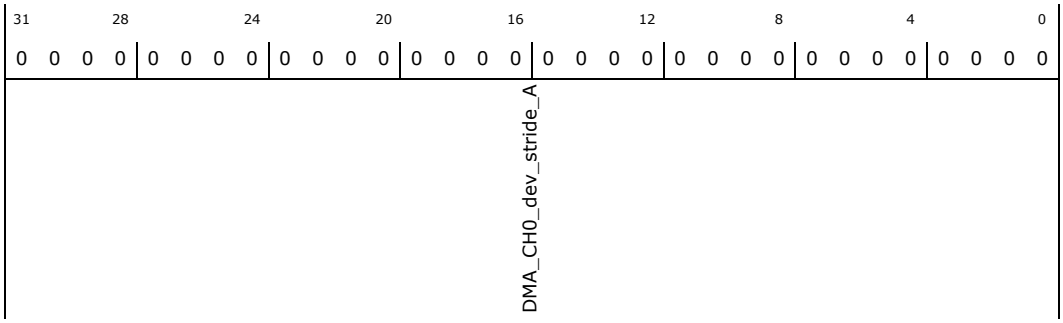
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_dev_stride_A: [ISPMMADR] + 86100h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH0_dev_stride_A:** DMA CH 0 PARAM 1: Device A stride

15.8.753 reg_inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_A_type (inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_A)—Offset 86200h

DMA CH 0 PARAM 2: Device A Packing LSE cropping/Elements

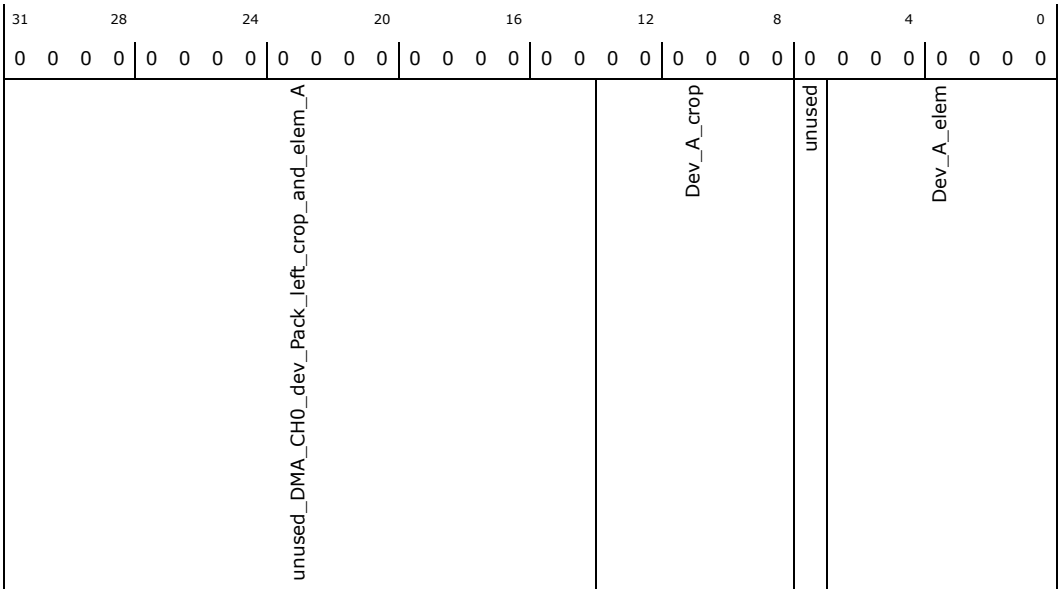
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_A: [ISPMMADR] + 86200h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_DMA_CH0_dev_Pack_left_crop_and_elem_A:** Unused
13:8	0h RO	**Dev_A_crop:** Device A left element cropping
7	0h RO	**unused:** unused
6:0	0h RO	**Dev_A_elem:** Device A element per word

15.8.754 reg_inp_sys_dma_DMA_CH0_Device_Xb_A_type (inp_sys_dma_DMA_CH0_Device_Xb_A)—Offset 86300h

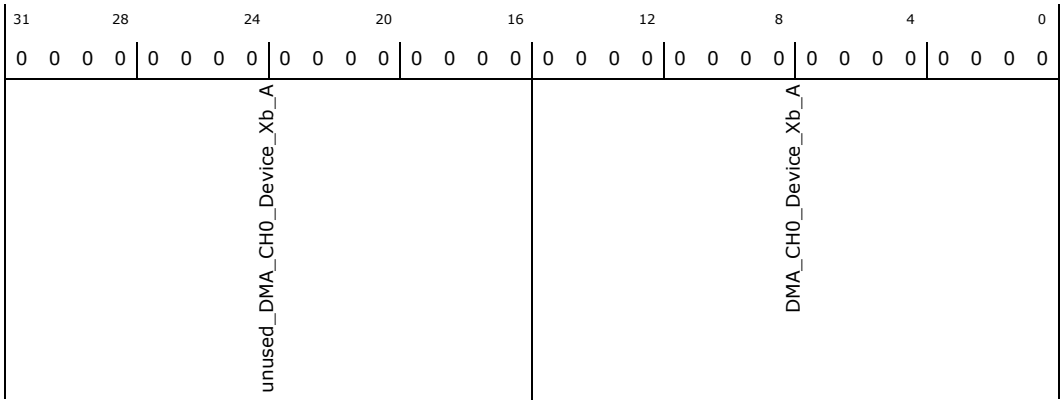
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_Device_Xb_A: [ISPMMADR] + 86300h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_DMA_CH0_Device_Xb_A:** Unused
15:0	0h RO	**DMA_CH0_Device_Xb_A:** DMA CH 0 PARAM 3: Device A block width (Xb)

15.8.755 reg_inp_sys_dma_DMA_CH0_dev_stride_B_type (inp_sys_dma_DMA_CH0_dev_stride_B)—Offset 86400h

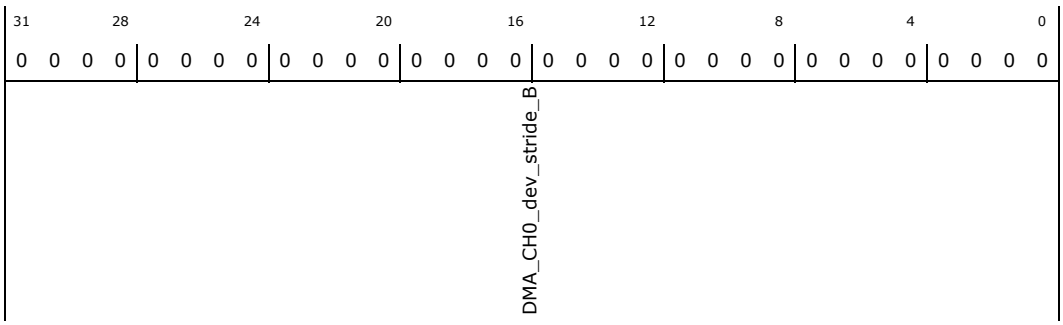
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_dev_stride_B: [ISPMMADR] + 86400h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_CH0_dev_stride_B:** DMA CH 0 PARAM 4: Device B stride

15.8.756 reg_inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_B_type (inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_B)—Offset 86500h

DMA CH 0 PARAM 5: Device B Packing LSE cropping/Elements

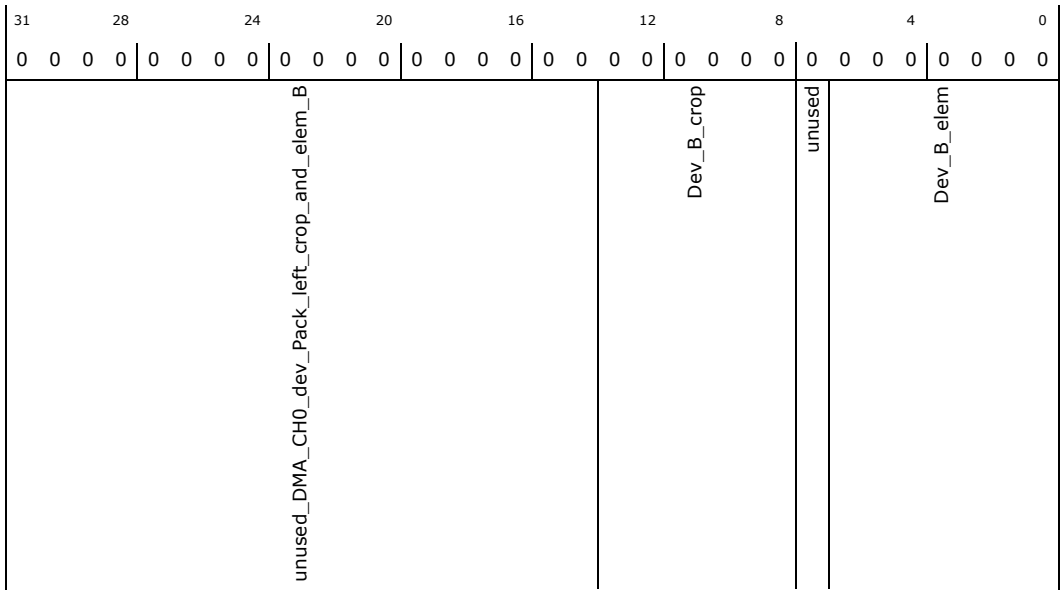
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_dev_Pack_left_crop_and_elem_B : [ISPMMADR] + 86500h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_DMA_CH0_dev_Pack_left_crop_and_elem_B:** Unused
13:8	0h RO	**Dev_B_crop:** Device B left element cropping
7	0h RO	**unused:** unused
6:0	0h RO	**Dev_B_elem:** Device B element per word

15.8.757 reg_inp_sys_dma_DMA_CH0_Device_Xb_B_type (inp_sys_dma_DMA_CH0_Device_Xb_B)—Offset 86600h

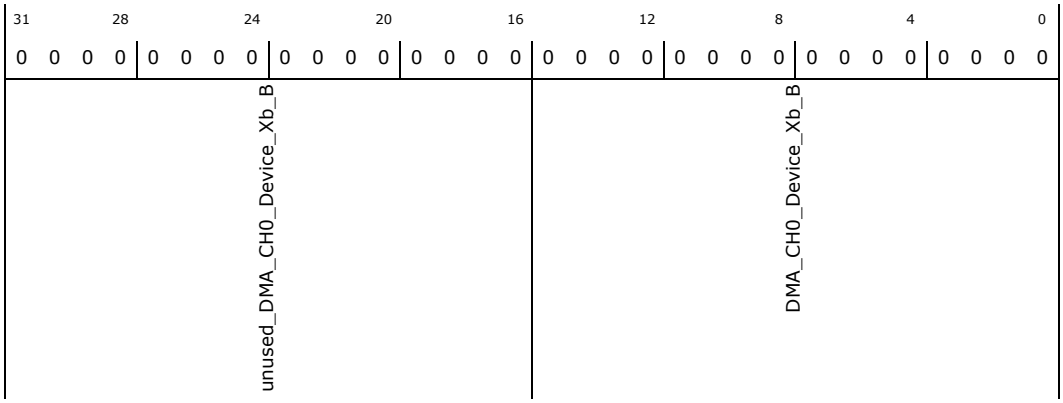
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_Device_Xb_B: [ISPMMADR] + 86600h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_DMA_CH0_Device_Xb_B:** Unused
15:0	0h RO	**DMA_CH0_Device_Xb_B:** DMA CH 0 PARAM 6: Device B block width (Xb)

15.8.758 reg_inp_sys_dma_DMA_CH0_Yb_type (inp_sys_dma_DMA_CH0_Yb)—Offset 86700h

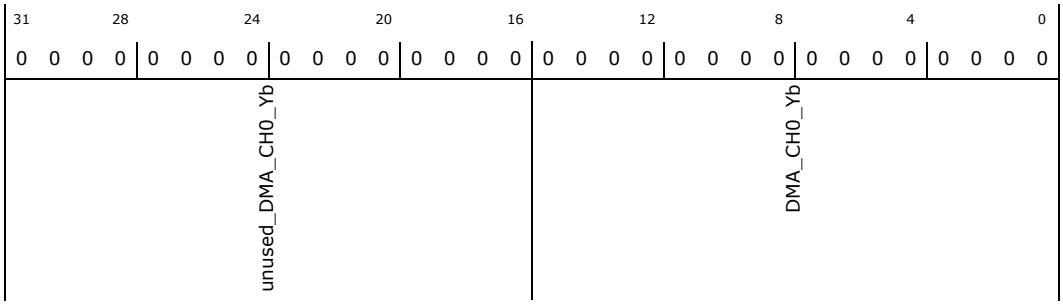
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_Yb: [ISPMMADR] + 86700h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_DMA_CH0_Yb:** Unused
15:0	0h RO	**DMA_CH0_Yb:** DMA CH 0 PARAM 7: block Height (Yb)

15.8.759 reg_inp_sys_dma_DMA_CH0_pending_command_type (inp_sys_dma_DMA_CH0_pending_command)—Offset 86800h

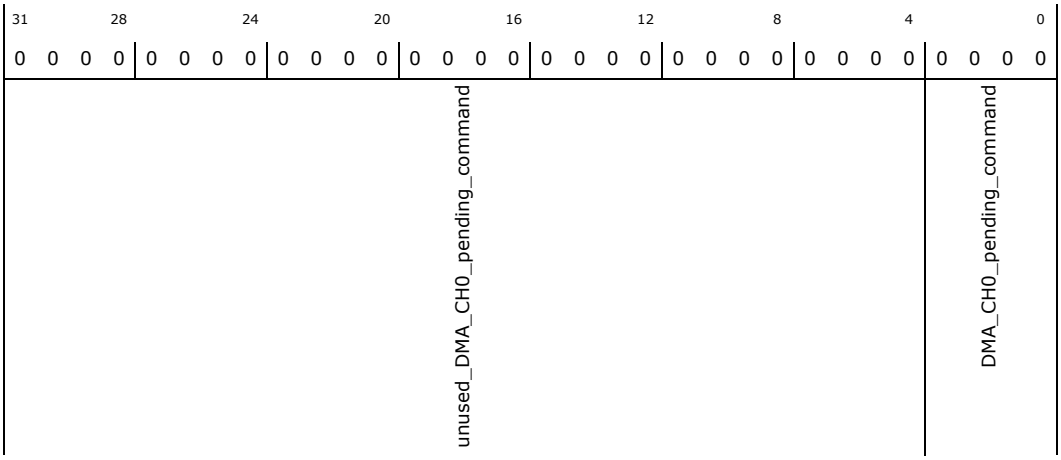
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_CH0_pending_command: [ISPMMADR] + 86800h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_DMA_CH0_pending_command:** Unused
3:0	0h RO	**DMA_CH0_pending_command:** DMA CH 0 PARAM 8: Pending commands which will use channel 0

15.8.760 reg_inp_sys_dma_DMA_command_token_type (inp_sys_dma_DMA_command_token)—Offset 87000h

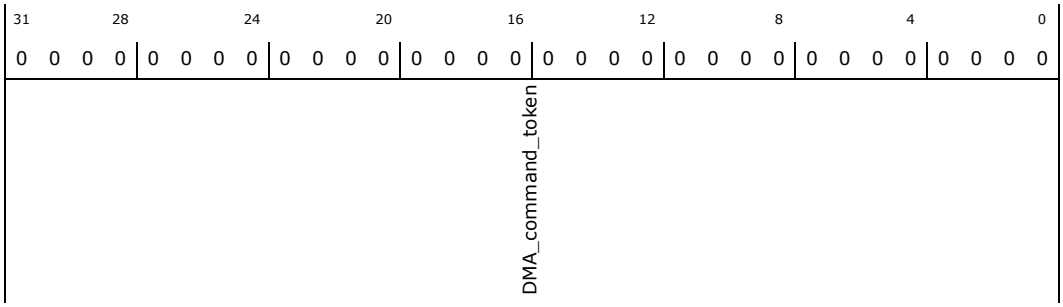
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_command_token: [ISPMMADR] + 87000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_command_token:** Pending or last executed command token

15.8.761 reg_inp_sys_dma_DMA_command_src_addr_type (inp_sys_dma_DMA_command_src_addr)—Offset 87004h

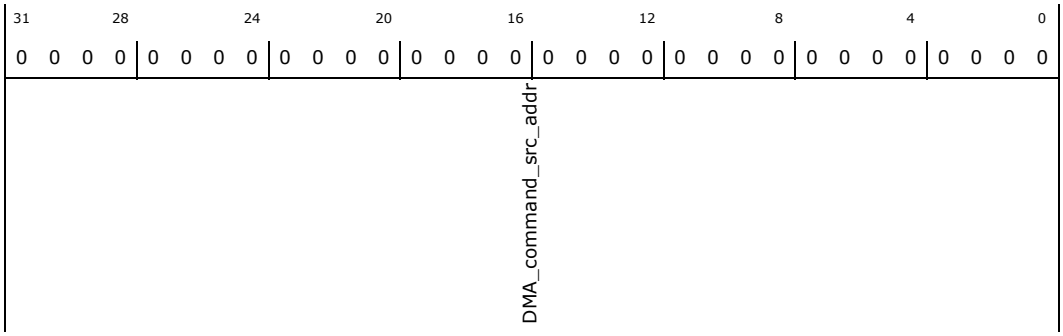
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_command_src_addr: [ISPMMADR] + 87004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_command_src_addr:** Source address of the pending or last executed command token

15.8.762 reg_inp_sys_dma_DMA_command_dst_addr_type (inp_sys_dma_DMA_command_dst_addr)—Offset 87008h

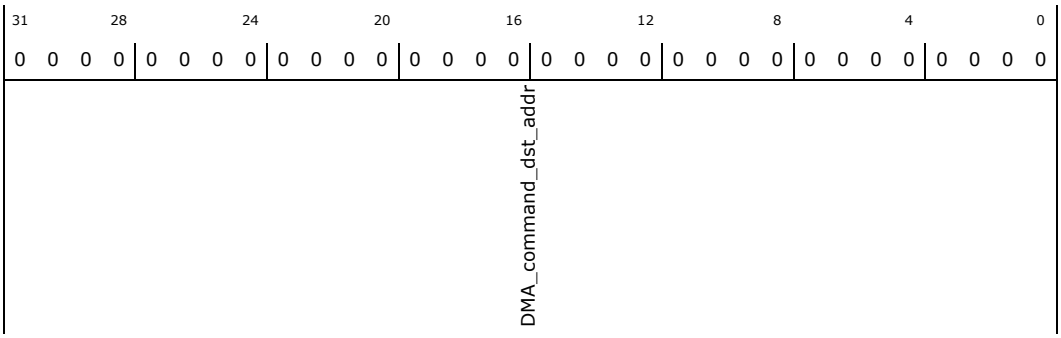
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_command_dst_addr: [ISPMMADR] + 87008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**DMA_command_dst_addr:** Destination address of the pending or last executed command token

15.8.763 reg_inp_sys_dma_DMA_command_ctrl_id_type (inp_sys_dma_DMA_command_ctrl_id)—Offset 8700Ch

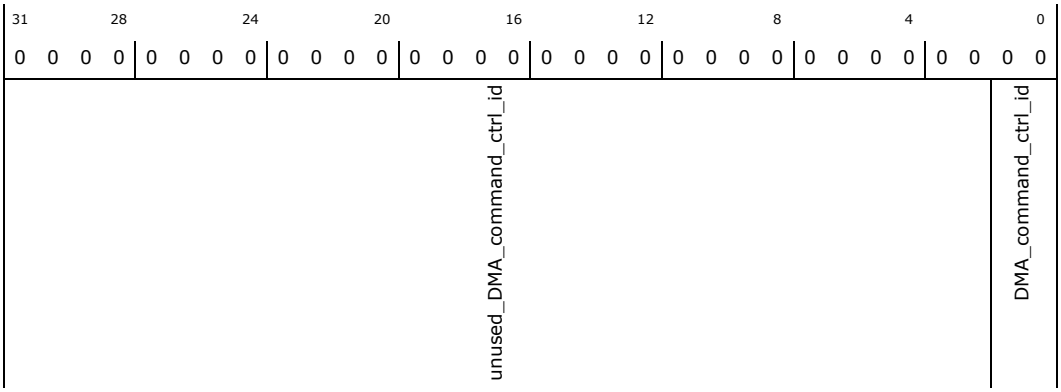
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_command_ctrl_id: [ISPMMADR] + 8700Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_DMA_command_ctrl_id:** Unused
1:0	0h RO	**DMA_command_ctrl_id:** Controller id of the pending or last executed command token

15.8.764 reg_inp_sys_dma_DMA_FSM_Ctrl_status_type (inp_sys_dma_DMA_FSM_Ctrl_status)—Offset 87010h

DMA FSM Control state and flags

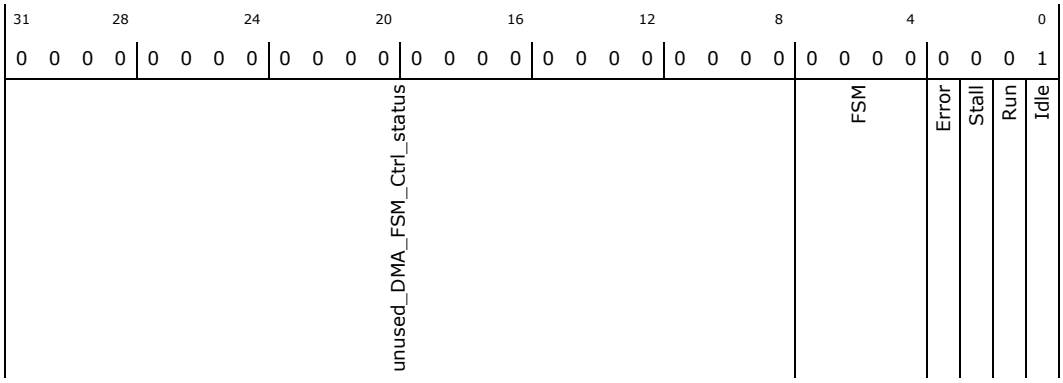
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_FSM_Ctrl_status: [ISPMMADR] + 87010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:8	0h RW	**unused_DMA_FSM_Ctrl_status:** Unused
7:4	0h RO	**FSM:** FSM control state: 0)Idle -- 1)req_rcv -- 2)rcv -- 3)rcv_req -- 4)init
3	0h RO	**Error:** Error flag
2	0h RO	**Stall:** Stall flag
1	0h RO	**Run:** Run flag
0	1h RO	**Idle:** Idle flag

15.8.765 reg_inp_sys_dma_DMA_FSM_Pack_status_type (inp_sys_dma_DMA_FSM_Pack_status)—Offset 87014h

DMA FSM Pack state

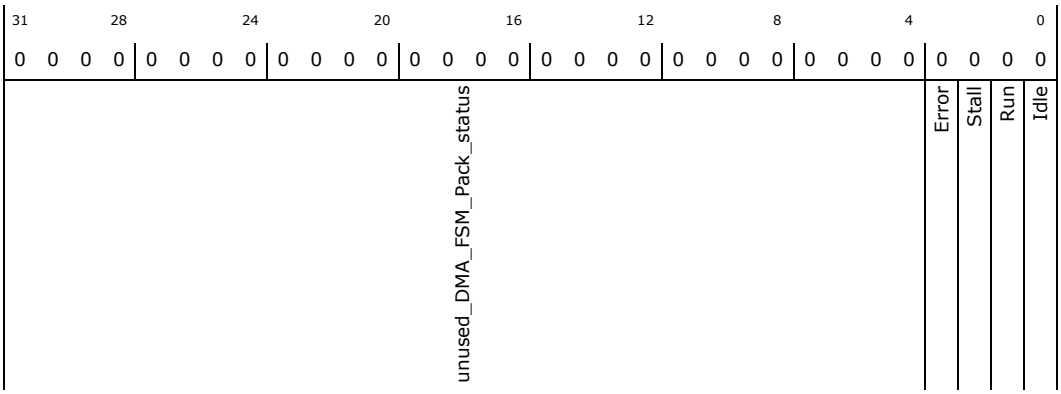
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_FSM_Pack_status: [ISPMMADR] + 87014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_DMA_FSM_Pack_status:** Unused
3	0h RO	**Error:** Error flag
2	0h RO	**Stall:** Stall flag
1	0h RO	**Run:** Run flag
0	0h RO	**Idle:** Idle flag

15.8.766 reg_inp_sys_dma_DMA_FSM_request_status_type (inp_sys_dma_DMA_FSM_request_status)—Offset 87018h

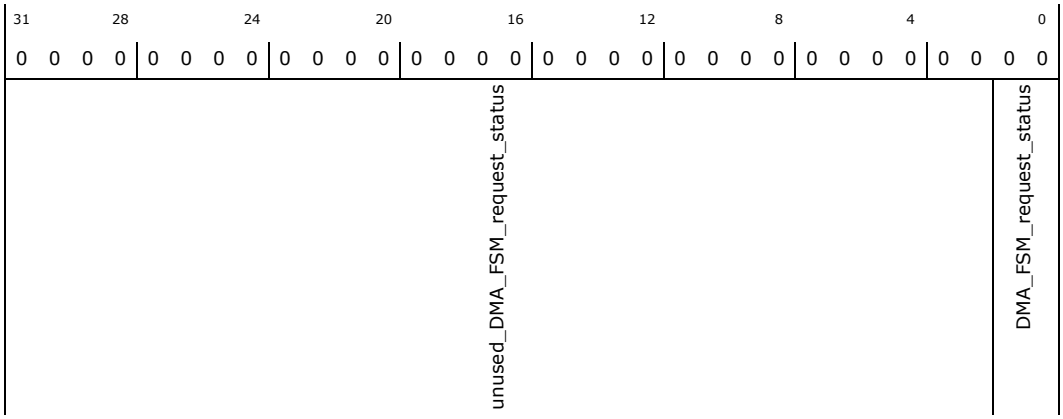
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_dma_DMA_FSM_request_status: [ISPMMADR] + 87018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

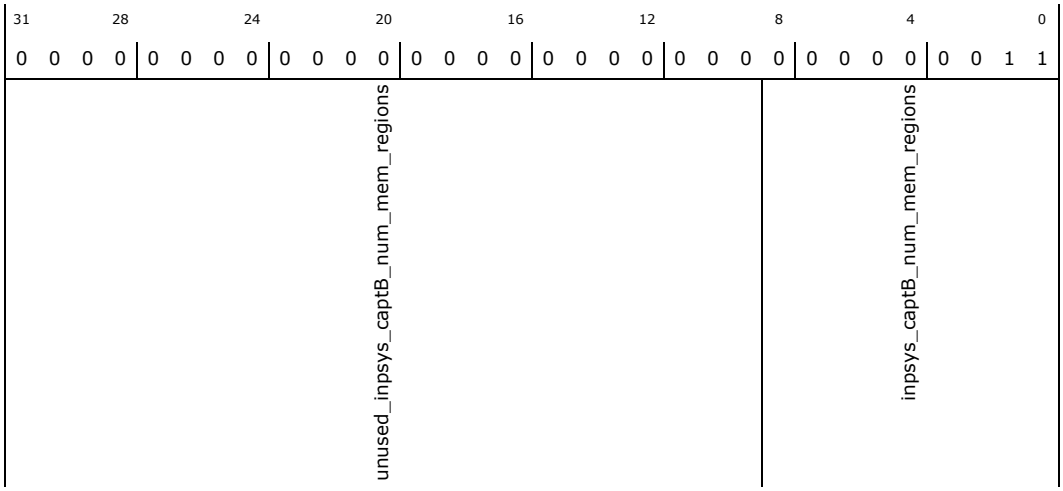
inp_sys_inp_ctrl_inpsys_captB_num_mem_regions: [ISPMMADR] + 8901Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000003h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_inpsys_captB_num_mem_regions:** Unused
8:0	003h RW	**inpsys_captB_num_mem_regions:** Input System Controller Capt B number of mem regions

15.8.811 reg_inp_sys_inp_ctrl_inpsys_captC_num_mem_regions_type (inp_sys_inp_ctrl_inpsys_captC_num_mem_regions)—Offset 89020h

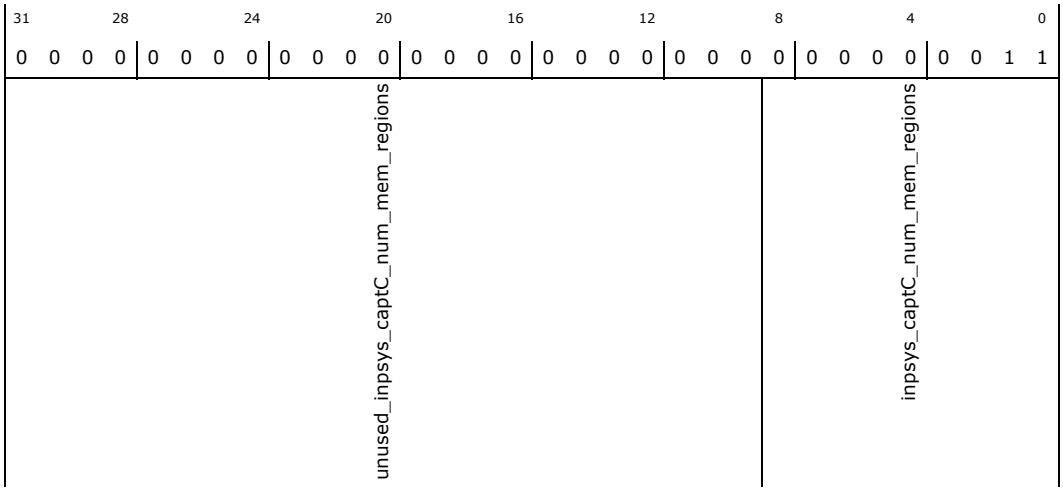
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_captC_num_mem_regions: [ISPMMADR] + 89020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000003h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_inpsys_captC_num_mem_regions:** Unused
8:0	003h RW	**inpsys_captC_num_mem_regions:** Input System Controller Capt C number of mem regions

15.8.812 reg_inp_sys_inp_ctrl_inpsys_acq_start_addr_type (inp_sys_inp_ctrl_inpsys_acq_start_addr)—Offset 89024h

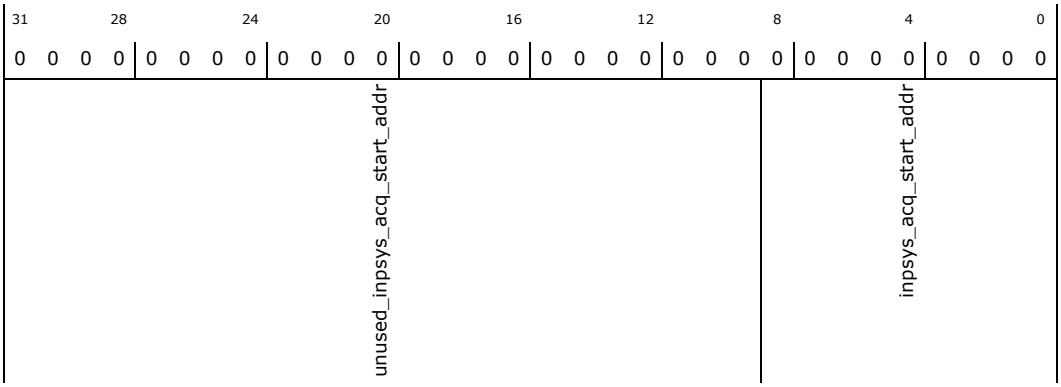
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_acq_start_addr: [ISPMMADR] + 89024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_inpsys_acq_start_addr:** Unused
8:0	0h RW	**inpsys_acq_start_addr:** Input System Controller Acquisition mem region start address

15.8.813 reg_inp_sys_inp_ctrl_inpsys_acq_mem_region_size_type (inp_sys_inp_ctrl_inpsys_acq_mem_region_size)—Offset 89028h

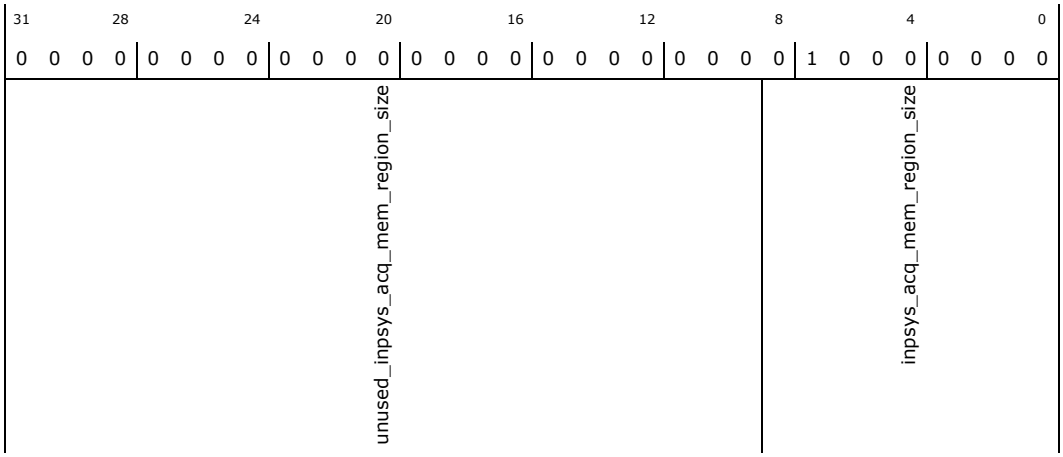
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_acq_mem_region_size: [ISPMMADR] + 89028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000080h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_inpsys_acq_mem_region_size:** Unused
8:0	080h RW	**inpsys_acq_mem_region_size:** Input System Controller Acquisition mem region size

15.8.814 reg_inp_sys_inp_ctrl_inpsys_acq_num_mem_regions_type (inp_sys_inp_ctrl_inpsys_acq_num_mem_regions)—Offset 8902Ch

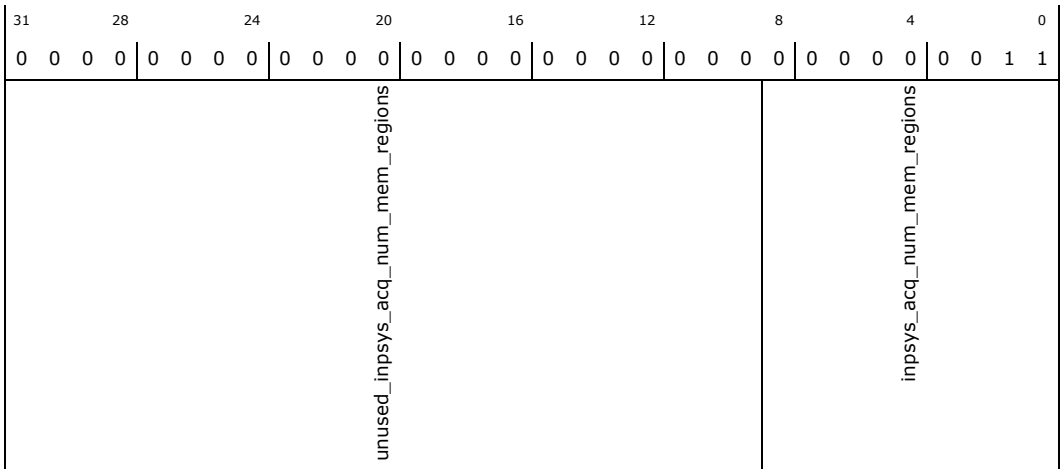
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_acq_num_mem_regions: [ISPMMADR] + 8902Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000003h



Bit Range	Default & Access	Description
31:9	0h RW	**unused_inpsys_acq_num_mem_regions:** Unused
8:0	003h RW	**inpsys_acq_num_mem_regions:** Input System Controller Acquisition number of mem regions

15.8.815 reg_inp_sys_inp_ctrl_inpsys_ctrl_init_type (inp_sys_inp_ctrl_inpsys_ctrl_init)—Offset 89030h

Input System Controller initialization register

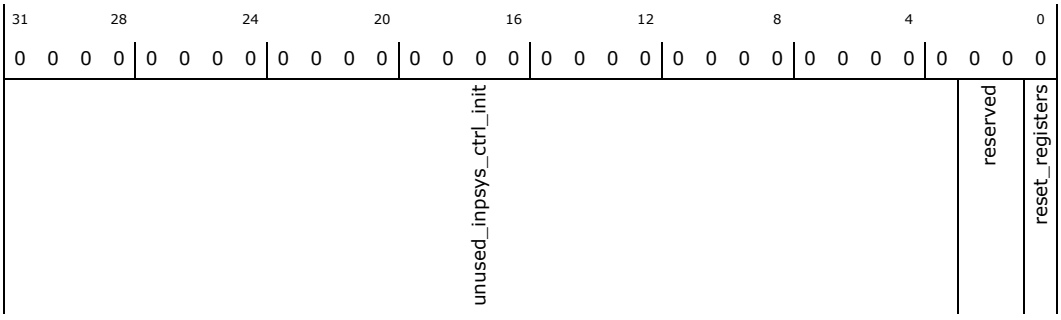
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_ctrl_init: [ISPMMADR] + 89030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:3	0h RW	**unused_inpsys_ctrl_init:** Unused
2:1	0h RW	**reserved:** reserved bits, no action for now
0	0h RW	**reset_registers:** Reset all registers in Input System Controller

15.8.816 reg_inp_sys_inp_ctrl_inpsys_last_cmd_type (inp_sys_inp_ctrl_inpsys_last_cmd)—Offset 89034h

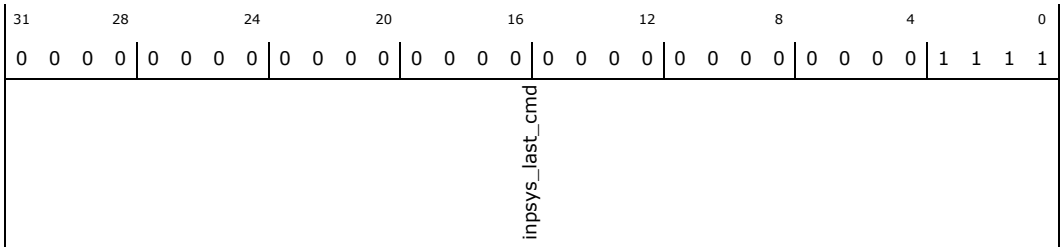
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_last_cmd: [ISPMMADR] + 89034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**inpsys_last_cmd:** Input System Controller last command register

15.8.817 reg_inp_sys_inp_ctrl_inpsys_next_cmd_type (inp_sys_inp_ctrl_inpsys_next_cmd)—Offset 89038h

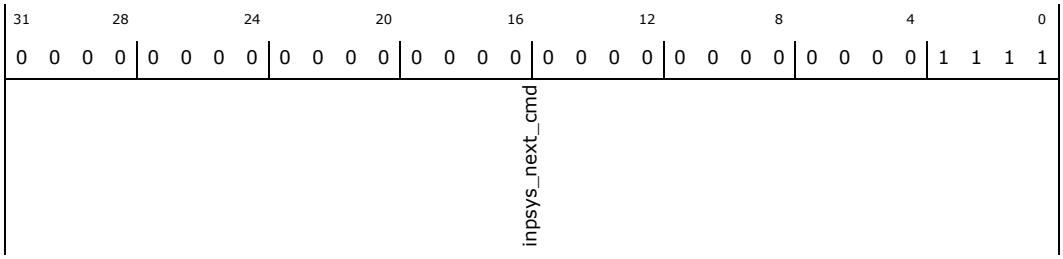
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_next_cmd: [ISPMMADR] + 89038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**inpsys_next_cmd:** Input System Controller next command register

15.8.818 reg_inp_sys_inp_ctrl_inpsys_last_ack_type (inp_sys_inp_ctrl_inpsys_last_ack)—Offset 8903Ch

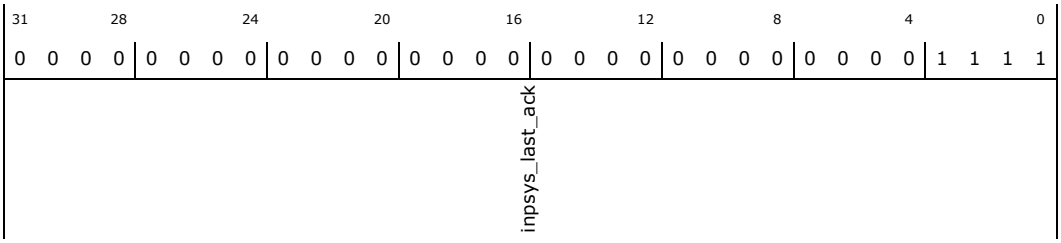
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_last_ack: [ISPMMADR] + 8903Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**inpsys_last_ack:** Input System Controller last acknowledge register

15.8.819 reg_inp_sys_inp_ctrl_inpsys_next_ack_type (inp_sys_inp_ctrl_inpsys_next_ack)—Offset 89040h

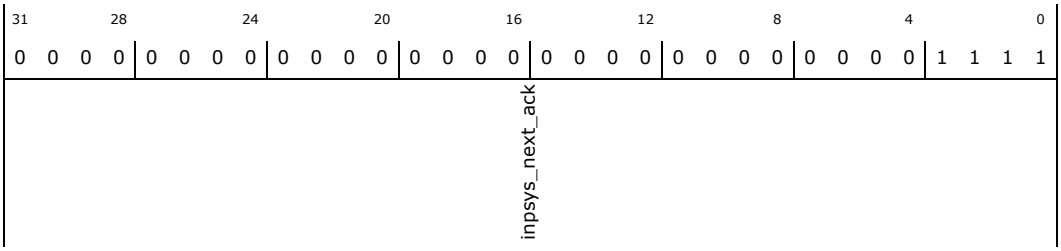
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_next_ack: [ISPMMADR] + 89040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000Fh



Bit Range	Default & Access	Description
31:0	0000000Fh RO	**inpsys_next_ack:** Input System Controller next acknowledge register

15.8.820 reg_inp_sys_inp_ctrl_inpsys_top_fsm_state_type (inp_sys_inp_ctrl_inpsys_top_fsm_state)—Offset 89044h

Input System Controller top-ctrl FSM current and next state info Register (both Cmd/ Ack FSM)

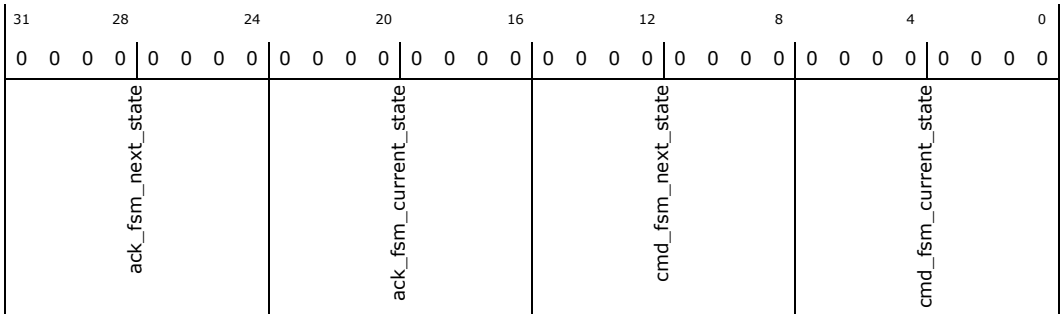
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_top_fsm_state: [ISPMMADR] + 89044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**ack_fsm_next_state:** Next state of top-ctrl Acknowledge FSM
23:16	0h RW	**ack_fsm_current_state:** Current state of top-ctrl Acknowledge FSM
15:8	0h RW	**cmd_fsm_next_state:** Next state of top-ctrl Command FSM
7:0	0h RW	**cmd_fsm_current_state:** Current state of top-ctrl Command FSM

15.8.821 reg_inp_sys_inp_ctrl_inpsys_captA_fsm_state_type (inp_sys_inp_ctrl_inpsys_captA_fsm_state)—Offset 89048h

Input System Controller captureA sub-ctrl current and next state info Register (FSM and DMA cmd state)

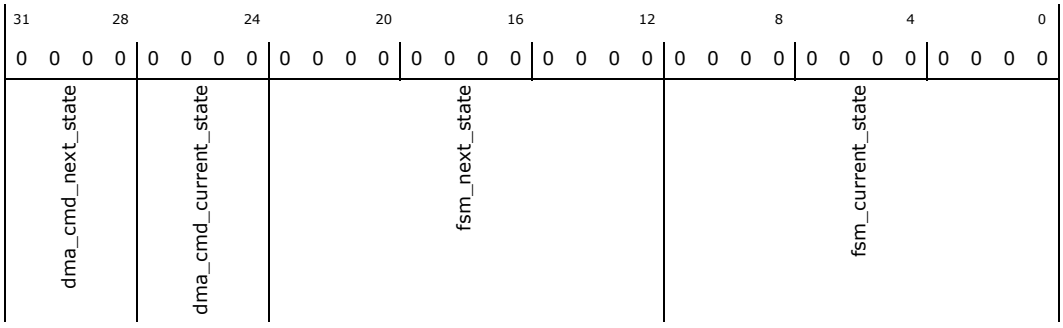
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_captA_fsm_state: [ISPMMADR] + 89048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**dma_cmd_next_state:** Next state of DMA cmd

Bit Range	Default & Access	Description
27:24	0h RW	**dma_cmd_current_state:** Current state of DMA cmd
23:12	0h RW	**fsm_next_state:** Next state of sub-ctrl FSM
11:0	0h RW	**fsm_current_state:** Current state of sub-ctrl FSM

15.8.822 reg_inp_sys_inp_ctrl_inpsys_captB_fsm_state_type (inp_sys_inp_ctrl_inpsys_captB_fsm_state)—Offset 8904Ch

Input System Controller captureB sub-ctrl current and next state info Register (FSM and DMA cmd state)

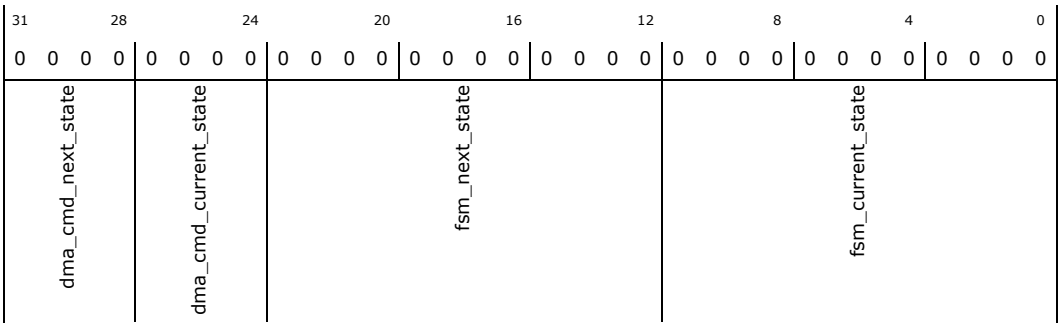
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_captB_fsm_state: [ISPMMADR] + 8904Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**dma_cmd_next_state:** Next state of DMA cmd
27:24	0h RW	**dma_cmd_current_state:** Current state of DMA cmd
23:12	0h RW	**fsm_next_state:** Next state of sub-ctrl FSM
11:0	0h RW	**fsm_current_state:** Current state of sub-ctrl FSM

15.8.823 reg_inp_sys_inp_ctrl_inpsys_captC_fsm_state_type (inp_sys_inp_ctrl_inpsys_captC_fsm_state)—Offset 89050h

Input System Controller captureC sub-ctrl current and next state info Register (FSM and DMA cmd state)

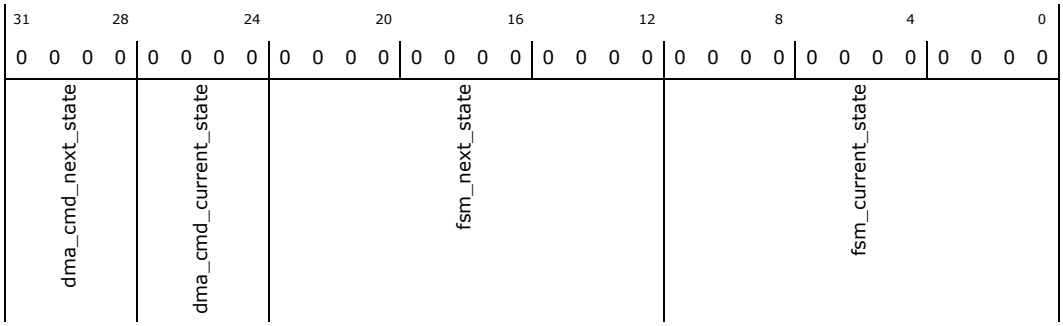
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_captC_fsm_state: [ISPMMADR] + 89050h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**dma_cmd_next_state:** Next state of DMA cmd
27:24	0h RW	**dma_cmd_current_state:** Current state of DMA cmd
23:12	0h RW	**fsm_next_state:** Next state of sub-ctrl FSM
11:0	0h RW	**fsm_current_state:** Current state of sub-ctrl FSM

15.8.824 reg_inp_sys_inp_ctrl_inpsys_acq_fsm_state_type (inp_sys_inp_ctrl_inpsys_acq_fsm_state)—Offset 89054h

Input System Controller acquisition sub-ctrl current and next state info Register (FSM and DMA cmd state)

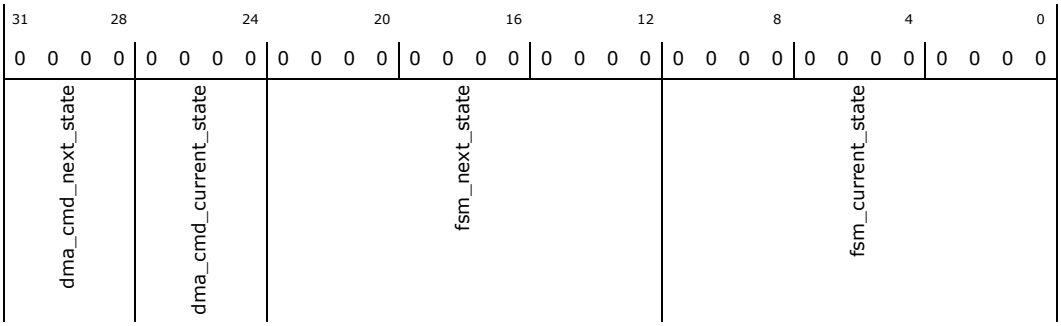
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_acq_fsm_state: [ISPMMADR] + 89054h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**dma_cmd_next_state:** Next state of DMA cmd
27:24	0h RW	**dma_cmd_current_state:** Current state of DMA cmd
23:12	0h RW	**fsm_next_state:** Next state of sub-ctrl FSM
11:0	0h RW	**fsm_current_state:** Current state of sub-ctrl FSM

15.8.825 reg_inp_sys_inp_ctrl_inpsys_capt_reserve_one_mem_region_type (inp_sys_inp_ctrl_inpsys_capt_reserve_one_mem_region)—Offset 89058h

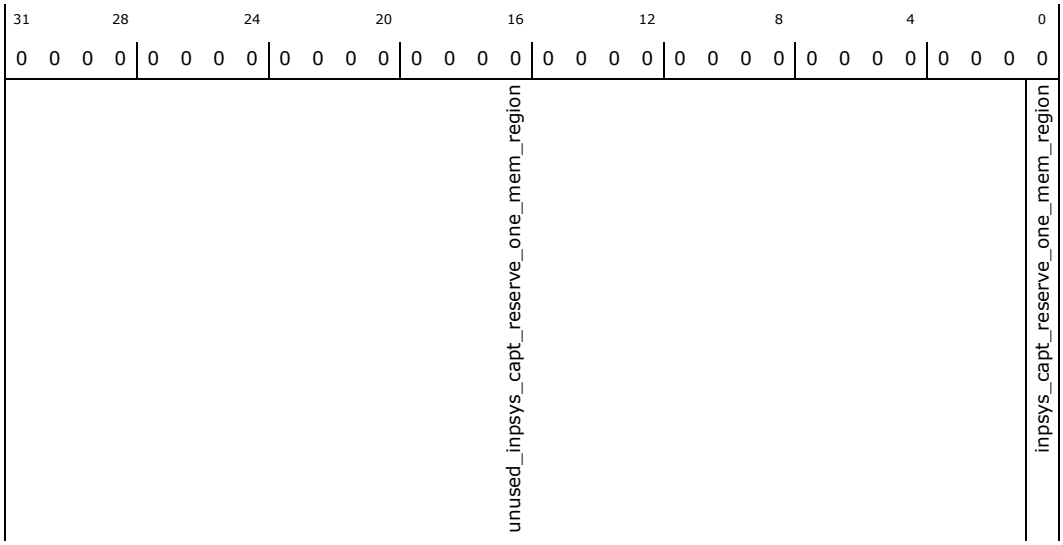
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_inp_ctrl_inpsys_capt_reserve_one_mem_region: [ISPMMADR] + 89058h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_inpsys_capt_reserve_one_mem_region:** Unused
0	0h RW	**inpsys_capt_reserve_one_mem_region:** Reserve 1 or 0 mem region of capture units in input buffer to avoid overflow of captured data. 0: zero mem region reserved, 1: one mem region reserved

15.8.826 reg_inp_sys_gpreg_str_multicastA_sel_type (inp_sys_gpreg_str_multicastA_sel)—Offset 8A000h

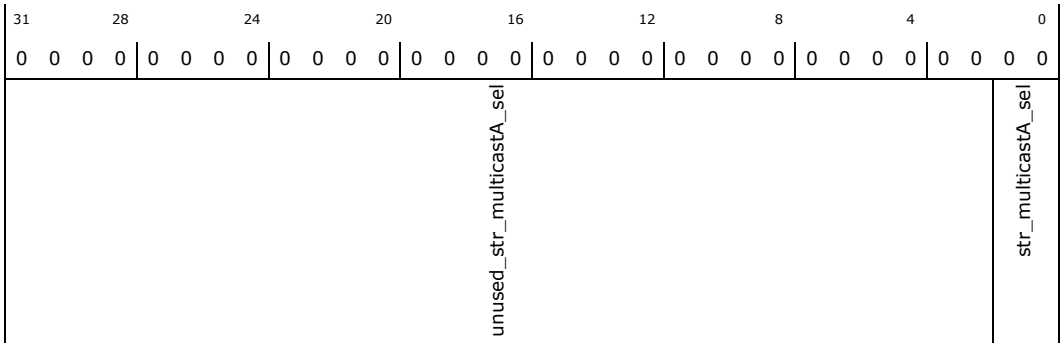
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_multicastA_sel: [ISPMMADR] + 8A000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_str_multicastA_sel:** Unused
1:0	0h RW	**str_multicastA_sel:** StreamMulticastA_select

15.8.827 reg_inp_sys_gpreg_str_multicastB_sel_type (inp_sys_gpreg_str_multicastB_sel)—Offset 8A004h

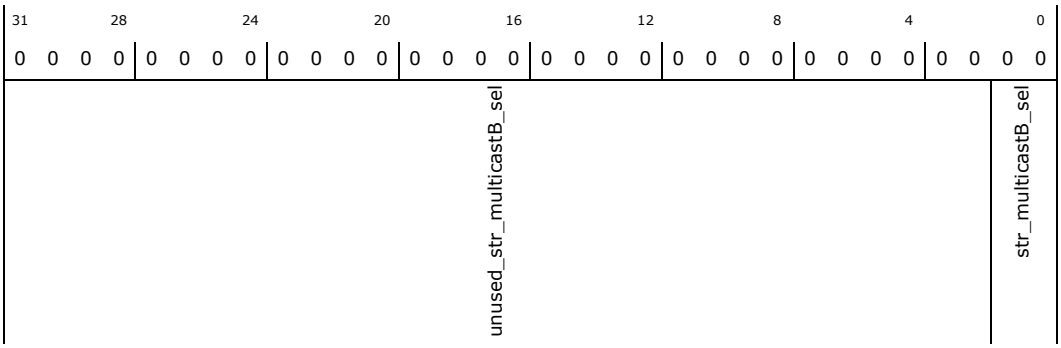
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_multicastB_sel: [ISPMMADR] + 8A004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_str_multicastB_sel:** Unused
1:0	0h RW	**str_multicastB_sel:** StreamMulticastB_select

15.8.828 reg_inp_sys_gpreg_str_multicastC_sel_type (inp_sys_gpreg_str_multicastC_sel)—Offset 8A008h

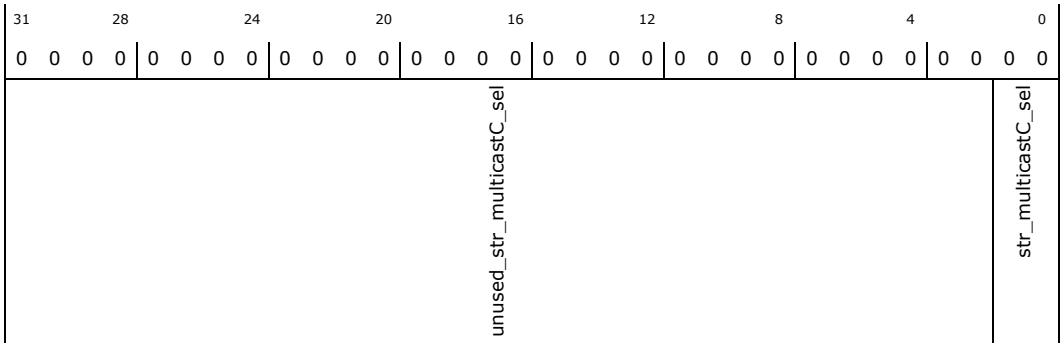
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_multicastC_sel: [ISPMMADR] + 8A008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_str_multicastC_sel:** Unused
1:0	0h RW	**str_multicastC_sel:** StreamMulticastC_select

15.8.829 reg_inp_sys_gpreg_str_mux_sel_type (inp_sys_gpreg_str_mux_sel)—Offset 8A00Ch

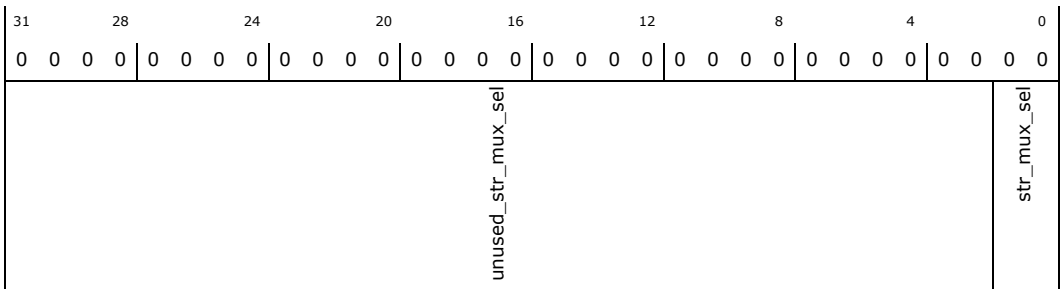
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_mux_sel: [ISPMMADR] + 8A00Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_str_mux_sel:** Unused
1:0	0h RW	**str_mux_sel:** StreamMux_select

15.8.830 reg_inp_sys_gpreg_str_mon_status_type (inp_sys_gpreg_str_mon_status)—Offset 8A010h

Streaming Monitor Status, [accept,valid] of streaming port

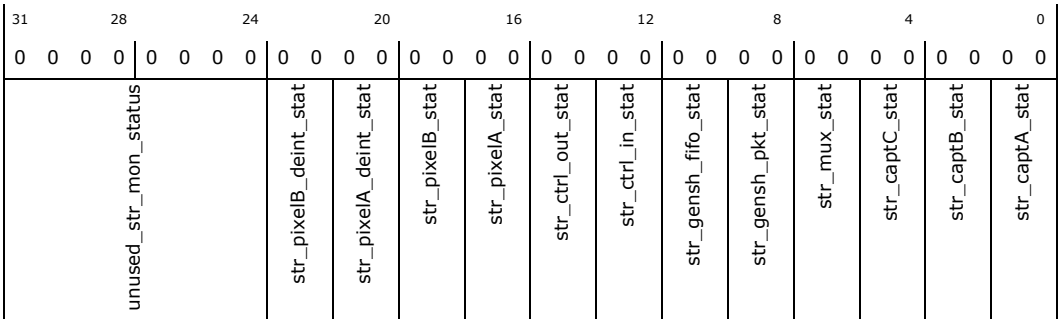
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_mon_status: [ISPMMADR] + 8A010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_str_mon_status:** Unused
23:22	0h RW	**str_pixelB_deint_stat:** Pixel B streaming output from Stream Deinterleaver
21:20	0h RW	**str_pixelA_deint_stat:** Pixel A streaming output from Stream Deinterleaver
19:18	0h RW	**str_pixelB_stat:** Pixel B streaming output from CSI receiver
17:16	0h RW	**str_pixelA_stat:** Pixel A streaming output from CSI receiver
15:14	0h RW	**str_ctrl_out_stat:** Control streaming output
13:12	0h RW	**str_ctrl_in_stat:** Control streaming input
11:10	0h RW	**str_gensh_fifo_stat:** Generic short FIFO streaming output
9:8	0h RW	**str_gensh_pkt_stat:** Generic short packet streaming output from CSI receiver
7:6	0h RW	**str_mux_stat:** Stream Mux streaming output
5:4	0h RW	**str_captC_stat:** Capture port C streaming output from CSI receiver
3:2	0h RW	**str_captB_stat:** Capture port B streaming output from CSI receiver
1:0	0h RW	**str_captA_stat:** Capture port A streaming output from CSI receiver

15.8.831 reg_inp_sys_gpreg_str_mon_irq_cond_type (inp_sys_gpreg_str_mon_irq_cond)—Offset 8A014h

Streaming Monitor IRQ condition, [accept,valid] for streaming port

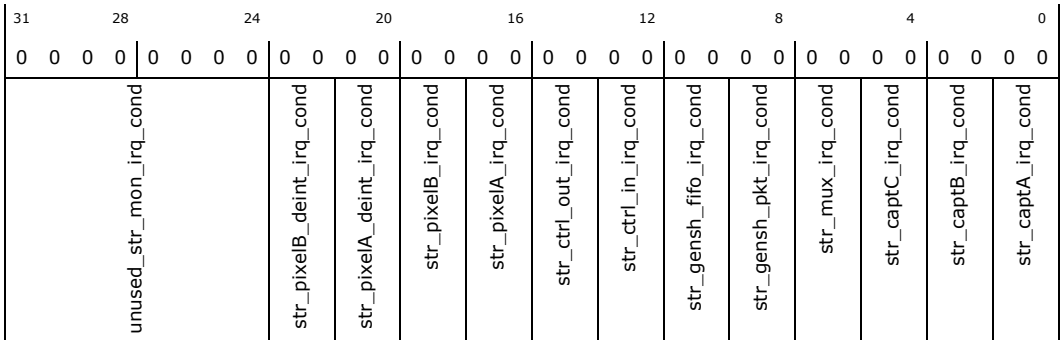
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_mon_irq_cond: [ISPMMADR] + 8A014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_str_mon_irq_cond:** Unused
23:22	0h RW	**str_pixelB_deint_irq_cond:** Pixel B streaming output from Stream Deinterleaver
21:20	0h RW	**str_pixelA_deint_irq_cond:** Pixel A streaming output from Stream Deinterleaver
19:18	0h RW	**str_pixelB_irq_cond:** Pixel B streaming output from CSI receiver
17:16	0h RW	**str_pixelA_irq_cond:** Pixel A streaming output from CSI receiver
15:14	0h RW	**str_ctrl_out_irq_cond:** Control streaming output
13:12	0h RW	**str_ctrl_in_irq_cond:** Control streaming input
11:10	0h RW	**str_gensh_fifo_irq_cond:** Generic short FIFO streaming output
9:8	0h RW	**str_gensh_pkt_irq_cond:** Generic short packet streaming output from CSI receiver
7:6	0h RW	**str_mux_irq_cond:** Stream Mux streaming output
5:4	0h RW	**str_captC_irq_cond:** Capture port C streaming output from CSI receiver
3:2	0h RW	**str_captB_irq_cond:** Capture port B streaming output from CSI receiver

Bit Range	Default & Access	Description
1:0	0h RW	**str_captA_irq_cond:** Capture port A streaming output from CSI receiver

15.8.832 reg_inp_sys_gpreg_str_mon_irq_en_type (inp_sys_gpreg_str_mon_irq_en)—Offset 8A018h

Streaming Monitor IRQ enable

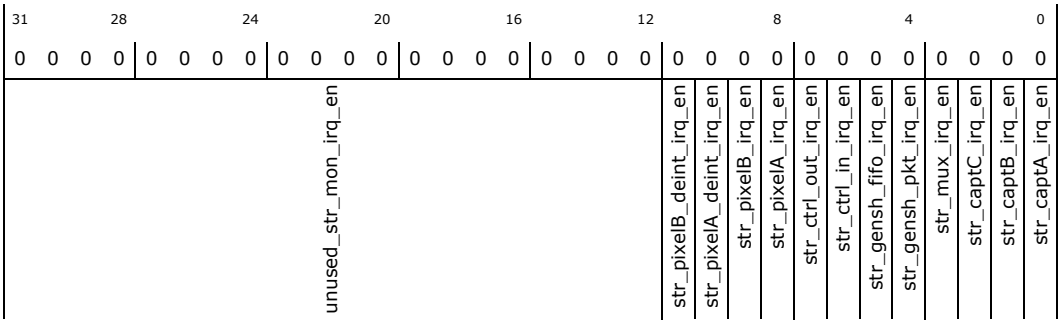
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_mon_irq_en: [ISPMMADR] + 8A018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_str_mon_irq_en:** Unused
11	0h RW	**str_pixelB_deint_irq_en:** Pixel B streaming output from Stream Deinterleaver
10	0h RW	**str_pixelA_deint_irq_en:** Pixel A streaming output from Stream Deinterleaver
9	0h RW	**str_pixelB_irq_en:** Pixel B streaming output from CSI receiver
8	0h RW	**str_pixelA_irq_en:** Pixel A streaming output from CSI receiver
7	0h RW	**str_ctrl_out_irq_en:** Control streaming output
6	0h RW	**str_ctrl_in_irq_en:** Control streaming input
5	0h RW	**str_gensh_fifo_irq_en:** Generic short FIFO streaming output
4	0h RW	**str_gensh_pkt_irq_en:** Generic short packet streaming output from CSI receiver
3	0h RW	**str_mux_irq_en:** Stream Mux streaming output

Bit Range	Default & Access	Description
2	0h RW	**str_captC_irq_en:** Capture port C streaming output from CSI receiver
1	0h RW	**str_captB_irq_en:** Capture port B streaming output from CSI receiver
0	0h RW	**str_captA_irq_en:** Capture port A streaming output from CSI receiver

15.8.833 reg_inp_sys_gpreg_isys_srst_type (inp_sys_gpreg_isys_srst)—Offset 8A01Ch

Soft resets the modules of the input system. Writing a 1 to a field brings a module in reset, writing a 0 brings that module out of reset

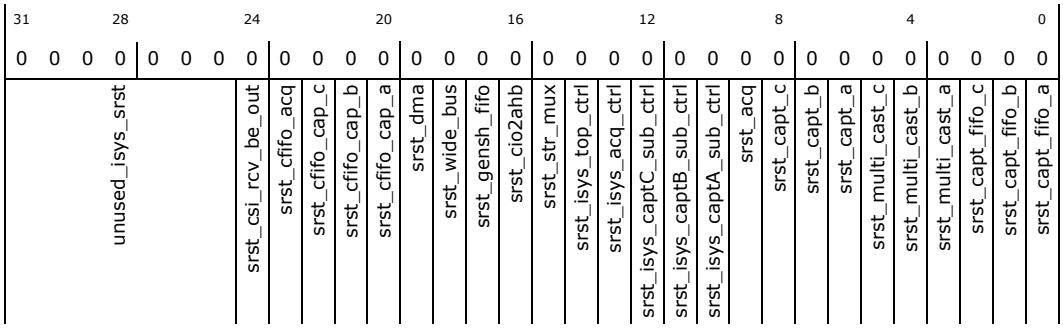
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

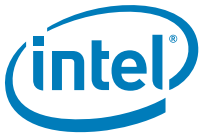
inp_sys_gpreg_isys_srst: [ISPMMADR] + 8A01Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_isys_srst:** Unused
24	0h RW	**srst_csi_rcv_be_out:** Soft resets the output of the csi receiver backend
23	0h RW	**srst_cfifo_acq:** Soft resets the control and acknowledge FIFOs for the acquistion unit
22	0h RW	**srst_cfifo_cap_c:** Soft resets the control and acknowledge FIFOs for capture unit C
21	0h RW	**srst_cfifo_cap_b:** Soft resets the control and acknowledge FIFOs for capture unit B
20	0h RW	**srst_cfifo_cap_a:** Soft resets the control and acknowledge FIFOs for capture unit A
19	0h RW	**srst_dma:** Soft resets the DMA



Bit Range	Default & Access	Description
18	0h RW	**srst_wide_bus:** Soft resets the wide bus including the CIO converter
17	0h RW	**srst_gensh_fifo:** Soft resets the generic short FIFO
16	0h RW	**srst_cio2ahb:** Soft resets the CIO2AHB adapter
15	0h RW	**srst_str_mux:** Soft resets the streaming mux
14	0h RW	**srst_isys_top_ctrl:** Soft resets the input system Top controller
13	0h RW	**srst_isys_acq_ctrl:** Soft resets the input system Acquisition sub-controller (controls data-path from selected captA/captB/captC/dma_acq to acq)
12	0h RW	**srst_isys_captC_sub_ctrl:** Soft resets the input system CaptureC sub-controller (controls data-path from captC to dma_captC)
11	0h RW	**srst_isys_captB_sub_ctrl:** Soft resets the input system CaptureB sub-controller (controls data-path from captB to dma_captB)
10	0h RW	**srst_isys_captA_sub_ctrl:** Soft resets the input system CaptureA sub-controller (controls data-path from captA to dma_captA)
9	0h RW	**srst_acq:** Soft resets the acquision unit
8	0h RW	**srst_capt_c:** Soft resets the capture unit C
7	0h RW	**srst_capt_b:** Soft resets the capture unit B
6	0h RW	**srst_capt_a:** Soft resets the capture unit A
5	0h RW	**srst_multi_cast_c:** Soft resets multi cast C
4	0h RW	**srst_multi_cast_b:** Soft resets multi cast B
3	0h RW	**srst_multi_cast_a:** Soft resets multi cast A
2	0h RW	**srst_capt_fifo_c:** Soft resets the FIFO before multi cast C
1	0h RW	**srst_capt_fifo_b:** Soft resets the FIFO before multi cast B
0	0h RW	**srst_capt_fifo_a:** Soft resets the FIFO before multi cast A

15.8.834 reg_inp_sys_gpreg_isys_slv_reg_srst_type (inp_sys_gpreg_isys_slv_reg_srst)—Offset 8A020h

Soft resets the slave accessible registers of certain input system modules. Writing a 1 to a field brings the registers for a module to their default value, writing a 0 allows them to be overwritten

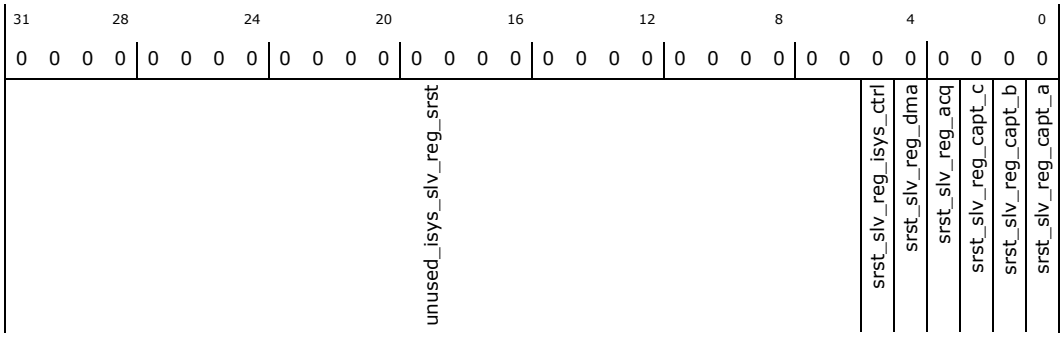
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_isys_slv_reg_srst: [ISPMMADR] + 8A020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0h RW	**unused_isys_slv_reg_srst:** Unused
5	0h RW	**srst_slv_reg_isys_ctrl:** Soft resets the slave accessible registers of the input system controller
4	0h RW	**srst_slv_reg_dma:** Soft resets the slave accessible registers of the DMA
3	0h RW	**srst_slv_reg_acq:** Soft resets the slave accessible registers of the acquisition unit
2	0h RW	**srst_slv_reg_capt_c:** Soft resets the slave accessible registers of capture unit C
1	0h RW	**srst_slv_reg_capt_b:** Soft resets the slave accessible registers of capture unit B
0	0h RW	**srst_slv_reg_capt_a:** Soft resets the slave accessible registers of capture unit A

15.8.835 reg_inp_sys_gpreg_str_deint_portA_cnt_type (inp_sys_gpreg_str_deint_portA_cnt)—Offset 8A024h

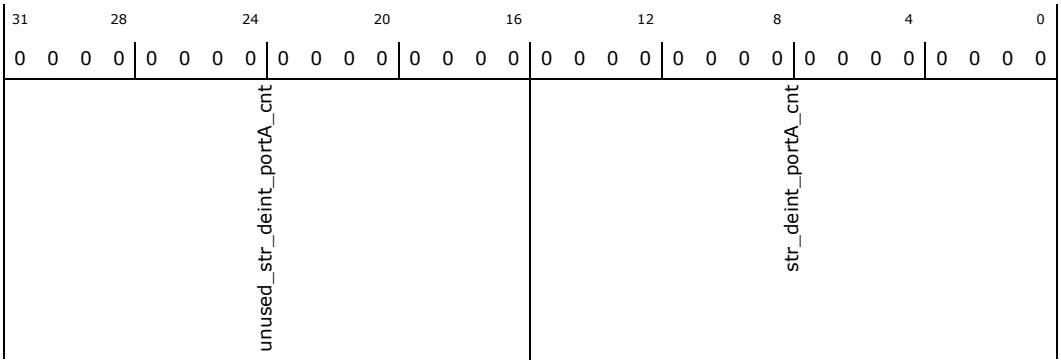
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_deint_portA_cnt: [ISPMMADR] + 8A024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_str_deint_portA_cnt:** Unused
15:0	0h RW	**str_deint_portA_cnt:** stream data count for portA of stream deinterleave block

15.8.836 reg_inp_sys_gpreg_str_deint_portB_cnt_type (inp_sys_gpreg_str_deint_portB_cnt)—Offset 8A028h

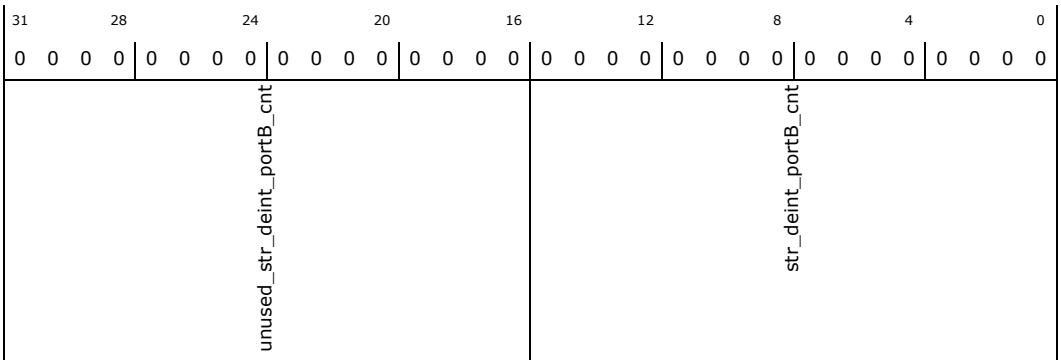
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_gpreg_str_deint_portB_cnt: [ISPMMADR] + 8A028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**unused_str_deint_portB_cnt:** Unused
15:0	0h RW	**str_deint_portB_cnt:** stream data count for portB of stream deinterleave block

15.8.837 reg_inp_sys_fifo_adapter_CSI_generic_short_packet_available_type (inp_sys_fifo_adapter_CSI_generic_short_packet_available)—Offset 8B008h

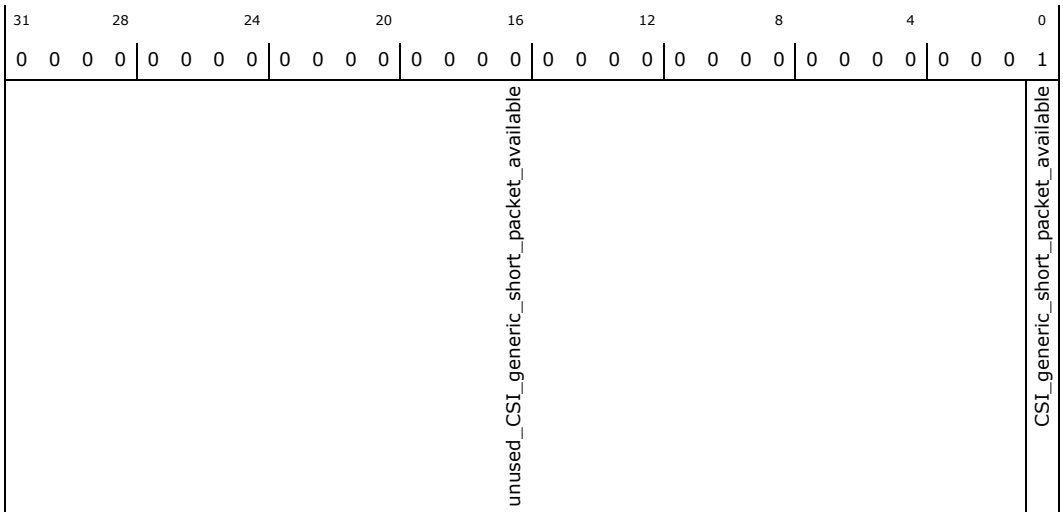
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_fifo_adapter_CSI_generic_short_packet_available : [ISPMMADR] + 8B008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_CSI_generic_short_packet_available:** Unused
0	1h RO	**CSI_generic_short_packet_available:** Returns 1 if there is a generic short packet available. Returns 0 is there is no generic short packet available.

15.8.838 reg_inp_sys_irq_ctrl_irq_edge_type (inp_sys_irq_ctrl_irq_edge)—Offset 8C000h

IRQ active edge select per interrupt input. Rising edge: 1, Falling edge: 0

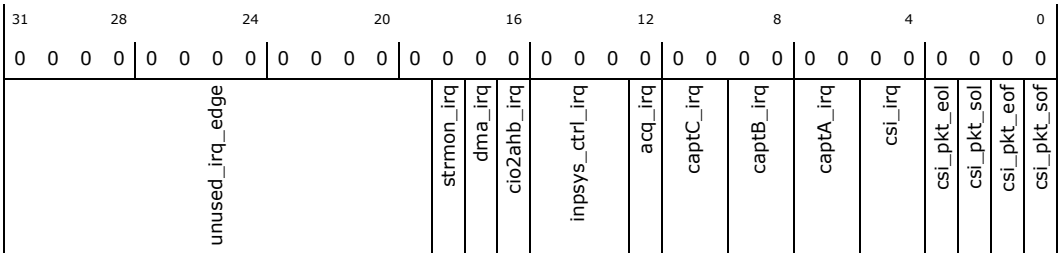
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_edge: [ISPMMADR] + 8C000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_edge:** Unused
18	0h RW	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h RW	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h RW	**acq_irq:** Acquisition unit interrupt request
11:10	0h RW	**captC_irq:** Capture unit C interrupt request
9:8	0h RW	**captB_irq:** Capture unit B interrupt request
7:6	0h RW	**captA_irq:** Capture unit A interrupt request
5:4	0h RW	**csi_irq:** CSI receiver interrupt request
3	0h RW	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver
2	0h RW	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h RW	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h RW	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.839 reg_inp_sys_irq_ctrl_irq_mask_type (inp_sys_irq_ctrl_irq_mask)—Offset 8C004h

IRQ mask per interrupt

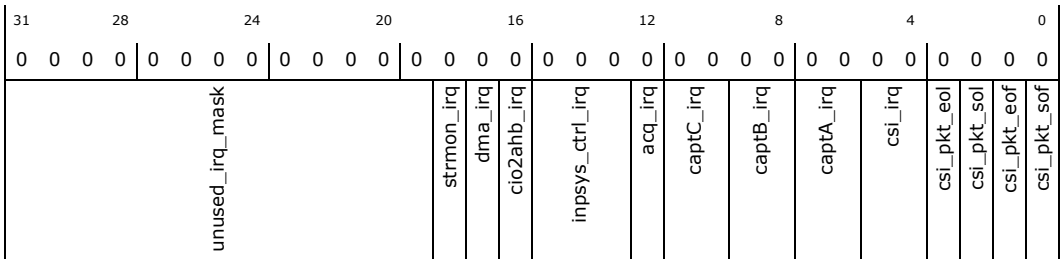
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_mask: [ISPMMADR] + 8C004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_mask:** Unused
18	0h RW	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h RW	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h RW	**acq_irq:** Acquisition unit interrupt request
11:10	0h RW	**captC_irq:** Capture unit C interrupt request
9:8	0h RW	**captB_irq:** Capture unit B interrupt request
7:6	0h RW	**captA_irq:** Capture unit A interrupt request
5:4	0h RW	**csi_irq:** CSI receiver interrupt request
3	0h RW	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver
2	0h RW	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h RW	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h RW	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.840 reg_inp_sys_irq_ctrl_irq_status_type (inp_sys_irq_ctrl_irq_status)—Offset 8C008h

IRQ status for each unmasked interrupt

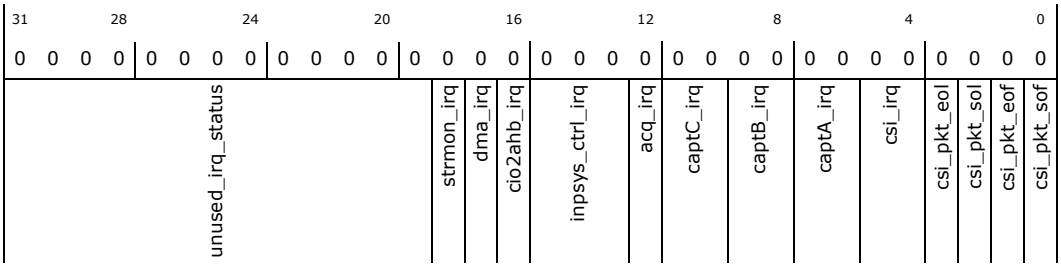
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_status: [ISPMMADR] + 8C008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_status:** Unused
18	0h RO	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h RO	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RO	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h RO	**acq_irq:** Acquisition unit interrupt request
11:10	0h RO	**captC_irq:** Capture unit C interrupt request
9:8	0h RO	**captB_irq:** Capture unit B interrupt request
7:6	0h RO	**captA_irq:** Capture unit A interrupt request
5:4	0h RO	**csi_irq:** CSI receiver interrupt request
3	0h RO	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver
2	0h RO	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h RO	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h RO	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.841 reg_inp_sys_irq_ctrl_irq_clear_type (inp_sys_irq_ctrl_irq_clear)—Offset 8C00Ch

IRQ clear for interrupt set in irq_status

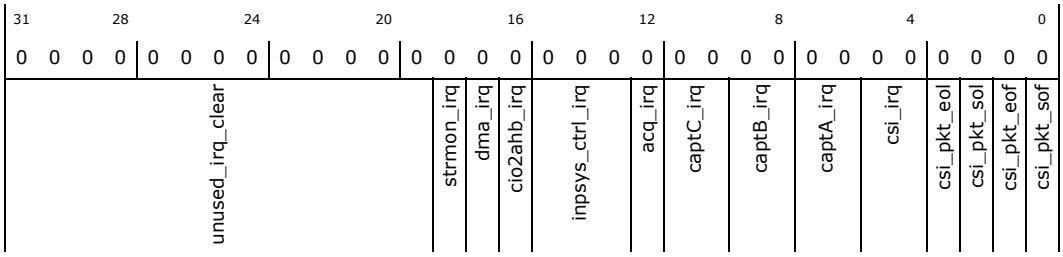
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_clear: [ISPMMADR] + 8C00Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_clear:** Unused
18	0h WO	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h WO	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h WO	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h WO	**acq_irq:** Acquisition unit interrupt request
11:10	0h WO	**captC_irq:** Capture unit C interrupt request
9:8	0h WO	**captB_irq:** Capture unit B interrupt request
7:6	0h WO	**captA_irq:** Capture unit A interrupt request
5:4	0h WO	**csi_irq:** CSI receiver interrupt request
3	0h WO	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver
2	0h WO	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h WO	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h WO	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.842 reg_inp_sys_irq_ctrl_irq_en_type (inp_sys_irq_ctrl_irq_en)—Offset 8C010h

IRQ enable per interrupt bit

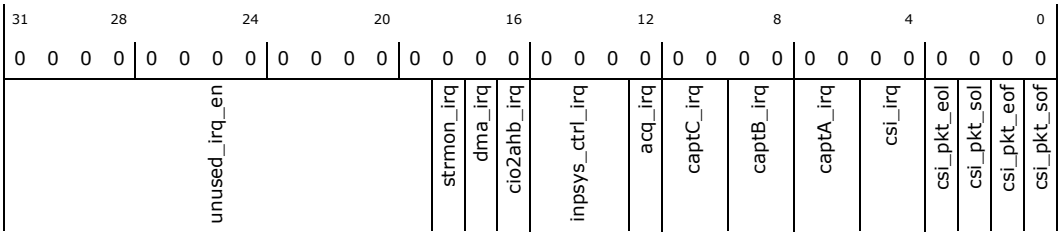
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_en: [ISPMMADR] + 8C010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_en:** Unused
18	0h RW	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h RW	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h RW	**acq_irq:** Acquisition unit interrupt request
11:10	0h RW	**captC_irq:** Capture unit C interrupt request
9:8	0h RW	**captB_irq:** Capture unit B interrupt request
7:6	0h RW	**captA_irq:** Capture unit A interrupt request
5:4	0h RW	**csi_irq:** CSI receiver interrupt request
3	0h RW	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver
2	0h RW	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h RW	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h RW	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.843 reg_inp_sys_irq_ctrl_irq_level_not_pulse_type (inp_sys_irq_ctrl_irq_level_not_pulse)—Offset 8C014h

IRQ setting per interrupt bit for level or pulse irq generation at output pin. Level: 1, Pulse: 0

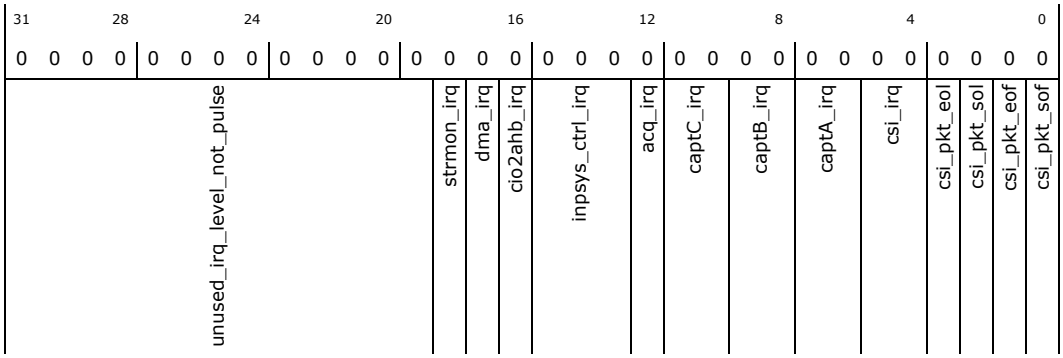
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_level_not_pulse: [ISPMMADR] + 8C014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_irq_level_not_pulse:** Unused
18	0h RW	**strmon_irq:** Streaming monitor interrupt request
17	0h RO	**dma_irq:** DMA interrupt request
16	0h RW	**cio2ahb_irq:** CIO to AHB converter (for CSI receiver AHB slave) interrupt request
15:13	0h RW	**inpsys_ctrl_irq:** Input system controller interrupt request
12	0h RW	**acq_irq:** Acquisition unit interrupt request
11:10	0h RW	**captC_irq:** Capture unit C interrupt request
9:8	0h RW	**captB_irq:** Capture unit B interrupt request
7:6	0h RW	**captA_irq:** Capture unit A interrupt request
5:4	0h RW	**csi_irq:** CSI receiver interrupt request
3	0h RW	**csi_pkt_eol:** End of Line of Frame packet from CSI receiver

Bit Range	Default & Access	Description
2	0h RW	**csi_pkt_sol:** Start of Line packet from CSI receiver
1	0h RW	**csi_pkt_eof:** End of Frame packet from CSI receiver
0	0h RW	**csi_pkt_sof:** Start of Frame packet from CSI receiver

15.8.844 reg_isel_gpr_reg_gp_syncgen_enable_type (isel_gpr_reg_gp_syncgen_enable)—Offset 90000h

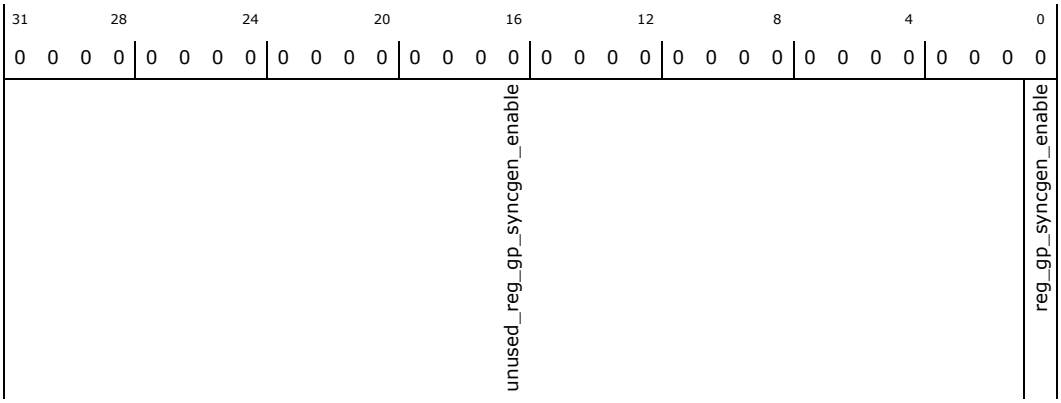
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_enable: [ISPMMADR] + 90000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_syncgen_enable:** Unused
0	0h RW	**reg_gp_syncgen_enable:** Enables (value=1) or disables (value=0) the Sync Generator.

15.8.845 reg_isel_gpr_reg_gp_syncgen_free_running_type (isel_gpr_reg_gp_syncgen_free_running)—Offset 90004h

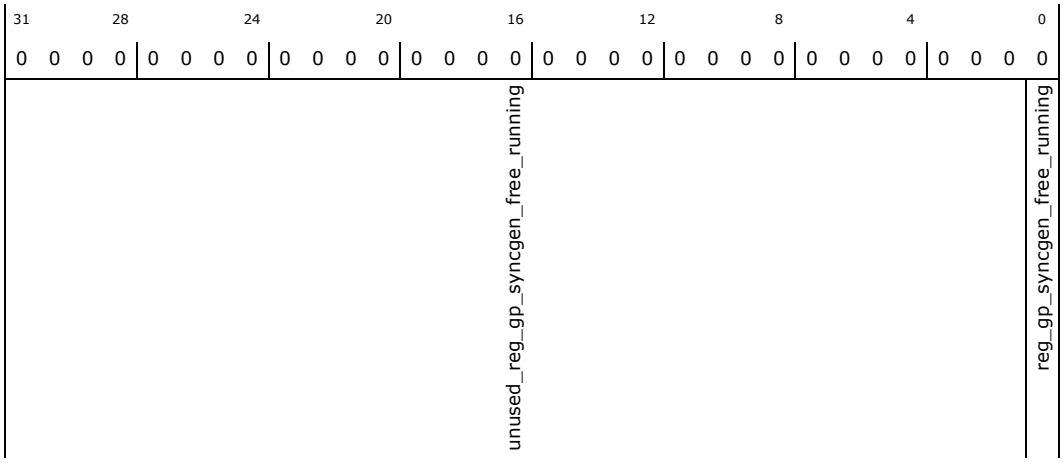
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_free_running: [ISPMMADR] + 90004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_syncgen_free_running:** Unused
0	0h RW	**reg_gp_syncgen_free_running:** Sets the sync generator in free running mode (value=1) or let it stall in sync with either the PRBS or TPG (value=0)

15.8.846 reg_isel_gpr_reg_gp_syncgen_pause_type (isel_gpr_reg_gp_syncgen_pause)—Offset 90008h

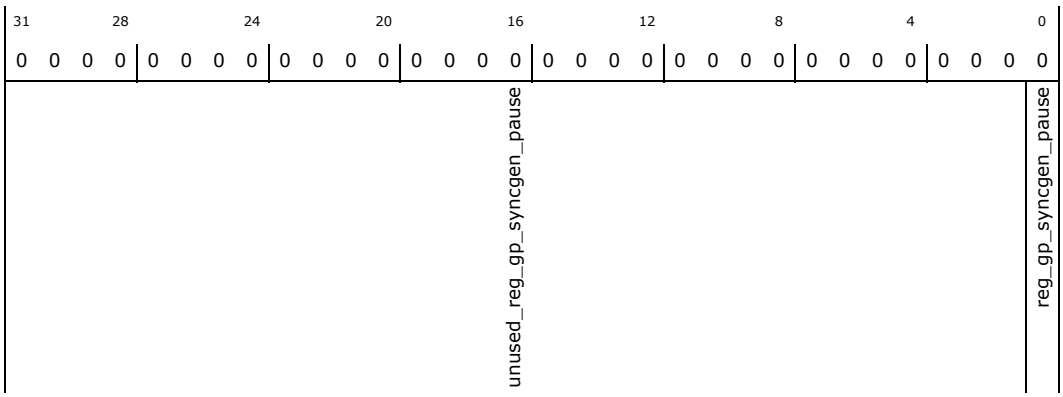
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_pause: [ISPMMADR] + 90008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_syncgen_pause:** Unused

Bit Range	Default & Access	Description
0	0h RW	**reg_gp_syncgen_pause:** Sets the sync generator in pause mode (value=1) or not (value=0)

15.8.847 reg_isel_gpr_reg_gp_nr_frames_type (isel_gpr_reg_gp_nr_frames)—Offset 9000Ch

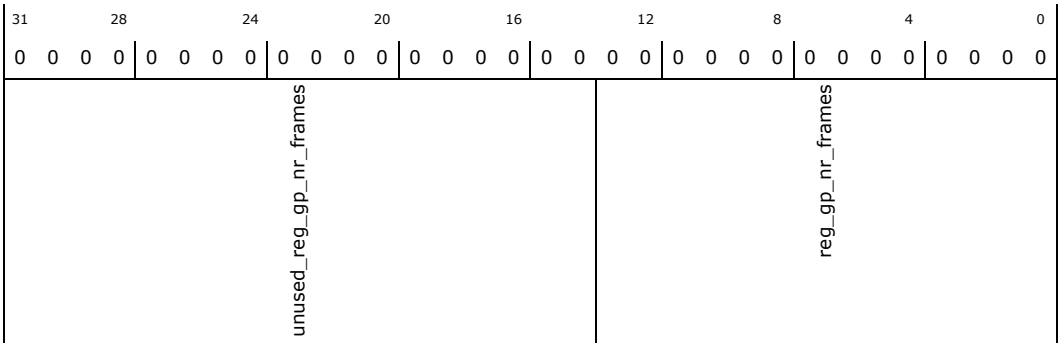
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_nr_frames: [ISPMMADR] + 9000Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_nr_frames:** Unused
13:0	0h RW	**reg_gp_nr_frames:** Sets the sync generator parameter Number of Frames

15.8.848 reg_isel_gpr_reg_gp_syngen_nr_pix_type (isel_gpr_reg_gp_syngen_nr_pix)—Offset 90010h

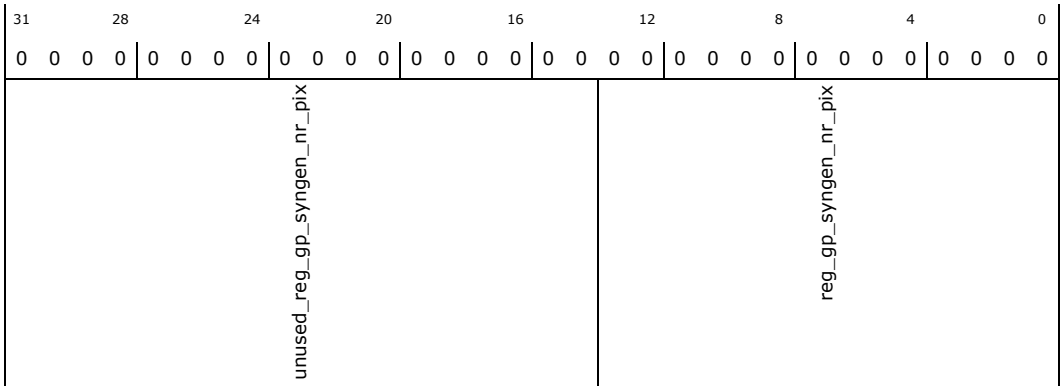
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syngen_nr_pix: [ISPMMADR] + 90010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syngen_nr_pix:** Unused
13:0	0h RW	**reg_gp_syngen_nr_pix:** Sets the number of active pixels per line in the Sync Generator

15.8.849 reg_isel_gpr_reg_gp_syngen_nr_lines_type (isel_gpr_reg_gp_syngen_nr_lines)—Offset 90014h

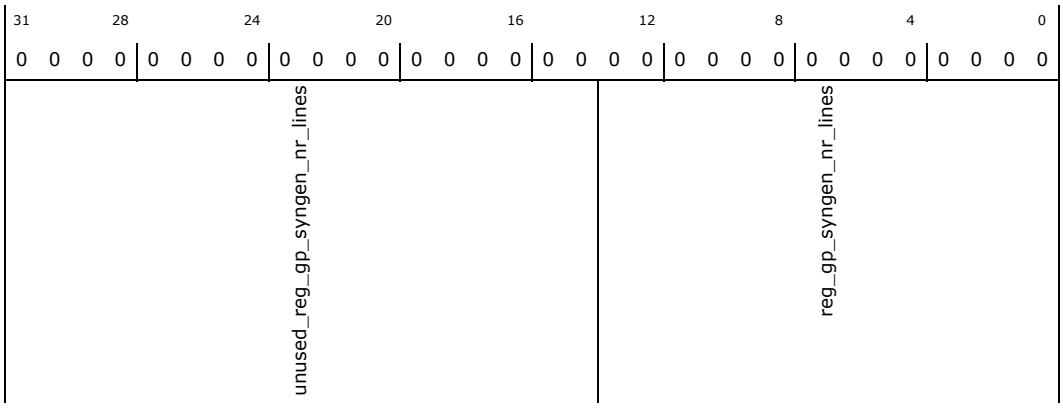
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syngen_nr_lines: [ISPMMADR] + 90014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syngen_nr_lines:** Unused
13:0	0h RW	**reg_gp_syngen_nr_lines:** Sets the number of lines per frame in the Sync generator

15.8.850 reg_isel_gpr_reg_gp_syngen_hblank_cycles_type (isel_gpr_reg_gp_syngen_hblank_cycles)—Offset 90018h

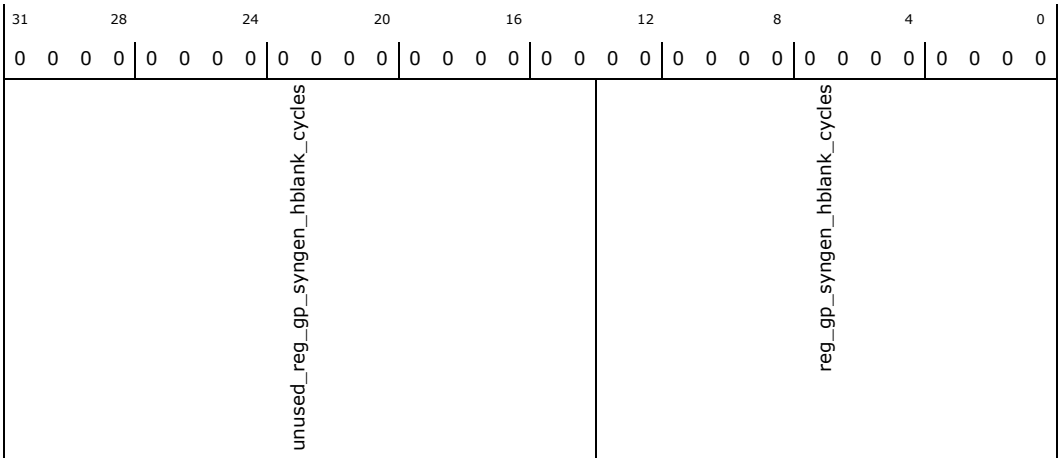
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syngen_hblank_cycles: [ISPMMADR] + 90018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syngen_hblank_cycles:** Unused
13:0	0h RW	**reg_gp_syngen_hblank_cycles:** Sets the number of cycles between the end-of-line and start-of-line pulses.

15.8.851 reg_isel_gpr_reg_gp_syngen_vblank_cycles_type (isel_gpr_reg_gp_syngen_vblank_cycles)—Offset 9001Ch

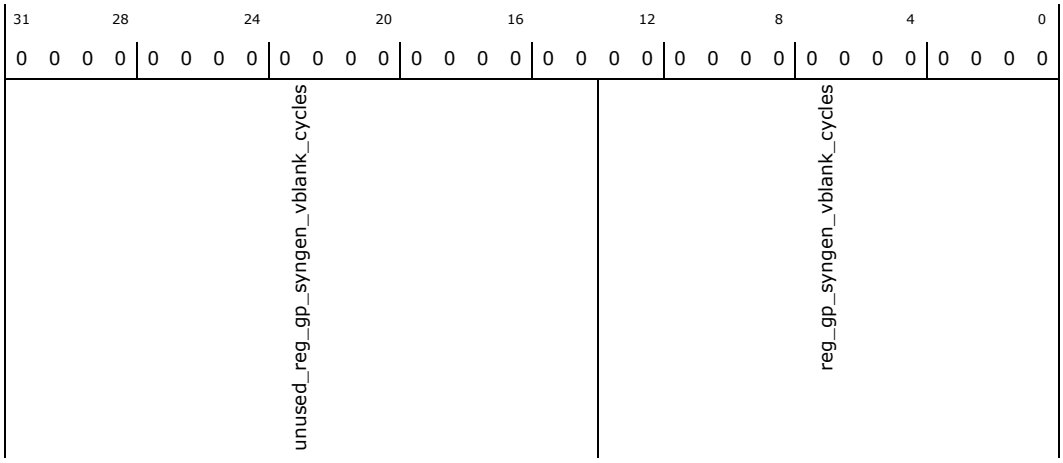
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syngen_vblank_cycles: [ISPMMADR] + 9001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syngen_vblank_cycles:** Unused
13:0	0h RW	**reg_gp_syngen_vblank_cycles:** Sets the number of cycles between the end-of-frame and start-of-frame pulses.

15.8.852 reg_isel_gpr_reg_gp_isel_sof_type (isel_gpr_reg_gp_isel_sof)—Offset 90020h

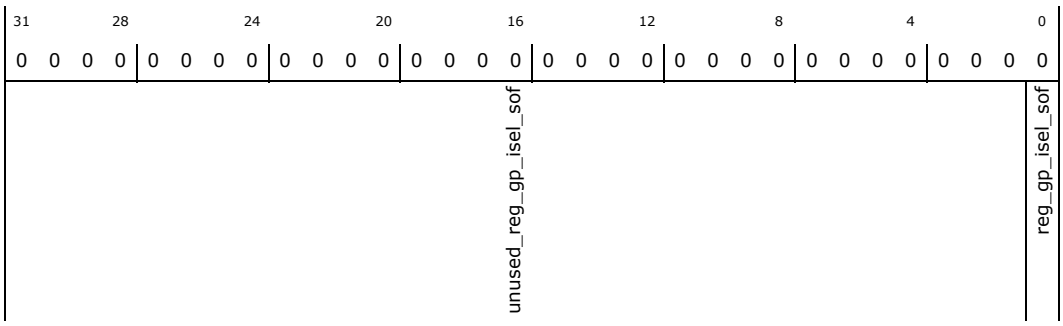
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_sof: [ISPMMADR] + 90020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_sof:** Unused
0	0h RW	**reg_gp_isel_sof:** Sets the input selector gp_sof input.

15.8.853 reg_isel_gpr_reg_gp_isel_eof_type (isel_gpr_reg_gp_isel_eof)—Offset 90024h

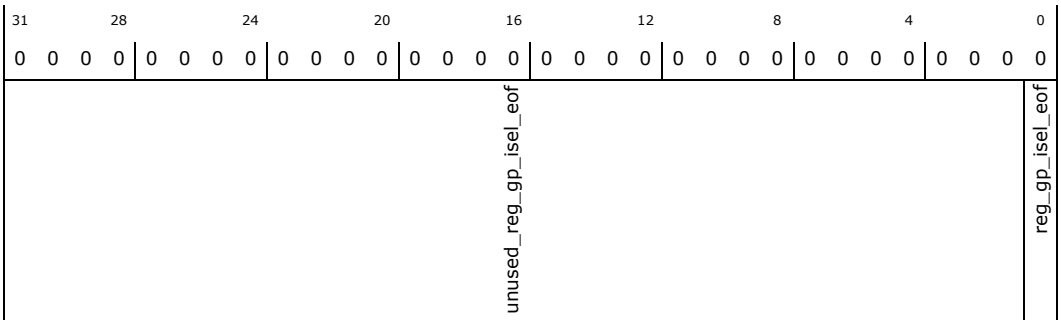
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_eof: [ISPMMADR] + 90024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_eof:** Unused
0	0h RW	**reg_gp_isel_eof:** Sets the input selector gp_eof input.

15.8.854 reg_isel_gpr_reg_gp_isel_sol_type (isel_gpr_reg_gp_isel_sol)—Offset 90028h

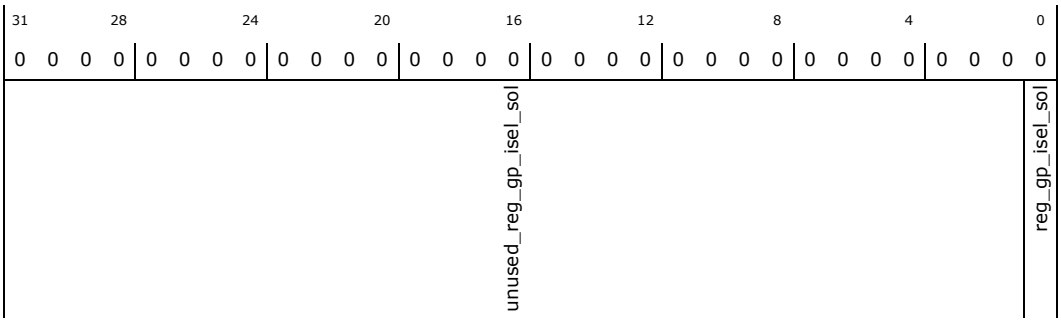
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_sol: [ISPMMADR] + 90028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_sol:** Unused
0	0h RW	**reg_gp_isel_sol:** Sets the input selector gp_sol input.

15.8.855 reg_isel_gpr_reg_gp_isel_eol_type (isel_gpr_reg_gp_isel_eol)—Offset 9002Ch

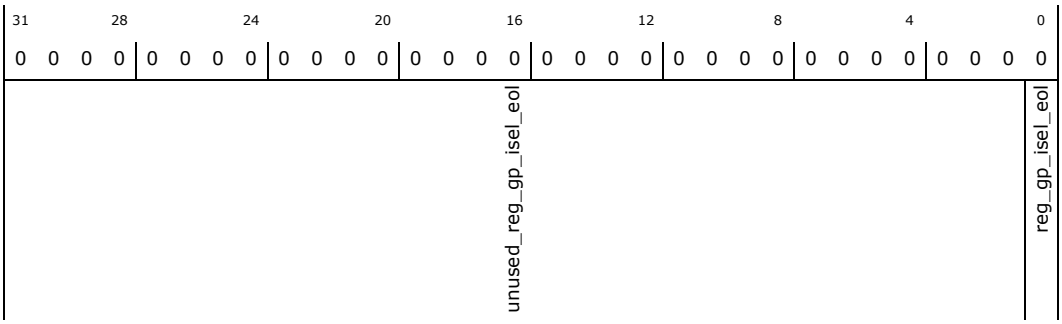
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_eol: [ISPMMADR] + 9002Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_eol:** Unused
0	0h RW	**reg_gp_isel_eol:** Sets the input selector gp_eol input.

15.8.856 reg_isel_gpr_reg_gp_isel_lfsr_enable_type (isel_gpr_reg_gp_isel_lfsr_enable)—Offset 90030h

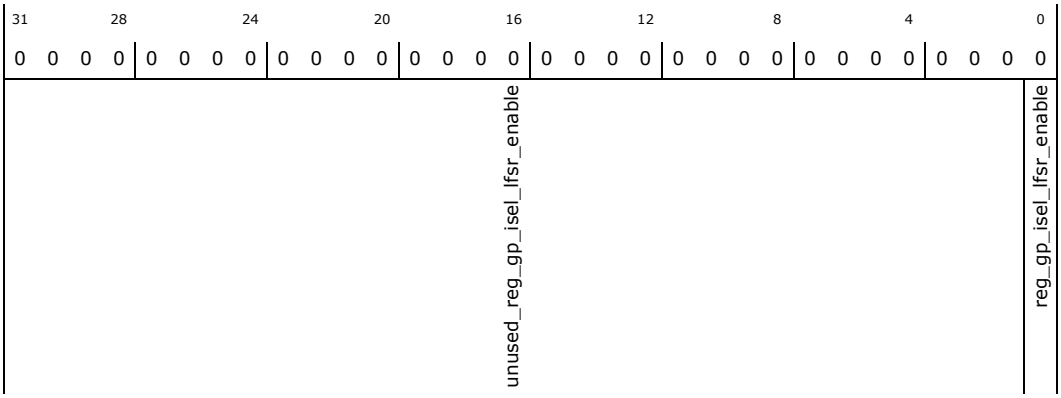
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_lfsr_enable: [ISPMMADR] + 90030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_lfsr_enable:** Unused
0	0h RW	**reg_gp_isel_lfsr_enable:** Enables the PRBS

15.8.857 reg_isel_gpr_reg_gp_isel_lfsr_enable_b_type (isel_gpr_reg_gp_isel_lfsr_enable_b)—Offset 90034h

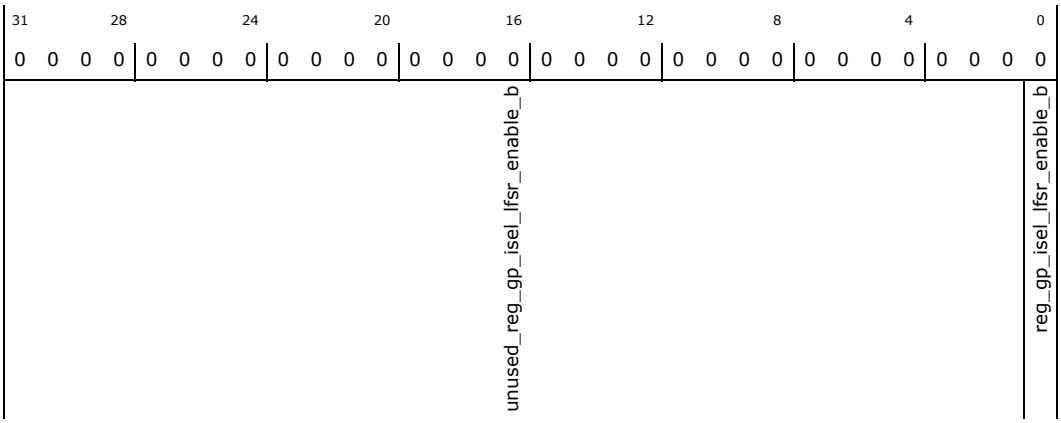
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_lfsr_enable_b: [ISPMMADR] + 90034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_lfsr_enable_b:** Unused

Bit Range	Default & Access	Description
0	0h RW	**reg_gp_isel_lfsr_enable_b:** Enables the PRBS for port b

15.8.858 reg_isel_gpr_reg_gp_isel_lfsr_reset_value_type (isel_gpr_reg_gp_isel_lfsr_reset_value)—Offset 90038h

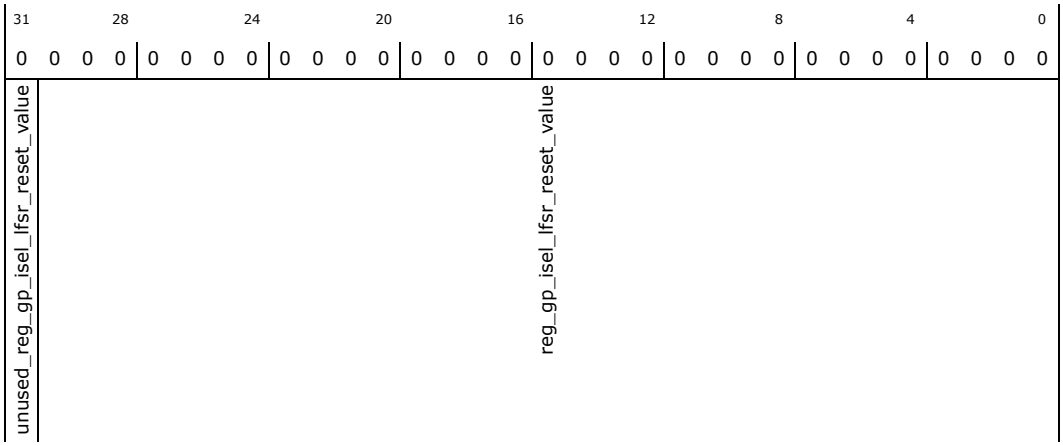
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_lfsr_reset_value: [ISPMMADR] + 90038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**unused_reg_gp_isel_lfsr_reset_value:** Unused
30:0	0h RW	**reg_gp_isel_lfsr_reset_value:** Set the reset value of the LFSR in the PRBS of the Input selector

15.8.859 reg_isel_gpr_reg_gp_isel_tpg_enable_type (isel_gpr_reg_gp_isel_tpg_enable)—Offset 9003Ch

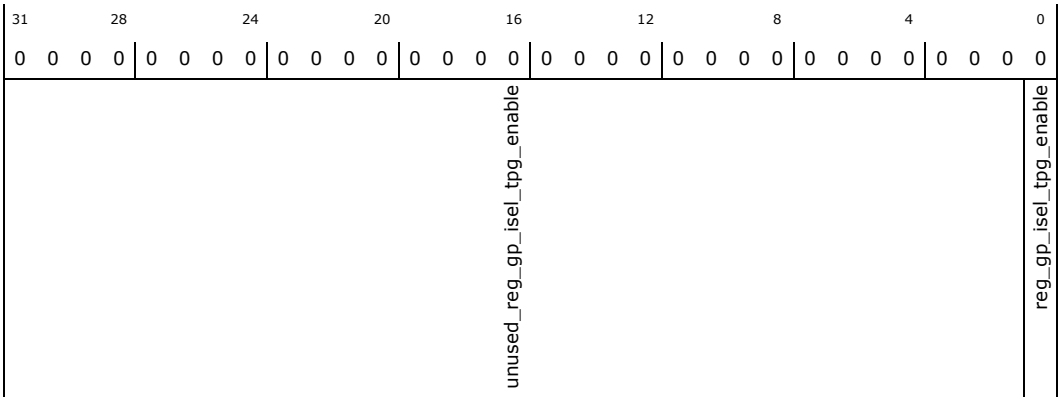
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_enable: [ISPMMADR] + 9003Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_tpg_enable:** Unused
0	0h RW	**reg_gp_isel_tpg_enable:** Enables the test pattern generator

15.8.860 reg_isel_gpr_reg_gp_isel_tpg_enable_b_type (isel_gpr_reg_gp_isel_tpg_enable_b)—Offset 90040h

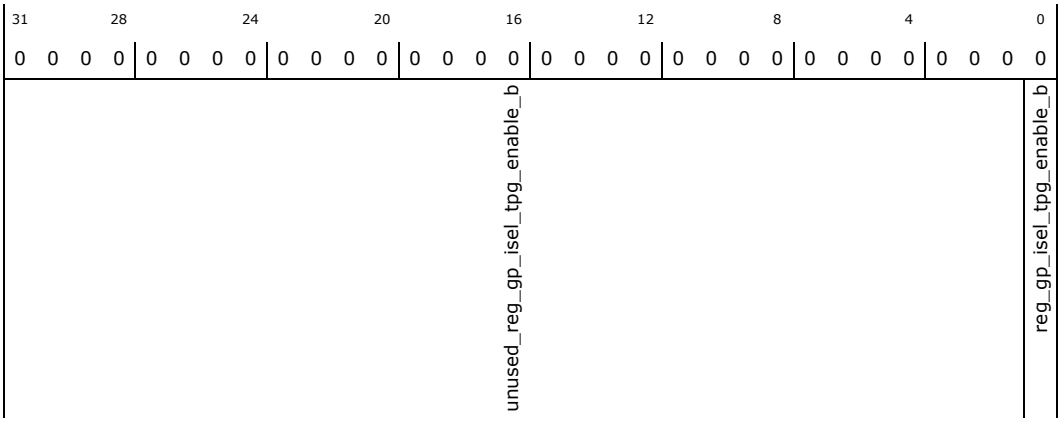
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_enable_b: [ISPMMADR] + 90040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_isel_tpg_enable_b:** Unused

Bit Range	Default & Access	Description
0	0h RW	**reg_gp_isel_tpg_enable_b:** Enables the test pattern generator for port b

15.8.861 reg_isel_gpr_reg_gp_isel_hor_cnt_mask_type (isel_gpr_reg_gp_isel_hor_cnt_mask)—Offset 90044h

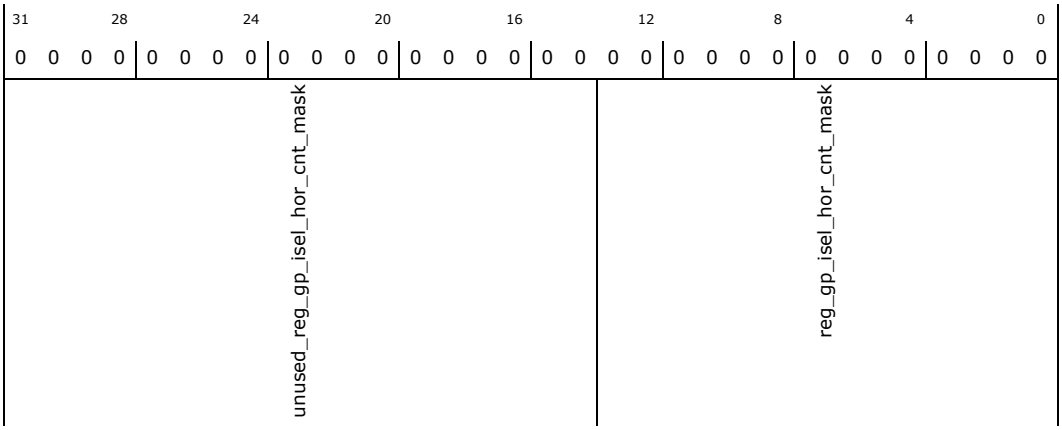
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_hor_cnt_mask: [ISPMMADR] + 90044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_isel_hor_cnt_mask:** Unused
13:0	0h RW	**reg_gp_isel_hor_cnt_mask:** Sets the horizontal counter mask in the Input selector

15.8.862 reg_isel_gpr_reg_gp_isel_ver_cnt_mask_type (isel_gpr_reg_gp_isel_ver_cnt_mask)—Offset 90048h

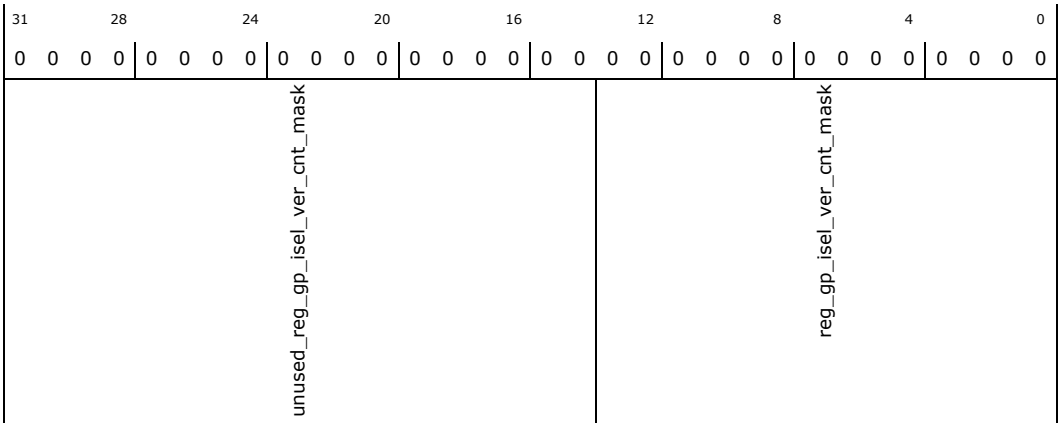
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_ver_cnt_mask: [ISPMMADR] + 90048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_isel_ver_cnt_mask:** Unused
13:0	0h RW	**reg_gp_isel_ver_cnt_mask:** Sets the vertical counter mask in the Input selector

15.8.863 reg_isel_gpr_reg_gp_isel_xy_cnt_mask_type (isel_gpr_reg_gp_isel_xy_cnt_mask)—Offset 9004Ch

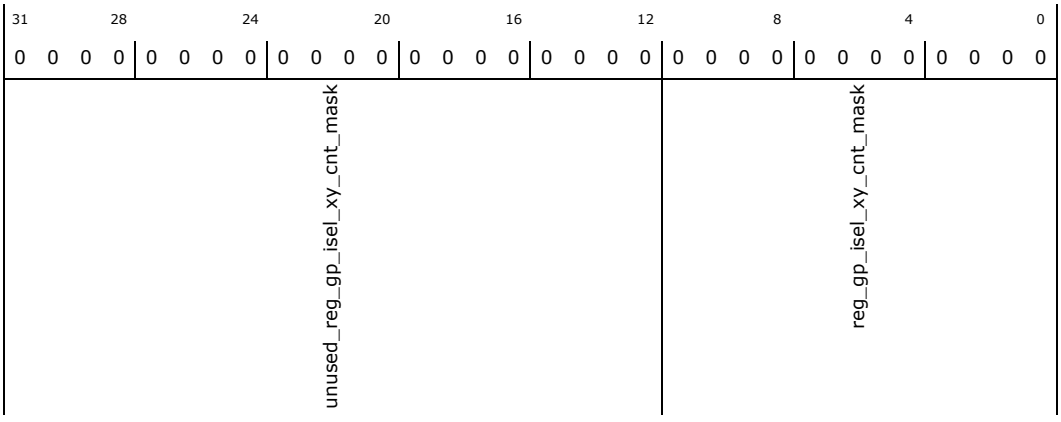
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_xy_cnt_mask: [ISPMMADR] + 9004Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_xy_cnt_mask:** Unused

Bit Range	Default & Access	Description
11:0	0h RW	**reg_gp_isel_xy_cnt_mask:** Sets the xy counter mask in the Input selector

15.8.864 reg_isel_gpr_reg_gp_isel_hor_cnt_delta_type (isel_gpr_reg_gp_isel_hor_cnt_delta)—Offset 90050h

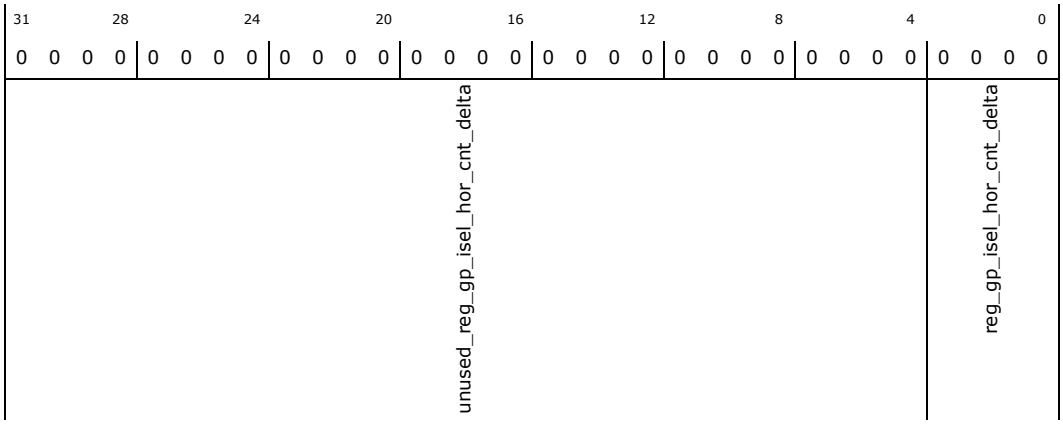
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_hor_cnt_delta: [ISPMMADR] + 90050h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_gp_isel_hor_cnt_delta:** Unused
3:0	0h RW	**reg_gp_isel_hor_cnt_delta:** sets the horizontal counter delta in the Input selector

15.8.865 reg_isel_gpr_reg_gp_isel_ver_cnt_delta_type (isel_gpr_reg_gp_isel_ver_cnt_delta)—Offset 90054h

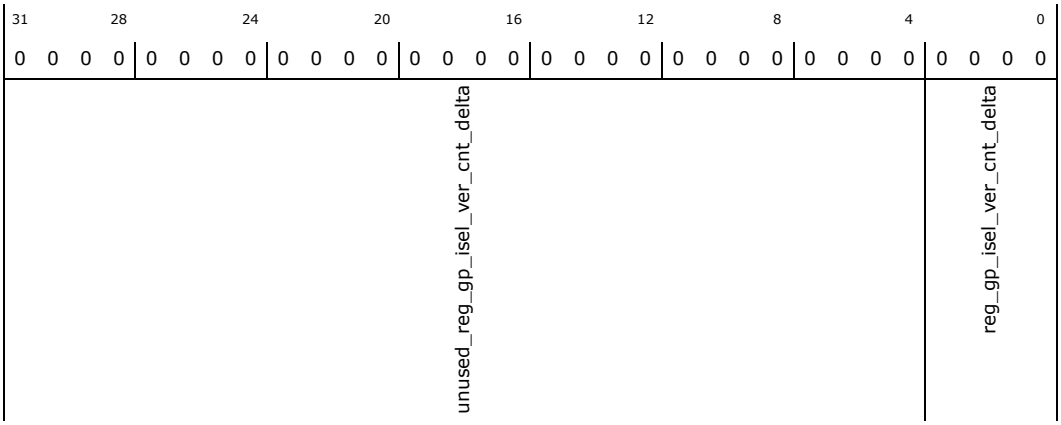
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_ver_cnt_delta: [ISPMMADR] + 90054h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_gp_isel_ver_cnt_delta:** Unused
3:0	0h RW	**reg_gp_isel_ver_cnt_delta:** Sets the vertical counter delta in the Input selector

15.8.866 reg_isel_gpr_reg_gp_isel_tpg_mode_type (isel_gpr_reg_gp_isel_tpg_mode)—Offset 90058h

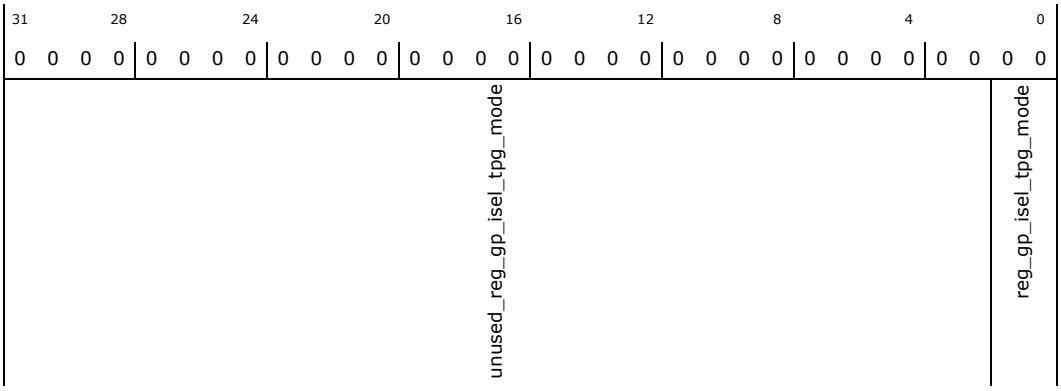
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_mode: [ISPMMADR] + 90058h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_reg_gp_isel_tpg_mode:** Unused
1:0	0h RW	**reg_gp_isel_tpg_mode:** Sets the mode of the test pattern generator. 'b00-ramp mode, 'b01-checkerboard, 'b10-frame based color

15.8.867 reg_isel_gpr_reg_gp_isel_tpg_red1_type (isel_gpr_reg_gp_isel_tpg_red1)—Offset 9005Ch

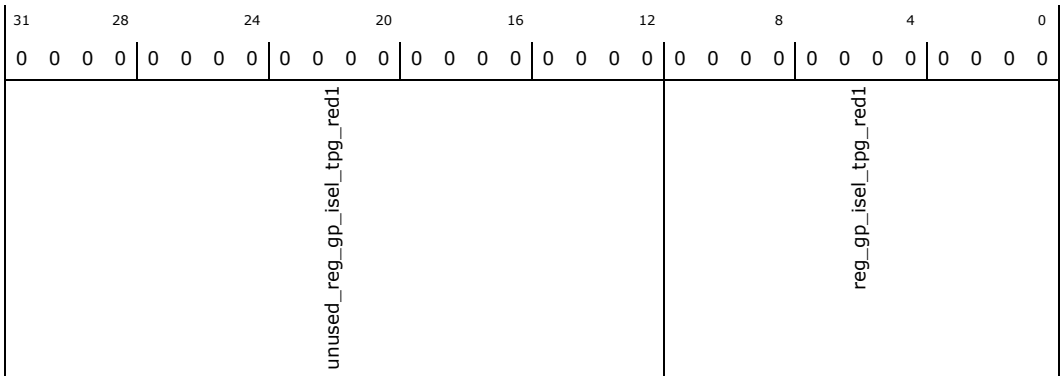
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_red1: [ISPMMADR] + 9005Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_red1:** Unused
11:0	0h RW	**reg_gp_isel_tpg_red1:** Defines the red1 color for test pattern generator

15.8.868 reg_isel_gpr_reg_gp_isel_tpg_green1_type (isel_gpr_reg_gp_isel_tpg_green1)—Offset 90060h

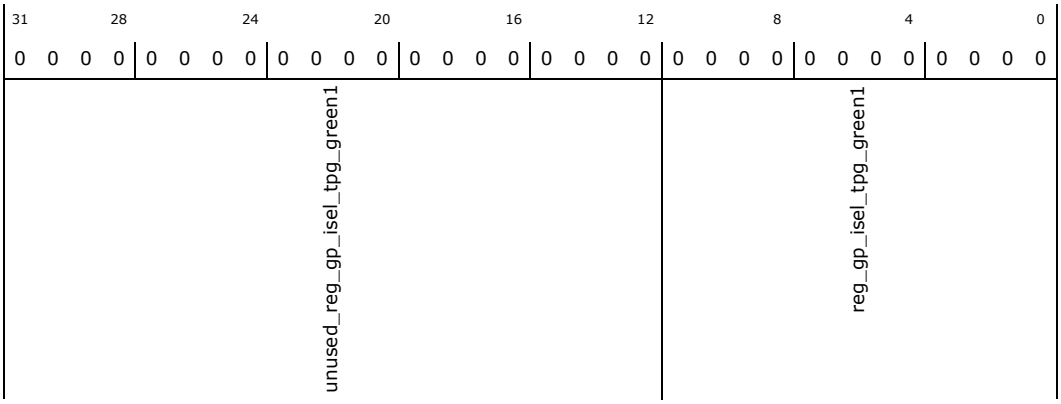
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_green1: [ISPMMADR] + 90060h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_green1:** Unused
11:0	0h RW	**reg_gp_isel_tpg_green1:** Defines the green1 color for test pattern generator

15.8.869 reg_isel_gpr_reg_gp_isel_tpg_blue1_type (isel_gpr_reg_gp_isel_tpg_blue1)—Offset 90064h

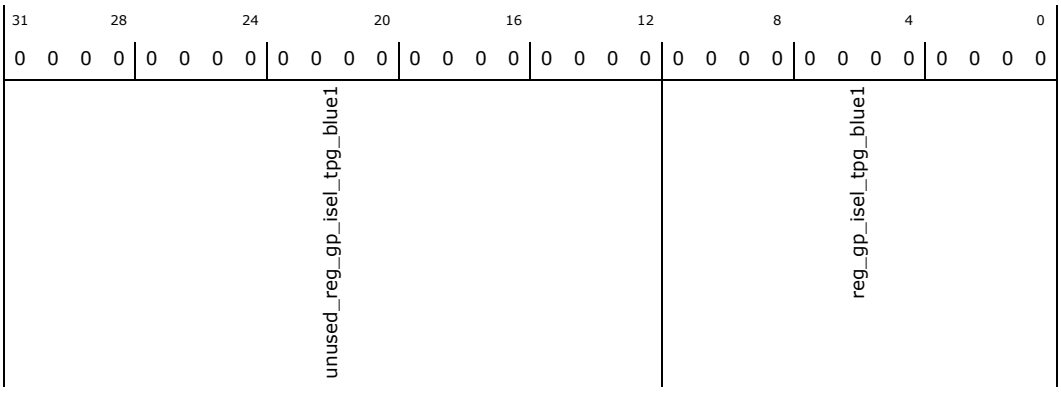
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_blue1: [ISPMMADR] + 90064h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_blue1:** Unused
11:0	0h RW	**reg_gp_isel_tpg_blue1:** Defines the blue1 color for test pattern generator

15.8.870 reg_isel_gpr_reg_gp_isel_tpg_red2_type (isel_gpr_reg_gp_isel_tpg_red2)—Offset 90068h

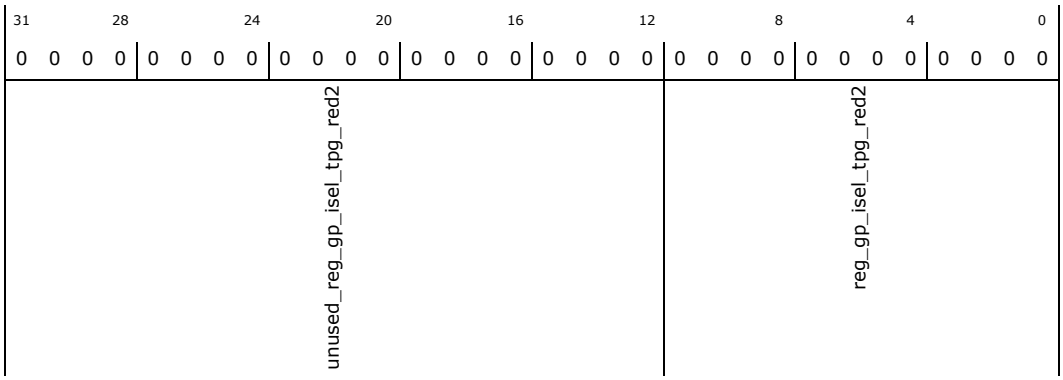
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_red2: [ISPMMADR] + 90068h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_red2:** Unused
11:0	0h RW	**reg_gp_isel_tpg_red2:** Defines the red2 color for test pattern generator

15.8.871 reg_isel_gpr_reg_gp_isel_tpg_green2_type (isel_gpr_reg_gp_isel_tpg_green2)—Offset 9006Ch

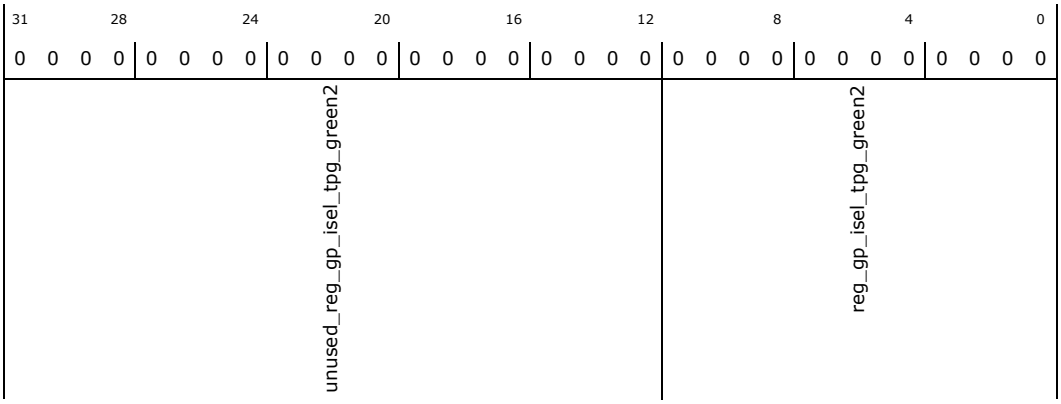
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_green2: [ISPMMADR] + 9006Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_green2:** Unused
11:0	0h RW	**reg_gp_isel_tpg_green2:** Defines the green2 color for test pattern generator

15.8.872 reg_isel_gpr_reg_gp_isel_tpg_blue2_type (isel_gpr_reg_gp_isel_tpg_blue2)—Offset 90070h

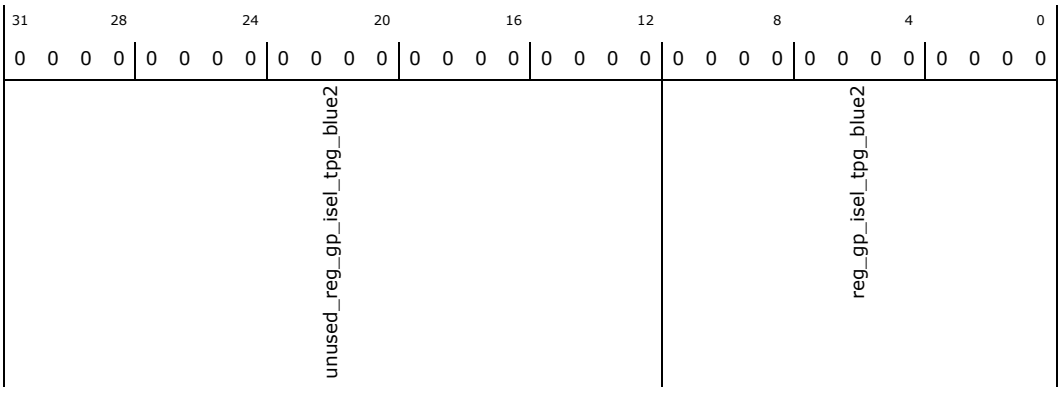
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_blue2: [ISPMMADR] + 90070h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gp_isel_tpg_blue2:** Unused
11:0	0h RW	**reg_gp_isel_tpg_blue2:** Defines the blue2 color for test pattern generator

15.8.873 reg_isel_gpr_reg_gp_isel_ch_id_type (isel_gpr_reg_gp_isel_ch_id)—Offset 90074h

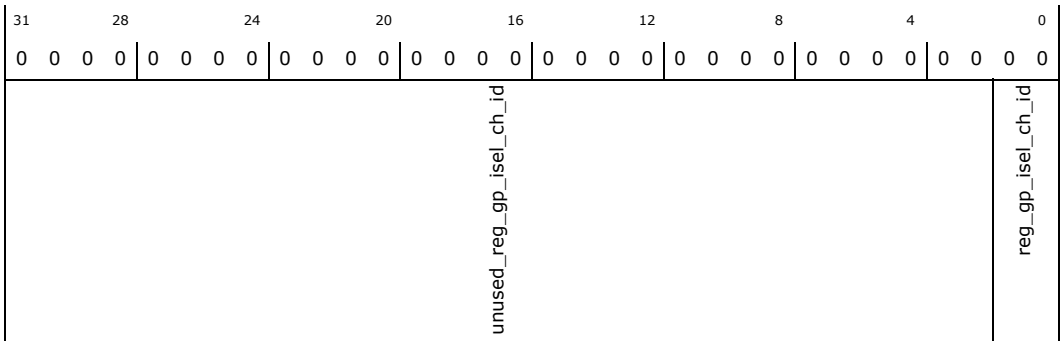
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_ch_id: [ISPMMADR] + 90074h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_reg_gp_isel_ch_id:** Unused
1:0	0h RW	**reg_gp_isel_ch_id:** Sets the channel id input for the Input selector

15.8.874 reg_isel_gpr_reg_gp_isel_fmt_type_type (isel_gpr_reg_gp_isel_fmt_type)—Offset 90078h

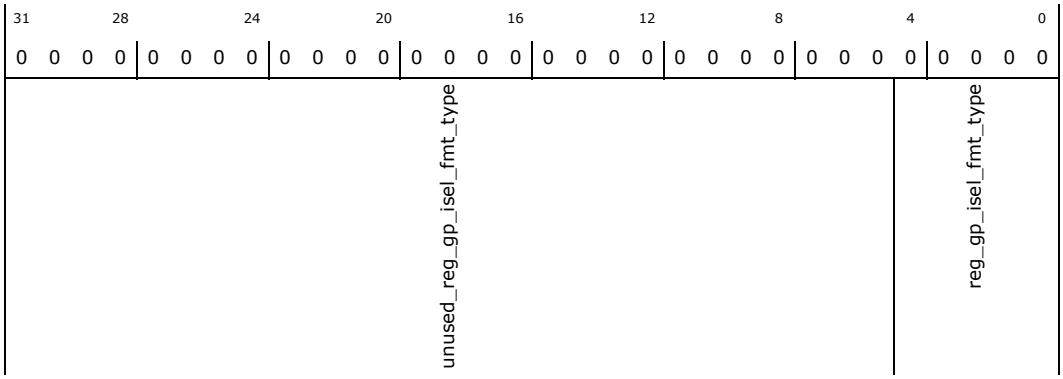
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_fmt_type: [ISPMMADR] + 90078h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0h RW	**unused_reg_gp_isel_fmt_type:** Unused
4:0	0h RW	**reg_gp_isel_fmt_type:** Sets the format type input for the Input selector

15.8.875 reg_isel_gpr_reg_gp_isel_data_sel_type (isel_gpr_reg_gp_isel_data_sel)—Offset 9007Ch

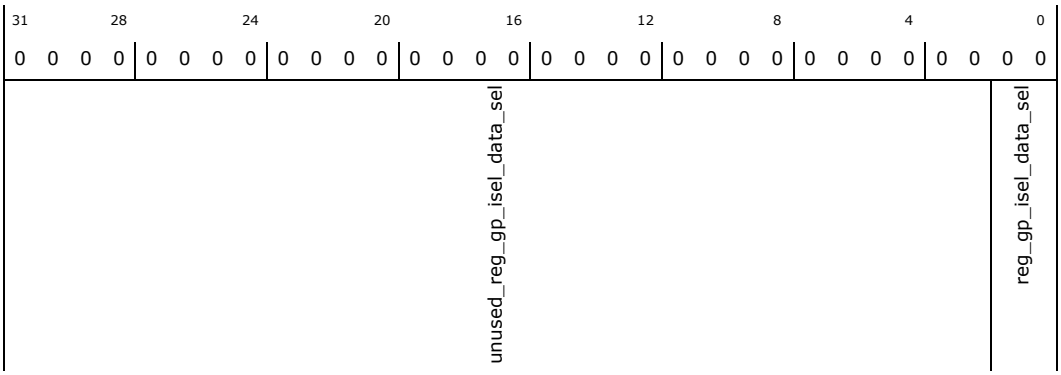
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_data_sel: [ISPMMADR] + 9007Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_reg_gp_isel_data_sel:** Unused
1:0	0h RW	**reg_gp_isel_data_sel:** Select value for the data multiplexer in the Input selector

15.8.876 reg_isel_gpr_reg_gp_isel_sband_sel_type (isel_gpr_reg_gp_isel_sband_sel)—Offset 90080h

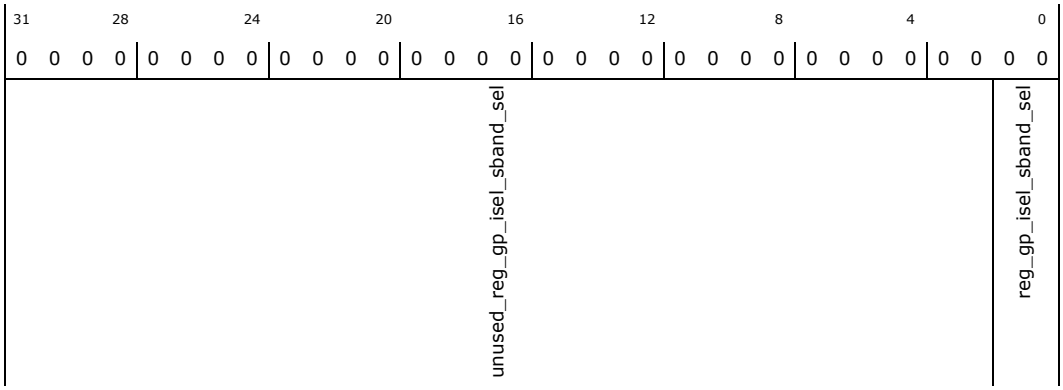
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_sband_sel: [ISPMMADR] + 90080h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_reg_gp_isel_sband_sel:** Unused
1:0	0h RW	**reg_gp_isel_sband_sel:** Select value for the side band multiplexer in the Input selector

15.8.877 reg_isel_gpr_reg_gp_isel_sync_sel_type (isel_gpr_reg_gp_isel_sync_sel)—Offset 90084h

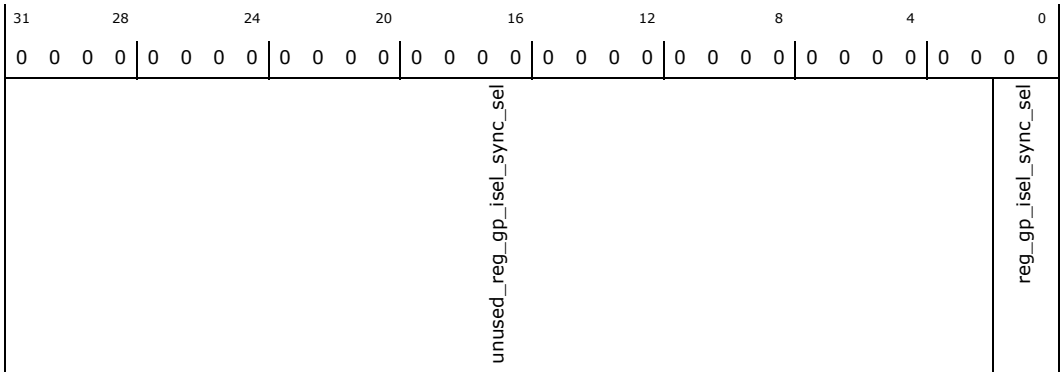
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_sync_sel: [ISPMMADR] + 90084h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**unused_reg_gp_isel_sync_sel:** Unused
1:0	0h RW	**reg_gp_isel_sync_sel:** Select value for the sync multiplexer in the Input selector

15.8.878 reg_isel_gpr_reg_gp_syncgen_hor_cnt_type (isel_gpr_reg_gp_syncgen_hor_cnt)—Offset 90088h

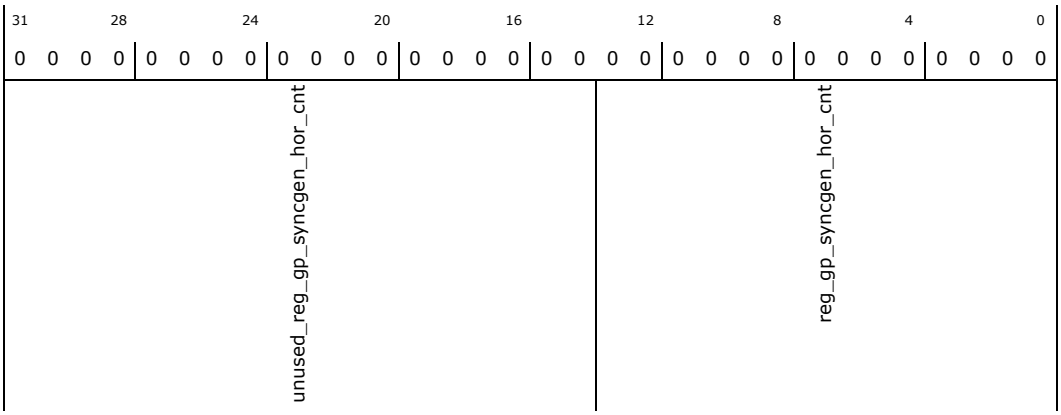
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_hor_cnt: [ISPMMADR] + 90088h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syncgen_hor_cnt:** Unused
13:0	0h RO	**reg_gp_syncgen_hor_cnt:** Returns the value of the horizontal counter in the sync generator

15.8.879 reg_isel_gpr_reg_gp_syncgen_ver_cnt_type (isel_gpr_reg_gp_syncgen_ver_cnt)—Offset 9008Ch

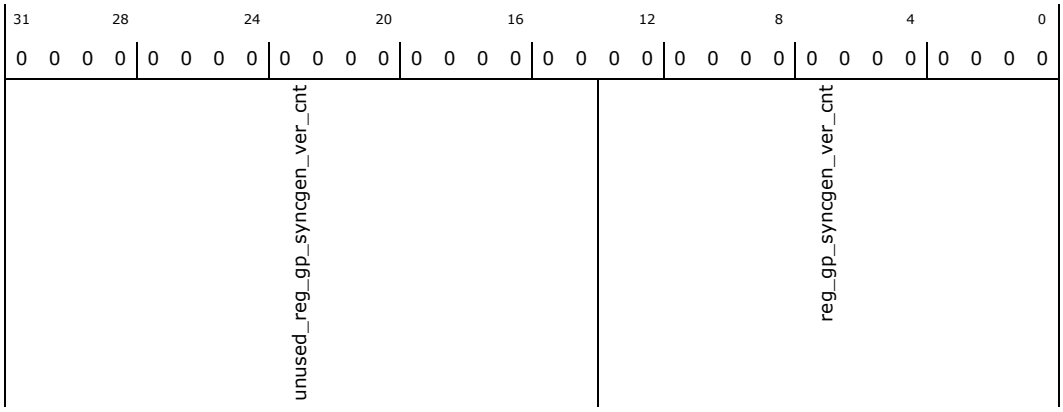
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_ver_cnt: [ISPMMADR] + 9008Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syncgen_ver_cnt:** Unused
13:0	0h RO	**reg_gp_syncgen_ver_cnt:** Returns the value of the vertical counter in the sync generator

15.8.880 reg_isel_gpr_reg_gp_syncgen_frame_cnt_type (isel_gpr_reg_gp_syncgen_frame_cnt)—Offset 90090h

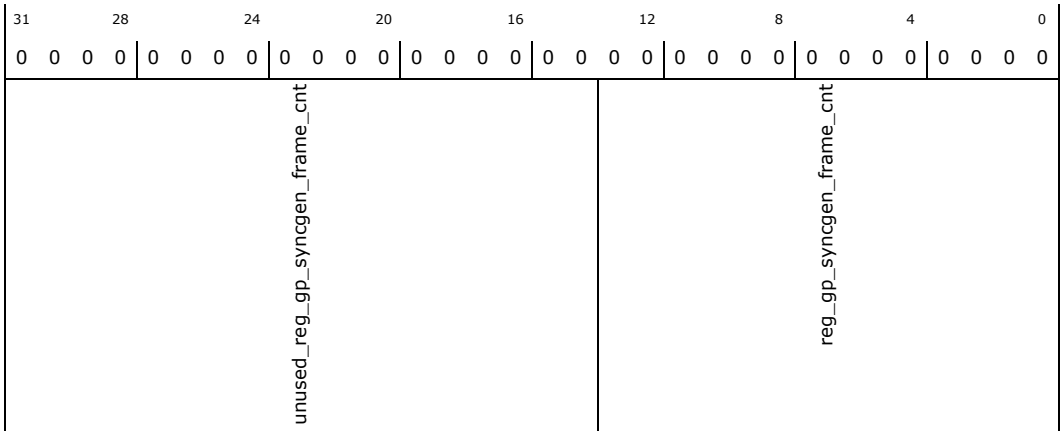
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syncgen_frame_cnt: [ISPMMADR] + 90090h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RW	**unused_reg_gp_syncgen_frame_cnt:** Unused

Bit Range	Default & Access	Description
13:0	0h RO	**reg_gp_syncgen_frame_cnt:** Returns the value of the frame counter in the sync generator

15.8.881 reg_isel_gpr_reg_gp_soft_reset_type (isel_gpr_reg_gp_soft_reset)—Offset 90094h

Soft resets the modules in the input selector cluster

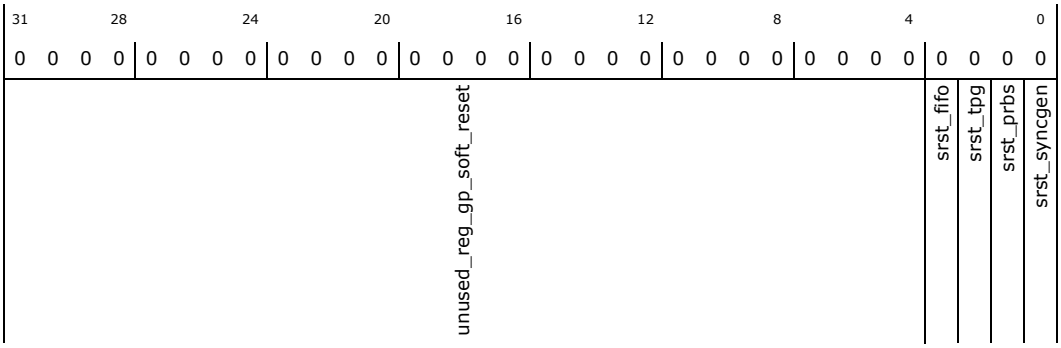
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_soft_reset: [ISPMMADR] + 90094h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_gp_soft_reset:** Unused
3	0h RW	**srst_fifo:** If 1, the fifo is held in reset mode. If 0, the fifo is not in reset state.
2	0h RW	**srst_tpg:** If 1, the TPG is held in reset mode. If 0, the TPG is not in reset state.
1	0h RW	**srst_prbs:** If 1, the PRBS is held in reset mode. If 0, the PRBS is not in reset state.
0	0h RW	**srst_syncgen:** If 1, the sync generator is held in reset mode. If 0, the sync generator is not in reset state.

15.8.882 reg_isel_fa_send_to_GP_FIFO_type (isel_fa_send_to_GP_FIFO)—Offset 90100h

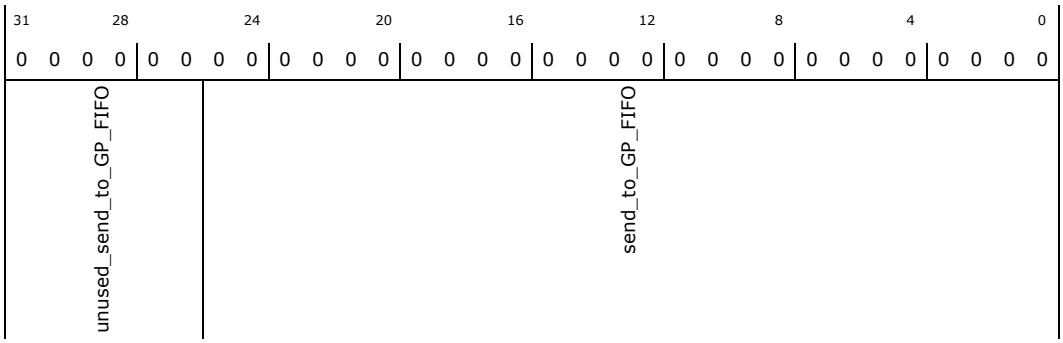
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_fa_send_to_GP_FIFO: [ISPMMADR] + 90100h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:26	0h RW	**unused_send_to_GP_FIFO:** Unused
25:0	0h WO	**send_to_GP_FIFO:** Send data to input selector GP FIFO

15.8.883 reg_isel_fa_check_send_to_GP_FIFO_type (isel_fa_check_send_to_GP_FIFO)—Offset 90108h

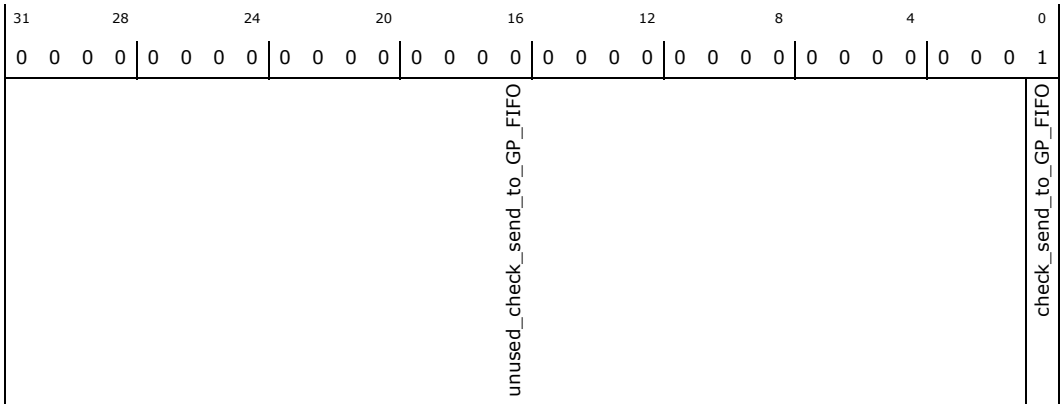
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_fa_check_send_to_GP_FIFO: [ISPMMADR] + 90108h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_send_to_GP_FIFO:** Unused
0	1h WO	**check_send_to_GP_FIFO:** Check for availability of GP FIFO. Returns 1 if a word can be send to the input selector, without it being stalled

15.8.884 reg_isel_irq_ctrl_reg_irq_edge_type (isel_irq_ctrl_reg_irq_edge)—Offset 90200h

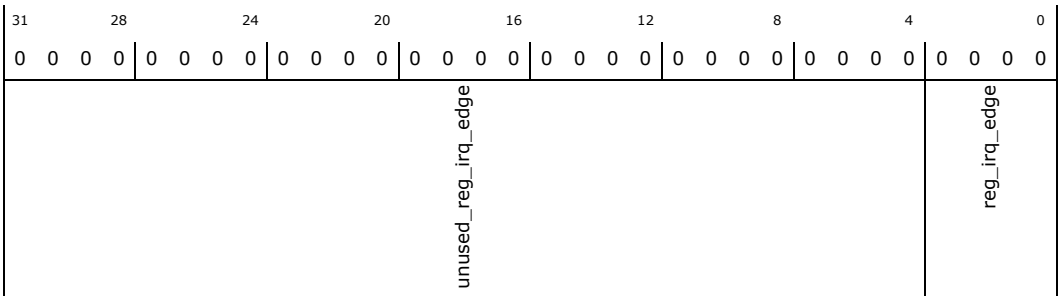
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_edge: [ISPMMADR] + 90200h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_edge:** Unused
3:0	0h RW	**reg_irq_edge:** indicates for each bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

15.8.885 reg_isel_irq_ctrl_reg_irq_mask_type (isel_irq_ctrl_reg_irq_mask)—Offset 90204h

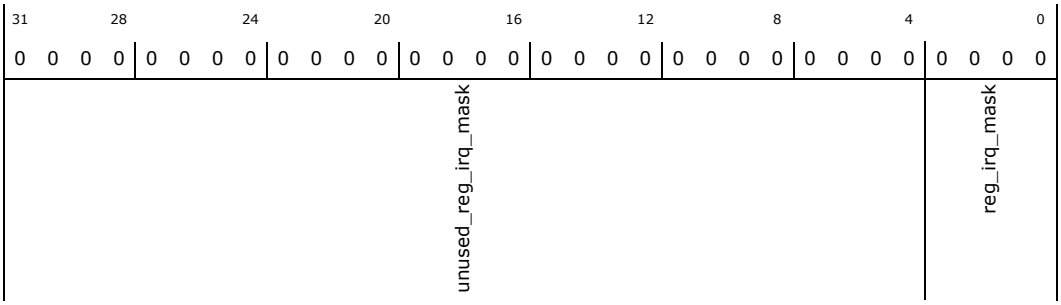
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_mask: [ISPMMADR] + 90204h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_mask:** Unused
3:0	0h RW	**reg_irq_mask:** indicates for each bit of irq_di whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

15.8.886 reg_isel_irq_ctrl_reg_irq_status_type (isel_irq_ctrl_reg_irq_status)—Offset 90208h

Indicates for each bit whether a non-masked interrupt has been generated (value='1'). Can be cleared by writing a '1' into the the corresponding bit of the req_irq_clear register.

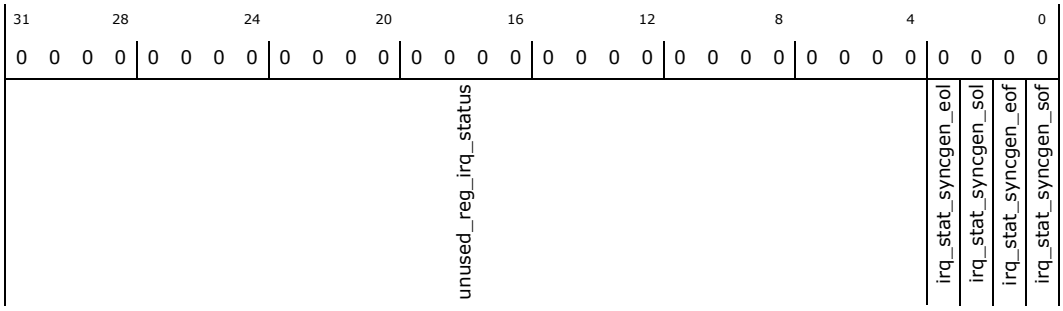
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_status: [ISPMMADR] + 90208h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_status:** Unused
3	0h RO	**irq_stat_syncgen_eol:** Represents the irq status of the eol (end of line) bit generated by the sync generator
2	0h RO	**irq_stat_syncgen_sol:** Represents the irq status of the sol (start of line) bit generated by the sync generator
1	0h RO	**irq_stat_syncgen_eof:** Represents the irq status of the eof (end of frame) bit generated by the sync generator
0	0h RO	**irq_stat_syncgen_sof:** Represents the irq status of the sof (start of frame) bit generated by the sync generator

15.8.887 reg_isel_irq_ctrl_reg_irq_clear_type (isel_irq_ctrl_reg_irq_clear)—Offset 9020Ch

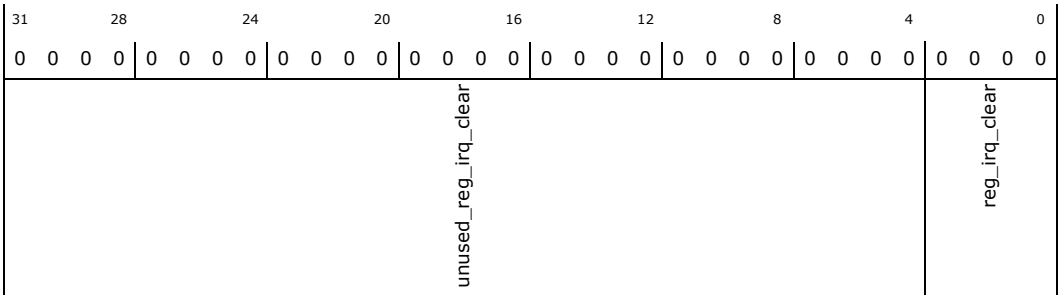
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_clear: [ISPMMADR] + 9020Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_clear:** Unused
3:0	0h WO	**reg_irq_clear:** Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

15.8.888 reg_isel_irq_ctrl_reg_irq_enable_type (isel_irq_ctrl_reg_irq_enable)—Offset 90210h

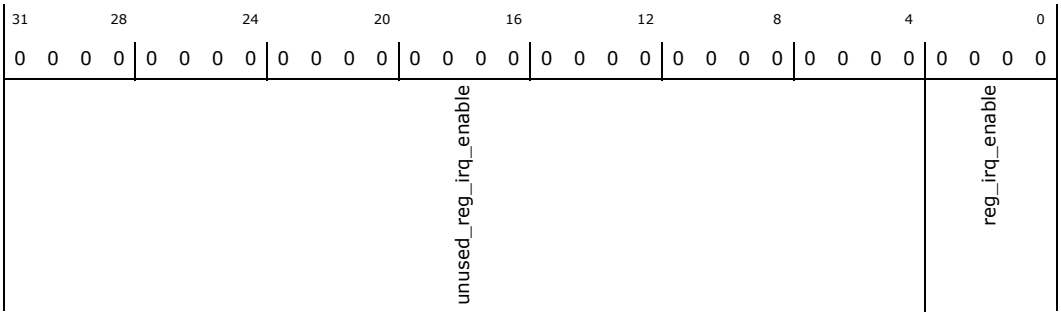
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_enable: [ISPMMADR] + 90210h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_enable:** Unused
3:0	0h RW	**reg_irq_enable:** Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also affects the IRQ pin (value='1') or not (value='0')

15.8.889 reg_isel_irq_ctrl_reg_irq_level_not_pulse_type (isel_irq_ctrl_reg_irq_level_not_pulse)—Offset 90214h

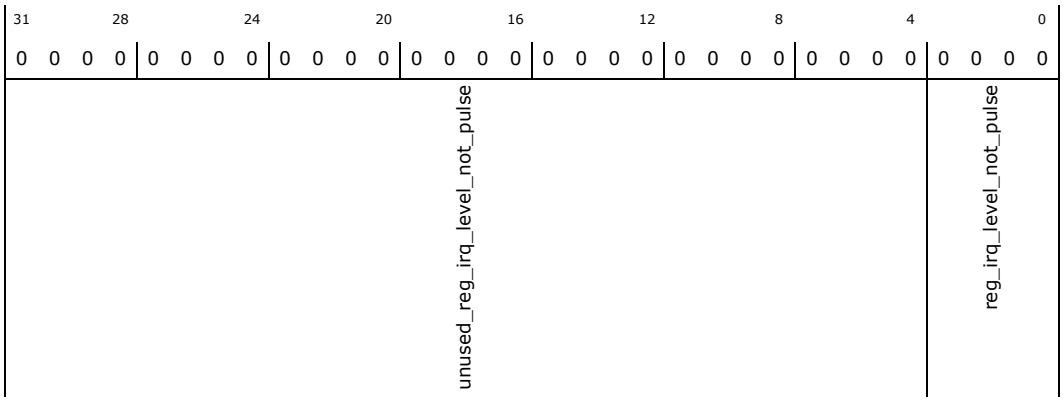
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_level_not_pulse: [ISPMMADR] + 90214h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_level_not_pulse:** Unused
3:0	0h RW	**reg_irq_level_not_pulse:** Indicates for each bit whether an interrupt cause is translated into a pulse (value='0') or into a constant level '1' (value='1') on the IRQ pin

15.8.890 reg_icache_out_sys_c_mmu_MMU_invalidate_cache_type (icache_out_sys_c_mmu_MMU_invalidate_cache)—Offset A0000h

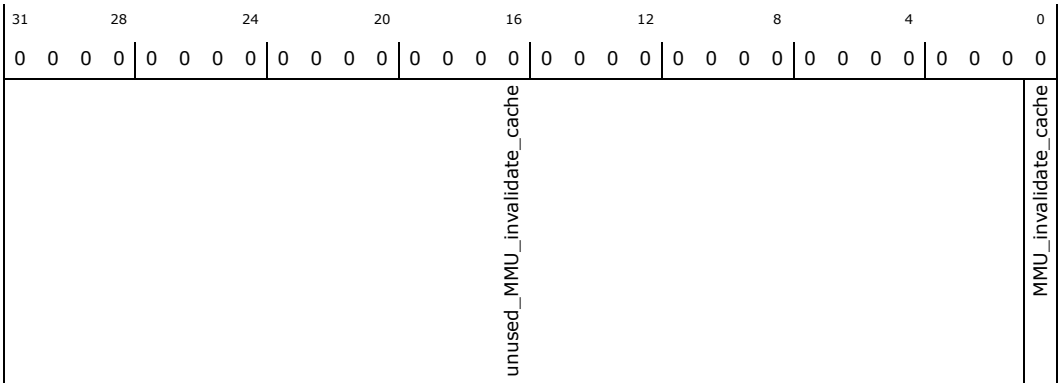
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

icache_out_sys_c_mmu_MMU_invalidate_cache: [ISPMMADR] + A0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_MMU_invalidate_cache:** Unused
0	0h WO	**MMU_invalidate_cache:** MMU invalidate cache. When '1', the MMUs TLB is invalidated.

15.8.891 reg_icache_out_sys_c_mmu_MMU_page_table_base_type (icache_out_sys_c_mmu_MMU_page_table_base)—Offset A0004h

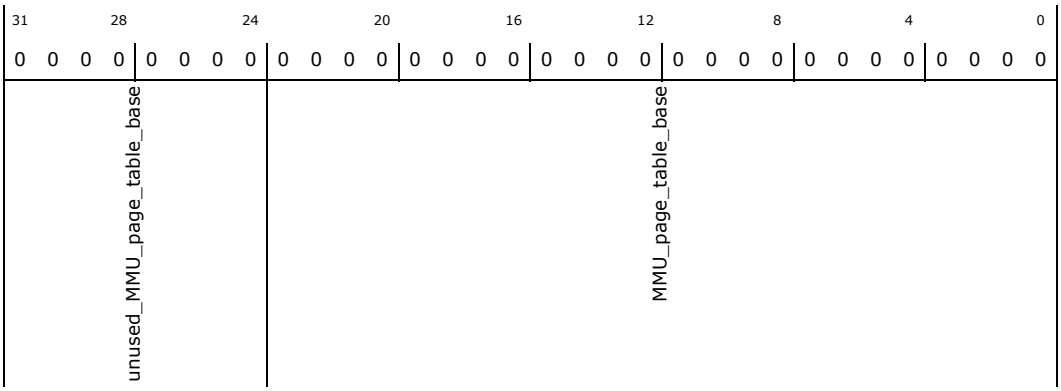
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

icache_out_sys_c_mmu_MMU_page_table_base: [ISPMMADR] + A0004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_MMU_page_table_base:** Unused

Bit Range	Default & Access	Description
23:0	0h RW	**MMU_page_table_base:** Defines the physical page number of the page tables

15.8.892 mem_scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_first_type (scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_first)—Offset B0000h

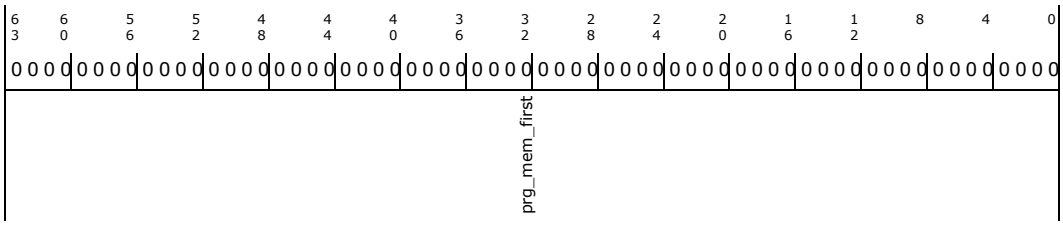
Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_first: [ISPMMADR] + B0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:0	0h RW	**prg_mem_first:** Read Latency of 1 cycles. Write latency of 0 cycles

15.8.893 mem_scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_last_type (scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_last)—Offset B7FF8h

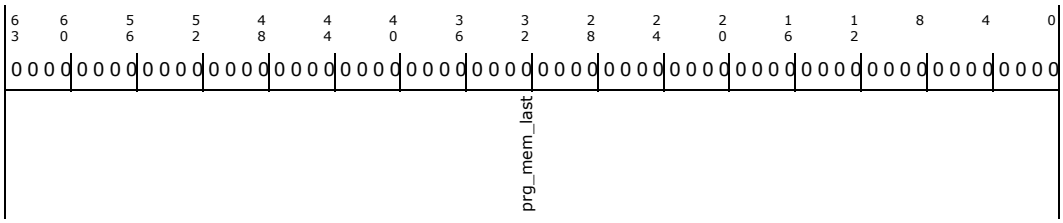
Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

scp_config_ilm_conf_ilm_prg_mem_sl_ip_pmem_prg_mem_last: [ISPMMADR] + B7FF8h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:0	0h RW	**prg_mem_last:** Read Latency of 1 cycles. Write latency of 0 cycles

15.8.894 mem_isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_first_type (isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_first)—Offset 1C0000h

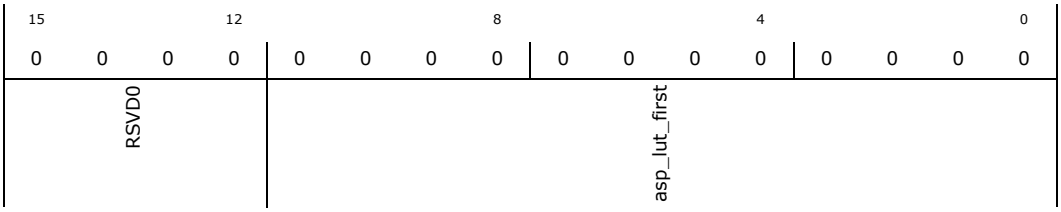
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_first: [ISPMMADR] + 1C0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_first:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.895 mem_isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_last_type (isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_last)—Offset 1C0FFEh

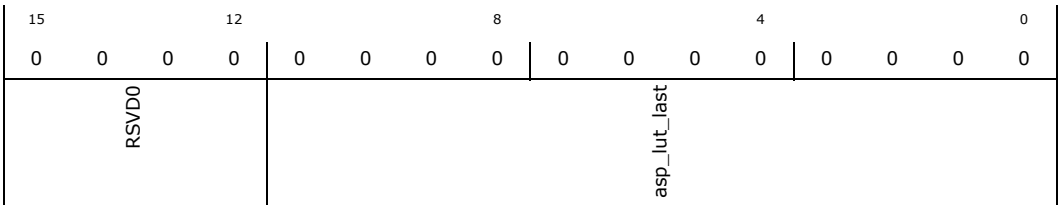
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem1_asp_lut_sl_ipvamem_asp_lut_last: [ISPMMADR] + 1C0FFEh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_last:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.896 mem_isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_first_type (isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_first)—Offset 1D0000h

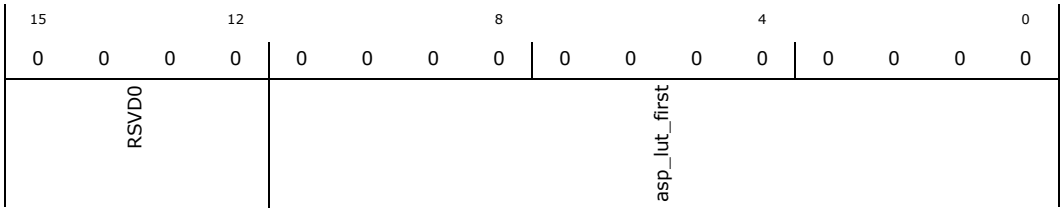
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_first: [ISPMMADR] + 1D0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_first:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.897 mem_isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_last_type (isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_last)—Offset 1D0FFEh

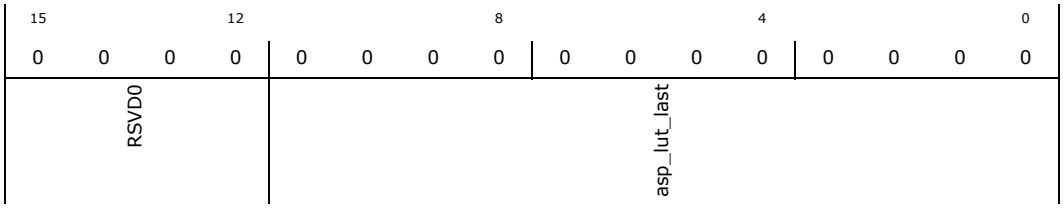
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem2_asp_lut_sl_ipvamem_asp_lut_last: [ISPMMADR] + 1D0FFEh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_last:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.898 mem_isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_first_type (isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_first)—Offset 1E0000h

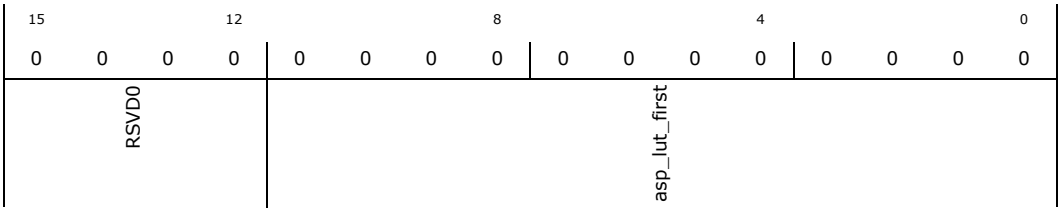
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_first: [ISPMMADR] + 1E0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_first:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.899 mem_isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_last_type (isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_last)—Offset 1E0FFEh

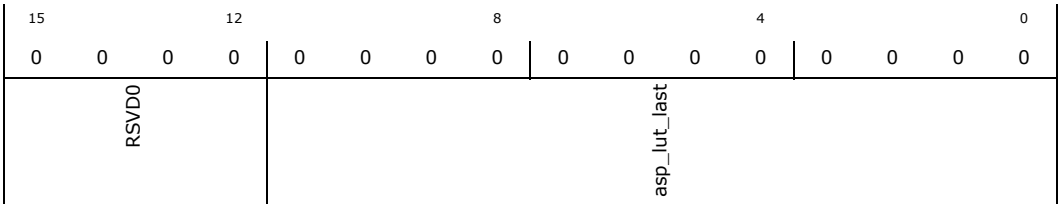
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

isp_simd_vamem3_asp_lut_sl_ipvamem_asp_lut_last: [ISPMMADR] + 1E0FFEh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:0	0h RW	**asp_lut_last:** Read Latency of 67 cycles. Write latency of 0 cycles

15.8.900 mem_isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_first_type (isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_first)—Offset 1F0000h

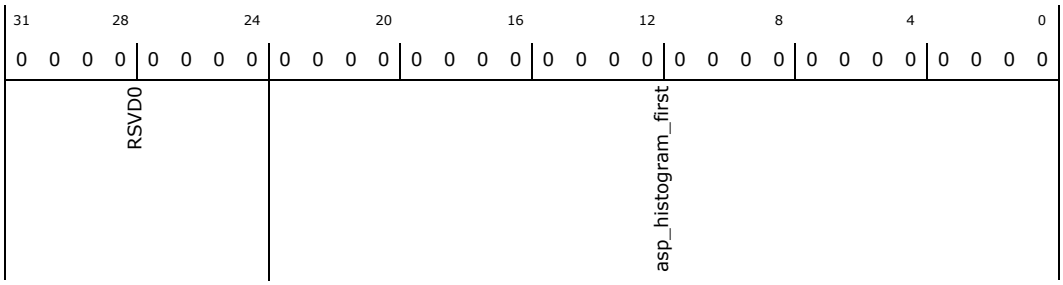
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_first: [ISPMMADR] + 1F0000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RO	**RSVD0:** Reserved
23:0	0h RW	**asp_histogram_first:** Read Latency of 66 cycles. Write latency of 0 cycles

15.8.901 mem_isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_last_type (isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_last)—Offset 1F0FFCh

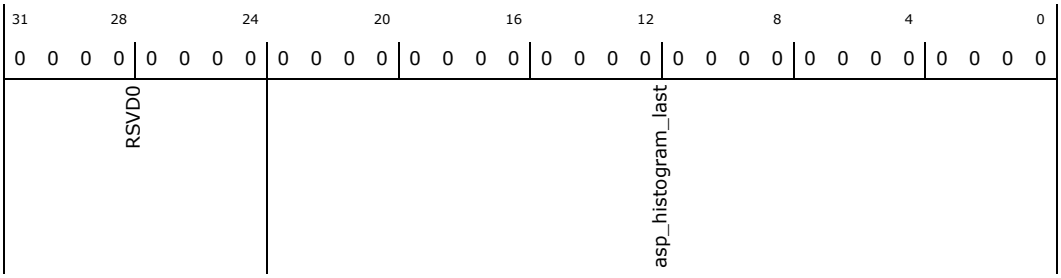
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_simd_histogram_asp_histogram_sl_iphist_asp_histogram_last: [ISPMMADR] + 1F0FFCh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0b RO	**RSVD0:** Reserved
23:0	0h RW	**asp_histogram_last:** Read Latency of 66 cycles. Write latency of 0 cycles

15.8.902 mem_isp_base_dmem_data_mem_sl_ipdmem_data_mem_first_type (isp_base_dmem_data_mem_sl_ipdmem_data_mem_first)—Offset 200000h

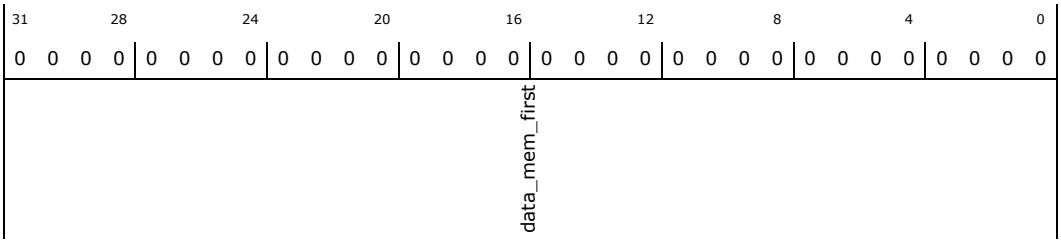
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_base_dmem_data_mem_sl_ipdmem_data_mem_first: [ISPMMADR] + 200000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**data_mem_first:** Read Latency of 2 cycles. Write latency of 0 cycles

15.8.903 mem_isp_base_dmem_data_mem_sl_ipdmem_data_mem_last_type (isp_base_dmem_data_mem_sl_ipdmem_data_mem_last)—Offset 203FFCh

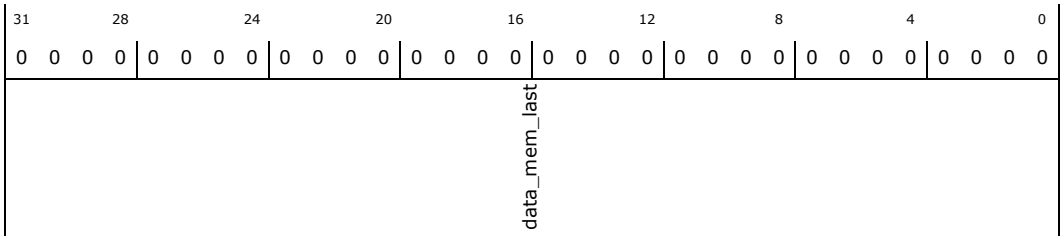
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_base_dmem_data_mem_sl_ipdmem_data_mem_last: [ISPMMADR] + 203FFCh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**data_mem_last:** Read Latency of 2 cycles. Write latency of 0 cycles

15.8.904 mem_scp_dmem_mem_sl_ip_dmem_mem_first_type (scp_dmem_mem_sl_ip_dmem_mem_first)—Offset 300000h

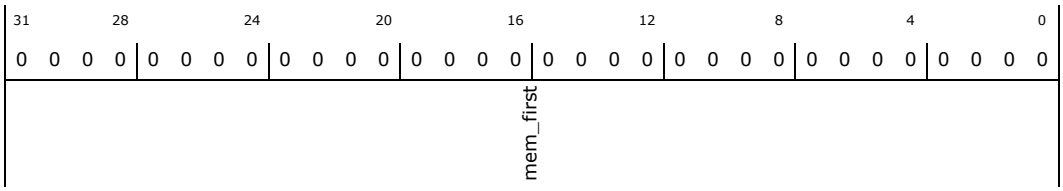
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

scp_dmem_mem_sl_ip_dmem_mem_first: [ISPMMADR] + 300000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**mem_first:** Read Latency of 2 cycles. Write latency of 0 cycles

15.8.905 mem_scp_dmem_mem_sl_ip_dmem_mem_last_type (scp_dmem_mem_sl_ip_dmem_mem_last)—Offset 307FFCh

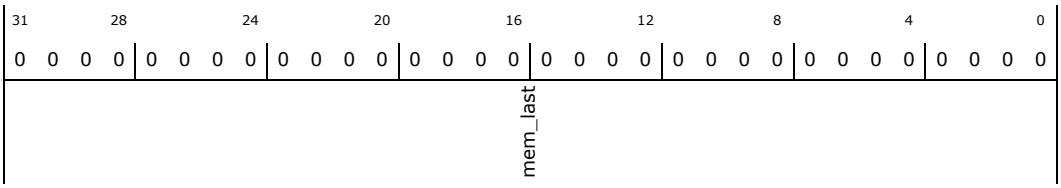
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

scp_dmem_mem_sl_ip_dmem_mem_last: [ISPMMADR] + 307FFCh

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**mem_last:** Read Latency of 2 cycles. Write latency of 0 cycles

15.8.906 reg_fa_sp_isp_send_to_SP_type (fa_sp_isp_send_to_SP)—Offset 380008h

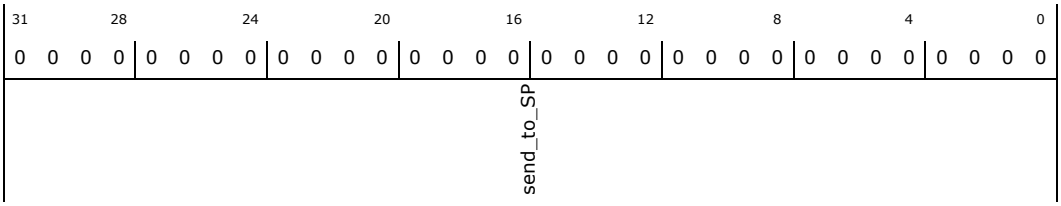
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_send_to_SP: [ISPMMADR] + 380008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h WO	**send_to_SP:** Send data to SP streaming input port

15.8.907 reg_fa_sp_isp_send_to_ISP_type (fa_sp_isp_send_to_ISP)—Offset 38000Ch

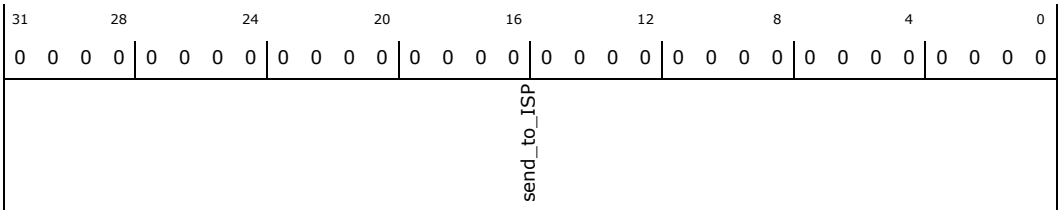
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_send_to_ISP: [ISPMMADR] + 38000Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h WO	**send_to_ISP:** Send data to ISP streaming input port

15.8.908 reg_fa_sp_isp_check_receive_from_SP_type (fa_sp_isp_check_receive_from_SP)—Offset 380010h

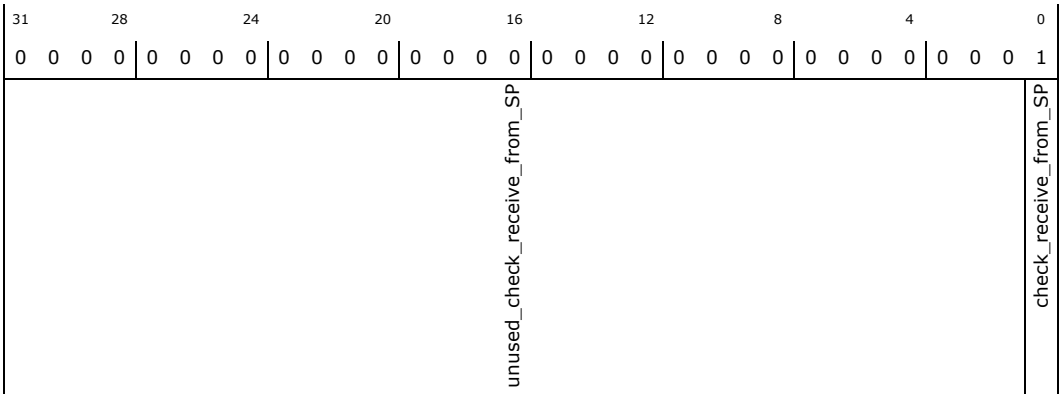
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_check_receive_from_SP: [ISPMMADR] + 380010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_receive_from_SP:** Unused
0	1h RO	**check_receive_from_SP:** Check for potential stalling for receiving data on SP streaming output port. Returns 1 if a receive from SP would lead to a stall. Returns 0 if a token is available from the SP.

15.8.909 reg_fa_sp_isp_check_receive_from_ISP_type (fa_sp_isp_check_receive_from_ISP)—Offset 380014h

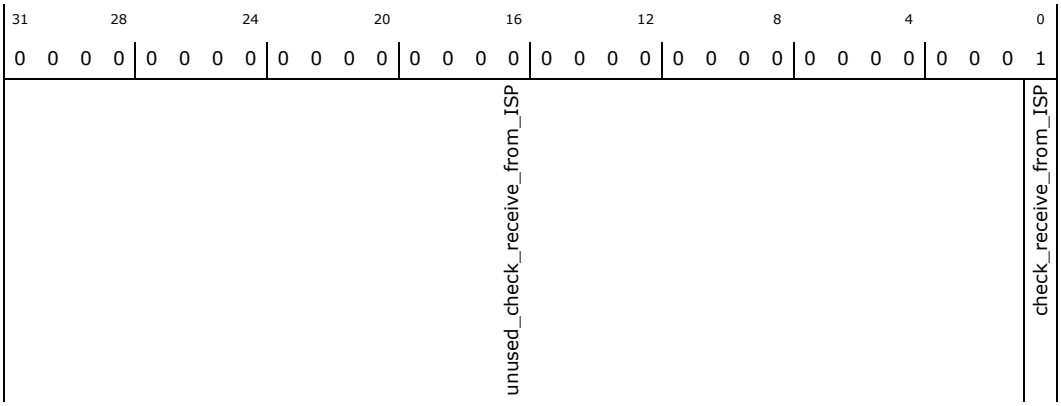
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_check_receive_from_ISP: [ISPMMADR] + 380014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_receive_from_ISP:** Unused
0	1h RO	**check_receive_from_ISP:** Check for potential stalling for receiving data on ISP streaming output port. Returns 1 if a receive from ISP would lead to a stall. Returns 0 if a token is available from the ISP.

15.8.910 reg_fa_sp_isp_check_send_to_SP_type (fa_sp_isp_check_send_to_SP)—Offset 380018h

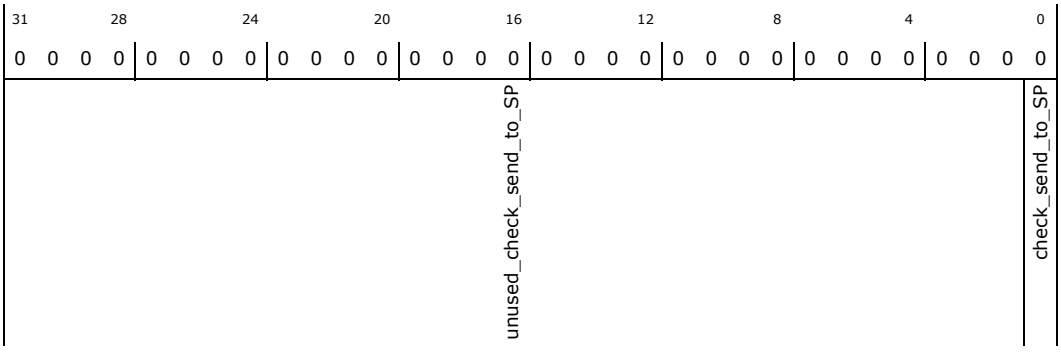
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_check_send_to_SP: [ISPMMADR] + 380018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_send_to_SP:** Unused
0	0h RO	**check_send_to_SP:** Check for potential stalling for sending data to SP streaming input port. Returns 1 if a send to SP would lead to a stall. Returns 0 when there is space left in the SP token FIFO

15.8.911 reg_fa_sp_isp_check_send_to_ISP_type (fa_sp_isp_check_send_to_ISP)—Offset 38001Ch

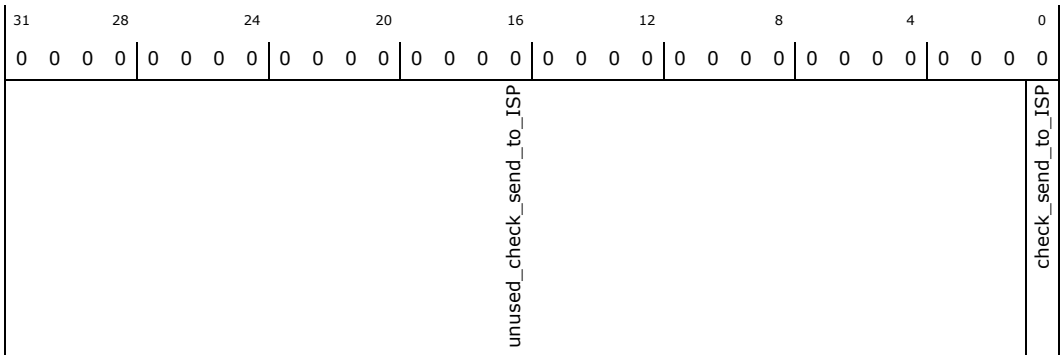
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

fa_sp_isp_check_send_to_ISP: [ISPMMADR] + 38001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



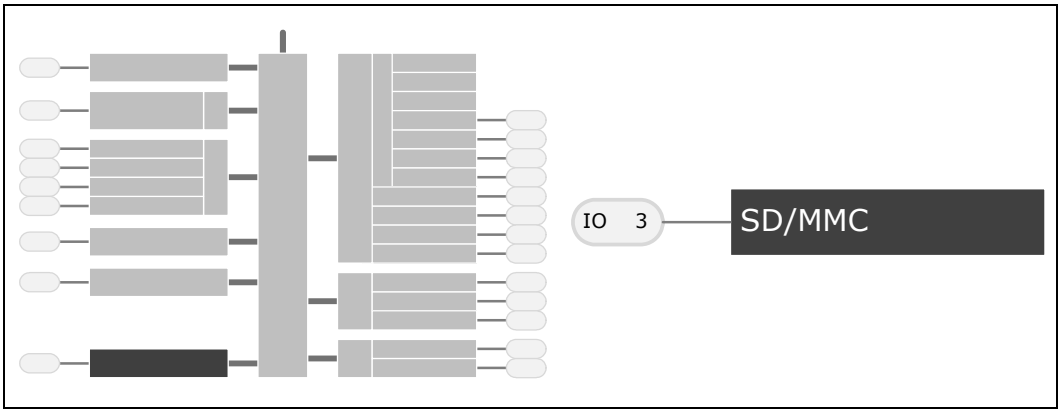
Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_send_to_ISP:** Unused
0	0h RO	**check_send_to_ISP:** Check for potential stalling for sending data to ISP streaming input port. Returns 1 if a send to ISP would lead to a stall. Returns 0 when there is space left in the ISP token FIFO

16 Storage Control Cluster (eMMC, SDIO, SD Card)

The Storage Control Cluster (SCC) consists of SDIO, SD Card and eMMC controllers to support mass storage and IO devices.

- One eMMC 4.5 interface
- One SD Card 3.0 interface
- One SDIO 3.0 interface for SDIO-based WIFI

Note: All units in the SCC support both PCI mode and ACPI mode of operation. A level shifter may be needed on the platform for SDIO 3.0 compliance. An eMMC 4.41 controller also exists but shouldn't be used.



16.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 168. eMMC Signals

Signal Name	Direction Power	Description
MMC1_CLK	O V1P8S	**eMMC Clock** The frequency may vary between 26 and 52 MHz.
MMC1_D[7:0]	I/O V1P8S	**eMMC Port Data bits 0 to 7** Bidirectional port used to transfer data to and from eMMC device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using either D[0]-D[3] or D[0]-D[7], by the MultiMedia Card controller. The MultiMedia Card includes internal pull-ups for data lines D[1]-D[7]. Immediately after entering the 4-bit mode, the card disconnects the internal pull ups of lines D[1], D[2], and D[3]. Correspondingly, immediately after entering to the 8-bit mode the card disconnects the internal pull-ups of lines D[1]-D[7].
MMC1_CMD	I/O V1P8S	**eMMC Port Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
MMC1_RCOMP	-	**eMMC RCOMP** This signal is used for pre-driver slew rate compensation.
MMC1_RST#	O V1P8S	**eMMC Reset Signals** Active low to reset.

Table 169. SDIO Signals

Signal Name	Direction Power	Description
SD2_CLK	O V1P8S	**SDIO Clock** The frequency may vary between 24 and 50MHz.
SD2_D[2:0]	I/O V1P8S	**SDIO Port Data bits 0 to 2** Bidirectional port used to transfer data to and from SDIO device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD2_D[3]_CD#	I/O V1P8S	**SDIO Port Data bit 3** Bidirectional port used to transfer data to and from the SDIO device. Also, **Card Detect**. Active low when device is present.
SD2_CMD	I/O V1P8S	**SDIO Port Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.

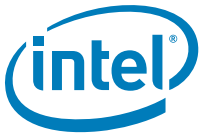


Table 170. SD Card Signals

Signal Name	Direction Power	Description
SD3_CLK	O VSDIO	**SD Card Clock** The frequency may vary between 24 and 50 MHz.
SD3_D[3:0]	I/O VSDIO	**SD Card Data bits 0 to 3** Bidirectional port used to transfer data to and from SD card. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD3_CD#	I/O V1P8S	**SD Card Detect** Active low when a card is present. Floating (pulled high with internal PU) when a card is not present.
SD3_CMD	I/O VSDIO	**SD Card Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
SD3_1P8EN	O V1P8S	**SD Card 1.8V Enable** Indicates the voltage of the SD Card to the power delivery subsystem. The default voltage (3.3 V) is requested when this signal is driven low. 1.8 V is requested when this signal is high. This voltage change applies to the SD3_V1P8V3P3_S3 (VSDIO) rail on the SoC.
SD3_RCOMP	-	**SD Card RCOMP** This signal is used for pre-driver slew rate compensation.
SD3_PWREN#	O V1P8S	**SD Card Power Enable** This signal is used to enable power on a SD device.

16.2 Features

16.2.1 eMMC Interface Features

- eMMC 4.5 controller supported
- Transfers the data in 1 bit, 4 bit and 8 bit modes.
- Transfers data in the following speed classes: Baseline (1, 4, 8 bit up to 25Mhz), HS SDR/DDR (4, 8 bit up to 50Mhz) and HS200 (4, 8 bit up to 200MHz - 4.5 controller only)
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Supports MMC Plus and MMC mobile.
- Supports both round-robin and priority-based arbitration for transmit operation.
- Run-time configurabilty of channel ID bits.

16.2.2 SDIO/SD Card Interface Features

- Up to 832Mbits per second data rate using 4 parallel data lines.
- Transfers the data in 1 bit and 4 bit SD modes.
- Transfers the data in following UHS-I modes: HS and DDR50.
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Designed to work with I/O cards, Read-only cards and Read/Write cards.
- Supports Read wait Control.
- SDIO only validated with WIFI devices.

16.2.3 Storage Interfaces Overview

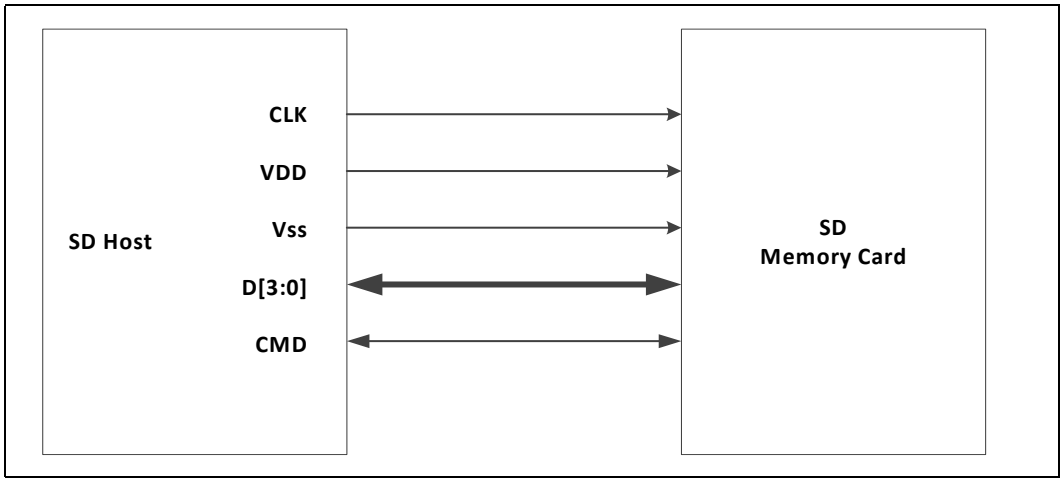
This section provides a very high level overview of the SD, SDIO, eMMC 4.5 specification. Refer to the SD and eMMC specifications for complete details.

16.2.3.1 SD Card 3.0 Bus Interface

The SD Card bus has a single master, single slaves (card), synchronous topology (refer to Figure 101). During initialization process commands are sent to the card, allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Card will use only SD3_D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while DAT1-SD3_D[3:1] are not in use, the SoC will tri-state those signals.

Figure 101.SD Memory Card Bus Topology

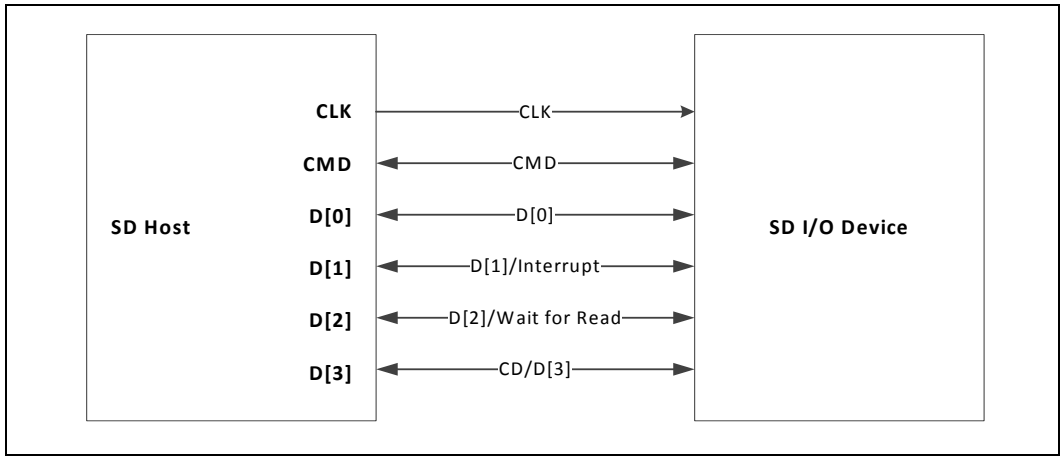


16.2.3.2 SDIO 3.0 Interface

The SDIO interface is the very much like the SD card interface. The SoC supports one SDIO device for wireless devices only (no memory card support).

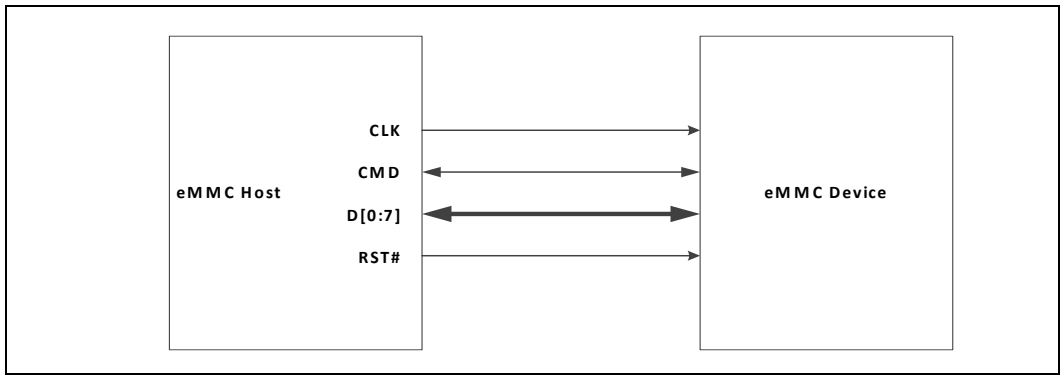
Note: SDIO interface does not support WAKE function.

Figure 102.SDIO Device Bus Topology



16.2.3.3 eMMC4.5 Interface

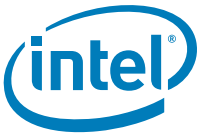
Figure 103.eMMC Interface



16.3 References

The controller is configured to comply with:

- SD Specification Part 01 Physical Layer Specification version 3.00, April 16, 2009
- SD Specification Part E1 SDIO Specification version 3.00, December 16, 2010
- SD Specification Part A2 SD Host Controller Standard Specification version 3.00, February 18, 2010



- SD Specification Part 03 security Specification version 1.01, April 15, 2001
- Embedded MultiMedia Card (eMMC) Product Standard v4.51, JESD84-A451

16.4 Register Map

Refer to Chapter 3, "Register Access Methods" and Chapter 4, "Mapping Address Spaces" for additional information.

16.5 eMMC PCI Configuration Registers

Table 171. Summary of eMMC PCI Configuration Registers—0/16/0

Offset	Size	Register ID—Description	Default Value
0h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 1587	00000000h
4h	4	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 1588	00100000h
8h	4	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 1589	00000000h
Ch	4	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 1589	00000000h
10h	4	"reg_BAR_type (BAR)—Offset 10h" on page 1590	00000000h
14h	4	"reg_BAR1_type (BAR1)—Offset 14h" on page 1590	00000000h
2Ch	4	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 1591	00000000h
30h	4	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1592	00000000h
34h	4	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 1592	00000080h
3Ch	4	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 1593	00000100h
80h	4	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 1593	48030001h
84h	4	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 1594	00000008h
A0h	4	"reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h" on page 1594	00000000h
A4h	4	"reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h" on page 1595	00000000h
A8h	4	"reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h" on page 1595	00000000h
ACh	4	"reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh" on page 1596	00000000h
C0h	4	"reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h" on page 1596	00000000h
F8h	4	"reg_MANID_type (MANID)—Offset F8h" on page 1597	00000000h

16.5.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

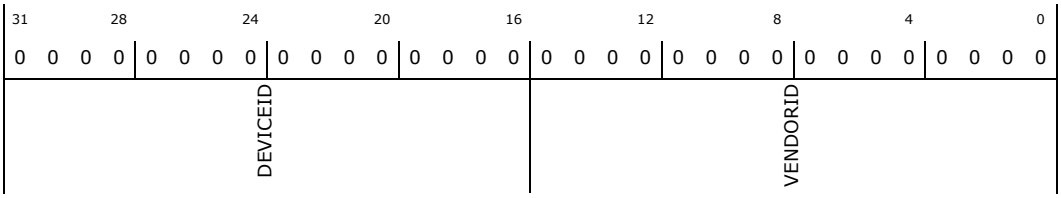
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

DEVVENDID: [B:0, D:16, F:0] + 0h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**DEVICEID:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RO	**VENDORID:** Reserved.

16.5.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

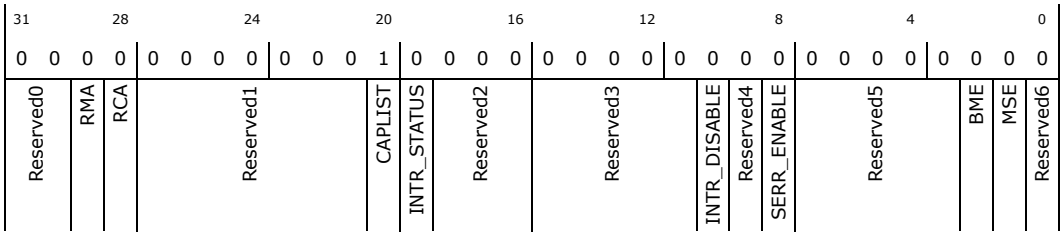
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

STATUSCOMMAND: [B:0, D:16, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**RMA:** Reserved.
28	0h RW/1C	**RCA:** Reserved.
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**CAPLIST:** Reserved.
19	0h RO	**INTR_STATUS:** Reserved.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**INTR_DISABLE:** Reserved.
9	0h RO	**Reserved4:** Reserved.
8	0h RW	**SERR_ENABLE:** Reserved.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**BME:** Reserved.

Bit Range	Default & Access	Description
1	0h RW	**MSE:** Reserved.
0	0h RO	**Reserved6:** Reserved.

16.5.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

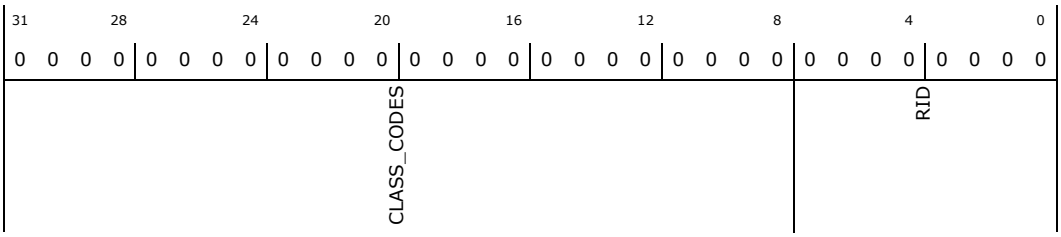
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:16, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

16.5.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

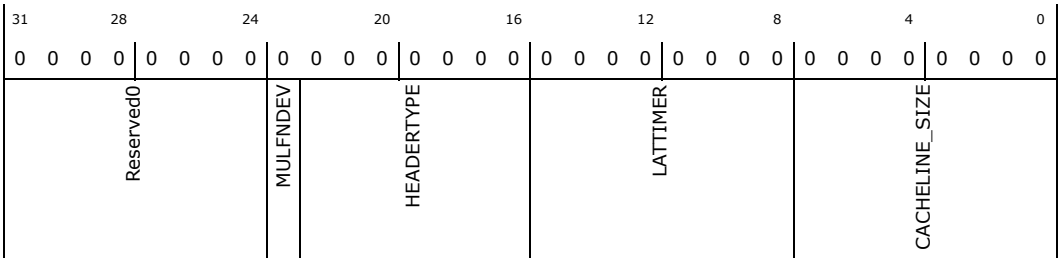
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:16, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

16.5.5 reg_BAR_type (BAR)—Offset 10h

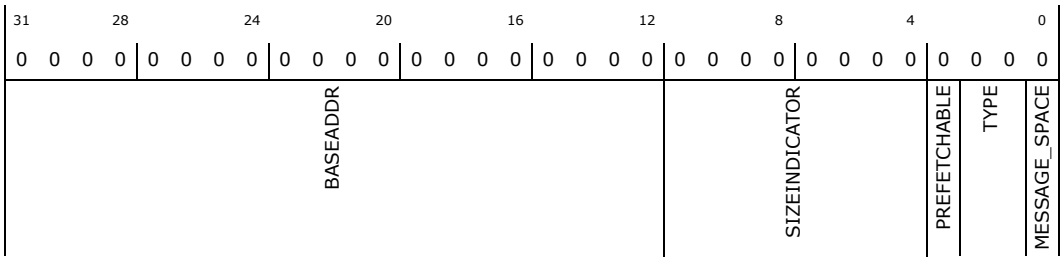
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR:** Reserved.
11:4	00h RO	**SIZEINDICATOR:** Reserved.
3	0h RO	**PREFETCHABLE:** Reserved.
2:1	0h RO	**TYPE:** Reserved.
0	0h RO	**MESSAGE_SPACE:** Reserved.

16.5.6 reg_BAR1_type (BAR1)—Offset 14h

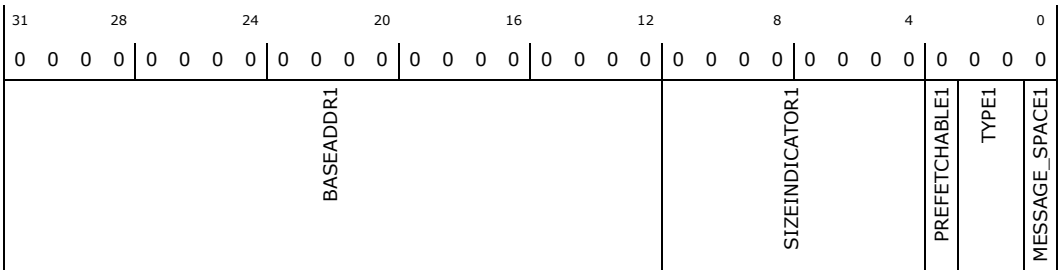
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR1: [B:0, D:16, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR1:** Reserved.
11:4	00h RO	**SIZEINDICATOR1:** Reserved.
3	0h RO	**PREFETCHABLE1:** Reserved.
2:1	0h RO	**TYPE1:** Reserved.

16.5.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

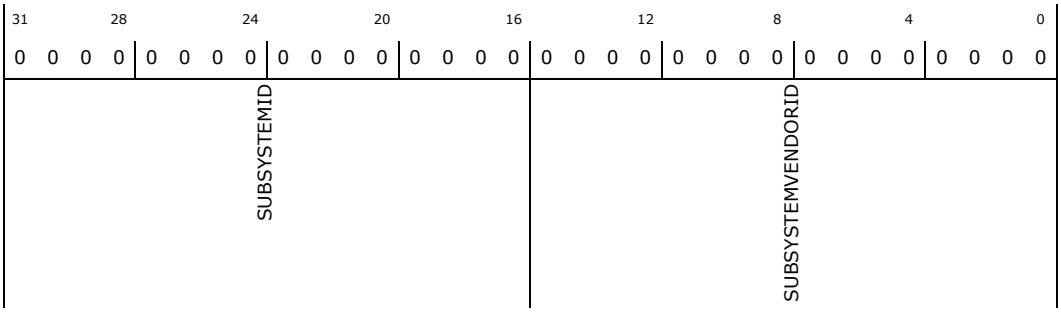
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:16, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

16.5.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

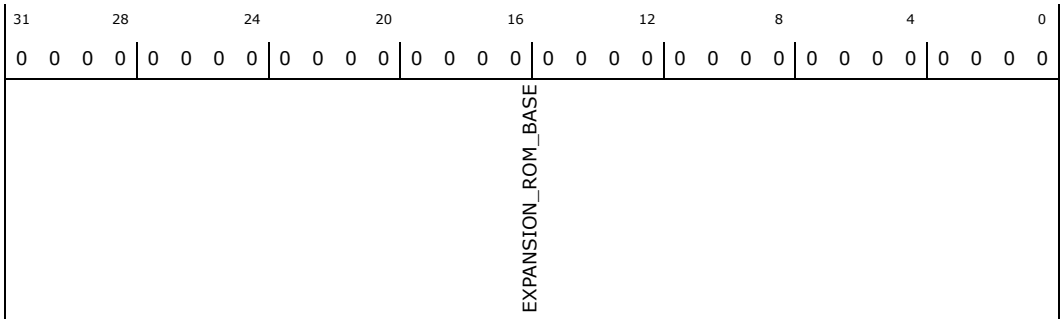
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

EXPANSION_ROM_BASEADDR: [B:0, D:16, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

16.5.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

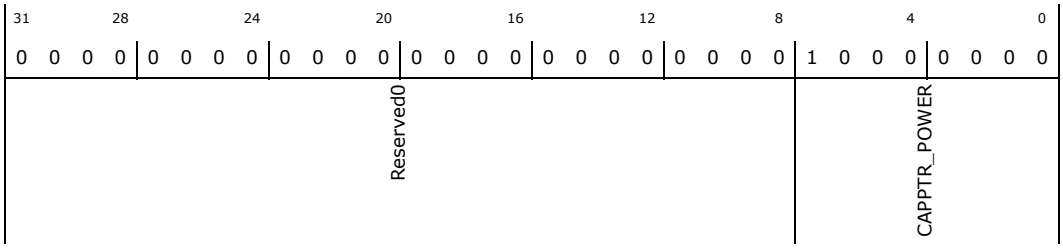
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPABILITYPTR: [B:0, D:16, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**CAPPTR_POWER:** Reserved.

16.5.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

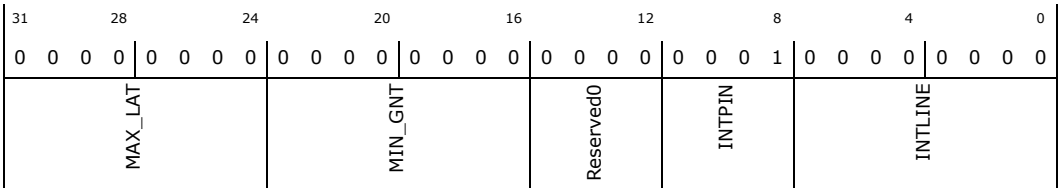
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTERRUPTREG: [B:0, D:16, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Description
31:24	00h RO	**MAX_LAT:** Reserved.
23:16	00h RO	**MIN_GNT:** Reserved.
15:12	0h RO	**Reserved0:** Reserved.

16.5.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

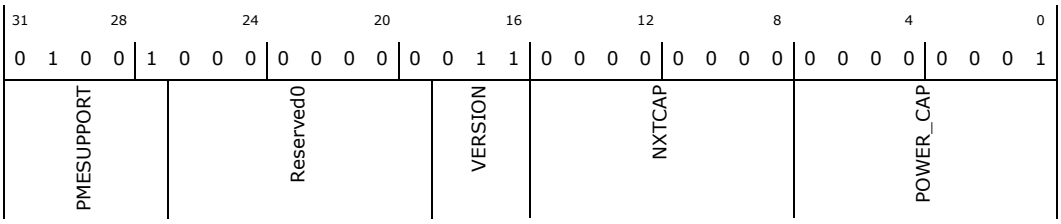
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

POWERCAPID: [B:0, D:16, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Description
31:27	09h RO	**PMESUPPORT:** Reserved.
26:19	00h RO	**Reserved0:** Reserved.

Bit Range	Default & Access	Description
18:16	3h RO	**VERSION:** Reserved.
15:8	00h RO	**NXTCAP:** Reserved.
7:0	01h RO	**POWER_CAP:** Reserved.

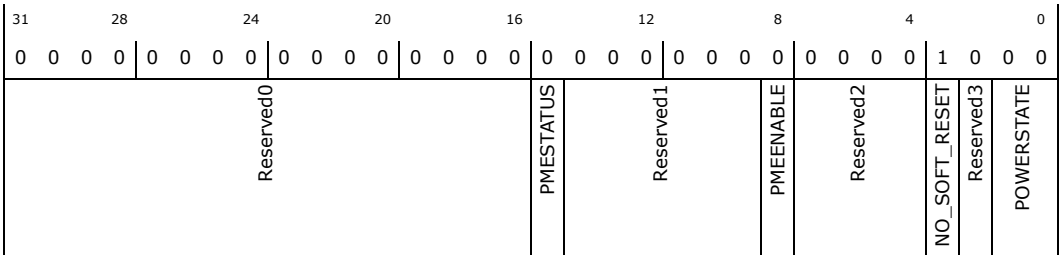
16.5.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMECTRLSTATUS: [B:0, D:16, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PMESTATUS:** Reserved.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PMEENABLE:** Reserved.

3	1h RO	**NO_SOFT_RESET:** Reserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**POWERSTATE:** Reserved.

16.5.13 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

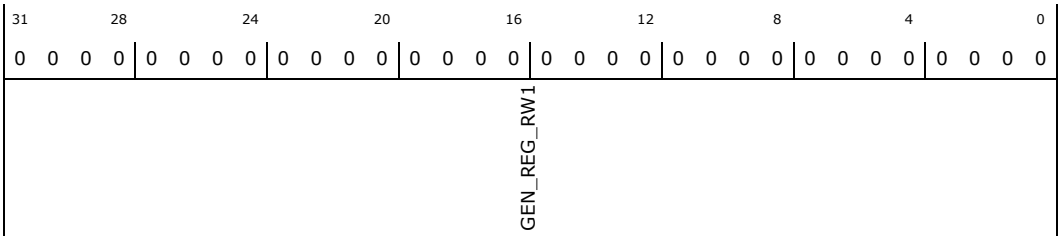
General Purpose Read Write Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:16, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.5.14 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

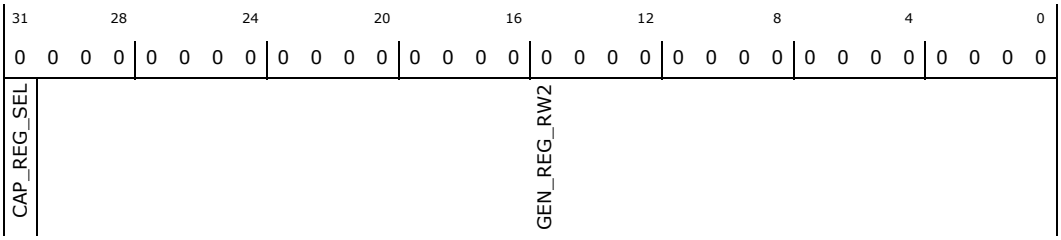
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW2: [B:0, D:16, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.5.15 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

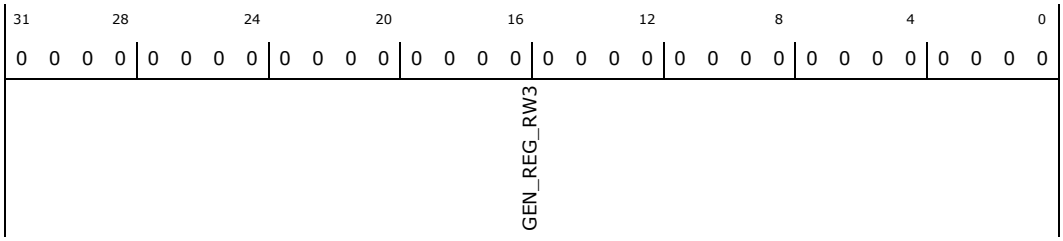
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW3: [B:0, D:16, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.5.16 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

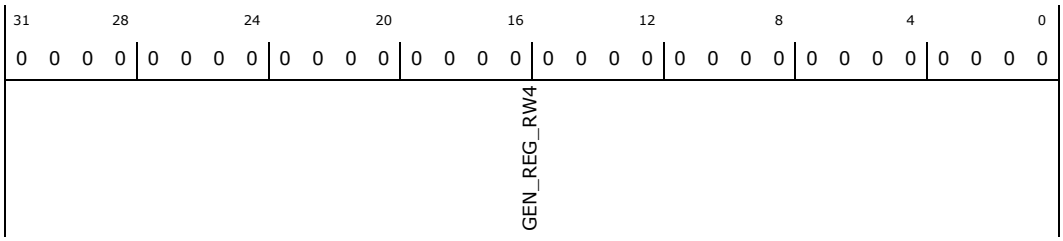
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW4: [B:0, D:16, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.5.17 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

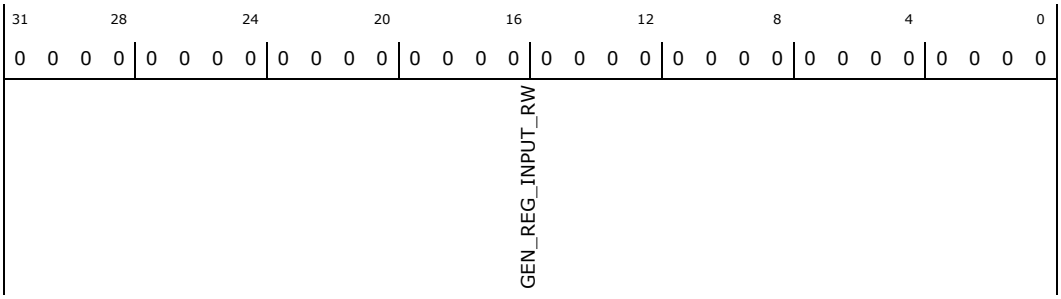
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:16, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.5.18 reg_MANID_type (MANID)—Offset F8h

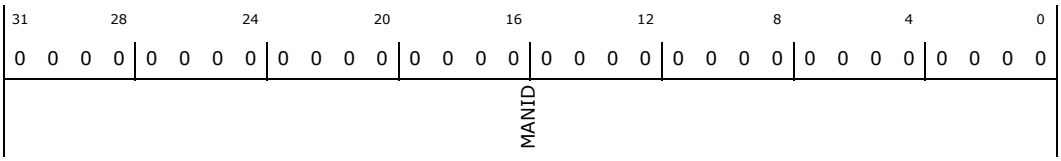
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:16, F:0] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**MANID:** Reserved.

16.6 eMMC Memory Mapped IO Registers

Table 172. Summary of eMMC Memory Mapped I/O Registers—BAR

Offset	Size	Register ID—Description	Default Value

FEh	2	"Host Controller Version Register (HOST_CTRL_VER)—Offset FEh" on page 1630	B402h

16.6.1 SDMA System Address Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers

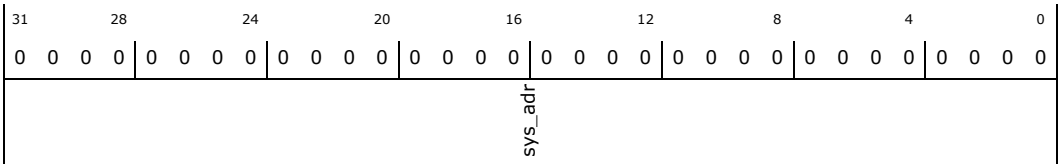
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SYS_ADR: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**SYS_ADR (sys_adr):** SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register.

16.6.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

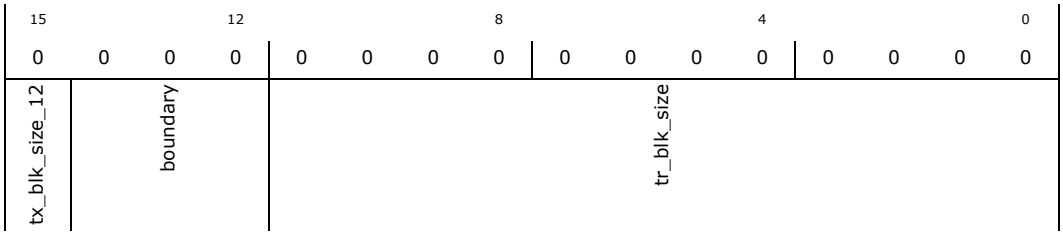
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_SIZE: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.
14:12	000b RW	**BOUNDARY (boundary):** Host SDMA Buffer Boundary The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. 000b - 4K bytes (Detects A11 carry out) 001b - 8K bytes (Detects A12 carry out) 010b - 16K Bytes (Detects A13 carry out) 011b - 32K Bytes (Detects A14 carry out) 100b - 64K bytes (Detects A15 carry out) 101b - 128K Bytes (Detects A16 carry out) 110b - 256K Bytes (Detects A17 carry out) 111b - 512K Bytes (Detects A18 carry out)
11:0	000h RW	**TR_BLK_SIZE (tr_blk_size):** Transfer Block Size This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. 0800h 2048 Bytes ??? ??? 0200h 512 Bytes 01FFh 511 Bytes ??? ??? 0004h 4 Bytes 0003h 3 Bytes 0002h 2 Bytes 0001h 1 Byte 0000h No data transfer

16.6.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks

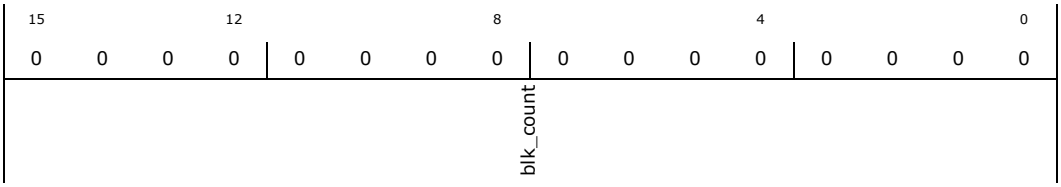
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_COUNT: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW	**BLK_COUNT (blk_count):** Blocks Count For Current Transfer This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers

16.6.4 Argument Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

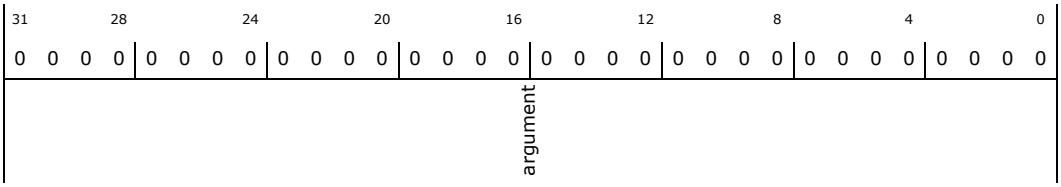
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ARGUMENT: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ARGUMENT (argument):** Command Argument The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.6.5 Transfer Mode Register (TX_MODE)—Offset Ch

Transfer Mode Register

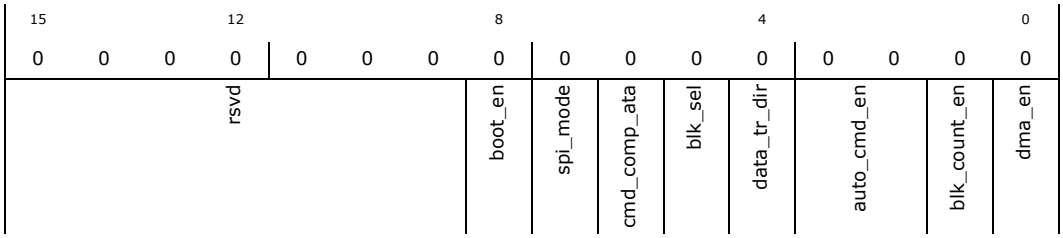
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

TX_MODE: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:9	00h RO	**RSVD (rsvd):** Reserved
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data_TR_Dir (data_tr_dir):** Data Transfer Direction Select This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands. 1 Read (Card to Host) 0 Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**BLK_COUNT_EN (blk_count_en):** Block Count Enable This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8) If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. 1 Enable 0 Disable
0	0b RW	**DMA_EN (dma_en):** DMA Enable This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). 1 DMA Data transfer 0 No data transfer or Non DMA data transfer

16.6.6 Command Register (CMD)—Offset Eh

Command Register

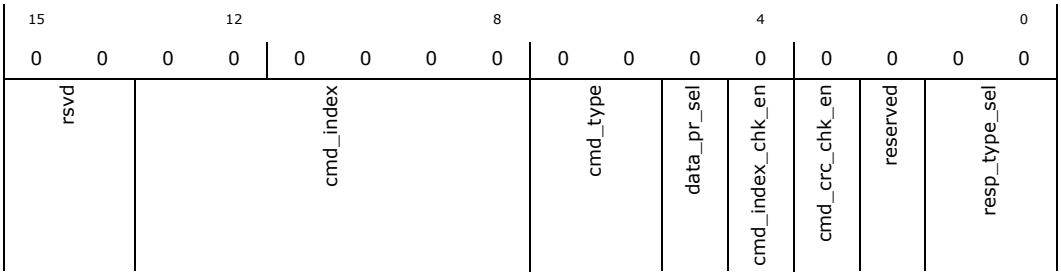
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CMD: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:14	0h RO	**RSVD (rsvd):** Reserved
13:8	0h RW	**CMD_INDEX (cmd_index):** Command Index These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**CMD_TYPE (cmd_type):** Command Type
5	0b RW	**DATA_PR_SEL (data_pr_sel):** Data Present Select This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38) (3) Resume command 1 Data Present 0 No Data Present
4	0b RW	**CMD_INDEX_CHK_EN (cmd_index_chk_en):** Command Index Check Enable If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. 1 Enable 0 Disable
3	0b RW	**CMD_CRC_CHK_EN (cmd_crc_chk_en):** Command CRC Check Enable If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) 1 Enable 0 Disable
2	0b RO	**Reserved (reserved):** Reserved
1:0	0h RW	**RESP_TYPE_SEL (resp_type_sel):** Response Type Select 00 No Response 01 Response Length 136 10 Response Length 48 11 Response Length 48 check Busy after response

16.6.7 Response Register0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards

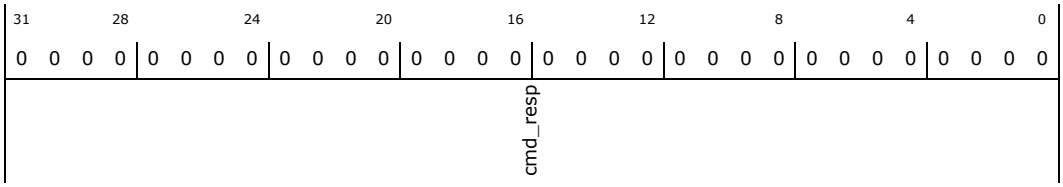
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE0: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP0 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.6.8 Response Register2 (RESPONSE2)—Offset 14h

This register is used to store responses from SD cards

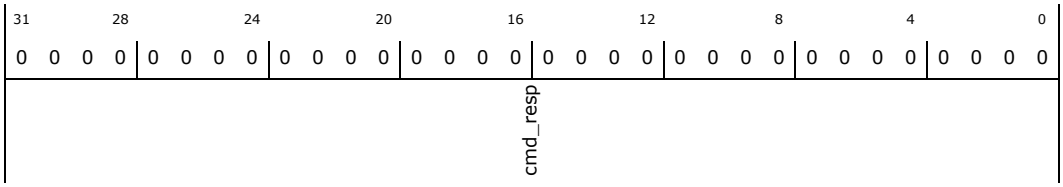
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE2: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP2 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.6.9 Response Register4 (RESPONSE4)—Offset 18h

This register is used to store responses from SD cards

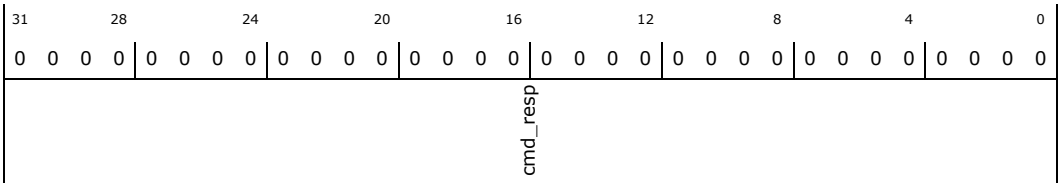
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE4: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP4 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.6.10 Response Register6 (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD cards

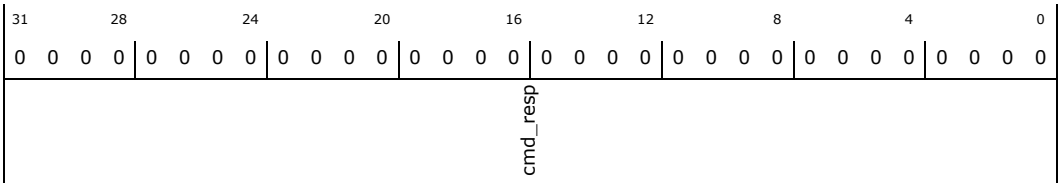
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE6: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP6 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.6.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer

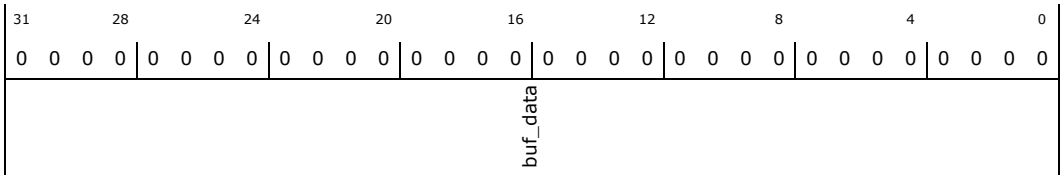
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BUF_DATA_PORT: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**BUF_DATA (buf_data):** Buffer Data The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to 1.7

16.6.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register

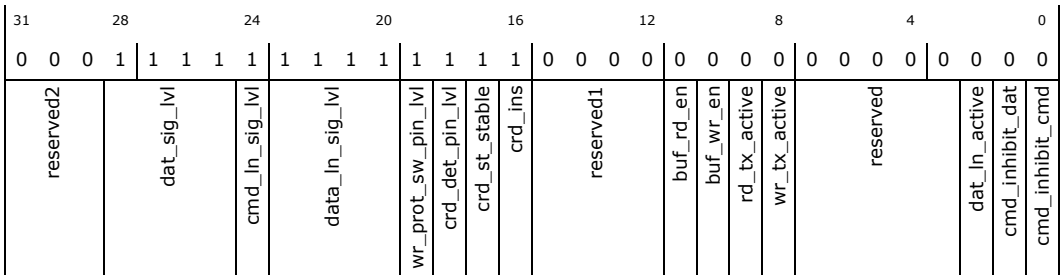
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRE_STATE: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 1FFF0000h



Bit Range	Default & Access	Description
31:29	0h RO	**Reserved2 (reserved2):** Reserved
28:25	1111b RO	**DAT_SIG_LVL (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. D28 - DAT[7] D27 - DAT[6] D26 - DAT[5] D25 - DAT[4]

16.6.13 Host Control Register (HOST_CTL)—Offset 28h

Host Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

HOST_CTL: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel		hi_spd_en	data_tx_wid	led_ctl

Bit Range	Default & Access	Description
7	0b RW	**CRD_DET_SIG_SEL (crd_det_sig_sel):** Card Detect Signal Selection
6	0b RW	**CRD_DET_TST_LVL (crd_det_tst_lvl):** Card Detect Test Level

Bit Range	Default & Access	Description
5	0b RW	**SD8_BIT_MODE (sd8_bit_mode):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	**DMA_SEL (dma_sel):** DMA Select
2	0b RW	**HI_SPD_EN (hi_spd_en):** High Speed Enable
1	0b RW	**DATA_TX_WID (data_tx_wid):** Data Transfer Width
0	0b RW	**LED_CTL (led_ctl):** LED Control

16.6.14 Power Control Register (PWR_CTL)—Offset 29h

Power Control Register

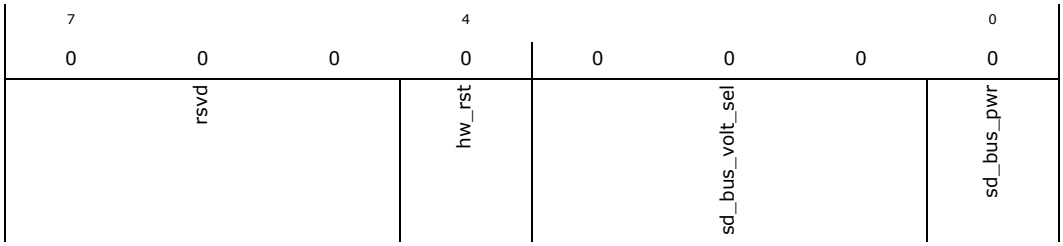
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PWR_CTL: [BAR] + 29h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:5	0h RO	**RSVD (rsvd):** Reserved
4	0b RW	**HW_rst (hw_rst):** HW reset
3:1	0h RW	**SD_BUS_VOLT_SEL (sd_bus_volt_sel):** SD Bus Voltage Select
0	0b RW	**SD_BUS_PWR (sd_bus_pwr):** SD Bus Power

16.6.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Block Gap Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

_BLK_GAP_CTL: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req

Bit Range	Default & Access	Description
7:5	0h RO	**RSVD (rsvd):** Reserved
4	0b RW	**DRIVE_CCSD (drive_ccsd):** If the driver set this bit (change from ???0?? to ???1??), Host controller will send command completion
3	0b RW	**INT_BLK_GAP (int_blk_gap):** Interrupt At Block Gap
2	0b RW	**RD_WAIT_CTL (rd_wait_ctl):** Read Wait Control
1	0b RW	**CONT_REQ (cont_req):** Continue Request
0	0b RW	**STP_BLK_GAP_REQ (stp_blk_gap_req):** Stop At Block Gap Request

16.6.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is used for wakeup event control.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

WAKEUP_CTL: [BAR] + 2Bh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd					wakeup_en_sd_rm	wakeup_en_sd_ins	wakeup_en_crd_int

Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**WAKEUP_EN_SD_RM (wakeup_en_sd_rm):** Wakeup Event Enable On SD Card Removal
1	0b RW	**WAKEUP_EN_SD_INS (wakeup_en_sd_ins):** Wakeup Event Enable On SD Card Insertion
0	0b RW	**WAKEUP_EN_CRD_INT (wakeup_en_crd_int):** Wakeup Event Enable On Card Interrupt

16.6.17 Clock Control Register (CLK_CTL)—Offset 2Ch

This register is used configure the frequency of the SDIO controller, and enable the clock.

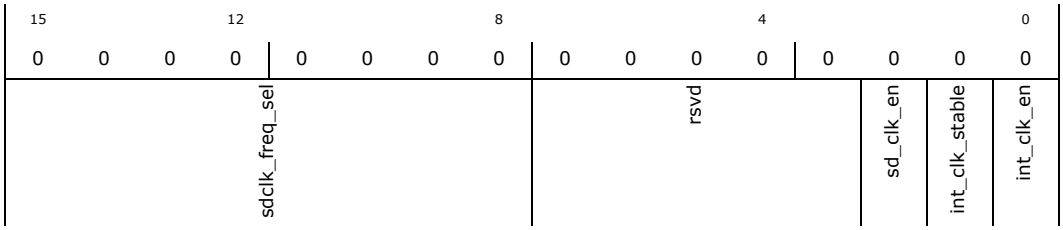
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CLK_CTL: [BAR] + 2Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RW	**SDCLK_FREQ_SEL (sdclk_freq_sel):** SDCLK Frequency Select
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SD_CLK_EN (sd_clk_en):** SD Clock Enable
1	0b RO	**INT_CLK_STABLE (int_clk_stable):** Internal Clock Stable
0	0b RW	**INT_CLK_EN (int_clk_en):** Internal Clock Enable

16.6.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

Timeout Control Register

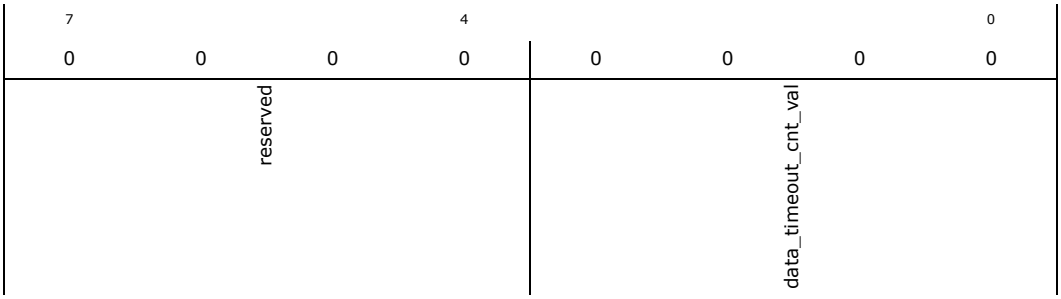
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

TIMEOUT_CTL: [BAR] + 2Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:4	0h RO	**Reserved (reserved):** Reserved
3:0	0h RW	**DATA_TIMEOUT_CNT_VAL (data_timeout_cnt_val):** Data Timeout Counter Value

16.6.19 Software Reset Register (SW_RST)—Offset 2Fh

Software Reset Register

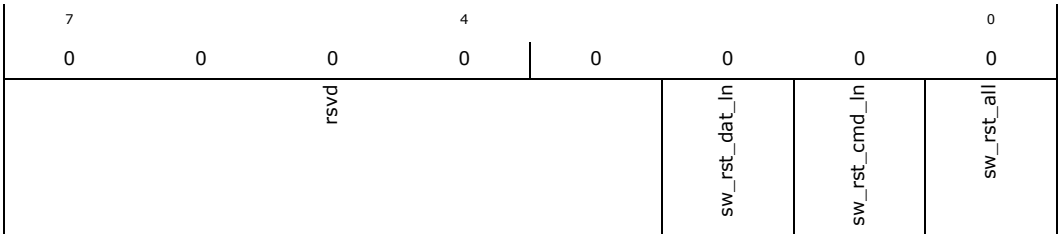
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SW_RST: [BAR] + 2Fh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SW_RST_DAT_LN (sw_rst_dat_ln):** Software Reset For DAT Line
1	0b RW	**SW_RST_CMD_LN (sw_rst_cmd_ln):** Software Reset For CMD Line

Bit Range	Default & Access	Description
0	0b RW	**SW_RST_ALL (sw_rst_all):** Software Reset For All

16.6.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

Normal Interrupt Status Register

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

NML_INT_STATUS: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h

16.6.26 Auto CMD12 Error Status Register and Host control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch

Auto CMD12 Error Status Register and Host control 2 Register

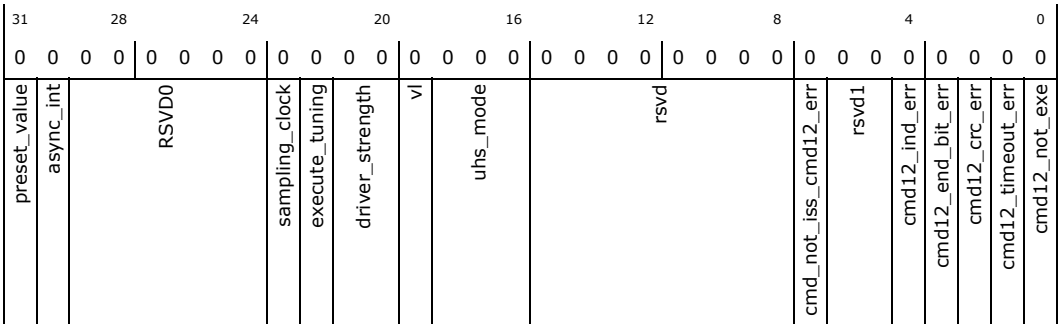
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CMD12_ERR_STAT_HOST_CTRL_2: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**PRESET_VALUE (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**ASYNC_INT (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 1 Enabled 0 Disabled
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**SAMPLING_CLOCK (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared
22	0b RW/AC	**EXECUTE_TUNING (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 1 Execute Tuning 0 Not Tuned or Tuning Completed
21:20	0b RW	**DRIVER_STRENGTH (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit
19	0b RW	**VL (vl):** This bit controls voltage regulator for I/O cell
18:16	0b RW	**UHS_MODE (uhs_mode):** This field is used to select one of UHS-I modes
15:8	0h RO	**RSVD (rsvd):** Reserved

Bit Range	Default & Access	Description
7	0b RO	**CMD_NOT_ISS_CMD12_ERR (cmd_not_iss_cmd12_err):** Command Not Issued By Auto CMD12 Error

Bit Range	Default & Access	Description
31:24	0h RO	**RSVD (rsvd):** Reserved
23:16	00h RO	**MAX_CUR_1p8V (max_cur_1p8v):** Maximum Current for 1.8V
15:8	00h RO	**MAX_CUR_3p0V (max_cur_3p0v):** Maximum Current for 3.0V
7:0	00h RO	**MAX_CUR_3p3V (max_cur_3p3v):** Maximum Current for 3.3V

16.6.30 Force Event Register for Auto CMD12 Error Status (FORCE_EVENT_CMD12_ERR_STAT)—Offset 50h

Force Event Register for Auto CMD12 Error Status

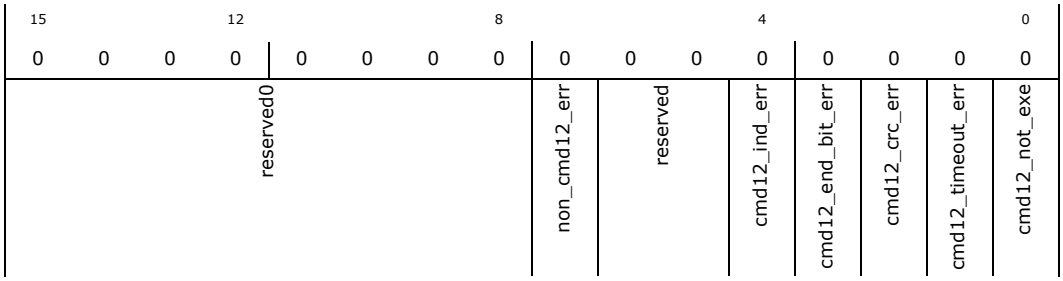
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

FORCE_EVENT_CMD12_ERR_STAT: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RO	**Reserved0 (reserved0):** Reserved
7	0b RW	**NON_CMD12_ERR (non_cmd12_err):** Force Event for Command Not Issued By Auto CMD12 Error :
6:5	00b RO	**Reserved (reserved):** Reserved
4	0b RW	**CMD12_IND_ERR (cmd12_ind_err):** Force Event for Auto CMD12 Index Error
3	0b RW	**CMD12_END_BIT_ERR (cmd12_end_bit_err):** Force Event for Auto CMD12 End Bit Error
2	0b RW	**CMD12_CRC_ERR (cmd12_crc_err):** Force Event for Auto CMD12 CRC Error
1	0b RW	**CMD12_TIMEOUT_ERR (cmd12_timeout_err):** Force Event for Auto CMD12 Timeout Error
0	0b RW	**CMD12_NOT_EXE (cmd12_not_exe):** Force Event for Auto CMD12 Not Executed

16.6.31 Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h

Force Event Register for Error Interrupt Status

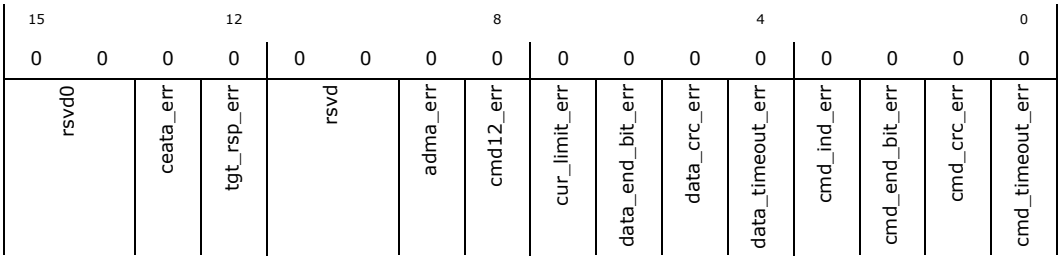
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

FORCE_EVENT_ERR_INT_STAT: [BAR] + 52h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:14	00b RO	**RSVD0 (rsvd0):** Reserved
13	0b RW	**CEATA_ERR (ceata_err):** Force Event for CEATA error
12	0b RW	**TGT_RSP_ERR (tgt_rsp_err):** Force Event for Target Response Error
11:10	0h RO	**RSVD (rsvd):** Reserved
9	0b RW	**ADMA_ERR (adma_err):** Force Event for ADMA Error
8	0b RW	**CMD12_ERR (cmd12_err):** Force Event for Auto CMD12 Error
7	0b RW	**CUR_LIMIT_ERR (cur_limit_err):** Force Event for Current Limit Error
6	0b RW	**DATA_END_BIT_ERR (data_end_bit_err):** Force Event for Data End Bit Error
5	0b RW	**DATA_CRC_ERR (data_crc_err):** Event for Data CRC Error
4	0b RW	**DATA_TIMEOUT_ERR (data_timeout_err):** Event for Data Timeout Error
3	0b RW	**CMD_IND_ERR (cmd_ind_err):** Force Event for Command Index Error
2	0b RW	**CMD_END_BIT_ERR (cmd_end_bit_err):** Force Event for Command End Bit Error
1	0b RW	**CMD_CRC_ERR (cmd_crc_err):** Force Event for Command CRC Error
0	0b RW	**CMD_TIMEOUT_ERR (cmd_timeout_err):** Force Event for Command Timeout Error

16.6.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

ADMA Error Status Register

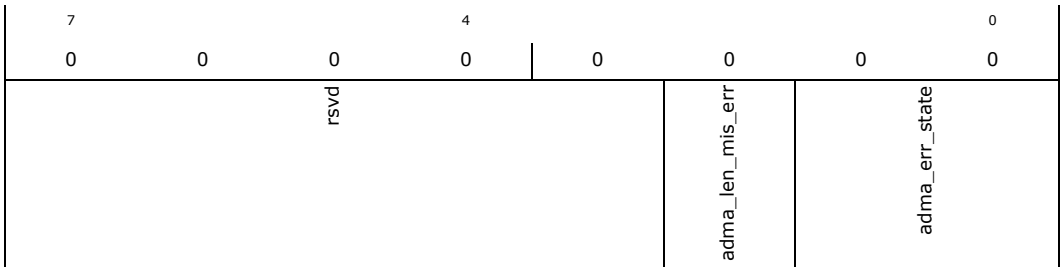
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

ADMA_ERR_STAT: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RO	**ADMA_LEN_MIS_ERR (adma_len_mis_err):** ADMA Length Mismatch Error
1:0	00b RO	**ADMA_ERR_STATE (adma_err_state):** ADMA Error State

16.6.33 ADMA System Address Register (ADMA_SYS_ADDR)—Offset 58h

This register contains the physical Descriptor address used for ADMA data transfer.

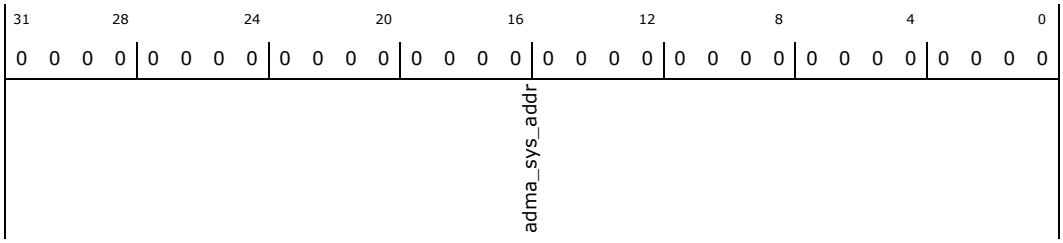
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ADMA_SYS_ADDR: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**ADMA_SYS_ADDR (adma_sys_addr):** ADMA System Address

16.6.34 Preset Values registers (PRESET_VALUE_0)—Offset 60h

Preset Values init and default speed

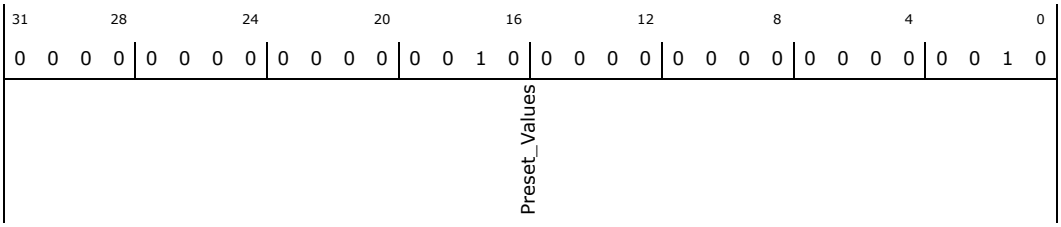
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_0: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00020002h



Bit Range	Default & Access	Description
31:0	00020002h RO	**PresetValues (Preset_Values):** Reserved.

16.6.35 Preset Values 1 registers (PRESET_VALUE_1)—Offset 64h

Preset Values high and sdr12

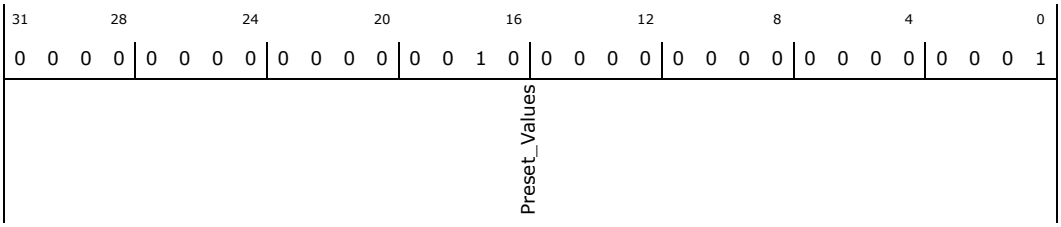
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_1: [BAR] + 64h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00020001h



Bit Range	Default & Access	Description
31:0	00020001h RO	**PresetValues (Preset_Values):** Reserved.

16.6.36 Preset Values 2 registers (PRESET_VALUE_2)—Offset 68h

Preset Values sdr25 and sdr50

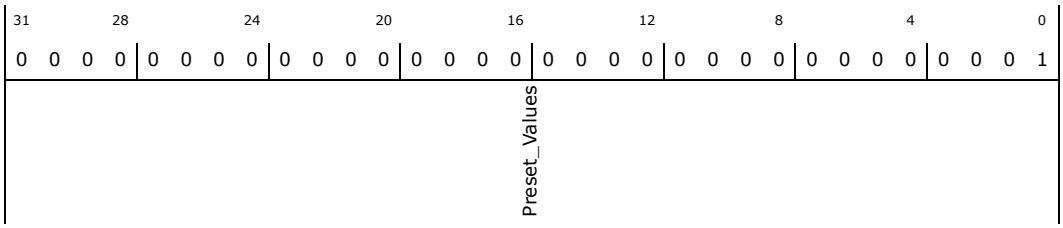
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_2: [BAR] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:0	00000001h RO	**PresetValues (Preset_Values):** Reserved.

16.6.37 Preset Values 3 registers (PRESET_VALUE_3)—Offset 6Ch

Preset Values sdr104 and ddr50

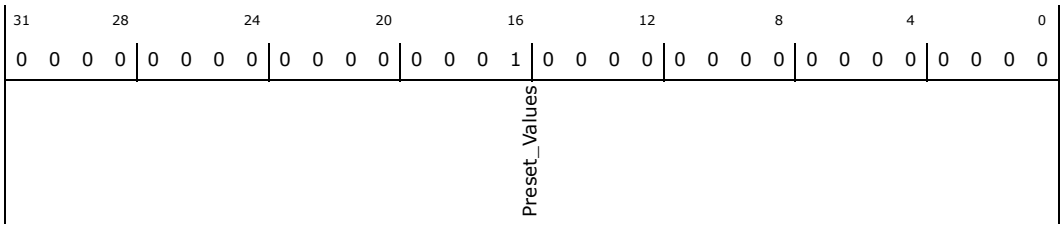
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_3: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00010000h



Bit Range	Default & Access	Description
31:0	00010000h RO	**PresetValues (Preset_Values):** Reserved.

16.6.38 BOOT_TIMEOUT_CTRL (BOOT_TIMEOUT_CTRL)—Offset 70h

BOOT_TIMEOUT_CTRL

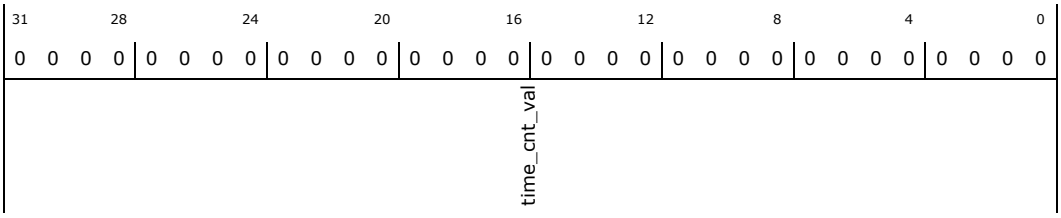
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BOOT_TIMEOUT_CTRL: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**TIME_CNT_VAL (time_cnt_val):** Boot Data Timeout Counter Value

16.6.39 DEBUG_SEL (DEBUG_SEL)—Offset 74h

Debug Selection Register

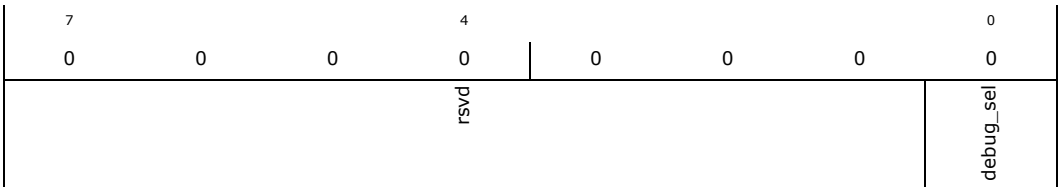
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

DEBUG_SEL: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	00h RO	**RSVD (rsvd):** Reserved
0	0b WO	**DEBUG_SEL (debug_sel):** 1 - cmd register, interrupt status, transmitter module, ahb_iface module and clk sdcard signals are probed out..

16.6.40 Shared Bus Control Register (SHARED_BUS)—Offset E0h

Shared Bus Control Register

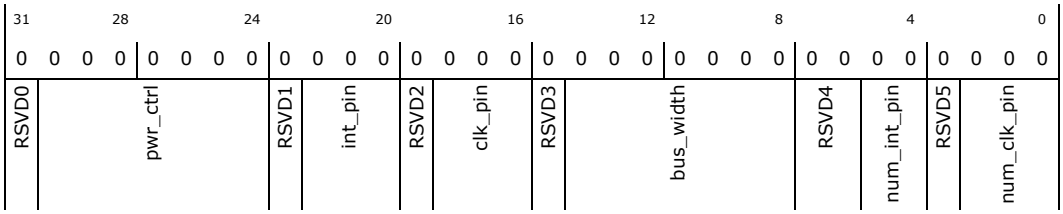
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SHARED_BUS: [BAR] + E0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**RSVD0:** Reserved
30:24	0h RW	**PWR_CTRL (pwr_ctrl):** Each bit of this field controls back-end power supply for an embedded device. Host interface voltage (VDDH) is not controlled by this field. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices can be controlled D24 Back-end Power Control for Device 1 D25 Back-end Power Control for Device 2 D26 Back-end Power Control for Device 3 D27 Back-end Power Control for Device 4 D28 Back-end Power Control for Device 5 D29 Back-end Power Control for Device 6 D30 Back-end Power Control for Device 7 The function of each bit is defined as follows: 0 Back-end Power is Off 1 Back-end Power is Supplied Back-End power control is effective for embedded memory devices in the Sleep State that support the Sleep command (CMD14) to reduce power consumption and embedded SDIO devices when IOEx is set to 0.
23	0b RO	**RSVD1:** Reserved
22:20	0h RW	**INT_PIN (int_pin):** Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless. 000b Interrupt is detected by Interrupt Cycle xx1b INT_A is Enabled x1xb INT_B is Enabled 1xxb INT_C is Enabled
19	0b RO	**RSVD2:** Reserved
18:16	0h RW	**CLK_PIN (clk_pin):** One of clock pin outputs is selected by this field. Select of unsupported clock pin is meaningless. Refer to Figure 2-38 for the timing of clock outputs. 000b Clock Pins are Disabled 001b CLK[1] is Selected 010b CLK[2] is Selected .... 111b CLK[7] is Selected
15	0b RO	**RSVD3:** Reserved
14:8	0h RO	**BUS_WIDTH (bus_width):** Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices are supported.This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1.D08 - Bus width preset for Device 1 D09 - Bus width preset for Device 2 D10 - Bus width preset for Device 3 D11 - Bus width preset for Device 4 D12 - Bus width preset for Device 5 D13 - Bus width preset for Device 6 D14 - Bus width preset for Device 7 The function of each bit is defined as follows: 0 - 4 bit buswidth mode 1 - 8 bit buswidth mode
7:6	0b RO	**RSVD4:** Reserved
5:4	0h RO	**NUM_INT_PIN (num_int_pin):** This field indicates support of interrupt input pins for shared bus system.Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired or connection is possible. 00b Interrupt Input Pin is Not Supported 01b INTA is Supported 10b INTA and INTB are Supported 11b INTA, INTB and INTC are Supported
3	0b RO	**RSVD5:** Reserved

Bit Range	Default & Access	Description
2:0	0h RO	**NUM_CLK_PIN (num_clk_pin):** This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported.Shared bus is supported by specific system. Then Standard Host Driver does not support control of these clock pins. 000b Shared bus is not supported 001b 1 SDCLK pin is supported 010b 2 SDCLK pins are supported .... 111b 7 SDCLK pins are supported

16.6.41 SPI_INT_SUP (SPI_INT_SUP)—Offset F0h

SPI_INT_SUP

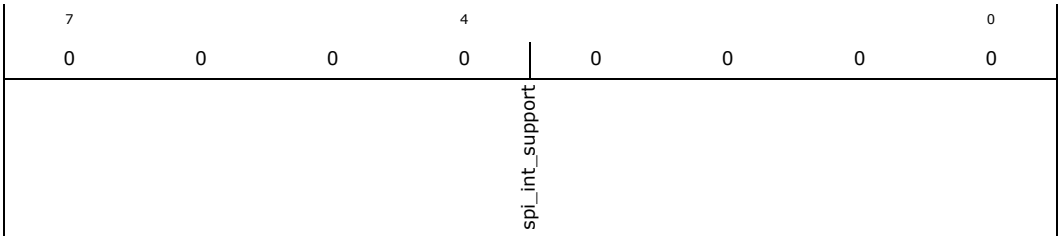
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SPI_INT_SUP: [BAR] + F0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**SPI_INT_SUPPORT (spi_int_support):** This bit is set to indicate the assertion assertion of interrupts in the SPI mode at any time, irrespective of the status of thecard select (CS) line. If this bit is zero, then SDIO card can only assert the interrupt line in the SPI mode when the CS line is asserted.

16.6.42 Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh

Slot Interrupt Status Register

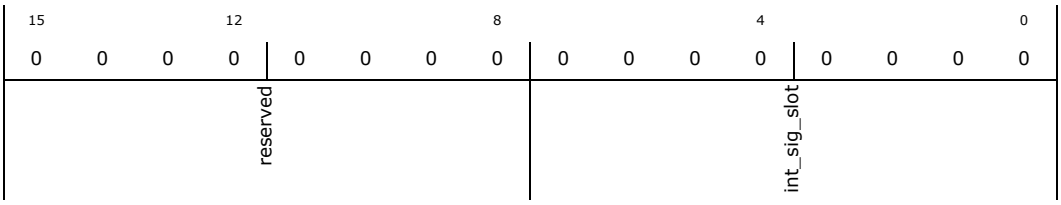
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SLOT_INT_STAT: [BAR] + FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RO	**Reserved (reserved):** Reserved
7:0	00h RO	**INT_SIG_SLOT (int_sig_slot):** Interrupt Signal For Each Slot

16.6.43 Host Controller Version Register (HOST_CTRL_VER)—Offset FEh

Host Controller Version Register

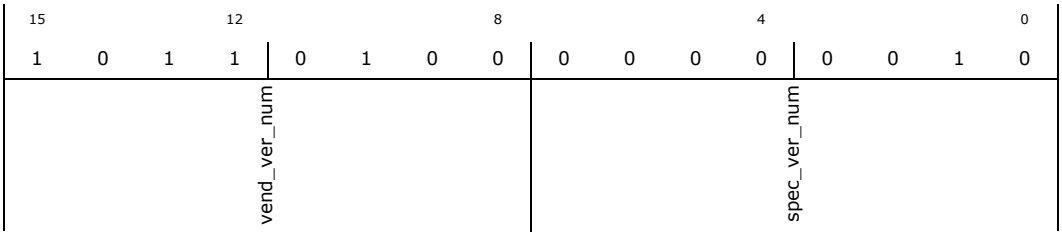
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

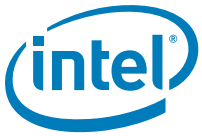
HOST_CTRL_VER: [BAR] + FEh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:16, F:0] + 10h

Default: B402h



Bit Range	Default & Access	Description
15:8	b4h RO	**VEND_VER_NUM (vend_ver_num):** Vendor Version Number
7:0	02h RO	**SPEC_VER_NUM (spec_ver_num):** Version Number



16.7 SDIO PCI Configuration Registers

Table 173. Summary of SDIO PCI Configuration Registers—0/17/0

Offset	Size	Register ID—Description	Default Value
0h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 1631	00000000h
4h	4	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 1632	00100000h
8h	4	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 1633	00000000h
Ch	4	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 1633	00000000h
10h	4	"reg_BAR_type (BAR)—Offset 10h" on page 1634	00000000h
14h	4	"reg_BAR1_type (BAR1)—Offset 14h" on page 1634	00000000h
2Ch	4	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 1635	00000000h
30h	4	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1636	00000000h
34h	4	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 1636	00000080h
3Ch	4	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 1637	00000100h
80h	4	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 1637	48030001h
84h	4	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 1638	00000008h
A0h	4	"reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h" on page 1638	00000000h
A4h	4	"reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h" on page 1639	00000000h
A8h	4	"reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h" on page 1639	00000000h
ACh	4	"reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh" on page 1640	00000000h
C0h	4	"reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h" on page 1640	00000000h
F8h	4	"reg_MANID_type (MANID)—Offset F8h" on page 1641	00000000h

16.7.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

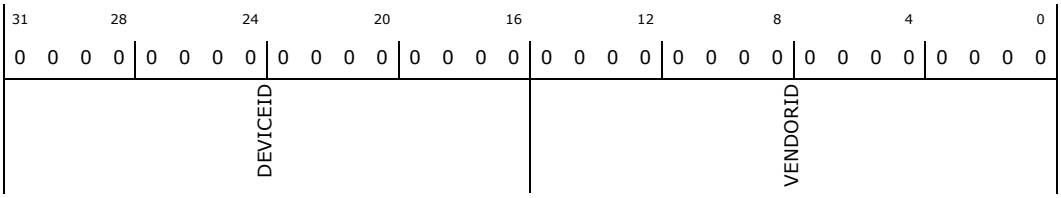
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

DEVVENDID: [B:0, D:17, F:0] + 0h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**DEVICEID:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RO	**VENDORID:** Reserved.

16.7.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

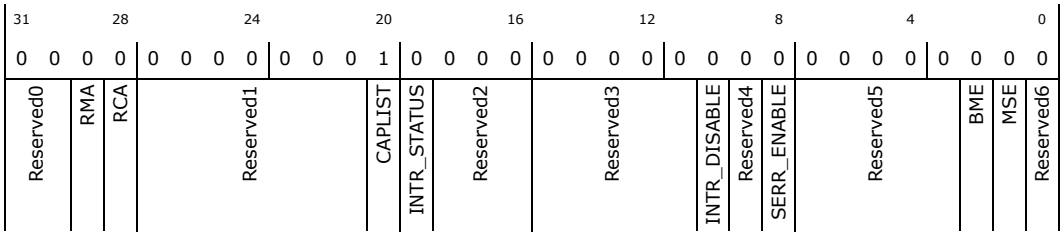
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

STATUSCOMMAND: [B:0, D:17, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**RMA:** Reserved.
28	0h RW/1C	**RCA:** Reserved.
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**CAPLIST:** Reserved.
19	0h RO	**INTR_STATUS:** Reserved.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**INTR_DISABLE:** Reserved.
9	0h RO	**Reserved4:** Reserved.
8	0h RW	**SERR_ENABLE:** Reserved.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**BME:** Reserved.

Bit Range	Default & Access	Description
1	0h RW	**MSE:** Reserved.
0	0h RO	**Reserved6:** Reserved.

16.7.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

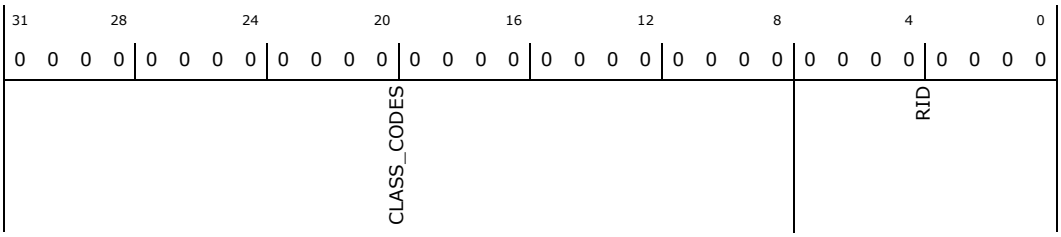
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:17, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

16.7.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

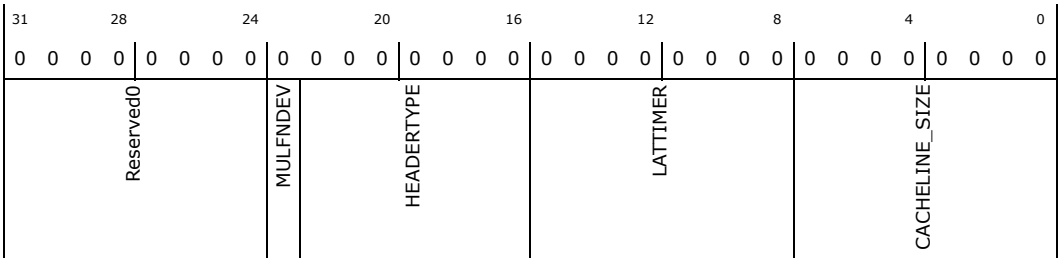
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:17, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

16.7.5 reg_BAR_type (BAR)—Offset 10h

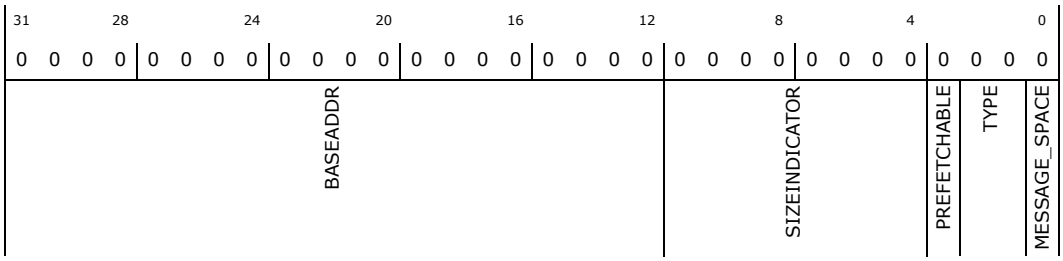
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR:** Reserved.
11:4	00h RO	**SIZEINDICATOR:** Reserved.
3	0h RO	**PREFETCHABLE:** Reserved.
2:1	0h RO	**TYPE:** Reserved.
0	0h RO	**MESSAGE_SPACE:** Reserved.

16.7.6 reg_BAR1_type (BAR1)—Offset 14h

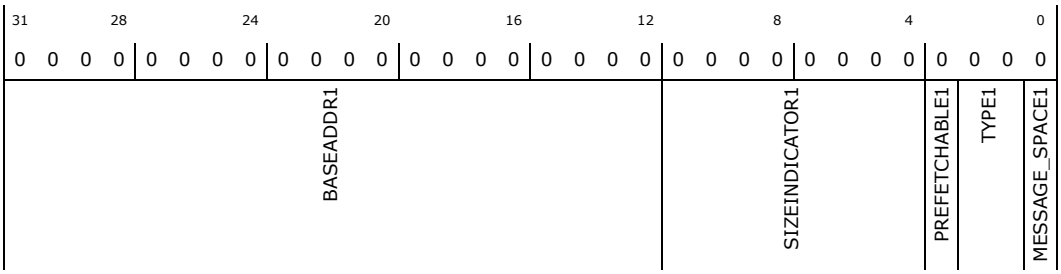
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR1: [B:0, D:17, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR1:** Reserved.
11:4	00h RO	**SIZEINDICATOR1:** Reserved.
3	0h RO	**PREFETCHABLE1:** Reserved.
2:1	0h RO	**TYPE1:** Reserved.
0	0h RO	**MESSAGE_SPACE1:** Reserved.

16.7.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

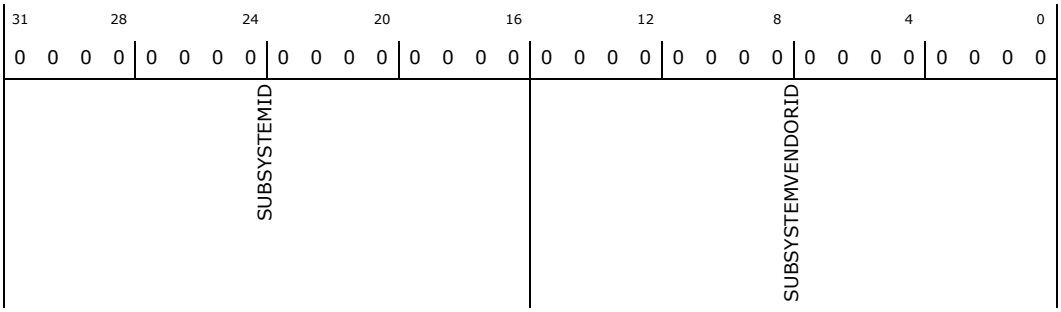
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:17, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

16.7.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

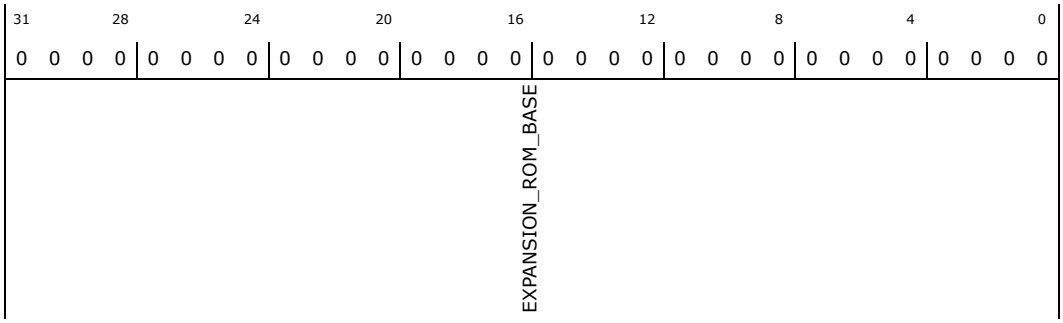
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

EXPANSION_ROM_BASEADDR: [B:0, D:17, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

16.7.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

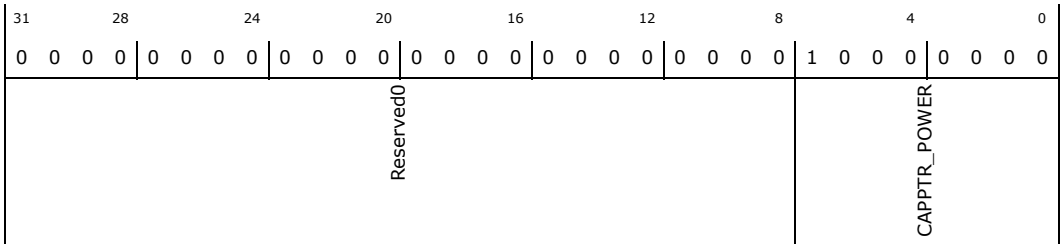
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPABILITYPTR: [B:0, D:17, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**CAPPTR_POWER:** Reserved.

16.7.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

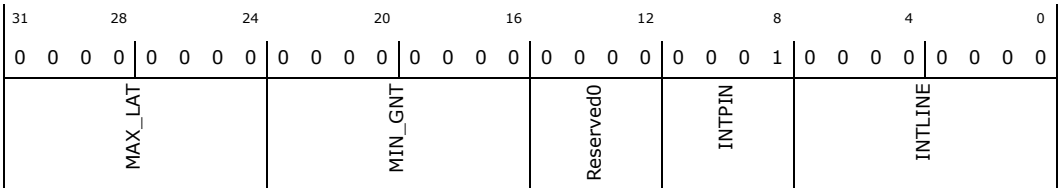
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTERRUPTREG: [B:0, D:17, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Description
31:24	00h RO	**MAX_LAT:** Reserved.
23:16	00h RO	**MIN_GNT:** Reserved.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**INTPIN:** Reserved.
7:0	00h RW	**INTLINE:** Reserved.

16.7.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

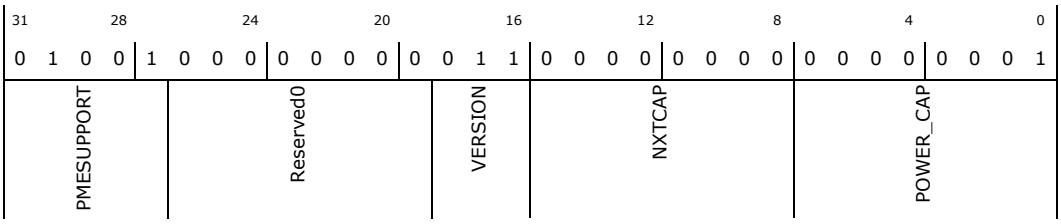
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

POWERCAPID: [B:0, D:17, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Description
31:27	09h RO	**PMESUPPORT:** Reserved.
26:19	00h RO	**Reserved0:** Reserved.

Bit Range	Default & Access	Description
18:16	3h RO	**VERSION:** Reserved.
15:8	00h RO	**NXTCAP:** Reserved.
7:0	01h RO	**POWER_CAP:** Reserved.

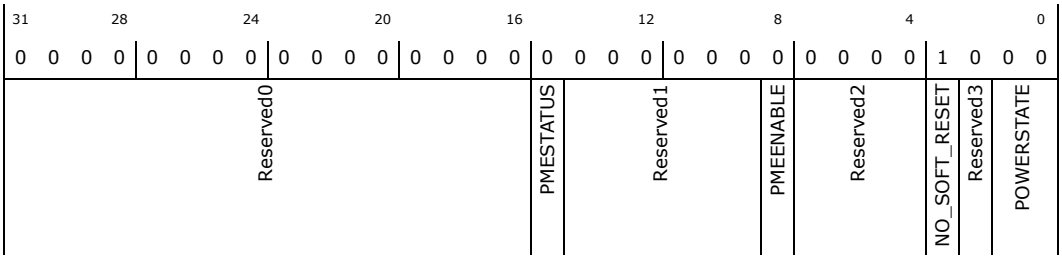
16.7.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMECTRLSTATUS: [B:0, D:17, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PMESTATUS:** Reserved.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PMEENABLE:** Reserved.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**NO_SOFT_RESET:** Reserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**POWERSTATE:** Reserved.

16.7.13 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

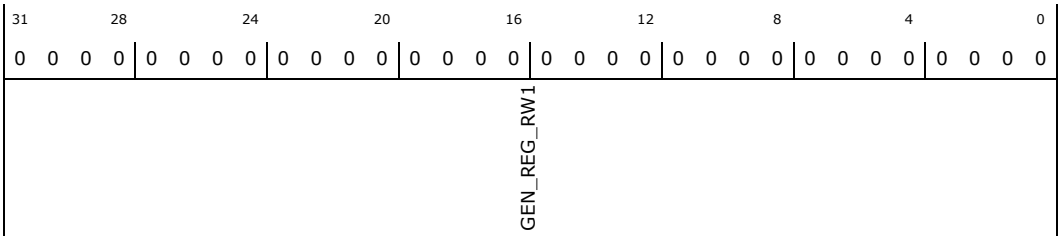
General Purpose Read Write Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:17, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.7.14 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

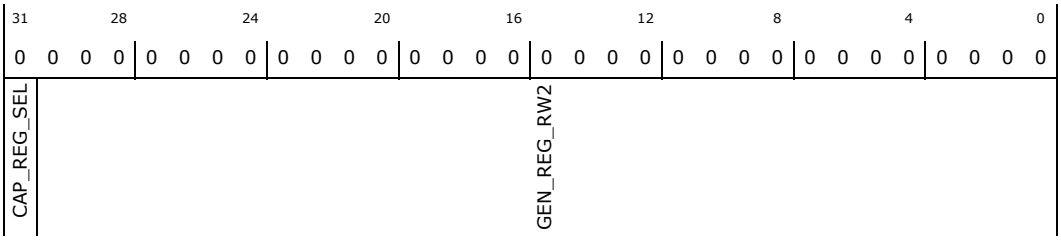
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW2: [B:0, D:17, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.7.15 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

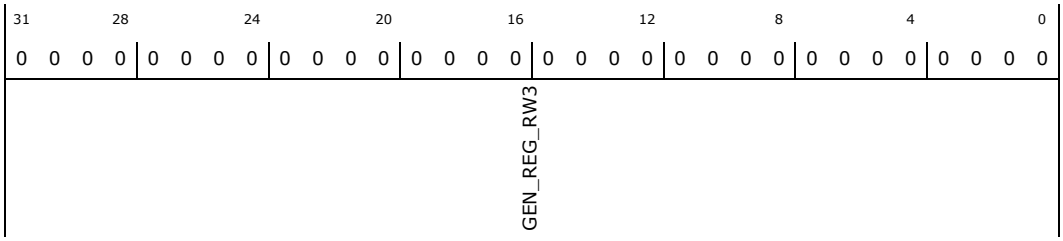
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW3: [B:0, D:17, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.7.16 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

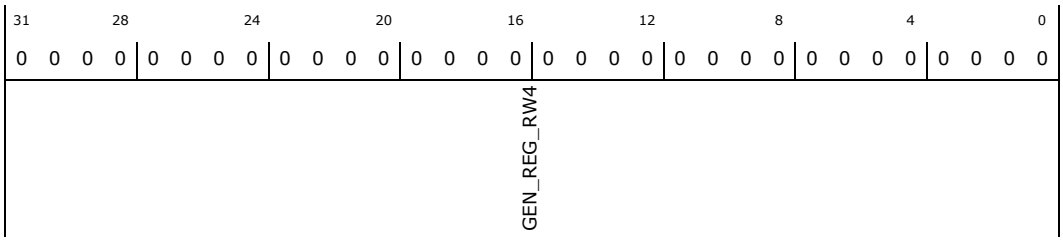
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW4: [B:0, D:17, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.7.17 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

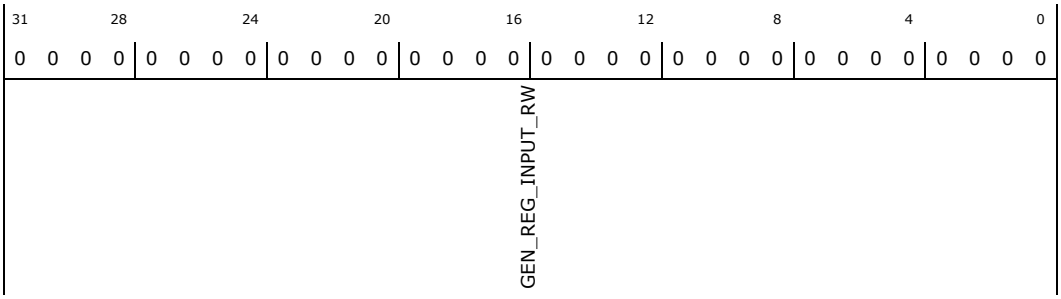
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:17, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.7.18 reg_MANID_type (MANID)—Offset F8h

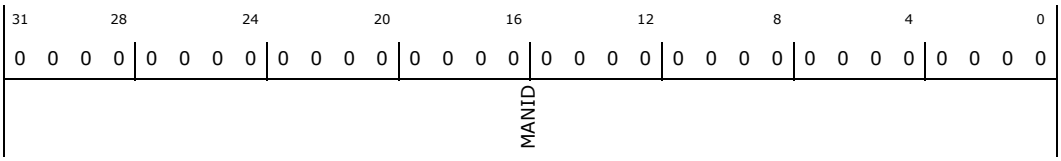
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:17, F:0] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**MANID:** Reserved.

16.8 SDIO Memory Mapped IO Registers

Table 174. Summary of SDIO Memory Mapped I/O Registers—BAR

Offset	Size	Register ID—Description	Default Value
0h	4	"SDMA System Address Register (SYS_ADR)—Offset 0h" on page 1643	00000000h
4h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1643	0000h

16.8.1 SDMA System Address Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers

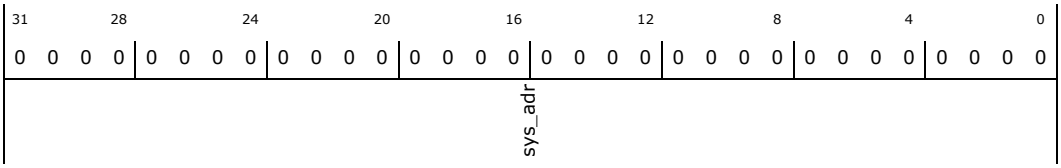
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SYS_ADR: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**SYS_ADR (sys_adr):** SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register.

16.8.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

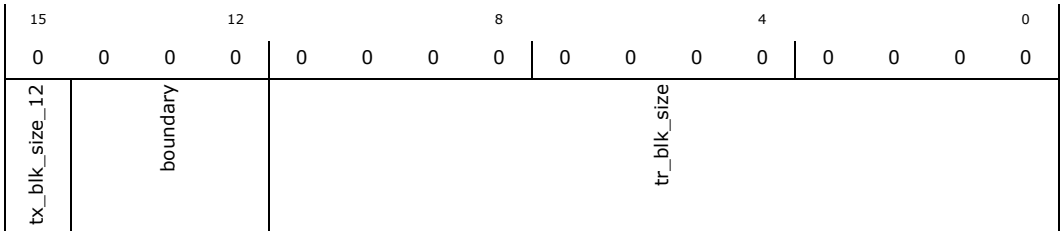
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_SIZE: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.
14:12	000b RW	**BOUNDARY (boundary):** Host SDMA Buffer Boundary The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. 000b - 4K bytes (Detects A11 carry out) 001b - 8K bytes (Detects A12 carry out) 010b - 16K Bytes (Detects A13 carry out) 011b - 32K Bytes (Detects A14 carry out) 100b - 64K bytes (Detects A15 carry out) 101b - 128K Bytes (Detects A16 carry out) 110b - 256K Bytes (Detects A17 carry out) 111b - 512K Bytes (Detects A18 carry out)
11:0	000h RW	**TR_BLK_SIZE (tr_blk_size):** Transfer Block Size This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. 0800h 2048 Bytes ??? ??? 0200h 512 Bytes 01FFh 511 Bytes ??? ??? 0004h 4 Bytes 0003h 3 Bytes 0002h 2 Bytes 0001h 1 Byte 0000h No data transfer

16.8.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks

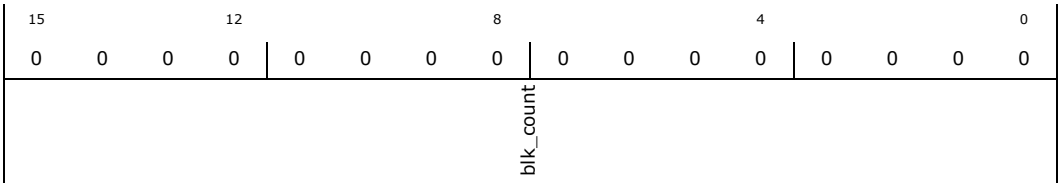
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_COUNT: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW	**BLK_COUNT (blk_count):** Blocks Count For Current Transfer This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers

16.8.4 Argument Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

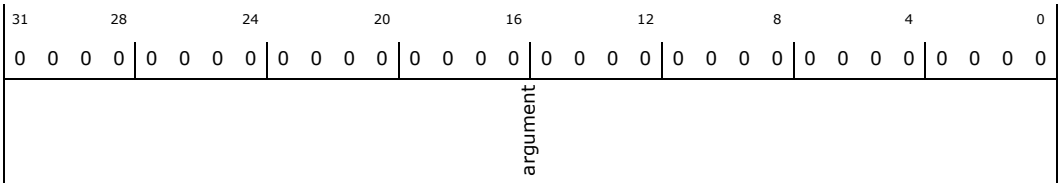
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ARGUMENT: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ARGUMENT (argument):** Command Argument The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.8.5 Transfer Mode Register (TX_MODE)—Offset Ch

Transfer Mode Register

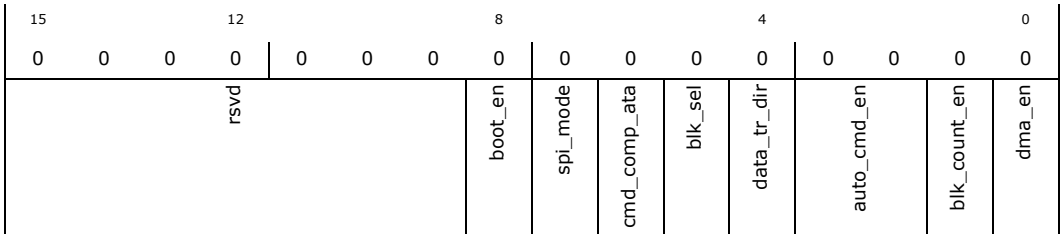
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

TX_MODE: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:9	00h RO	**RSVD (rsvd):** Reserved
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data_TR_Dir (data_tr_dir):** Data Transfer Direction Select This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands. 1 Read (Card to Host) 0 Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**BLK_COUNT_EN (blk_count_en):** Block Count Enable This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8) If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. 1 Enable 0 Disable
0	0b RW	**DMA_EN (dma_en):** DMA Enable This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). 1 DMA Data transfer 0 No data transfer or Non DMA data transfer

16.8.6 Command Register (CMD)—Offset Eh

Command Register

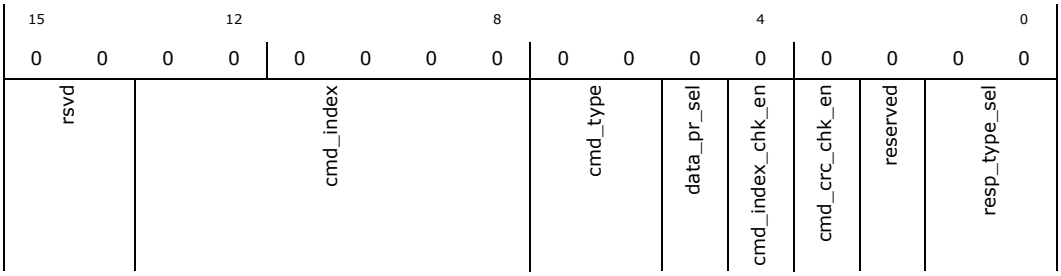
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CMD: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:14	0h RO	**RSVD (rsvd):** Reserved
13:8	0h RW	**CMD_INDEX (cmd_index):** Command Index These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**CMD_TYPE (cmd_type):** Command Type
5	0b RW	**DATA_PR_SEL (data_pr_sel):** Data Present Select This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38) (3) Resume command 1 Data Present 0 No Data Present
4	0b RW	**CMD_INDEX_CHK_EN (cmd_index_chk_en):** Command Index Check Enable If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. 1 Enable 0 Disable
3	0b RW	**CMD_CRC_CHK_EN (cmd_crc_chk_en):** Command CRC Check Enable If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) 1 Enable 0 Disable
2	0b RO	**Reserved (reserved):** Reserved
1:0	0h RW	**RESP_TYPE_SEL (resp_type_sel):** Response Type Select 00 No Response 01 Response Length 136 10 Response Length 48 11 Response Length 48 check Busy after response

16.8.7 Response Register0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards

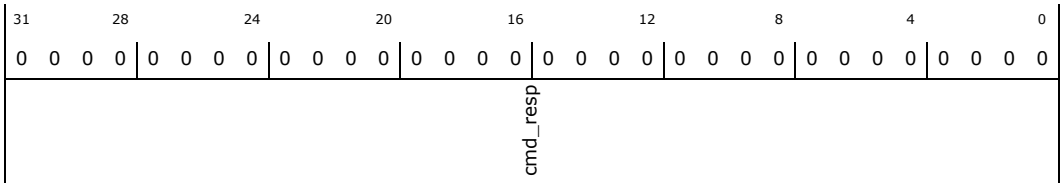
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE0: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP0 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.8 Response Register2 (RESPONSE2)—Offset 14h

This register is used to store responses from SD cards

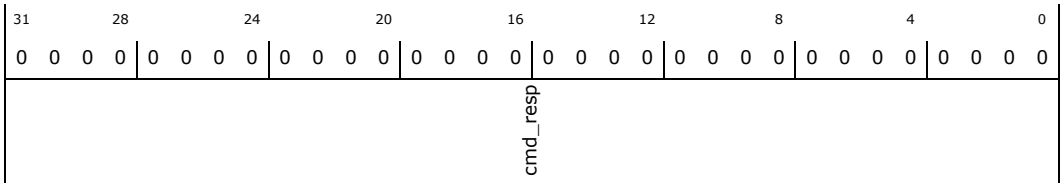
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE2: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP2 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.9 Response Register4 (RESPONSE4)—Offset 18h

This register is used to store responses from SD cards

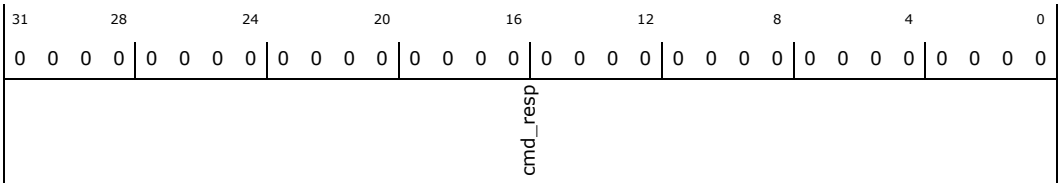
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE4: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP4 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.10 Response Register6 (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD cards

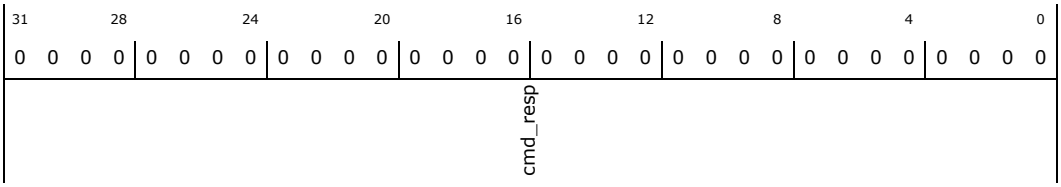
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE6: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP6 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer

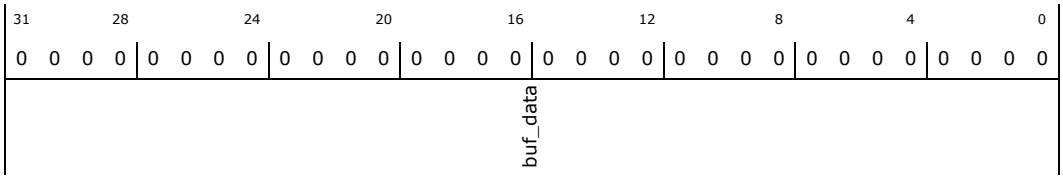
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BUF_DATA_PORT: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**BUF_DATA (buf_data):** Buffer Data The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to 1.7

16.8.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register

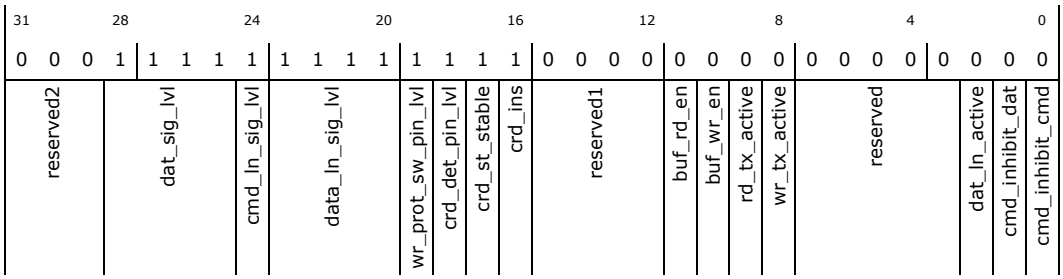
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

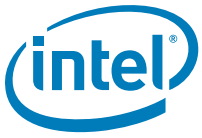
PRE_STATE: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 1FFF0000h



Bit Range	Default & Access	Description
31:29	0h RO	**Reserved2 (reserved2):** Reserved
28:25	1111b RO	**DAT_SIG_LVL (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. D28 - DAT[7] D27 - DAT[6] D26 - DAT[5] D25 - DAT[4]
24	1b RO	**CMD_LN_SIG_LVL (cmd_ln_sig_lvl):** CMD Line Signal Level This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DATA_LN_SIG_LVL (data_ln_sig_lvl):** DAT[3:0] Line Signal Level This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. D23 DAT[3] D22 DAT[2] D21 DAT[1] D20 DAT[0]
19	1b RO	**WR_PROT_SW_PIN_LVL (wr_prot_sw_pin_lvl):** Write Protect Switch Pin Level
18	1b RO	**CRD_DET_PIN_LVL (crd_det_pin_lvl):** Card Detect Pin Level
17	1b RO	**CRD_ST_STABLE (crd_st_stable):** Card State Stable



Bit Range	Default & Access	Description
16	1b RO	**CRD_INS (crd_ins):** Card Inserted
15:12	0h RO	**Reserved1 (reserved1):** Reserved
11	0b RO	**BUF_RD_EN (buf_rd_en):** Buffer Read Enable
10	0b RO	**BUF_WR_EN (buf_wr_en):** Buffer Write Enable
9	0b RO	**RD_TX_ACTIVE (rd_tx_active):** Read Transfer Active
8	0b RO	**WR_TX_ACTIVE (wr_tx_active):** Write Transfer Active
7:3	00h RO	**Reserved (reserved):** Reserved
2	0b RO	**DAT_LN_ACTIVE (dat_ln_active):** DAT Line Active
1	0b RO	**CMD_INHIBIT_DAT (cmd_inhibit_dat):** Command Inhibit (DAT)
0	0b RO	**CMD_INHIBIT_CMD (cmd_inhibit_cmd):** Command Inhibit (CMD)

16.8.13 Host Control Register (HOST_CTL)—Offset 28h

Host Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

HOST_CTL: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0

rsvd					wakeup_en_sd_rm	wakeup_en_sd_ins	wakeup_en_crd_int

Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**WAKEUP_EN_SD_RM (wakeup_en_sd_rm):** Wakeup Event Enable On SD Card Removal
1	0b RW	**WAKEUP_EN_SD_INS (wakeup_en_sd_ins):** Wakeup Event Enable On SD Card Insertion
0	0b RW	**WAKEUP_EN_CRD_INT (wakeup_en_crd_int):** Wakeup Event Enable On Card Interrupt

16.8.17 Clock Control Register (CLK_CTL)—Offset 2Ch

This register is used configure the frequency of the SDIO controller, and enable the clock.

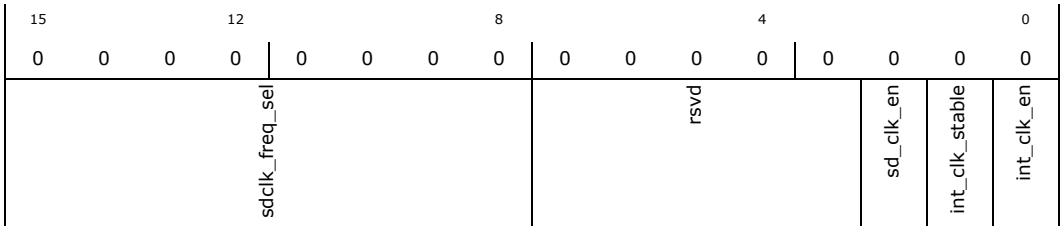
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CLK_CTL: [BAR] + 2Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RW	**SDCLK_FREQ_SEL (sdclk_freq_sel):** SDCLK Frequency Select
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SD_CLK_EN (sd_clk_en):** SD Clock Enable
1	0b RO	**INT_CLK_STABLE (int_clk_stable):** Internal Clock Stable
0	0b RW	**INT_CLK_EN (int_clk_en):** Internal Clock Enable

16.8.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

Timeout Control Register

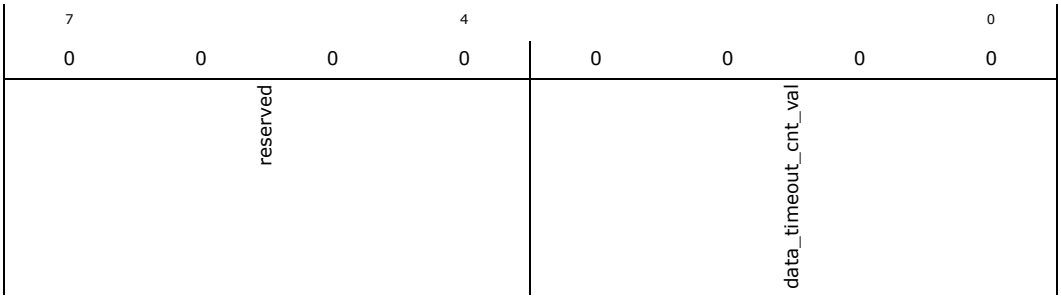
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

TIMEOUT_CTL: [BAR] + 2Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:4	0h RO	**Reserved (reserved):** Reserved
3:0	0h RW	**DATA_TIMEOUT_CNT_VAL (data_timeout_cnt_val):** Data Timeout Counter Value

16.8.19 Software Reset Register (SW_RST)—Offset 2Fh

Software Reset Register

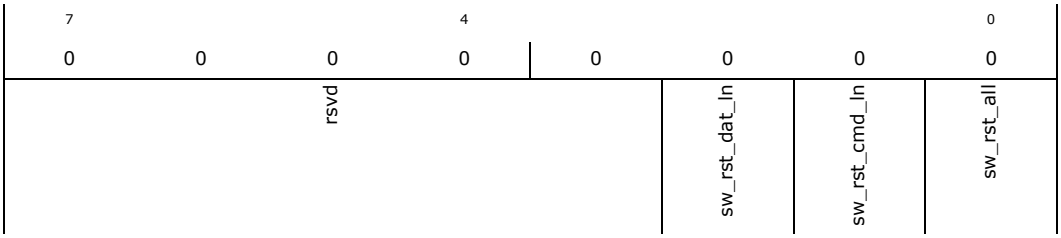
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SW_RST: [BAR] + 2Fh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SW_RST_DAT_LN (sw_rst_dat_ln):** Software Reset For DAT Line
1	0b RW	**SW_RST_CMD_LN (sw_rst_cmd_ln):** Software Reset For CMD Line

Bit Range	Default & Access	Description
0	0b RW	**SW_RST_ALL (sw_rst_all):** Software Reset For All

16.8.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

Normal Interrupt Status Register

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

NML_INT_STATUS: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

16.8.26 Auto CMD12 Error Status Register and Host control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch

Auto CMD12 Error Status Register and Host control 2 Register

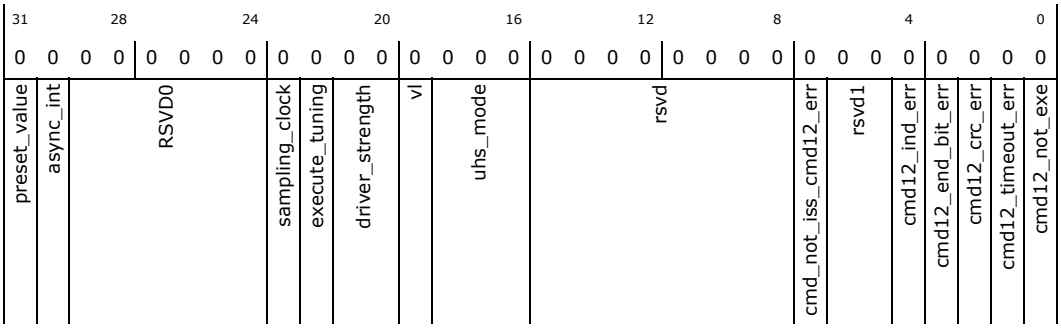
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CMD12_ERR_STAT_HOST_CTRL_2: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**PRESET_VALUE (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**ASYNC_INT (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 1 Enabled 0 Disabled
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**SAMPLING_CLOCK (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared
22	0b RW/AC	**EXECUTE_TUNING (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 1 Execute Tuning 0 Not Tuned or Tuning Completed
21:20	0b RW	**DRIVER_STRENGTH (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit
19	0b RW	**VL (vl):** This bit controls voltage regulator for I/O cell
18:16	0b RW	**UHS_MODE (uhs_mode):** This field is used to select one of UHS-I modes
15:8	0h RO	**RSVD (rsvd):** Reserved

Bit Range	Default & Access	Description

0	0b RW	**CMD_TIMEOUT_ERR (cmd_timeout_err):** Force Event for Command Timeout Error

16.8.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

ADMA Error Status Register

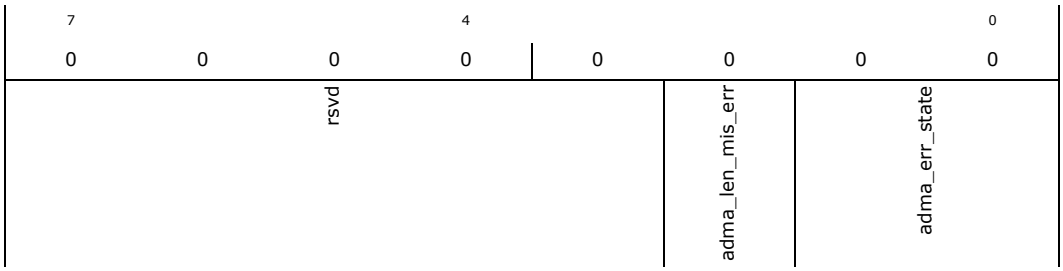
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

ADMA_ERR_STAT: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RO	**ADMA_LEN_MIS_ERR (adma_len_mis_err):** ADMA Length Mismatch Error
1:0	00b RO	**ADMA_ERR_STATE (adma_err_state):** ADMA Error State

16.8.33 ADMA System Address Register (ADMA_SYS_ADDR)—Offset 58h

This register contains the physical Descriptor address used for ADMA data transfer.

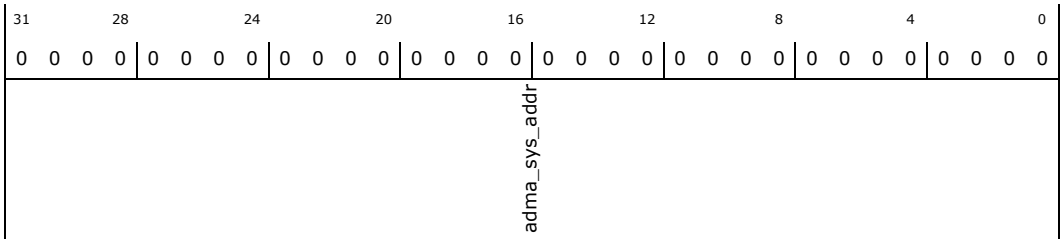
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ADMA_SYS_ADDR: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**ADMA_SYS_ADDR (adma_sys_addr):** ADMA System Address

16.8.34 Preset Values registers (PRESET_VALUE_0)—Offset 60h

Preset Values init and default speed

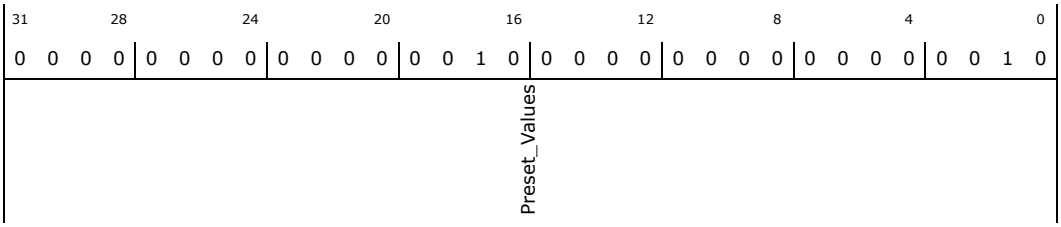
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_0: [BAR] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00020002h



Bit Range	Default & Access	Description
31:0	00020002h RO	**PresetValues (Preset_Values):** Reserved.

16.8.35 Preset Values 1 registers (PRESET_VALUE_1)—Offset 64h

Preset Values high and sdr12

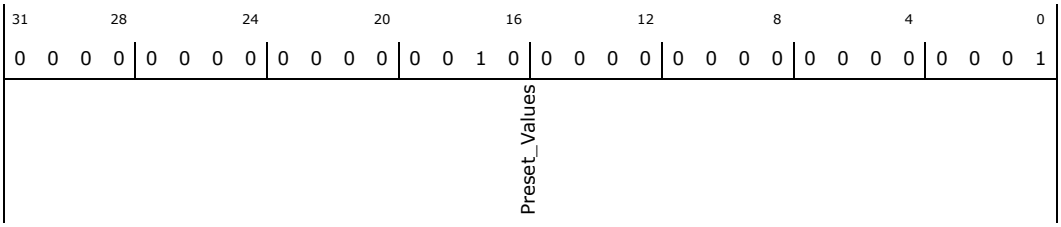
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_1: [BAR] + 64h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00020001h



Bit Range	Default & Access	Description
31:0	00020001h RO	**PresetValues (Preset_Values):** Reserved.

16.8.36 Preset Values 2 registers (PRESET_VALUE_2)—Offset 68h

Preset Values sdr25 and sdr50

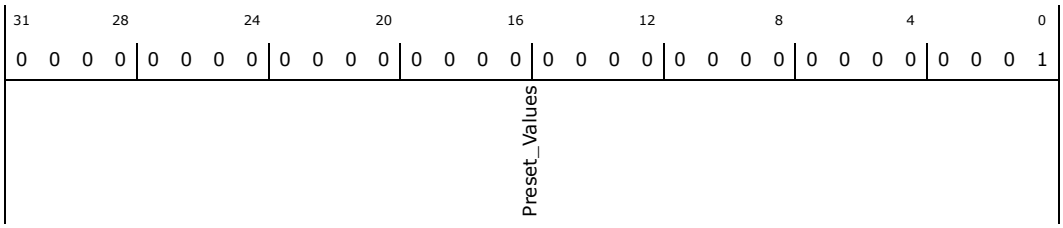
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_2: [BAR] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:0	00000001h RO	**PresetValues (Preset_Values):** Reserved.

16.8.37 Preset Values 3 registers (PRESET_VALUE_3)—Offset 6Ch

Preset Values sdr104 and ddr50

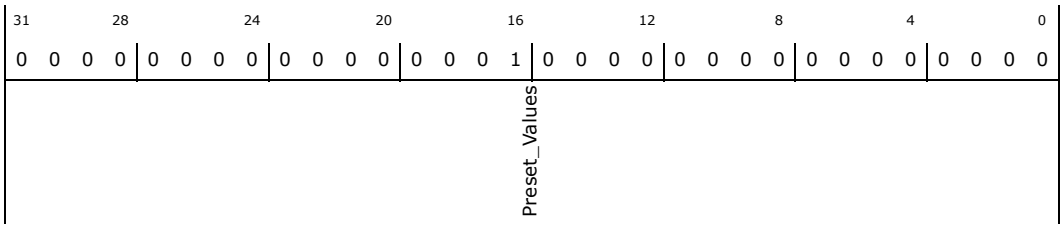
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRESET_VALUE_3: [BAR] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00010000h



Bit Range	Default & Access	Description
31:0	00010000h RO	**PresetValues (Preset_Values):** Reserved.

16.8.38 BOOT_TIMEOUT_CTRL (BOOT_TIMEOUT_CTRL)—Offset 70h

BOOT_TIMEOUT_CTRL

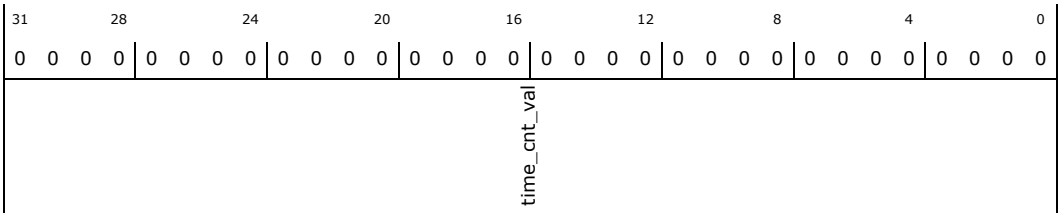
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BOOT_TIMEOUT_CTRL: [BAR] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**TIME_CNT_VAL (time_cnt_val):** Boot Data Timeout Counter Value

16.8.39 DEBUG_SEL (DEBUG_SEL)—Offset 74h

Debug Selection Register

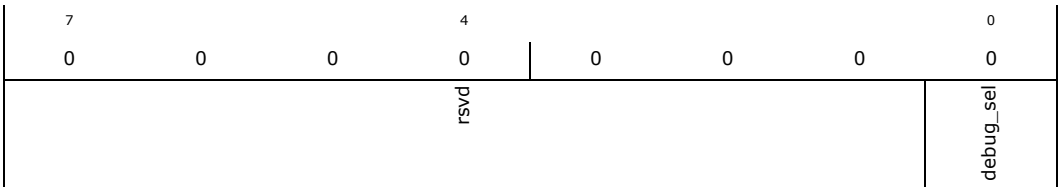
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

DEBUG_SEL: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	00h RO	**RSVD (rsvd):** Reserved
0	0b WO	**DEBUG_SEL (debug_sel):** 1 - cmd register, interrupt status, transmitter module, ahb_iface module and clk sdcard signals are probed out..

16.8.40 Shared Bus Control Register (SHARED_BUS)—Offset E0h

Shared Bus Control Register

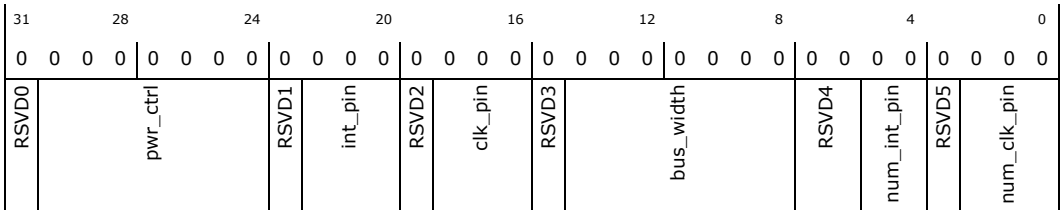
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SHARED_BUS: [BAR] + E0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**RSVD0:** Reserved
30:24	0h RW	**PWR_CTRL (pwr_ctrl):** Each bit of this field controls back-end power supply for an embedded device. Host interface voltage (VDDH) is not controlled by this field. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices can be controlled D24 Back-end Power Control for Device 1 D25 Back-end Power Control for Device 2 D26 Back-end Power Control for Device 3 D27 Back-end Power Control for Device 4 D28 Back-end Power Control for Device 5 D29 Back-end Power Control for Device 6 D30 Back-end Power Control for Device 7 The function of each bit is defined as follows: 0 Back-end Power is Off 1 Back-end Power is Supplied Back-End power control is effective for embedded memory devices in the Sleep State that support the Sleep command (CMD14) to reduce power consumption and embedded SDIO devices when IOEx is set to 0.
23	0b RO	**RSVD1:** Reserved
22:20	0h RW	**INT_PIN (int_pin):** Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless. 000b Interrupt is detected by Interrupt Cycle xx1b INT_A is Enabled x1xb INT_B is Enabled 1xxb INT_C is Enabled
19	0b RO	**RSVD2:** Reserved
18:16	0h RW	**CLK_PIN (clk_pin):** One of clock pin outputs is selected by this field. Select of unsupported clock pin is meaningless. Refer to Figure 2-38 for the timing of clock outputs. 000b Clock Pins are Disabled 001b CLK[1] is Selected 010b CLK[2] is Selected .... 111b CLK[7] is Selected
15	0b RO	**RSVD3:** Reserved
14:8	0h RO	**BUS_WIDTH (bus_width):** Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices are supported.This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1.D08 - Bus width preset for Device 1 D09 - Bus width preset for Device 2 D10 - Bus width preset for Device 3 D11 - Bus width preset for Device 4 D12 - Bus width preset for Device 5 D13 - Bus width preset for Device 6 D14 - Bus width preset for Device 7 The function of each bit is defined as follows: 0 - 4 bit buswidth mode 1 - 8 bit buswidth mode
7:6	0b RO	**RSVD4:** Reserved
5:4	0h RO	**NUM_INT_PIN (num_int_pin):** This field indicates support of interrupt input pins for shared bus system.Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired or connection is possible. 00b Interrupt Input Pin is Not Supported 01b INTA is Supported 10b INTA and INTB are Supported 11b INTA, INTB and INTC are Supported
3	0b RO	**RSVD5:** Reserved

Bit Range	Default & Access	Description
2:0	0h RO	**NUM_CLK_PIN (num_clk_pin):** This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported.Shared bus is supported by specific system. Then Standard Host Driver does not support control of these clock pins. 000b Shared bus is not supported 001b 1 SDCLK pin is supported 010b 2 SDCLK pins are supported .... 111b 7 SDCLK pins are supported

16.8.41 SPI_INT_SUP (SPI_INT_SUP)—Offset F0h

SPI_INT_SUP

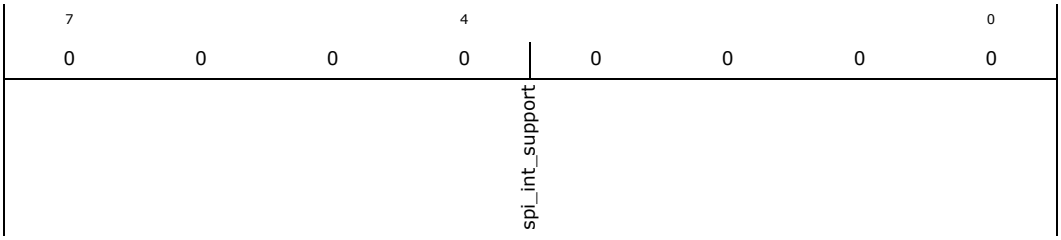
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SPI_INT_SUP: [BAR] + F0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**SPI_INT_SUPPORT (spi_int_support):** This bit is set to indicate the assertion assertion of interrupts in the SPI mode at any time, irrespective of the status of thecard select (CS) line. If this bit is zero, then SDIO card can only assert the interrupt line in the SPI mode when the CS line is asserted.

16.8.42 Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh

Slot Interrupt Status Register

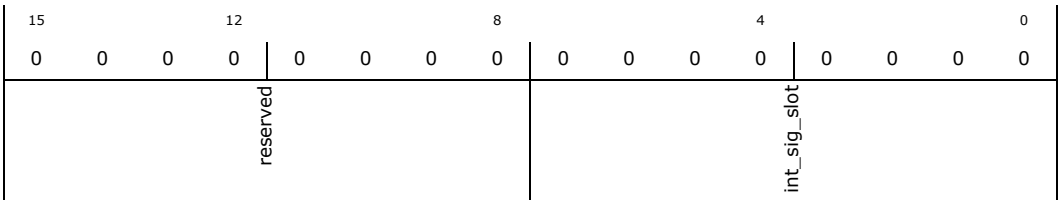
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SLOT_INT_STAT: [BAR] + FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RO	**Reserved (reserved):** Reserved
7:0	00h RO	**INT_SIG_SLOT (int_sig_slot):** Interrupt Signal For Each Slot

16.8.43 Host Controller Version Register (HOST_CTRL_VER)—Offset FEh

Host Controller Version Register

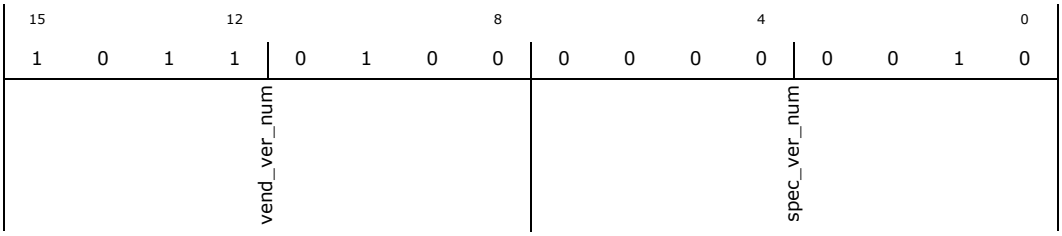
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

HOST_CTRL_VER: [BAR] + FEh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: B402h



Bit Range	Default & Access	Description
15:8	b4h RO	**VEND_VER_NUM (vend_ver_num):** Vendor Version Number
7:0	02h RO	**SPEC_VER_NUM (spec_ver_num):** Version Number

16.9 SD PCI Configuration Registers

Table 175. Summary of SD PCI Configuration Registers—0/18/0

Offset	Size	Register ID—Description	Default Value
0h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 1675	00000000h
4h	4	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 1676	00100000h
8h	4	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 1677	00000000h
Ch	4	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 1677	00000000h
10h	4	"reg_BAR_type (BAR)—Offset 10h" on page 1678	00000000h
14h	4	"reg_BAR1_type (BAR1)—Offset 14h" on page 1678	00000000h
2Ch	4	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 1679	00000000h
30h	4	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1680	00000000h
34h	4	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 1680	00000080h
3Ch	4	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 1681	00000100h
80h	4	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 1681	48030001h
84h	4	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 1682	00000008h
A0h	4	"reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h" on page 1682	00000000h
A4h	4	"reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h" on page 1683	00000000h
A8h	4	"reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h" on page 1683	00000000h
ACh	4	"reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh" on page 1684	00000000h
C0h	4	"reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h" on page 1684	00000000h
F8h	4	"reg_MANID_type (MANID)—Offset F8h" on page 1685	00000000h

16.9.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

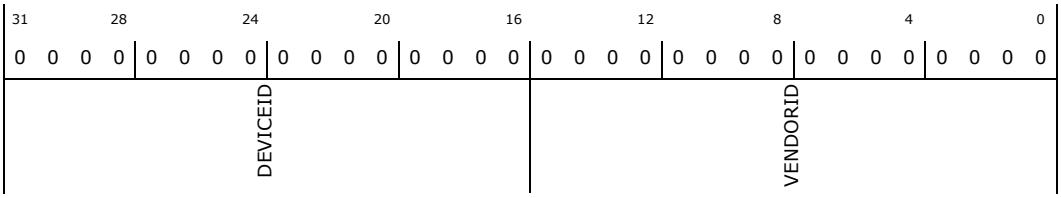
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

DEVVENDID: [B:0, D:18, F:0] + 0h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**DEVICEID:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RO	**VENDORID:** Reserved.

16.9.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

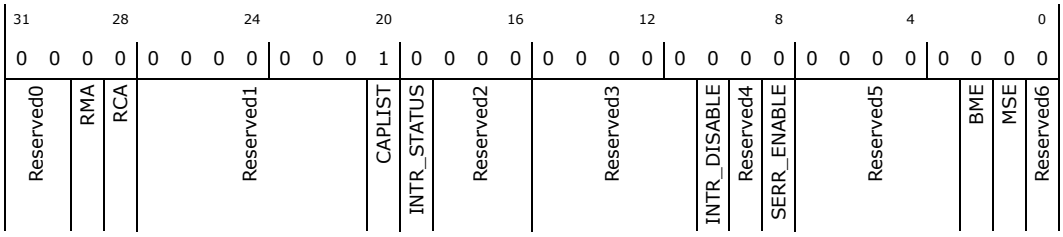
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

STATUSCOMMAND: [B:0, D:18, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**RMA:** Reserved.
28	0h RW/1C	**RCA:** Reserved.
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**CAPLIST:** Reserved.
19	0h RO	**INTR_STATUS:** Reserved.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**INTR_DISABLE:** Reserved.
9	0h RO	**Reserved4:** Reserved.
8	0h RW	**SERR_ENABLE:** Reserved.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**BME:** Reserved.

Bit Range	Default & Access	Description
1	0h RW	**MSE:** Reserved.
0	0h RO	**Reserved6:** Reserved.

16.9.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

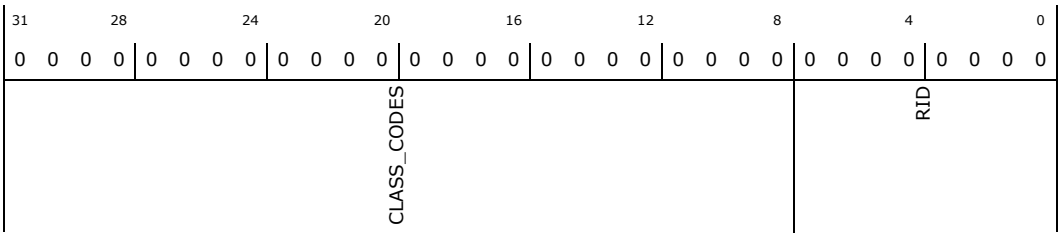
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:18, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

16.9.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

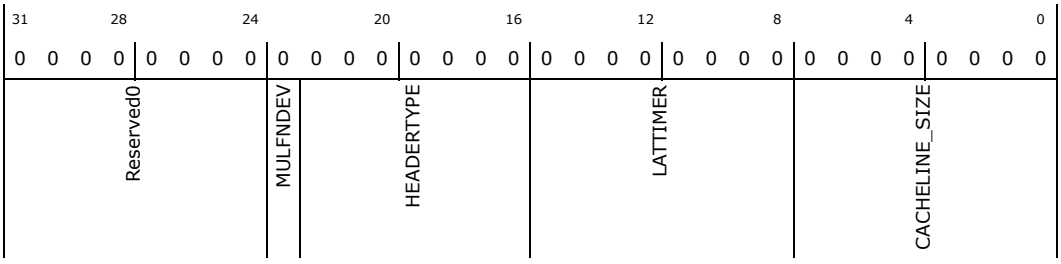
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:18, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

16.9.5 reg_BAR_type (BAR)—Offset 10h

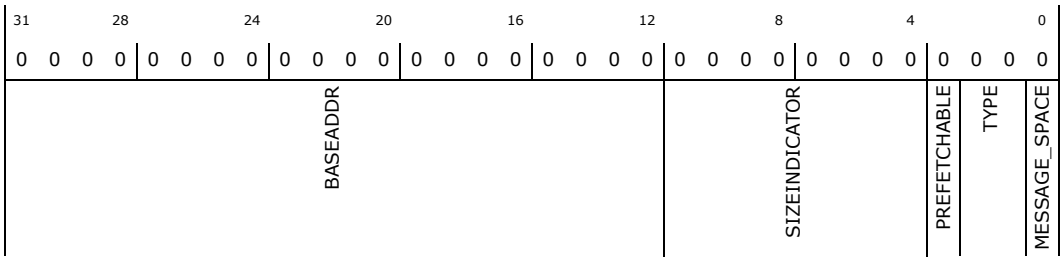
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR:** Reserved.
11:4	00h RO	**SIZEINDICATOR:** Reserved.
3	0h RO	**PREFETCHABLE:** Reserved.
2:1	0h RO	**TYPE:** Reserved.
0	0h RO	**MESSAGE_SPACE:** Reserved.

16.9.6 reg_BAR1_type (BAR1)—Offset 14h

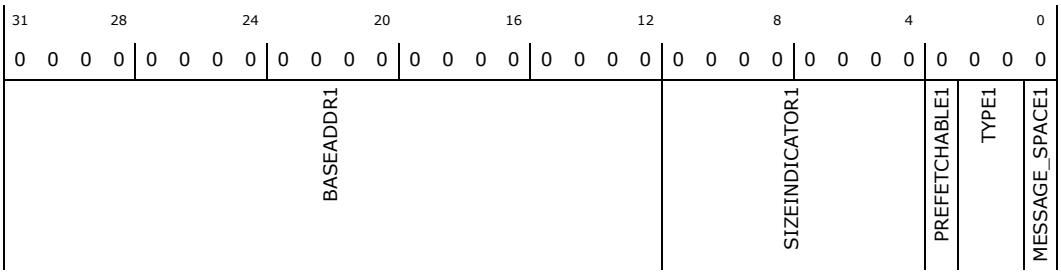
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR1: [B:0, D:18, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR1:** Reserved.
11:4	00h RO	**SIZEINDICATOR1:** Reserved.
3	0h RO	**PREFETCHABLE1:** Reserved.
2:1	0h RO	**TYPE1:** Reserved.
0	0h RO	**MESSAGE_SPACE1:** Reserved.

16.9.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

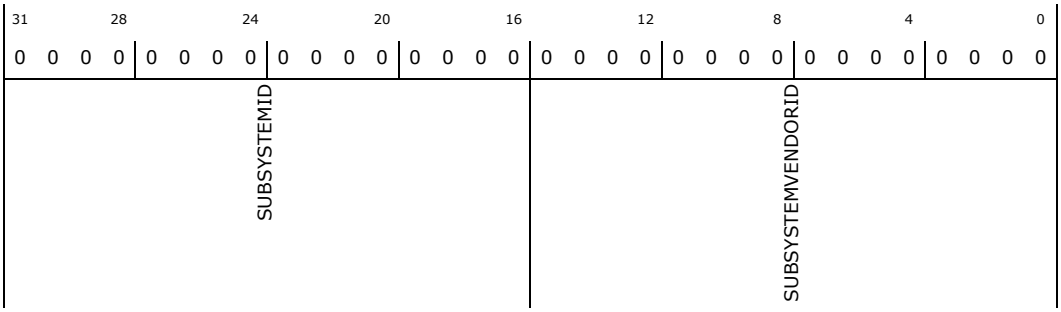
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:18, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

16.9.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

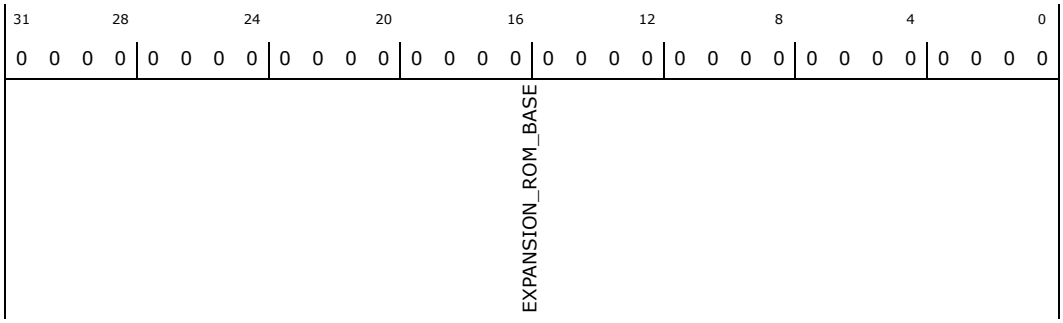
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

EXPANSION_ROM_BASEADDR: [B:0, D:18, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

16.9.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

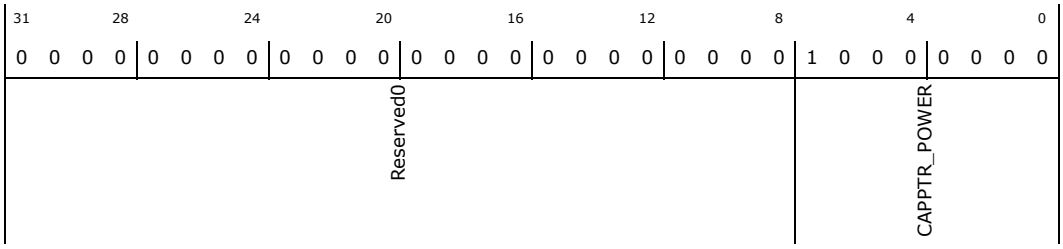
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPABILITYPTR: [B:0, D:18, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**CAPPTR_POWER:** Reserved.

16.9.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

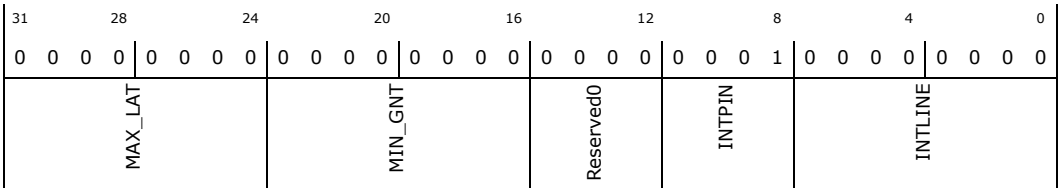
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTERRUPTREG: [B:0, D:18, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Description
31:24	00h RO	**MAX_LAT:** Reserved.
23:16	00h RO	**MIN_GNT:** Reserved.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**INTPIN:** Reserved.
7:0	00h RW	**INTLINE:** Reserved.

16.9.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

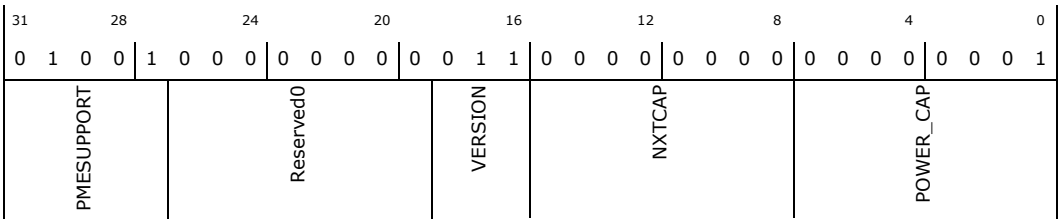
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

POWERCAPID: [B:0, D:18, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Description
31:27	09h RO	**PMESUPPORT:** Reserved.
26:19	00h RO	**Reserved0:** Reserved.

Bit Range	Default & Access	Description
18:16	3h RO	**VERSION:** Reserved.
15:8	00h RO	**NXTCAP:** Reserved.
7:0	01h RO	**POWER_CAP:** Reserved.

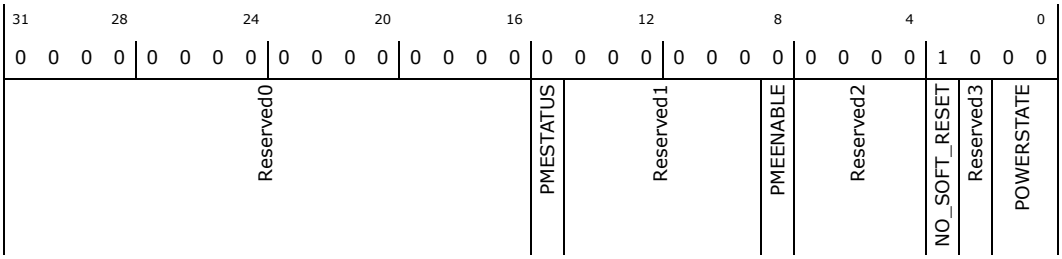
16.9.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMECTRLSTATUS: [B:0, D:18, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PMESTATUS:** Reserved.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PMEENABLE:** Reserved.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**NO_SOFT_RESET:** Reserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**POWERSTATE:** Reserved.

16.9.13 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

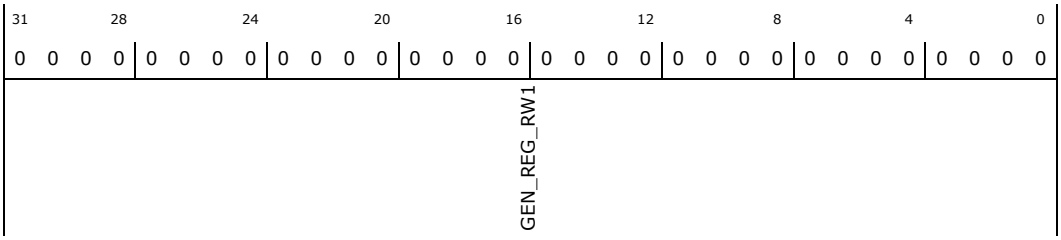
General Purpose Read Write Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:18, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.9.14 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

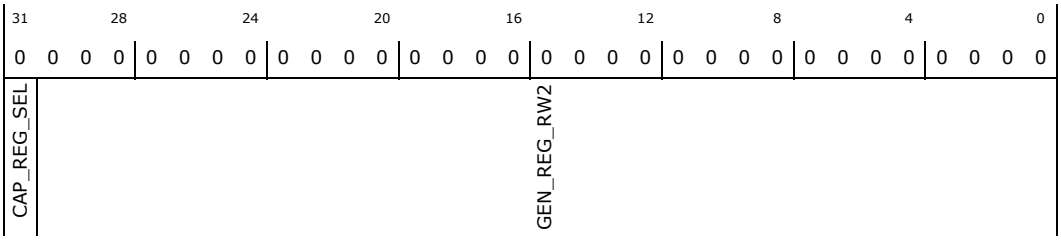
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW2: [B:0, D:18, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.9.15 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

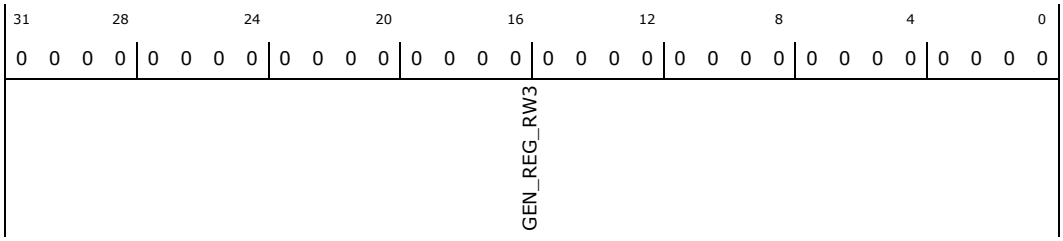
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW3: [B:0, D:18, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.9.16 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

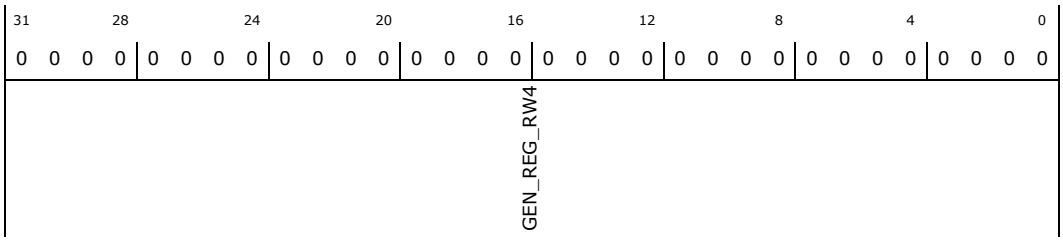
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW4: [B:0, D:18, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.9.17 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

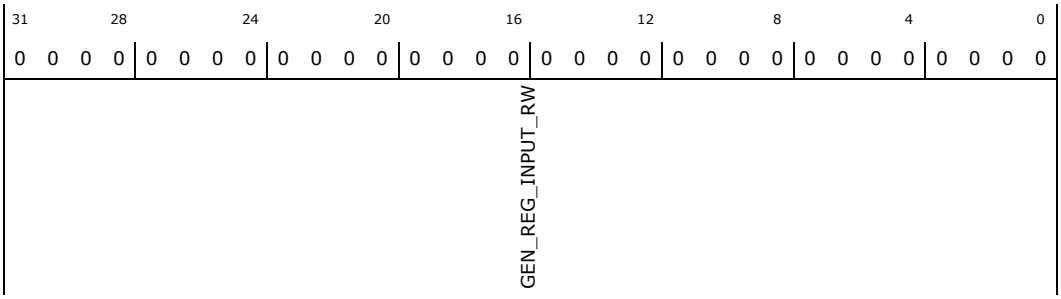
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:18, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.9.18 reg_MANID_type (MANID)—Offset F8h

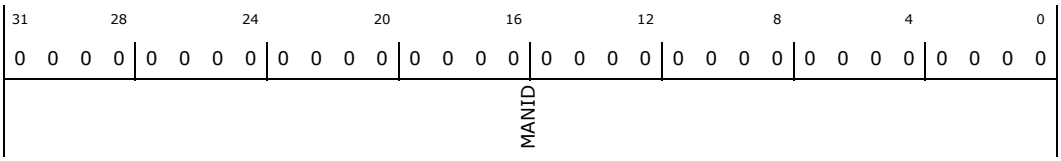
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:18, F:0] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**MANID:** Reserved.

16.10 SD Memory Mapped IO Registers

Table 176. Summary of SD Memory Mapped I/O Registers—BAR

Offset	Size	Register ID—Description	Default Value
0h	4	"SDMA System Address Register (SYS_ADR)—Offset 0h" on page 1687	00000000h
4h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1687	0000h
6h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1688	0000h
8h	4	"Argument Register (ARGUMENT)—Offset 8h" on page 1689	00000000h
Ch	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1689	0000h
Eh	2	"Command Register (CMD)—Offset Eh" on page 1690	0000h
10h	4	"Response Register0 (RESPONSE0)—Offset 10h" on page 1691	00000000h
14h	4	"Response Register2 (RESPONSE2)—Offset 14h" on page 1692	00000000h
18h	4	"Response Register4 (RESPONSE4)—Offset 18h" on page 1692	00000000h
1Ch	4	"Response Register6 (RESPONSE6)—Offset 1Ch" on page 1693	00000000h
20h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1693	00000000h
24h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1694	1FFF0000h
28h	1	"Host Control Register (HOST_CTL)—Offset 28h" on page 1695	00h
29h	1	"Power Control Register (PWR_CTL)—Offset 29h" on page 1696	00h
2Ah	1	"Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah" on page 1696	00h
2Bh	1	"Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh" on page 1697	00h
2Ch	2	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 1698	0000h
2Eh	1	"Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh" on page 1698	00h
2Fh	1	"Software Reset Register (SW_RST)—Offset 2Fh" on page 1699	00h
30h	2	"Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h" on page 1700	0000h
32h	2	"Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h" on page 1701	0000h
34h	2	"Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h" on page 1702	0000h
36h	2	"Error Interrupt Status Enable Register (ERR_INT_STAT_EN)—Offset 36h" on page 1703	0000h
38h	2	"Normal Interrupt Signal Enable Register (NRM_INT_SIG_EN)—Offset 38h" on page 1704	0000h
3Ah	2	"Error Interrupt Signal Enable Register (ERR_INT_SIG_EN)—Offset 3Ah" on page 1705	0000h
3Ch	4	"Auto CMD12 Error Status Register and Host control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch" on page 1706	00000000h
40h	4	"Capabilities Register (CAPABILITIES)—Offset 40h" on page 1708	00000000h
44h	4	"Capabilities Register 2 (CAPABILITIES_2)—Offset 44h" on page 1708	00000000h
48h	4	"Maximum Current Capabilities Register (MAX_CUR_CAP)—Offset 48h" on page 1709	00000000h
50h	2	"Force Event Register for Auto CMD12 Error Status (FORCE_EVENT_CMD12_ERR_STAT)—Offset 50h" on page 1709	0000h
52h	2	"Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h" on page 1710	0000h
54h	1	"ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h" on page 1711	00h

Table 176. Summary of SD Memory Mapped I/O Registers—BAR (Continued)

Offset	Size	Register ID—Description	Default Value
58h	4	"ADMA System Address Register (ADMA_SYS_ADDR)—Offset 58h" on page 1712	00000000h
60h	4	"Preset Values registers (PRESET_VALUE_0)—Offset 60h" on page 1712	00020002h
64h	4	"Preset Values 1 registers (PRESET_VALUE_1)—Offset 64h" on page 1713	00020001h
68h	4	"Preset Values 2 registers (PRESET_VALUE_2)—Offset 68h" on page 1713	00000001h
6Ch	4	"Preset Values 3 registers (PRESET_VALUE_3)—Offset 6Ch" on page 1714	00010000h
70h	4	"BOOT_TIMEOUT_CTRL (BOOT_TIMEOUT_CTRL)—Offset 70h" on page 1714	00000000h
74h	1	"DEBUG_SEL (DEBUG_SEL)—Offset 74h" on page 1715	00h
E0h	4	"Shared Bus Control Register (SHARED_BUS)—Offset E0h" on page 1715	00000000h
F0h	1	"SPI_INT_SUP (SPI_INT_SUP)—Offset F0h" on page 1717	00h
FCh	2	"Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh" on page 1717	0000h
FEh	2	"Host Controller Version Register (HOST_CTRL_VER)—Offset FEh" on page 1718	B402h

16.10.1 SDMA System Address Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers

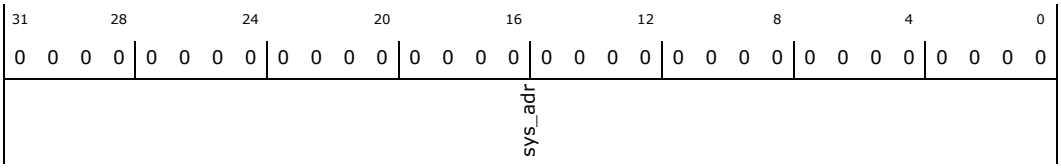
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SYS_ADR: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**SYS_ADR (sys_adr):** SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register.

16.10.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

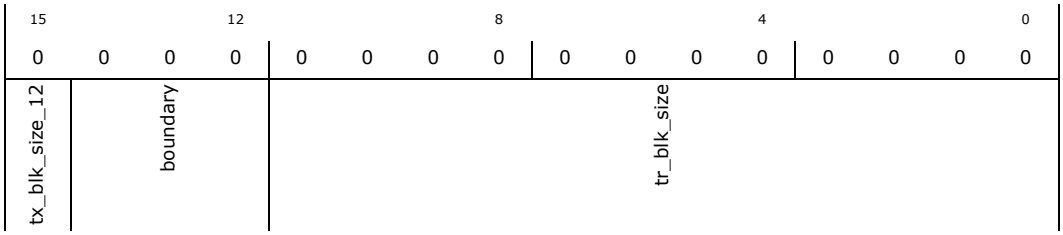
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_SIZE: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.
14:12	000b RW	**BOUNDARY (boundary):** Host SDMA Buffer Boundary The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. 000b - 4K bytes (Detects A11 carry out) 001b - 8K bytes (Detects A12 carry out) 010b - 16K Bytes (Detects A13 carry out) 011b - 32K Bytes (Detects A14 carry out) 100b - 64K bytes (Detects A15 carry out) 101b - 128K Bytes (Detects A16 carry out) 110b - 256K Bytes (Detects A17 carry out) 111b - 512K Bytes (Detects A18 carry out)
11:0	000h RW	**TR_BLK_SIZE (tr_blk_size):** Transfer Block Size This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. 0800h 2048 Bytes ??? ??? 0200h 512 Bytes 01FFh 511 Bytes ??? ??? 0004h 4 Bytes 0003h 3 Bytes 0002h 2 Bytes 0001h 1 Byte 0000h No data transfer

16.10.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks

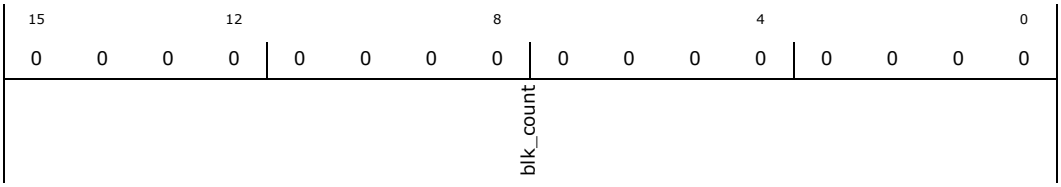
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_COUNT: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW	**BLK_COUNT (blk_count):** Blocks Count For Current Transfer This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers

16.10.4 Argument Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

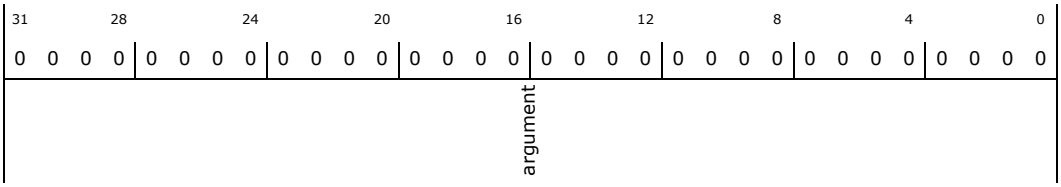
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ARGUMENT: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ARGUMENT (argument):** Command Argument The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.10.5 Transfer Mode Register (TX_MODE)—Offset Ch

Transfer Mode Register

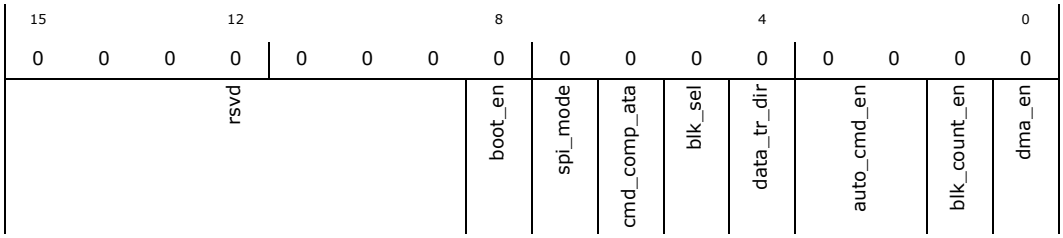
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

TX_MODE: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:9	00h RO	**RSVD (rsvd):** Reserved
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data_TR_Dir (data_tr_dir):** Data Transfer Direction Select This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands. 1 Read (Card to Host) 0 Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**BLK_COUNT_EN (blk_count_en):** Block Count Enable This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8) If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. 1 Enable 0 Disable
0	0b RW	**DMA_EN (dma_en):** DMA Enable This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). 1 DMA Data transfer 0 No data transfer or Non DMA data transfer

16.10.6 Command Register (CMD)—Offset Eh

Command Register

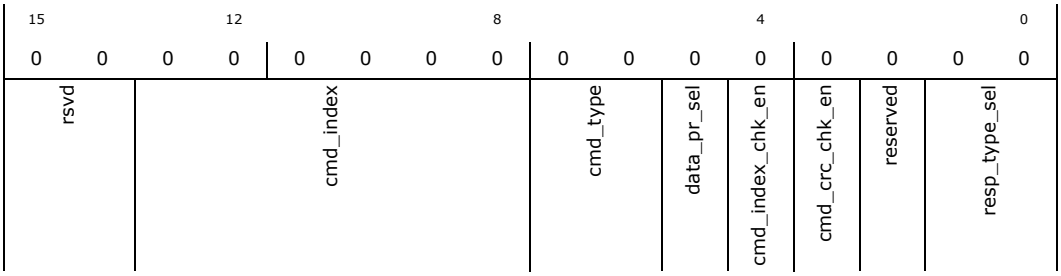
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CMD: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:14	0h RO	**RSVD (rsvd):** Reserved
13:8	0h RW	**CMD_INDEX (cmd_index):** Command Index These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**CMD_TYPE (cmd_type):** Command Type
5	0b RW	**DATA_PR_SEL (data_pr_sel):** Data Present Select This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38) (3) Resume command 1 Data Present 0 No Data Present
4	0b RW	**CMD_INDEX_CHK_EN (cmd_index_chk_en):** Command Index Check Enable If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. 1 Enable 0 Disable
3	0b RW	**CMD_CRC_CHK_EN (cmd_crc_chk_en):** Command CRC Check Enable If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) 1 Enable 0 Disable
2	0b RO	**Reserved (reserved):** Reserved
1:0	0h RW	**RESP_TYPE_SEL (resp_type_sel):** Response Type Select 00 No Response 01 Response Length 136 10 Response Length 48 11 Response Length 48 check Busy after response

16.10.7 Response Register0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards

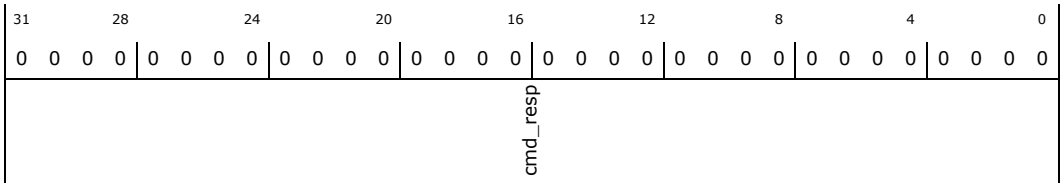
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE0: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP0 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.10.8 Response Register2 (RESPONSE2)—Offset 14h

This register is used to store responses from SD cards

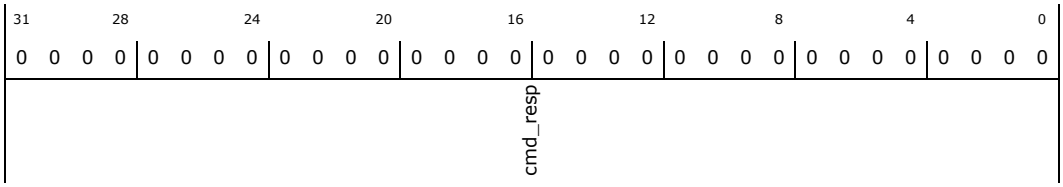
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE2: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP2 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.10.9 Response Register4 (RESPONSE4)—Offset 18h

This register is used to store responses from SD cards

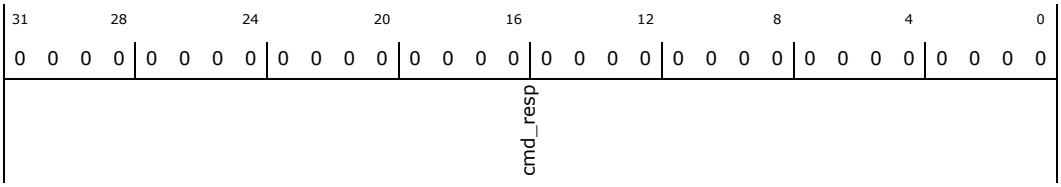
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE4: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP4 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.10.10 Response Register6 (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD cards

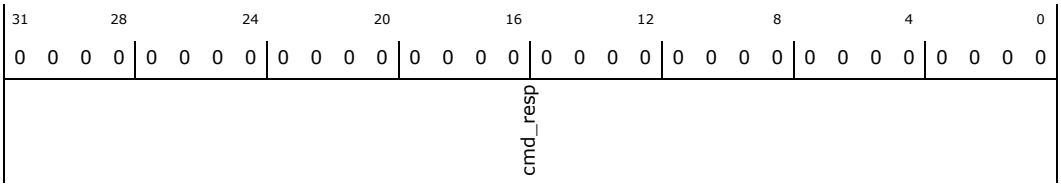
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE6: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP6 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.10.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer

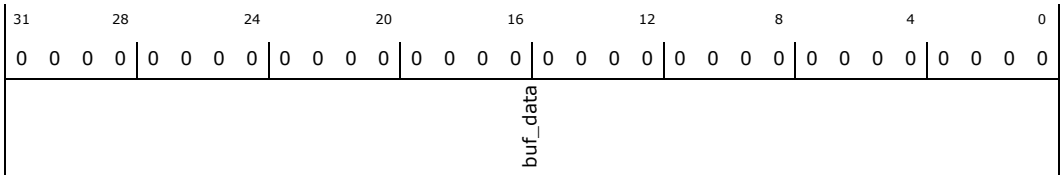
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BUF_DATA_PORT: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**BUF_DATA (buf_data):** Buffer Data The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to 1.7

16.10.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register

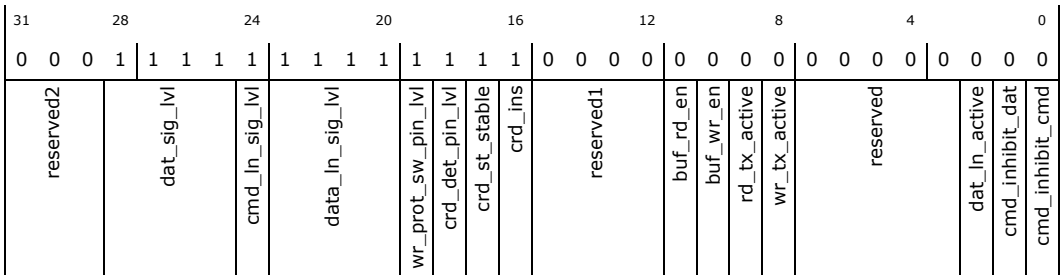
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRE_STATE: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 1FFF0000h



Bit Range	Default & Access	Description
31:29	0h RO	**Reserved2 (reserved2):** Reserved
28:25	1111b RO	**DAT_SIG_LVL (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. D28 - DAT[7] D27 - DAT[6] D26 - DAT[5] D25 - DAT[4]
24	1b RO	**CMD_LN_SIG_LVL (cmd_ln_sig_lvl):** CMD Line Signal Level This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DATA_LN_SIG_LVL (data_ln_sig_lvl):** DAT[3:0] Line Signal Level This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. D23 DAT[3] D22 DAT[2] D21 DAT[1] D20 DAT[0]
19	1b RO	**WR_PROT_SW_PIN_LVL (wr_prot_sw_pin_lvl):** Write Protect Switch Pin Level
18	1b RO	**CRD_DET_PIN_LVL (crd_det_pin_lvl):** Card Detect Pin Level
17	1b RO	**CRD_ST_STABLE (crd_st_stable):** Card State Stable

Bit Range	Default & Access	Description
16	1b RO	**CRD_INS (crd_ins):** Card Inserted
15:12	0h RO	**Reserved1 (reserved1):** Reserved
11	0b RO	**BUF_RD_EN (buf_rd_en):** Buffer Read Enable
10	0b RO	**BUF_WR_EN (buf_wr_en):** Buffer Write Enable
9	0b RO	**RD_TX_ACTIVE (rd_tx_active):** Read Transfer Active
8	0b RO	**WR_TX_ACTIVE (wr_tx_active):** Write Transfer Active
7:3	00h RO	**Reserved (reserved):** Reserved
2	0b RO	**DAT_LN_ACTIVE (dat_ln_active):** DAT Line Active
1	0b RO	**CMD_INHIBIT_DAT (cmd_inhibit_dat):** Command Inhibit (DAT)
0	0b RO	**CMD_INHIBIT_CMD (cmd_inhibit_cmd):** Command Inhibit (CMD)

16.10.13 Host Control Register (HOST_CTL)—Offset 28h

Host Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

HOST_CTL: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel		hi_spd_en	data_tx_wid	led_ctl

Bit Range	Default & Access	Description
7	0b RW	**CRD_DET_SIG_SEL (crd_det_sig_sel):** Card Detect Signal Selection
6	0b RW	**CRD_DET_TST_LVL (crd_det_tst_lvl):** Card Detect Test Level

Bit Range	Default & Access	Description
5	0b RW	**SD8_BIT_MODE (sd8_bit_mode):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	**DMA_SEL (dma_sel):** DMA Select
2	0b RW	**HI_SPD_EN (hi_spd_en):** High Speed Enable
1	0b RW	**DATA_TX_WID (data_tx_wid):** Data Transfer Width
0	0b RW	**LED_CTL (led_ctl):** LED Control

16.10.14 Power Control Register (PWR_CTL)—Offset 29h

Power Control Register

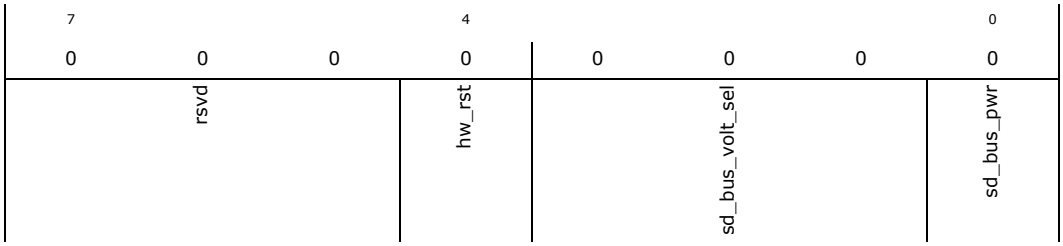
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

PWR_CTL: [BAR] + 29h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:5	0h RO	**RSVD (rsvd):** Reserved
4	0b RW	**HW_rst (hw_rst):** HW reset
3:1	0h RW	**SD_BUS_VOLT_SEL (sd_bus_volt_sel):** SD Bus Voltage Select
0	0b RW	**SD_BUS_PWR (sd_bus_pwr):** SD Bus Power

16.10.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Block Gap Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

_BLK_GAP_CTL: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req

Bit Range	Default & Access	Description
7:5	0h RO	**RSVD (rsvd):** Reserved
4	0b RW	**DRIVE_CCSD (drive_ccsd):** If the driver set this bit (change from ???0?? to ???1??), Host controller will send command completion
3	0b RW	**INT_BLK_GAP (int_blk_gap):** Interrupt At Block Gap
2	0b RW	**RD_WAIT_CTL (rd_wait_ctl):** Read Wait Control
1	0b RW	**CONT_REQ (cont_req):** Continue Request
0	0b RW	**STP_BLK_GAP_REQ (stp_blk_gap_req):** Stop At Block Gap Request

16.10.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is used for wakeup event control.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

WAKEUP_CTL: [BAR] + 2Bh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd					wakeup_en_sd_rm	wakeup_en_sd_ins	wakeup_en_crd_int

Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**WAKEUP_EN_SD_RM (wakeup_en_sd_rm):** Wakeup Event Enable On SD Card Removal
1	0b RW	**WAKEUP_EN_SD_INS (wakeup_en_sd_ins):** Wakeup Event Enable On SD Card Insertion
0	0b RW	**WAKEUP_EN_CRD_INT (wakeup_en_crd_int):** Wakeup Event Enable On Card Interrupt

16.10.17 Clock Control Register (CLK_CTL)—Offset 2Ch

This register is used configure the frequency of the SDIO controller, and enable the clock.

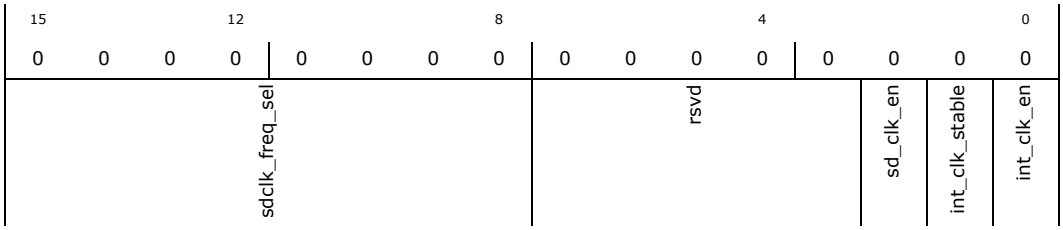
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CLK_CTL: [BAR] + 2Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RW	**SDCLK_FREQ_SEL (sdclk_freq_sel):** SDCLK Frequency Select
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SD_CLK_EN (sd_clk_en):** SD Clock Enable
1	0b RO	**INT_CLK_STABLE (int_clk_stable):** Internal Clock Stable
0	0b RW	**INT_CLK_EN (int_clk_en):** Internal Clock Enable

16.10.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

Timeout Control Register

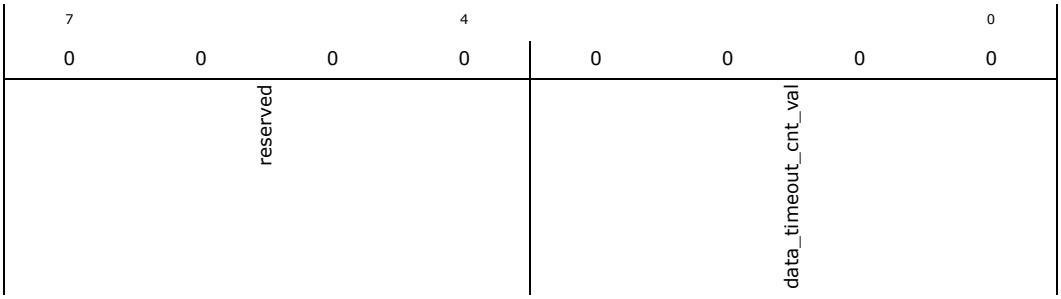
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

TIMEOUT_CTL: [BAR] + 2Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:4	0h RO	**Reserved (reserved):** Reserved
3:0	0h RW	**DATA_TIMEOUT_CNT_VAL (data_timeout_cnt_val):** Data Timeout Counter Value

16.10.19 Software Reset Register (SW_RST)—Offset 2Fh

Software Reset Register

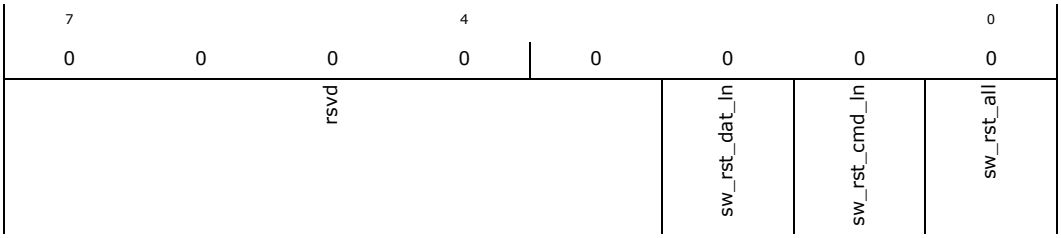
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SW_RST: [BAR] + 2Fh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SW_RST_DAT_LN (sw_rst_dat_ln):** Software Reset For DAT Line
1	0b RW	**SW_RST_CMD_LN (sw_rst_cmd_ln):** Software Reset For CMD Line

Bit Range	Default & Access	Description
0	0b RW	**SW_RST_ALL (sw_rst_all):** Software Reset For All

16.10.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

Normal Interrupt Status Register

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

NML_INT_STATUS: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

16.10.26 Auto CMD12 Error Status Register and Host control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch

Auto CMD12 Error Status Register and Host control 2 Register

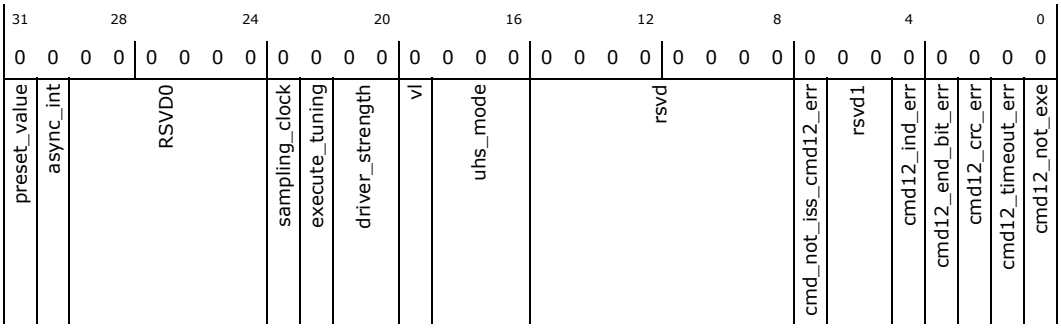
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CMD12_ERR_STAT_HOST_CTRL_2: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**PRESET_VALUE (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**ASYNC_INT (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 1 Enabled 0 Disabled
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**SAMPLING_CLOCK (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared
22	0b RW/AC	**EXECUTE_TUNING (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 1 Execute Tuning 0 Not Tuned or Tuning Completed
21:20	0b RW	**DRIVER_STRENGTH (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit
19	0b RW	**VL (vl):** This bit controls voltage regulator for I/O cell
18:16	0b RW	**UHS_MODE (uhs_mode):** This field is used to select one of UHS-I modes
15:8	0h RO	**RSVD (rsvd):** Reserved

Bit Range	Default & Access	Description

22:20	0h RW	**INT_PIN (int_pin):** Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless. 000b Interrupt is detected by Interrupt Cycle xx1b INT_A is Enabled x1xb INT_B is Enabled 1xxb INT_C is Enabled
19	0b RO	**RSVD2:** Reserved
18:16	0h RW	**CLK_PIN (clk_pin):** One of clock pin outputs is selected by this field. Select of unsupported clock pin is meaningless. Refer to Figure 2-38 for the timing of clock outputs. 000b Clock Pins are Disabled 001b CLK[1] is Selected 010b CLK[2] is Selected .... 111b CLK[7] is Selected
15	0b RO	**RSVD3:** Reserved
14:8	0h RO	**BUS_WIDTH (bus_width):** Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices are supported.This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1.D08 - Bus width preset for Device 1 D09 - Bus width preset for Device 2 D10 - Bus width preset for Device 3 D11 - Bus width preset for Device 4 D12 - Bus width preset for Device 5 D13 - Bus width preset for Device 6 D14 - Bus width preset for Device 7 The function of each bit is defined as follows: 0 - 4 bit buswidth mode 1 - 8 bit buswidth mode
7:6	0b RO	**RSVD4:** Reserved
5:4	0h RO	**NUM_INT_PIN (num_int_pin):** This field indicates support of interrupt input pins for shared bus system.Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired or connection is possible. 00b Interrupt Input Pin is Not Supported 01b INTA is Supported 10b INTA and INTB are Supported 11b INTA, INTB and INTC are Supported
3	0b RO	**RSVD5:** Reserved

Bit Range	Default & Access	Description
2:0	0h RO	**NUM_CLK_PIN (num_clk_pin):** This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported.Shared bus is supported by specific system. Then Standard Host Driver does not support control of these clock pins. 000b Shared bus is not supported 001b 1 SDCLK pin is supported 010b 2 SDCLK pins are supported .... 111b 7 SDCLK pins are supported

16.10.41 SPI_INT_SUP (SPI_INT_SUP)—Offset F0h

SPI_INT_SUP

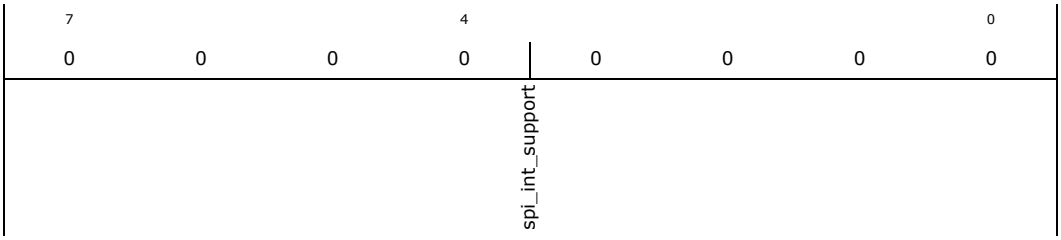
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SPI_INT_SUP: [BAR] + F0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**SPI_INT_SUPPORT (spi_int_support):** This bit is set to indicate the assertion assertion of interrupts in the SPI mode at any time, irrespective of the status of thecard select (CS) line. If this bit is zero, then SDIO card can only assert the interrupt line in the SPI mode when the CS line is asserted.

16.10.42 Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh

Slot Interrupt Status Register

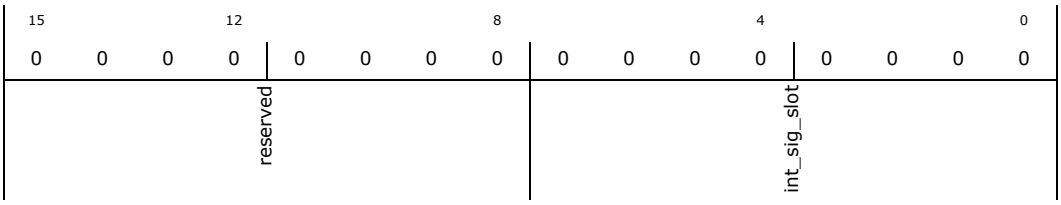
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SLOT_INT_STAT: [BAR] + FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RO	**Reserved (reserved):** Reserved
7:0	00h RO	**INT_SIG_SLOT (int_sig_slot):** Interrupt Signal For Each Slot

16.10.43 Host Controller Version Register (HOST_CTRL_VER)—Offset FEh

Host Controller Version Register

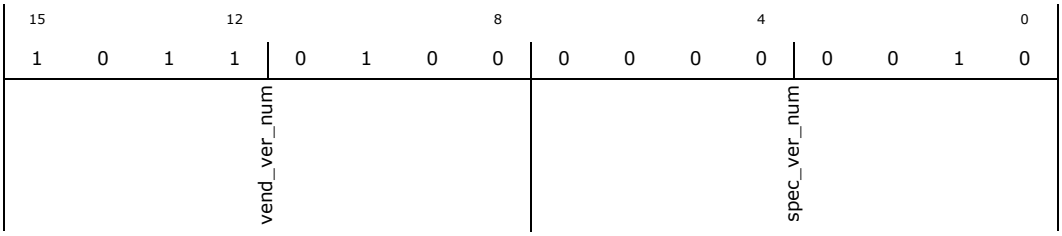
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

HOST_CTRL_VER: [BAR] + FEh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: B402h



Bit Range	Default & Access	Description
15:8	b4h RO	**VEND_VER_NUM (vend_ver_num):** Vendor Version Number
7:0	02h RO	**SPEC_VER_NUM (spec_ver_num):** Version Number

16.11.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

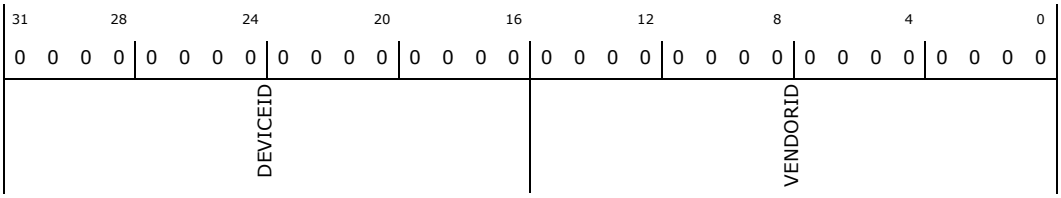
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

DEVVENDID: [B:0, D:23, F:0] + 0h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**DEVICEID:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RO	**VENDORID:** Reserved.

16.11.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

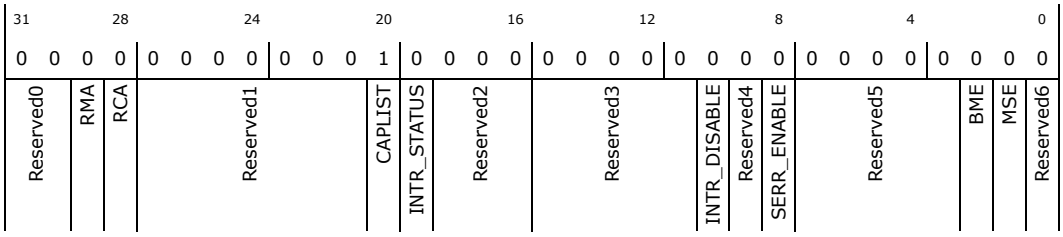
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

STATUSCOMMAND: [B:0, D:23, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**RMA:** Reserved.
28	0h RW/1C	**RCA:** Reserved.

1	0h RW	**MSE:** Reserved.
0	0h RO	**Reserved6:** Reserved.

16.11.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

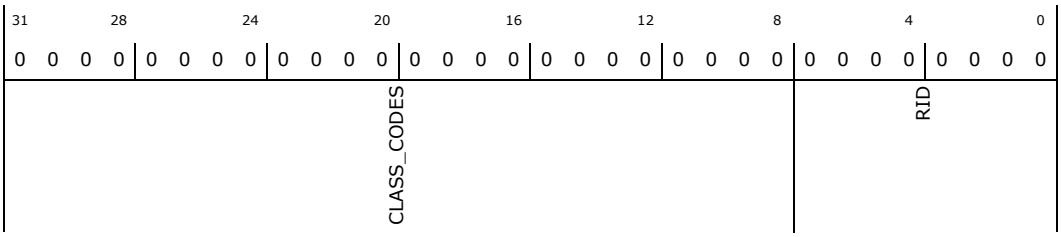
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:23, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

16.11.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

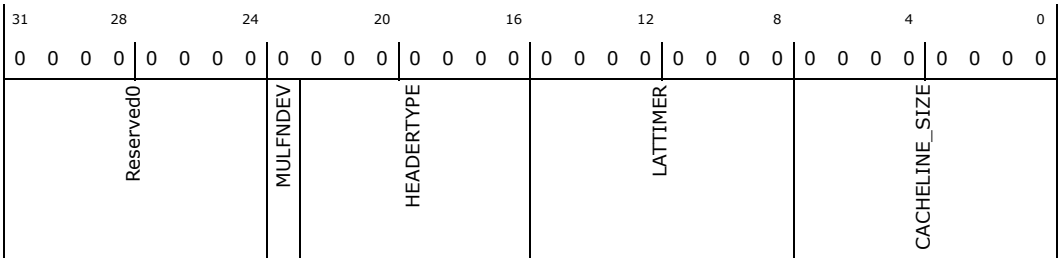
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:23, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

16.11.5 reg_BAR_type (BAR)—Offset 10h

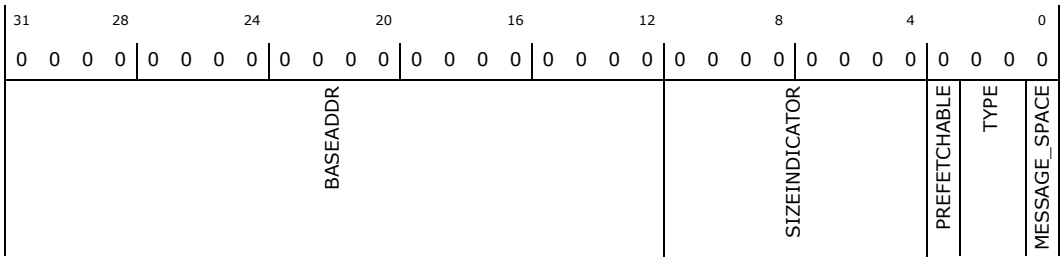
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR:** Reserved.
11:4	00h RO	**SIZEINDICATOR:** Reserved.
3	0h RO	**PREFETCHABLE:** Reserved.
2:1	0h RO	**TYPE:** Reserved.
0	0h RO	**MESSAGE_SPACE:** Reserved.

16.11.6 reg_BAR1_type (BAR1)—Offset 14h

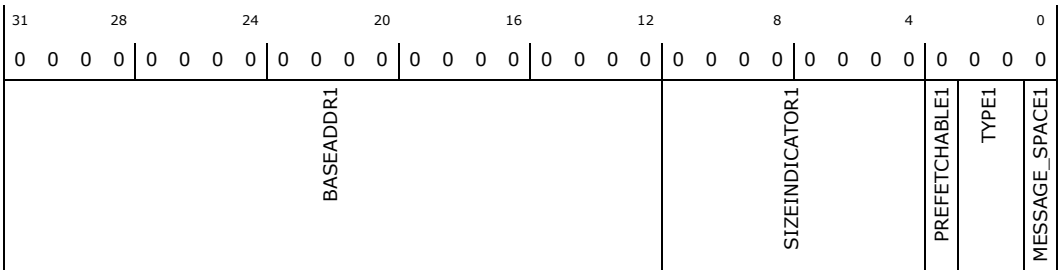
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR1: [B:0, D:23, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR1:** Reserved.
11:4	00h RO	**SIZEINDICATOR1:** Reserved.
3	0h RO	**PREFETCHABLE1:** Reserved.
2:1	0h RO	**TYPE1:** Reserved.
0	0h RO	**MESSAGE_SPACE1:** Reserved.

16.11.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

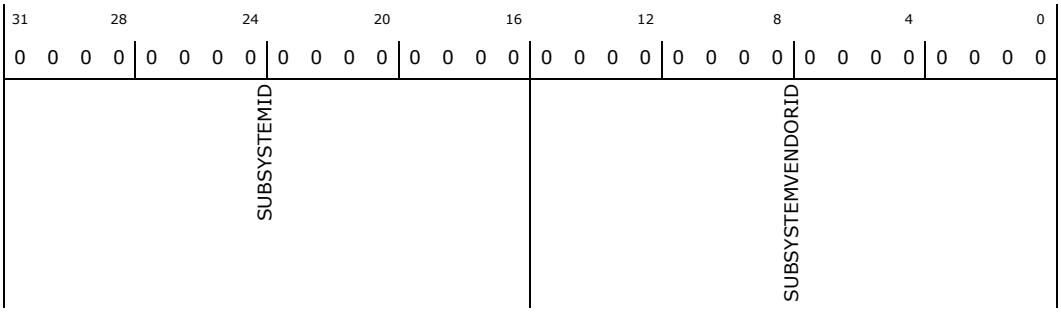
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:23, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

16.11.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

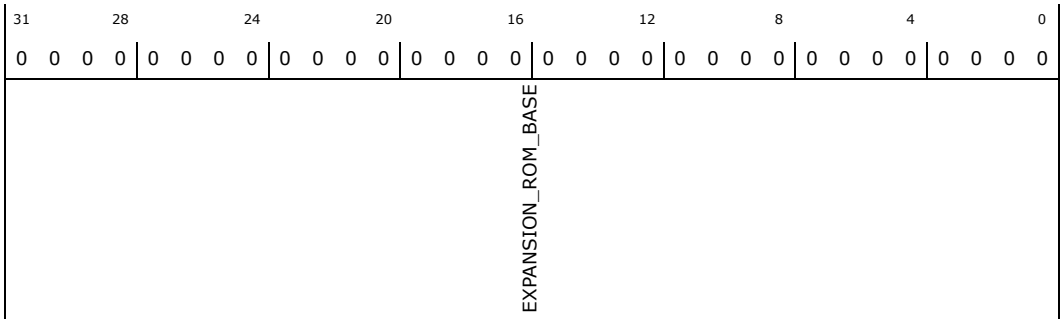
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

EXPANSION_ROM_BASEADDR: [B:0, D:23, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

16.11.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

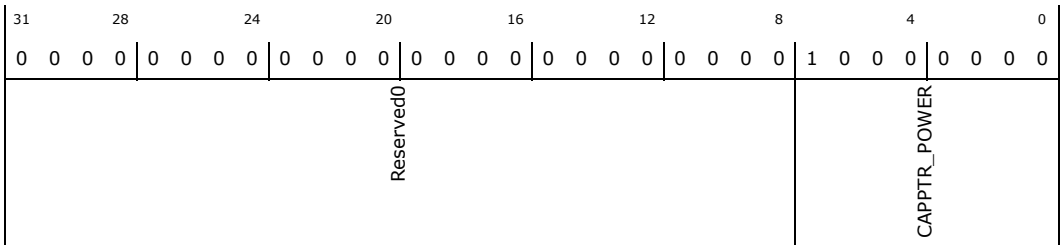
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPABILITYPTR: [B:0, D:23, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**CAPPTR_POWER:** Reserved.

16.11.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

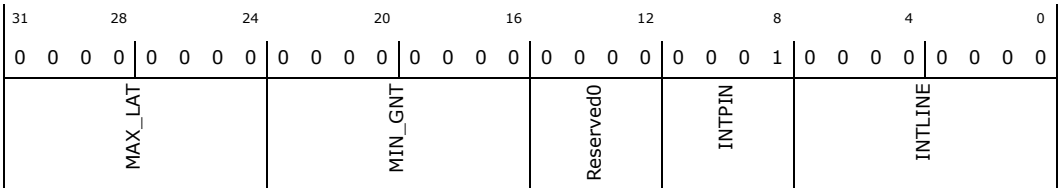
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTERRUPTREG: [B:0, D:23, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Description
31:24	00h RO	**MAX_LAT:** Reserved.
23:16	00h RO	**MIN_GNT:** Reserved.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**INTPIN:** Reserved.
7:0	00h RW	**INTLINE:** Reserved.

16.11.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

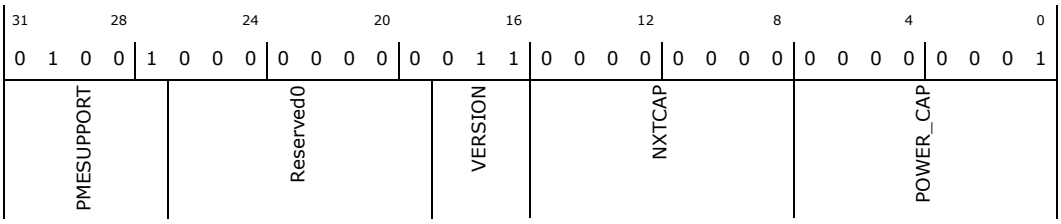
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

POWERCAPID: [B:0, D:23, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Description
31:27	09h RO	**PMESUPPORT:** Reserved.
26:19	00h RO	**Reserved0:** Reserved.

Bit Range	Default & Access	Description
18:16	3h RO	**VERSION:** Reserved.
15:8	00h RO	**NXTCAP:** Reserved.
7:0	01h RO	**POWER_CAP:** Reserved.

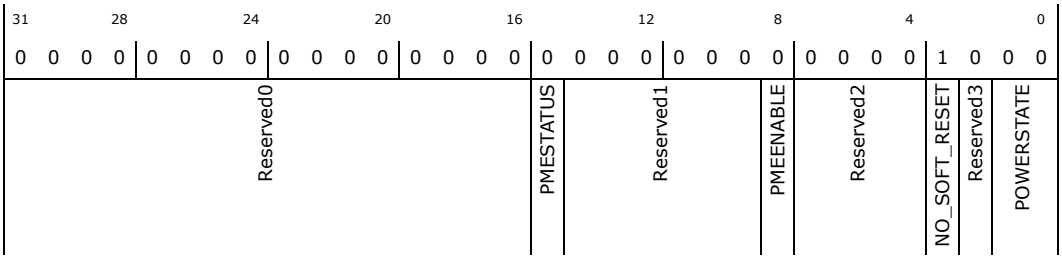
16.11.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMECTRLSTATUS: [B:0, D:23, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PMESTATUS:** Reserved.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PMEENABLE:** Reserved.
7:4	0h RO	**Reserved2:** Reserved.

2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**POWERSTATE:** Reserved.

16.11.13 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

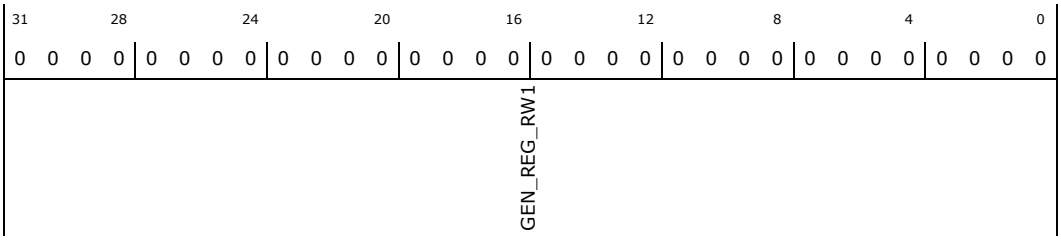
General Purpose Read Write Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:23, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.11.14 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

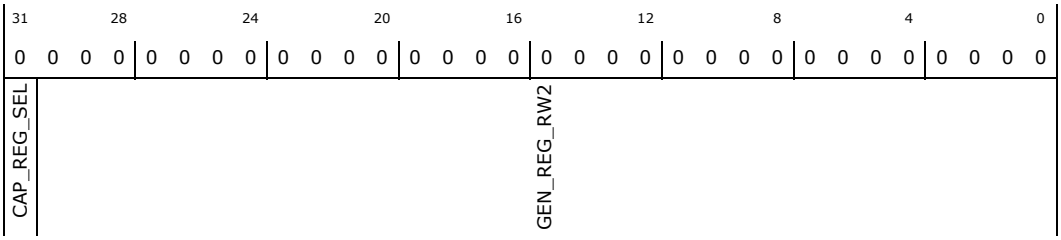
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW2: [B:0, D:23, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.11.15 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

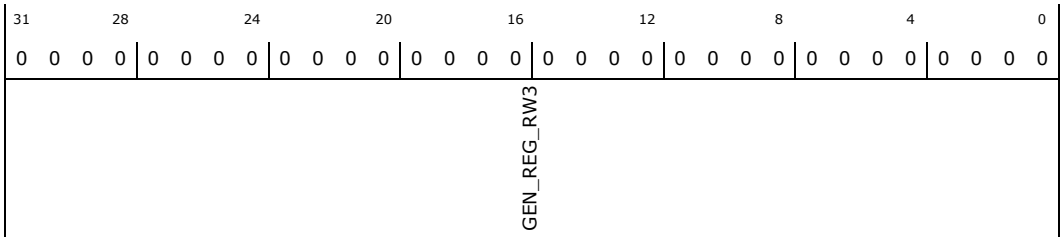
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW3: [B:0, D:23, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.11.16 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

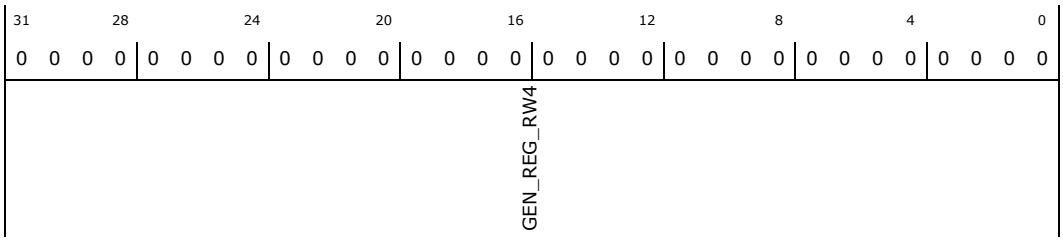
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW4: [B:0, D:23, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.11.17 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

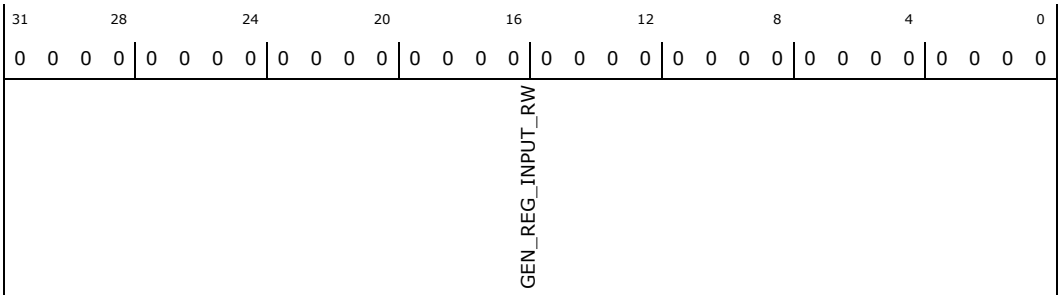
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:23, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.11.18 reg_MANID_type (MANID)—Offset F8h

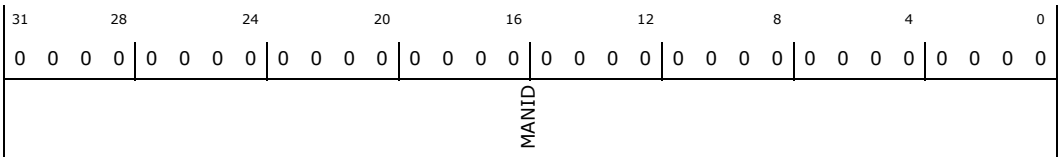
Manufacturers ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:23, F:0] + F8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**MANID:** Reserved.

16.12.1 SDMA System Address Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers

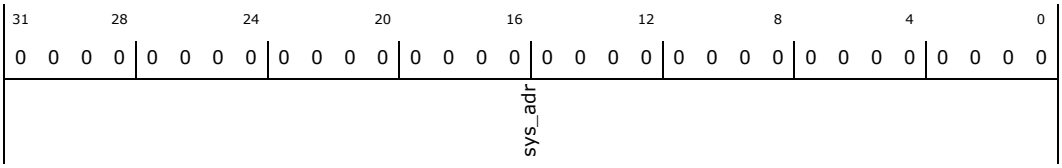
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SYS_ADR: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**SYS_ADR (sys_adr):** SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register.

16.12.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

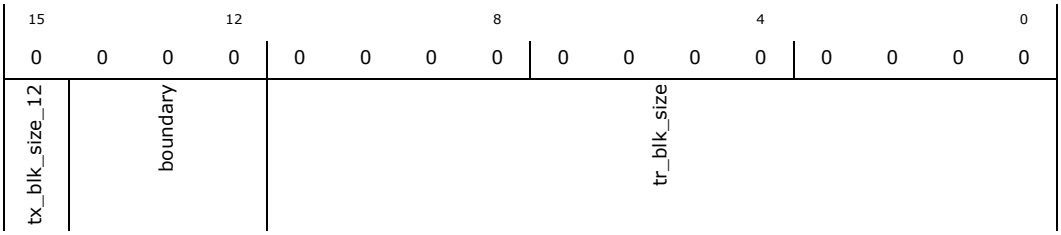
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_SIZE: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.
14:12	000b RW	**BOUNDARY (boundary):** Host SDMA Buffer Boundary The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. 000b - 4K bytes (Detects A11 carry out) 001b - 8K bytes (Detects A12 carry out) 010b - 16K Bytes (Detects A13 carry out) 011b - 32K Bytes (Detects A14 carry out) 100b - 64K bytes (Detects A15 carry out) 101b - 128K Bytes (Detects A16 carry out) 110b - 256K Bytes (Detects A17 carry out) 111b - 512K Bytes (Detects A18 carry out)
11:0	000h RW	**TR_BLK_SIZE (tr_blk_size):** Transfer Block Size This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. 0800h 2048 Bytes ??? ??? 0200h 512 Bytes 01FFh 511 Bytes ??? ??? 0004h 4 Bytes 0003h 3 Bytes 0002h 2 Bytes 0001h 1 Byte 0000h No data transfer

16.12.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks

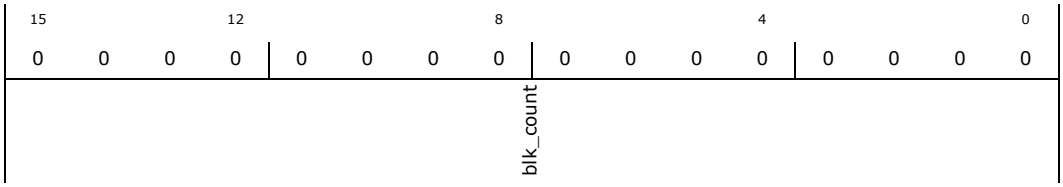
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

BLK_COUNT: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW	**BLK_COUNT (blk_count):** Blocks Count For Current Transfer This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers

16.12.4 Argument Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

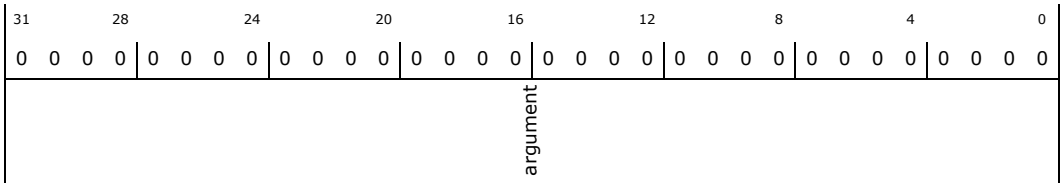
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ARGUMENT: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ARGUMENT (argument):** Command Argument The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.12.5 Transfer Mode Register (TX_MODE)—Offset Ch

Transfer Mode Register

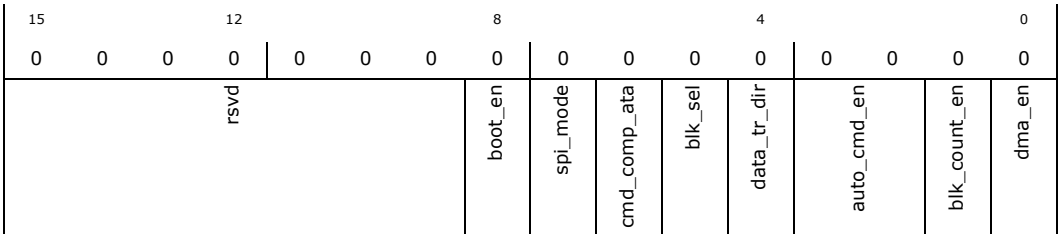
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

TX_MODE: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:9	00h RO	**RSVD (rsvd):** Reserved
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data_TR_Dir (data_tr_dir):** Data Transfer Direction Select This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands. 1 Read (Card to Host) 0 Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**BLK_COUNT_EN (blk_count_en):** Block Count Enable This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8) If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. 1 Enable 0 Disable
0	0b RW	**DMA_EN (dma_en):** DMA Enable This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). 1 DMA Data transfer 0 No data transfer or Non DMA data transfer

16.12.6 Command Register (CMD)—Offset Eh

Command Register

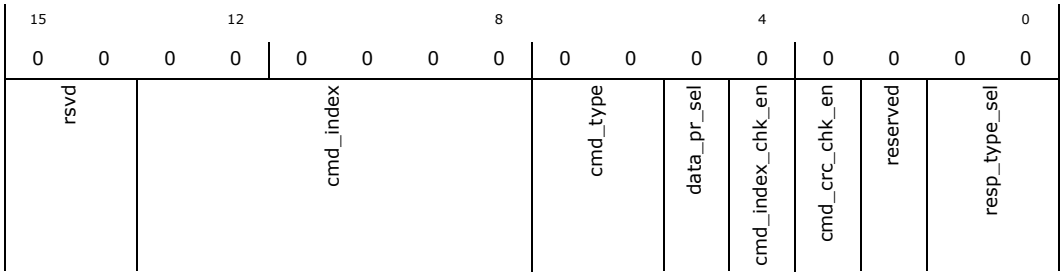
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CMD: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:14	0h RO	**RSVD (rsvd):** Reserved
13:8	0h RW	**CMD_INDEX (cmd_index):** Command Index These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**CMD_TYPE (cmd_type):** Command Type
5	0b RW	**DATA_PR_SEL (data_pr_sel):** Data Present Select This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38) (3) Resume command 1 Data Present 0 No Data Present
4	0b RW	**CMD_INDEX_CHK_EN (cmd_index_chk_en):** Command Index Check Enable If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. 1 Enable 0 Disable
3	0b RW	**CMD_CRC_CHK_EN (cmd_crc_chk_en):** Command CRC Check Enable If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) 1 Enable 0 Disable
2	0b RO	**Reserved (reserved):** Reserved
1:0	0h RW	**RESP_TYPE_SEL (resp_type_sel):** Response Type Select 00 No Response 01 Response Length 136 10 Response Length 48 11 Response Length 48 check Busy after response

16.12.7 Response Register0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards

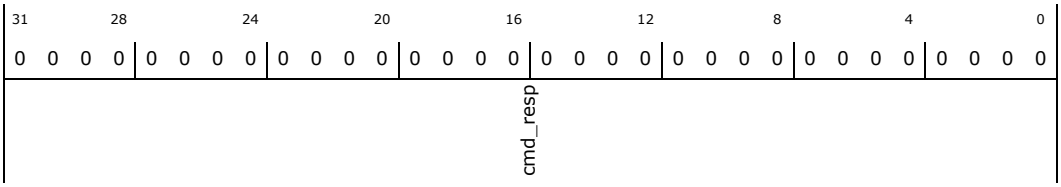
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE0: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP0 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.12.8 Response Register2 (RESPONSE2)—Offset 14h

This register is used to store responses from SD cards

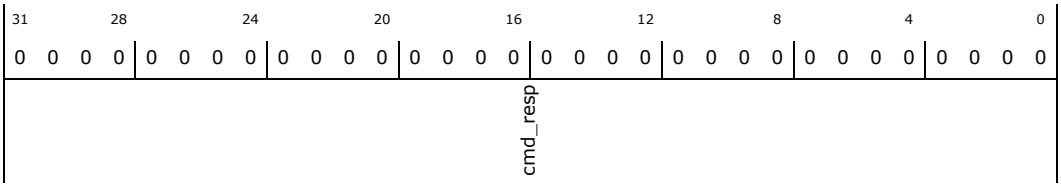
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE2: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP2 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.12.9 Response Register4 (RESPONSE4)—Offset 18h

This register is used to store responses from SD cards

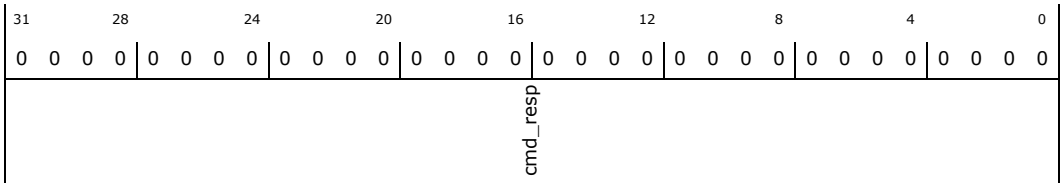
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE4: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP4 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.12.10 Response Register6 (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD cards

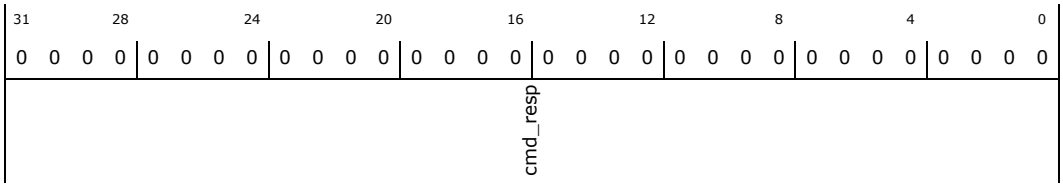
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESPONSE6: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**CMD_RESP6 (cmd_resp):** Command Response The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.12.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer

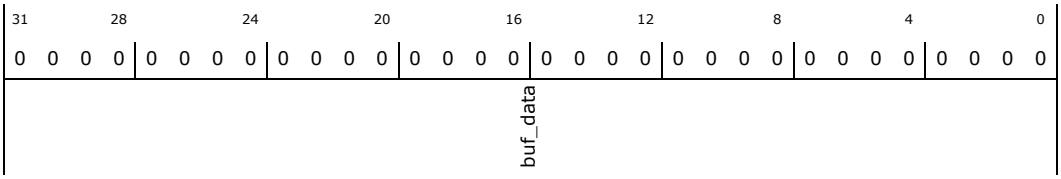
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

BUF_DATA_PORT: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**BUF_DATA (buf_data):** Buffer Data The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to 1.7

16.12.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register

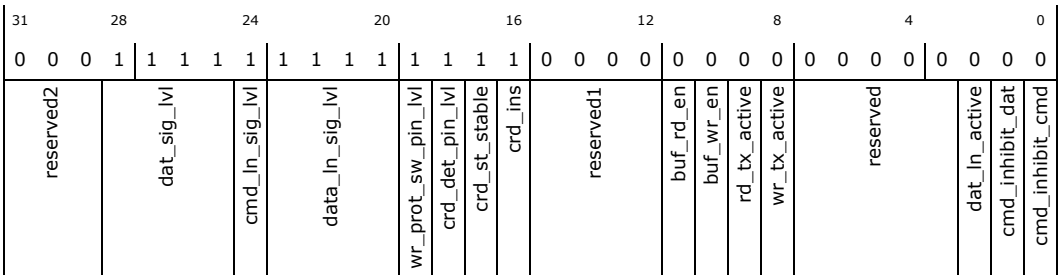
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PRE_STATE: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 1FFF0000h



Bit Range	Default & Access	Description
31:29	0h RO	**Reserved2 (reserved2):** Reserved
28:25	1111b RO	**DAT_SIG_LVL (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. D28 - DAT[7] D27 - DAT[6] D26 - DAT[5] D25 - DAT[4]
24	1b RO	**CMD_LN_SIG_LVL (cmd_ln_sig_lvl):** CMD Line Signal Level This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DATA_LN_SIG_LVL (data_ln_sig_lvl):** DAT[3:0] Line Signal Level This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. D23 DAT[3] D22 DAT[2] D21 DAT[1] D20 DAT[0]
19	1b RO	**WR_PROT_SW_PIN_LVL (wr_prot_sw_pin_lvl):** Write Protect Switch Pin Level
18	1b RO	**CRD_DET_PIN_LVL (crd_det_pin_lvl):** Card Detect Pin Level
17	1b RO	**CRD_ST_STABLE (crd_st_stable):** Card State Stable

Bit Range	Default & Access	Description
16	1b RO	**CRD_INS (crd_ins):** Card Inserted
15:12	0h RO	**Reserved1 (reserved1):** Reserved
11	0b RO	**BUF_RD_EN (buf_rd_en):** Buffer Read Enable
10	0b RO	**BUF_WR_EN (buf_wr_en):** Buffer Write Enable
9	0b RO	**RD_TX_ACTIVE (rd_tx_active):** Read Transfer Active
8	0b RO	**WR_TX_ACTIVE (wr_tx_active):** Write Transfer Active
7:3	00h RO	**Reserved (reserved):** Reserved
2	0b RO	**DAT_LN_ACTIVE (dat_ln_active):** DAT Line Active
1	0b RO	**CMD_INHIBIT_DAT (cmd_inhibit_dat):** Command Inhibit (DAT)
0	0b RO	**CMD_INHIBIT_CMD (cmd_inhibit_cmd):** Command Inhibit (CMD)

16.12.13 Host Control Register (HOST_CTL)—Offset 28h

Host Control Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

HOST_CTL: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**WAKEUP_EN_SD_RM (wakeup_en_sd_rm):** Wakeup Event Enable On SD Card Removal
1	0b RW	**WAKEUP_EN_SD_INS (wakeup_en_sd_ins):** Wakeup Event Enable On SD Card Insertion
0	0b RW	**WAKEUP_EN_CRD_INT (wakeup_en_crd_int):** Wakeup Event Enable On Card Interrupt

16.12.17 Clock Control Register (CLK_CTL)—Offset 2Ch

This register is used configure the frequency of the SDIO controller, and enable the clock.

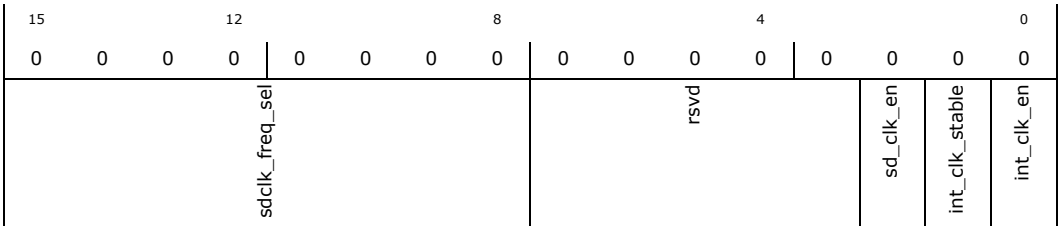
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

CLK_CTL: [BAR] + 2Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RW	**SDCLK_FREQ_SEL (sdclk_freq_sel):** SDCLK Frequency Select
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SD_CLK_EN (sd_clk_en):** SD Clock Enable
1	0b RO	**INT_CLK_STABLE (int_clk_stable):** Internal Clock Stable
0	0b RW	**INT_CLK_EN (int_clk_en):** Internal Clock Enable

16.12.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

Timeout Control Register

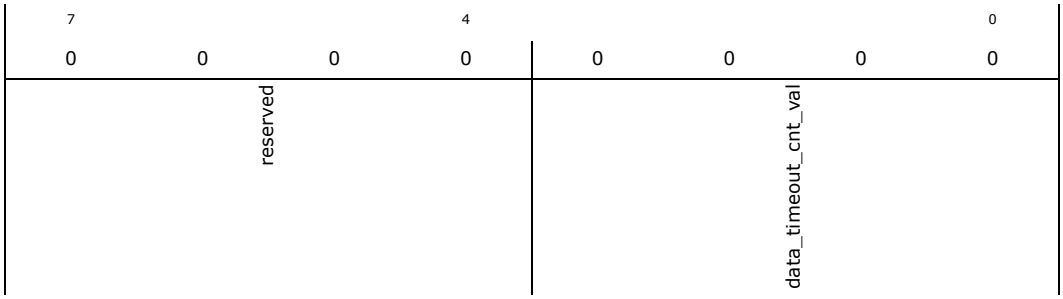
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

TIMEOUT_CTL: [BAR] + 2Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:4	0h RO	**Reserved (reserved):** Reserved
3:0	0h RW	**DATA_TIMEOUT_CNT_VAL (data_timeout_cnt_val):** Data Timeout Counter Value

16.12.19 Software Reset Register (SW_RST)—Offset 2Fh

Software Reset Register

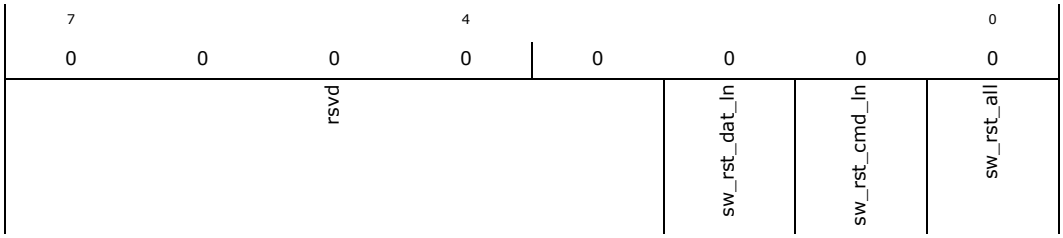
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SW_RST: [BAR] + 2Fh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:3	0h RO	**RSVD (rsvd):** Reserved
2	0b RW	**SW_RST_DAT_LN (sw_rst_dat_ln):** Software Reset For DAT Line
1	0b RW	**SW_RST_CMD_LN (sw_rst_cmd_ln):** Software Reset For CMD Line

Bit Range	Default & Access	Description
0	0b RW	**SW_RST_ALL (sw_rst_all):** Software Reset For All

16.12.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

Normal Interrupt Status Register

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

NML_INT_STATUS: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

16.12.26 Auto CMD12 Error Status Register and Host control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch

Auto CMD12 Error Status Register and Host control 2 Register

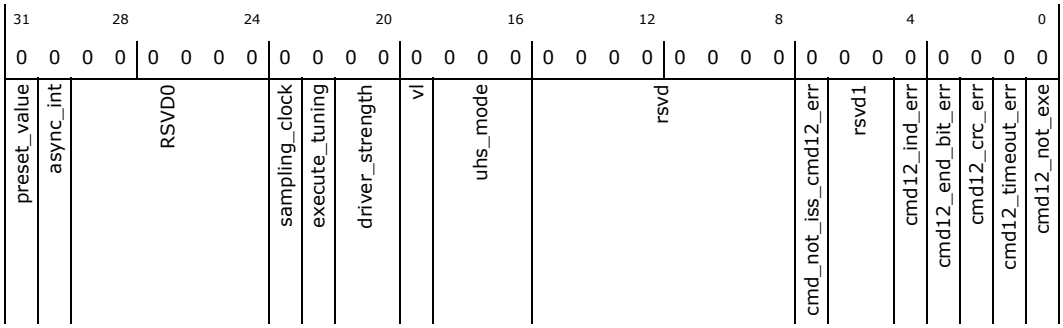
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CMD12_ERR_STAT_HOST_CTRL_2: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**PRESET_VALUE (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**ASYNC_INT (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 1 Enabled 0 Disabled
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**SAMPLING_CLOCK (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared
22	0b RW/AC	**EXECUTE_TUNING (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 1 Execute Tuning 0 Not Tuned or Tuning Completed
21:20	0b RW	**DRIVER_STRENGTH (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit
19	0b RW	**VL (vl):** This bit controls voltage regulator for I/O cell
18:16	0b RW	**UHS_MODE (uhs_mode):** This field is used to select one of UHS-I modes

16.12.39 DEBUG_SEL (DEBUG_SEL)—Offset 74h

Debug Selection Register

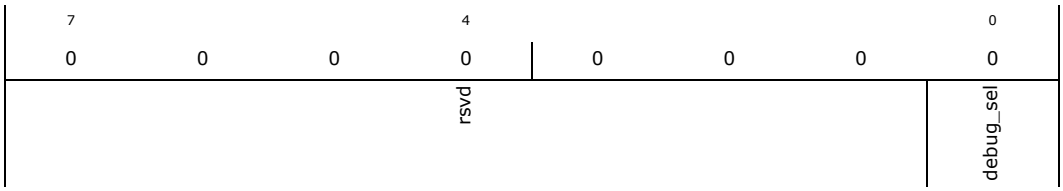
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

DEBUG_SEL: [BAR] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:1	00h RO	**RSVD (rsvd):** Reserved
0	0b WO	**DEBUG_SEL (debug_sel):** 1 - cmd register, interrupt status, transmitter module, ahb_iface module and clk sdcard signals are probed out..

16.12.40 Shared Bus Control Register (SHARED_BUS)—Offset E0h

Shared Bus Control Register

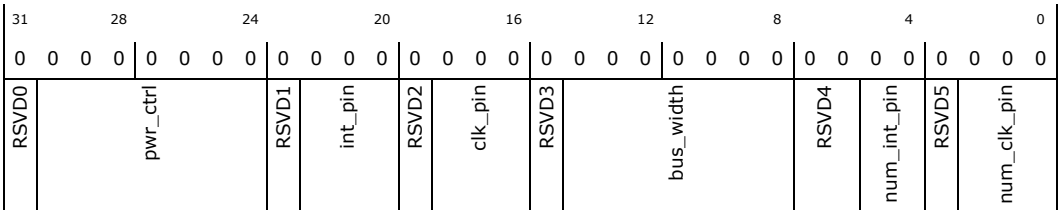
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

SHARED_BUS: [BAR] + E0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**RSVD0:** Reserved
30:24	0h RW	**PWR_CTRL (pwr_ctrl):** Each bit of this field controls back-end power supply for an embedded device. Host interface voltage (VDDH) is not controlled by this field. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices can be controlled D24 Back-end Power Control for Device 1 D25 Back-end Power Control for Device 2 D26 Back-end Power Control for Device 3 D27 Back-end Power Control for Device 4 D28 Back-end Power Control for Device 5 D29 Back-end Power Control for Device 6 D30 Back-end Power Control for Device 7 The function of each bit is defined as follows: 0 Back-end Power is Off 1 Back-end Power is Supplied Back-End power control is effective for embedded memory devices in the Sleep State that support the Sleep command (CMD14) to reduce power consumption and embedded SDIO devices when IOEx is set to 0.
23	0b RO	**RSVD1:** Reserved
22:20	0h RW	**INT_PIN (int_pin):** Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless. 000b Interrupt is detected by Interrupt Cycle xx1b INT_A is Enabled x1xb INT_B is Enabled 1xxb INT_C is Enabled
19	0b RO	**RSVD2:** Reserved
18:16	0h RW	**CLK_PIN (clk_pin):** One of clock pin outputs is selected by this field. Select of unsupported clock pin is meaningless. Refer to Figure 2-38 for the timing of clock outputs. 000b Clock Pins are Disabled 001b CLK[1] is Selected 010b CLK[2] is Selected .... 111b CLK[7] is Selected
15	0b RO	**RSVD3:** Reserved
14:8	0h RO	**BUS_WIDTH (bus_width):** Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins and a maximum of 7 devices are supported.This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1.D08 - Bus width preset for Device 1 D09 - Bus width preset for Device 2 D10 - Bus width preset for Device 3 D11 - Bus width preset for Device 4 D12 - Bus width preset for Device 5 D13 - Bus width preset for Device 6 D14 - Bus width preset for Device 7 The function of each bit is defined as follows: 0 - 4 bit buswidth mode 1 - 8 bit buswidth mode
7:6	0b RO	**RSVD4:** Reserved
5:4	0h RO	**NUM_INT_PIN (num_int_pin):** This field indicates support of interrupt input pins for shared bus system.Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired or connection is possible. 00b Interrupt Input Pin is Not Supported 01b INTA is Supported 10b INTA and INTB are Supported 11b INTA, INTB and INTC are Supported
3	0b RO	**RSVD5:** Reserved

Bit Range	Default & Access	Description
2:0	0h RO	**NUM_CLK_PIN (num_clk_pin):** This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported.Shared bus is supported by specific system. Then Standard Host Driver does not support control of these clock pins. 000b Shared bus is not supported 001b 1 SDCLK pin is supported 010b 2 SDCLK pins are supported .... 111b 7 SDCLK pins are supported

16.12.41 SPI_INT_SUP (SPI_INT_SUP)—Offset F0h

SPI_INT_SUP

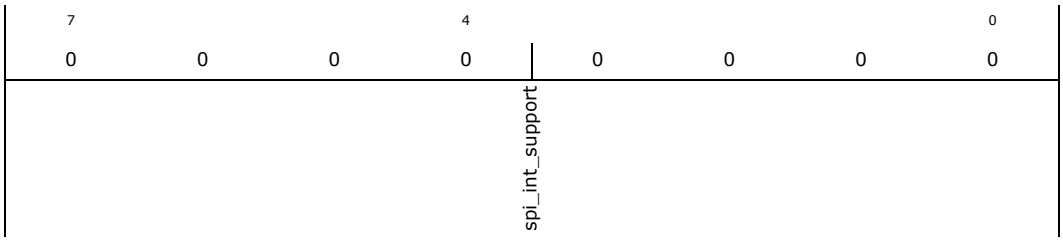
Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

SPI_INT_SUP: [BAR] + F0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**SPI_INT_SUPPORT (spi_int_support):** This bit is set to indicate the assertion assertion of interrupts in the SPI mode at any time, irrespective of the status of thecard select (CS) line. If this bit is zero, then SDIO card can only assert the interrupt line in the SPI mode when the CS line is asserted.

16.12.42 Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh

Slot Interrupt Status Register

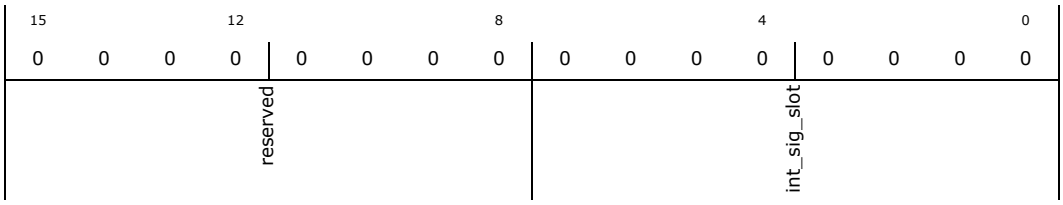
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SLOT_INT_STAT: [BAR] + FCh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h



Bit Range	Default & Access	Description

16.12.43 Host Controller Version Register (HOST_CTRL_VER)—Offset FEh

Host Controller Version Register

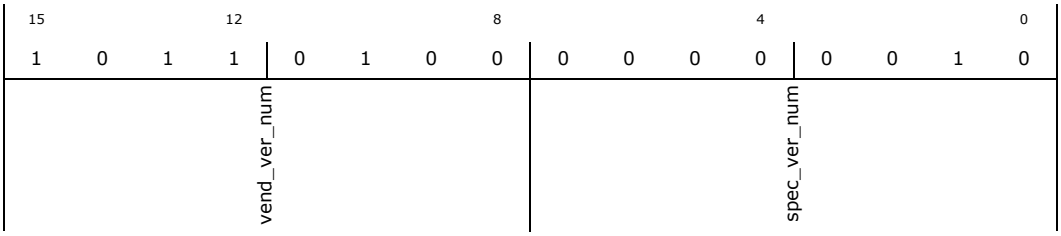
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

HOST_CTRL_VER: [BAR] + FEh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: B402h



Bit Range	Default & Access	Description
15:8	b4h RO	**VEND_VER_NUM (vend_ver_num):** Vendor Version Number
7:0	02h RO	**SPEC_VER_NUM (spec_ver_num):** Version Number

17 Serial ATA (SATA)

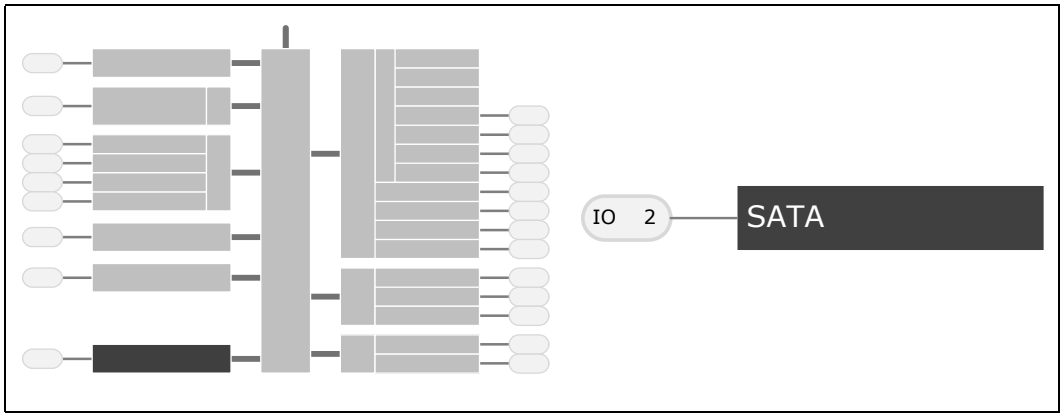
The SoC has one integrated SATA host controller that supports independent DMA operation on up to 2 ports and supports data transfer rates of 1.5 Gb/s (150 MB/s) and 3.0 Gb/s (300 MB/s). The SATA controller contains two modes of operation—a legacy mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

The SoC supports the Serial ATA Specification, Revision 2.6. The SoC also supports several optional sections of the SATA Revision 2.0 Specifications: Extensions to Serial ATA 1.0 Specification, Revision 1.0 (AHCI support is required for some elements).

The SATA controllers feature two sets of interface signals (ports) that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The SATA controllers interact with an attached mass storage device through a register interface that is equivalent to that presented by a traditional IDE host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

Note: SATA interface transfer rates are independent of UDMA mode settings. SATA interface transfer rates will operate at the bus's maximum speed, regardless of the UDMA mode reported by the SATA device or the system BIOS.

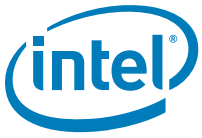


17.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin



- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 179. Signals

Signal Name	Direction Plat. Power	Description
SATA_GP[0]	I V1P8S	**Serial ATA 0 General Purpose:** This is an input pin which can be configured as an interlock switch or as a general purpose I/O, depending on the platform. When used as an interlock switch status indication, this signal should be driven to '0' to indicate that the switch is closed, and to '1' to indicate that the switch is open.
SATA_GP[1]	I V1P8S	**Serial ATA 1 General Purpose:** Same as above.
SATA_LED#	O V1P8S	**Serial ATA LED:** This is an open-collector output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tristated, the LED is off.
SATA_TXP[1:0] **SATA_TXN[1:0]**	O VPCIESATA	**Serial ATA Port 1 and 0:** These are outbound high-speed differential signals to Port 1 and 0.
SATA_RXP[1:0] **SATA_RXN[1:0]**	I VPCIESATA	**Serial ATA Port 1 and 0:** These are inbound high-speed differential signals to Port 1 and 0.
SATA_DEVSLP[1:0]	I/O V1P8S	These pins are used for hardware DEVSLP enabling. SATA_DEVSLP[0] is multiplexed with SATA_GPI[1], MMC1_RST#. SATA_DEVSLP[1] is multiplexed with LPE_I2S2_CLK.
SATA_RCOMP_P **SATA_RCOMP_N**	O	These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.

17.2 Features

17.2.1 Supported Features

Table 180. SATA Feature List (Sheet 1 of 2)

Feature	Description
Native Command Queuing (NCQ)	Allows the device to reorder commands for more efficient data transfers
Auto Activate for DMA	Collapses a DMA Setup then DMA Activate sequence into a DMA Setup only
Hot Plug Support	Allows for device detection without power being applied and ability to connect and disconnect devices without prior notification to the system
Asynchronous Signal Recovery	Provides a recovery from a loss of signal or establishing communication after hot plug
3 Gb/s Transfer Rate	Capable of data transfers up to 3 Gb/s
ATAPI Asynchronous Notification	A mechanism for a device to send a notification to the host that the device requires attention

Table 180. SATA Feature List (Sheet 2 of 2)

Feature	Description
Host & Link Initiated Power Management	Capability for the host controller or device to request Partial and Slumber interface power states
Staggered Spin-Up	Enables the host to spin up hard drives sequentially to prevent power load problems on boot
Command Completion Coalescing	Reduces interrupt and completion overhead by allowing a specified number of commands to complete and then generating an interrupt to process the commands

Table 181. SATA/AHCI Feature Matrix

Feature	AHCI Disabled	AHCI Enabled
Native Command Queuing (NCQ)	N/A	Supported
Auto Activate for DMA	N/A	Supported
Hot Plug Support	N/A	Supported
Asynchronous Signal Recovery	N/A	Supported
3 Gb/s Transfer Rate	Supported	Supported
ATAPI Asynchronous Notification	N/A	Supported
Host & Link Initiated Power Management	N/A	Supported
Staggered Spin-Up	Supported	Supported
Command Completion Coalescing	N/A	N/A

17.2.2 Theory of Operation

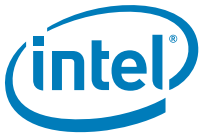
17.2.2.1 Standard ATA Emulation

The SoC contains a set of registers that shadow the contents of the legacy IDE registers. The behavior of the Command and Control Block registers, PIO, and DMA data transfers, resets, and interrupts are all emulated.

Note: The SoC will assert INTR when the master device completes the EDD command regardless of the command completion status of the slave device. If the master completes EDD first, an INTR is generated and BSY will remain '1' until the slave completes the command. If the slave completes EDD first, BSY will be '0' when the master completes the EDD command and asserts INTR. Software must wait for busy to clear (0) before completing an EDD command, as required by the ATA5 through ATA7 (T13) industry standards.

17.2.2.2 48-Bit LBA Operation

The SATA host controller supports 48-bit LBA through the host-to-device register FIS when accesses are performed using writes to the task file. The SATA host controller will ensure that the correct data is put into the correct byte of the host-to-device FIS.



There are special considerations when reading from the task file to support 48-bit LBA operation. Software may need to read all 16-bits. Since the registers are only 8-bits wide and act as a FIFO, a bit must be set in the device/control register, which is at offset 3F6h for primary and 376h for secondary (or their native counterparts).

If software clears Bit 7 of the control register before performing a read, the last item written will be returned from the FIFO. If software sets Bit 7 of the control register before performing a read, the first item written will be returned from the FIFO.

17.2.3 AHCI Operation

The SoC provides hardware support for Advanced Host Controller Interface (AHCI), a programming interface for SATA host controllers developed through a joint industry effort. AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as Hot-Plug. AHCI requires appropriate software support (such as, an AHCI driver) and for some features, hardware support in the SATA device or additional platform hardware.

The SoC supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and Hot-Plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

Note: For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port.

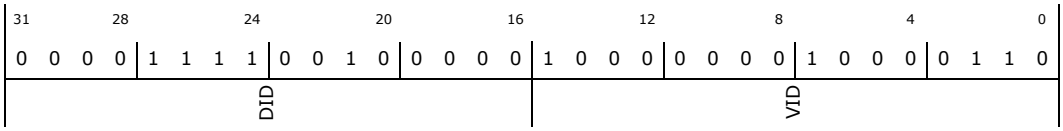
17.5.1 Identifiers (ID)—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ID: [B:0, D:19, F:0] + 0h

Default: 0F208086h



Bit Range	Default & Access	Description
31:16	0F20h RO	**Device ID (DID):** The specific value is dependent on config bits and fuses. The value is product specific. VLV SATA DID can be within the range of 0F20-0F27 and 0F2E and 0F2F. However, since VLV SATA does not support RAID, DID can be either 0F20 or OF22.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

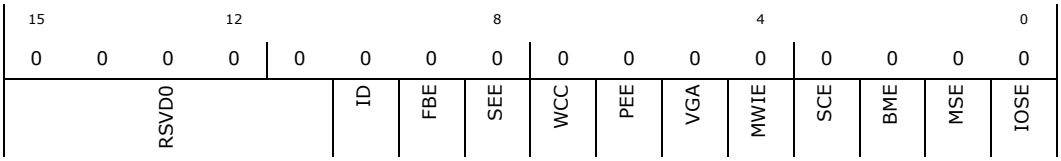
17.5.2 Command (CMD)—Offset 4h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

CMD: [B:0, D:19, F:0] + 4h

Default: 0000h



Bit Range	Default & Access	Description
15:11	0b RO	**RSVD0:** Reserved
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# is generated if there is an interrupt and MSI is not enabled.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Reserved.
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	**Wait Cycle Enable (WCC):** Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	**VGA Palette Snooping Enable (VGA):** Reserved.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved.
3	0h RO	**Special Cycle Enable (SCE):** Reserved.
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

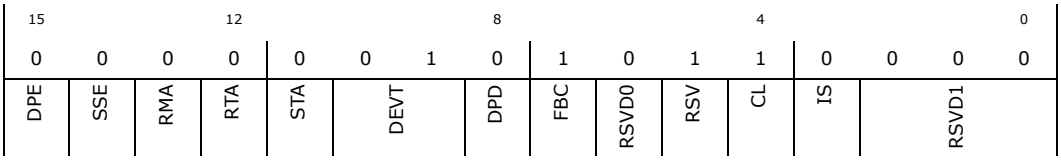
17.5.3 Device Status (STS)—Offset 6h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

STS: [B:0, D:19, F:0] + 6h

Default: 02B0h



Bit Range	Default & Access	Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	**Signaled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved.
6	0b RO	**RSVD0:** Reserved
5	1h RO	**66 MHz Capable (RSV):** Reserved.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0b RO	**RSVD1:** Reserved

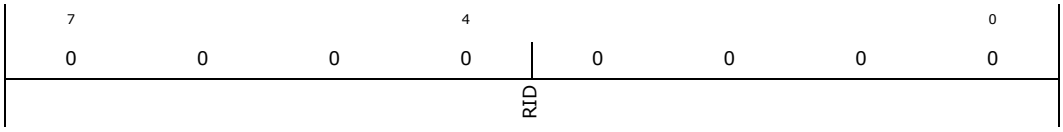
17.5.4 Revision ID (RID)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

RID: [B:0, D:19, F:0] + 8h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

17.5.5 Programming Interface (PI)—Offset 9h

This register definition depends on the CC.SCC field. When the CC.SCC is 01h(IDE mode), register definition corresponds to 1st table. When CC.SCC is 06h(AHCI mode), register definition follows the 2nd table.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

PI: [B:0, D:19, F:0] + 9h

Default: 8Ah

7			4				0
1	0	0	0	1	0	1	0
BMS	RSVD0			SNC	SNE	PNC	PNE

Bit Range	Default & Access	Description
7	1h RO	**Bus Master Support (BMS):** Indicates the SATA Controller supports bus master operation.
6:4	0b RO	**RSVD0:** Reserved
3	1h RO	**Secondary Mode Native Capable (SNC):** Indicates that the secondary controller supports both legacy and native modes.
2	0h RW	**Secondary Mode Native Enable (SNE):** Determines the mode that the secondary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the PNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.
1	1h RO	**Primary Mode Native Capable (PNC):** Indicates that the primary controller supports both legacy and native modes.
0	0h RW	**Primary Mode Native Enable (PNE):** Determines the mode that the primary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the SNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.

17.5.6 Class Code (CC)—Offset Ah

Access Method

Type: PCI Configuration Register (Size: 16 bits)

CC: [B:0, D:19, F:0] + Ah

Default: 0106h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0
BCC								SCC							

Bit Range	Default & Access	Description
15:8	01h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	06h RO	**Sub Class Code (SCC):** The value reported in this field is dependent on MAP.SMS and various fuses and configuration bits. The value is product specific. For VLV this field may read 01h (IDE) or 06h (AHCI).

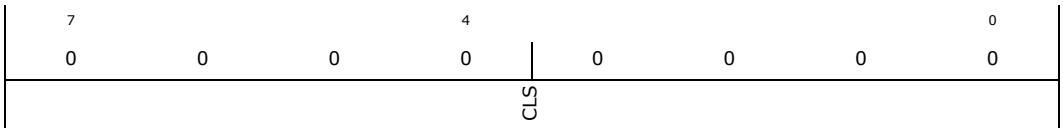
17.5.7 Cache Line Size (CLS)—Offset Ch

Access Method

Type: PCI Configuration Register (Size: 8 bits)

CLS: [B:0, D:19, F:0] + Ch

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

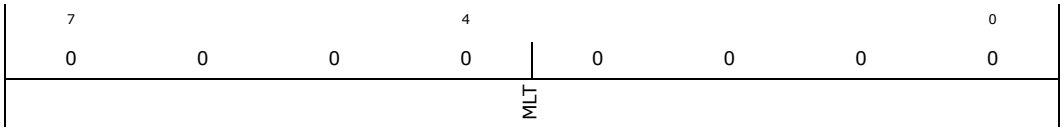
17.5.8 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: PCI Configuration Register (Size: 8 bits)

MLT: [B:0, D:19, F:0] + Dh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

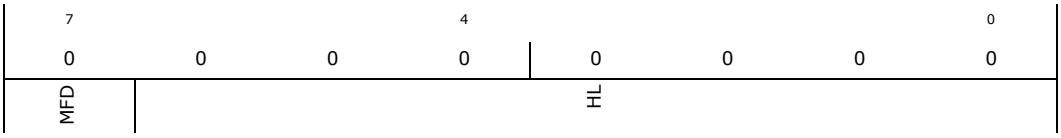
17.5.9 Header Type (HTYPE)—Offset Eh

Access Method

Type: PCI Configuration Register (Size: 8 bits)

HTYPE: [B:0, D:19, F:0] + Eh

Default: 00h



Bit Range	Default & Access	Description
7	0h RO	**Multi-function Device (MFD):** Indicates this controller is not part of a multi-function device.
6:0	00h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

17.5.10 Primary Command Block Base Address (PCMDBA)—Offset 10h

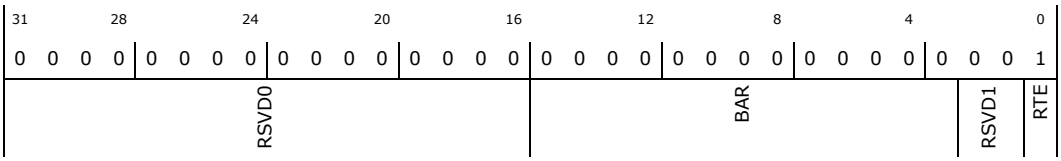
This 8-byte I/O space is used in Native Mode for the Primary Controller's Command Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCMDBA: [B:0, D:19, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.11 Primary Control Block Base Address (PCTLBA)—Offset 14h

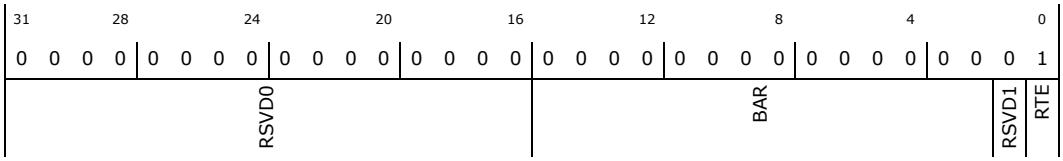
This 4-byte I/O space is used in Native Mode for the Primary Controller's Control Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCTLBA: [B:0, D:19, F:0] + 14h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.12 Secondary Command Block Base Address (SCMDBA)—Offset 18h

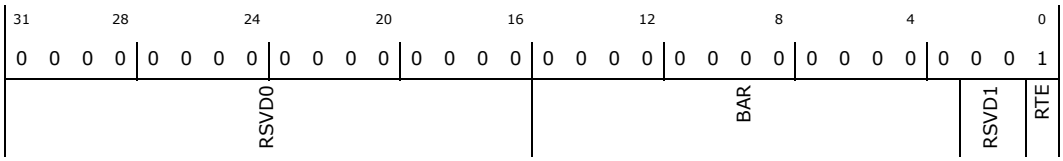
This 8-byte I/O space is used in Native Mode for the Secondary Controller's Command Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SCMDBA: [B:0, D:19, F:0] + 18h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.13 Secondary Control Block Base Address (SCTLBA)—Offset 1Ch

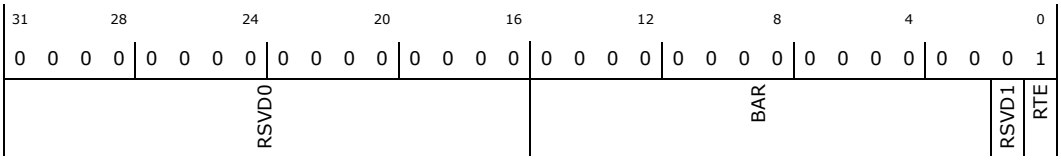
This 4-byte I/O space is used in Native Mode for the Secondary Controller's Control Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SCTLBA: [B:0, D:19, F:0] + 1Ch

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.14 Legacy IDE Base Address / AHCI Index Data Pair Base Address (LBAR)—Offset 20h

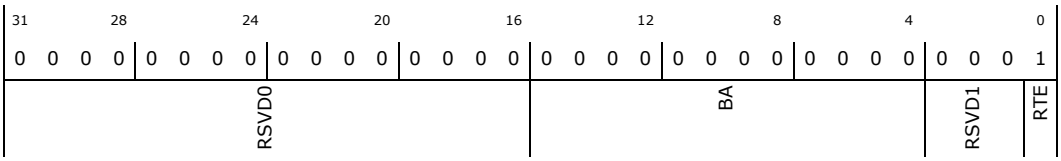
This BAR is used to allocate I/O space for the SFF-8038i mode of operation (aka Bus Master IDE) and if CC.SCC is not 01h, it is used to allocate I/O space for the AHCI index/data pair mechanism as well. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

LBAR: [B:0, D:19, F:0] + 20h

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:4	0h RW	**Base Address (BA):** Base address of the I/O space. Note for Base Address bit 4: When CC.SCC is 01h, this bit will be RW resulting in requesting 16B of I/O space. When CC.SCC is not 01h, this bit will be RO=0 resulting in requesting 32B of I/O space.
3:1	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Description
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.15 AHCI Base Address/Serial ATA Index Data Pair Base Address (ABAR)—Offset 24h

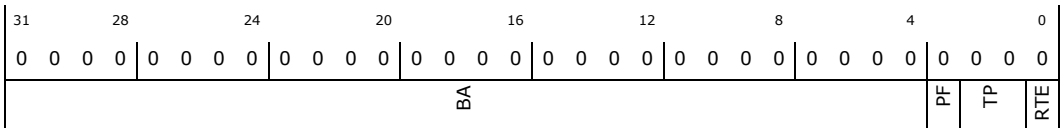
When the programming interface is not IDE (i.e. CC.SCC is not 01h), this register is named ABAR. When the programming interface is IDE, this register becomes SIDPBA. Note that hardware does not clear those BA bits when switching from IDE SKU to non-IDE SKU or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after SKU switching (as indicated by a change in CC.SCC). In the case, this register will then have to be re-programmed to a proper value. When the programming interface is not IDE, the register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. When the programming interface is IDE, the register becomes an I/O BAR allocating 16 bytes of I/O space for the I/O mapped registers defined in Memory Registers. Note that although 16 bytes of locations are allocated, only 8 bytes are used as SINDX and SDATA registers; with the remaining 8 bytes preserved for future enhancement.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ABAR: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**Base Address (BA):** When programming interface is non IDE, this is base address of register memory space (aligned to 2 KB). Bits 31:11 are RW, bits 10:4 are RO of 0; When programming interface is IDE, this is base address of the I/O space. Bits 31:16 are RO of 0, bits 15:4 are RW
3	0h RO	**Prefetchable (PF):** When programming interface is non IDE, this indicates that this range is not prefetch-able
2:1	0h RO	**Type (TP):** When programming interface is non IDE, this indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** When programming interface is non IDE, this indicates a request for register memory space; When programming interface is IDE, this indicates a request for IO space.

17.5.16 Sub System Identifiers (SS)—Offset 2Ch

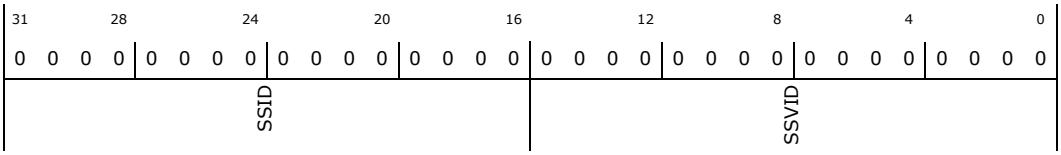
This register is initialized to logic 0 by the assertion of Backbone Reset. This register can be written only once after Backbone Reset de-assertion.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SS: [B:0, D:19, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

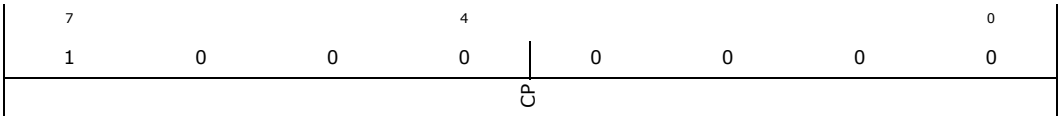
17.5.17 Capabilities Pointer (CAP)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

CAP: [B:0, D:19, F:0] + 34h

Default: 80h



Bit Range	Default & Access	Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default which is meant for non-IDE mode: CAP.CP - 80h (MSI) - 70h (PCI Power) - A8h (SATA) - 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability.[Br] If BIOS intends to operate in IDE mode, BIOS is requested to program this field to 70h and the subsequent capability list as such: CAP.CP - 70h (PCI Power) - end. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.

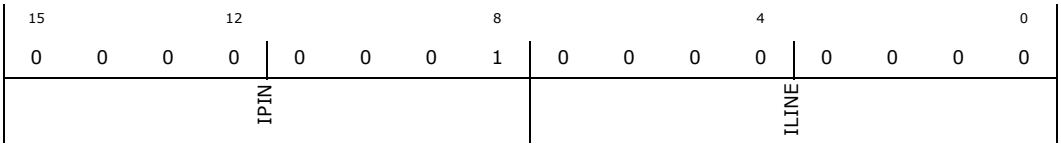
17.5.18 Interrupt Information (INTR)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 16 bits)

INTR: [B:0, D:19, F:0] + 3Ch

Default: 0100h



Bit Range	Default & Access	Description
15:8	01h RO	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#.
7:0	00h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.5.19 Minimum Grant (MGNT)—Offset 3Eh

Access Method

Type: PCI Configuration Register (Size: 8 bits)

MGNT: [B:0, D:19, F:0] + 3Eh

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RO	**MGNT:** Minimum Grant

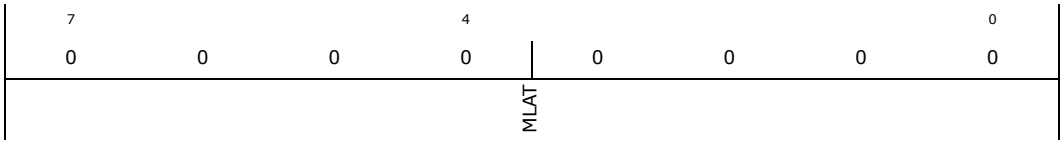
17.5.20 Maximum Latency (MLAT)—Offset 3Fh

Access Method

Type: PCI Configuration Register (Size: 8 bits)

MLAT: [B:0, D:19, F:0] + 3Fh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**MLAT:** Maximum Latency

17.5.21 Primary Timing (PTIM)—Offset 40h

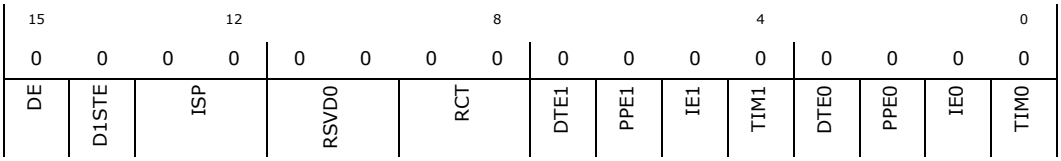
This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PTIM: [B:0, D:19, F:0] + 40h

Default: 0000h



15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DE	D1STE	ISP		RSVD0		RCT		DTE1	PPE1	IE1	TIM1	DTE0	PPE0	IE0	TIM0

Bit Range	Default & Access	Description
15	0h RW	**Decode Enable (DE):** Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	**Device 1 Separate Timing Enable (D1STE):** This register is not used by SATA controller.
13:12	0h RW	**IORDY Sample Point (ISP):** This register is not used by SATA controller.
11:10	0b RO	**RSVD0:** Reserved
9:8	0h RW	**Recovery Time (RCT):** This register is not used by SATA controller.
7	0h RW	**Device 1 DMA Timing Enable (DTE1):** This register is not used by SATA controller.
6	0h RW	**Device 1 Prefetch/Posting Enable (PPE1):** This register is not used by SATA controller.
5	0h RW	**Device 1 IORDY Sample Point Enable (IE1):** This register is not used by SATA controller.
4	0h RW	**Device 1 Fast Timing Bank (TIM1):** This register is not used by SATA controller.
3	0h RW	**Device 0 DMA Timing Enable (DTE0):** This register is not used by SATA controller.
2	0h RW	**Device 0 Prefetch/Posting Enable (PPE0):** This register is not used by SATA controller.
1	0h RW	**Device 0 IORDY Sample Point Enable (IE0):** This register is not used by SATA controller.
0	0h RW	**Device 0 Fast Timing Bank (TIM0):** This register is not used by SATA controller.

17.5.22 Secondary Timing (STIM)—Offset 42h

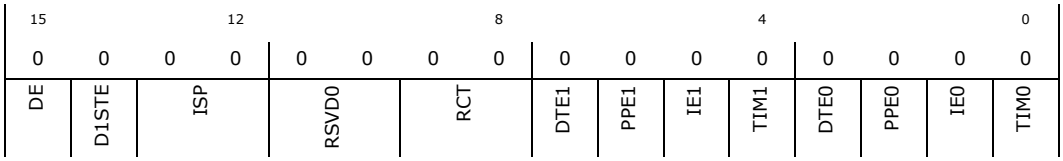
This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

STIM: [B:0, D:19, F:0] + 42h

Default: 0000h



Bit Range	Default & Access	Description
15	0h RW	**Decode Enable (DE):** Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	**Device 1 Separate Timing Enable (D1STE):** This register is not used by SATA controller.
13:12	0h RW	**IORDY Sample Point (ISP):** This register is not used by SATA controller.
11:10	0b RO	**RSVD0:** Reserved
9:8	0h RW	**Recovery Time (RCT):** This register is not used by SATA controller.
7	0h RW	**Device 1 DMA Timing Enable (DTE1):** This register is not used by SATA controller.
6	0h RW	**Device 1 Prefetch/Posting Enable (PPE1):** This register is not used by SATA controller.
5	0h RW	**Device 1 IORDY Sample Point Enable (IE1):** This register is not used by SATA controller.
4	0h RW	**Device 1 Fast Timing Bank (TIM1):** This register is not used by SATA controller.
3	0h RW	**Device 0 DMA Timing Enable (DTE0):** This register is not used by SATA controller.
2	0h RW	**Device 0 Prefetch/Posting Enable (PPE0):** This register is not used by SATA controller.
1	0h RW	**Device 0 IORDY Sample Point Enable (IE0):** This register is not used by SATA controller.
0	0h RW	**Device 0 Fast Timing Bank (TIM0):** This register is not used by SATA controller.

17.5.23 Device 1 IDE Timing (D1TIM)—Offset 44h

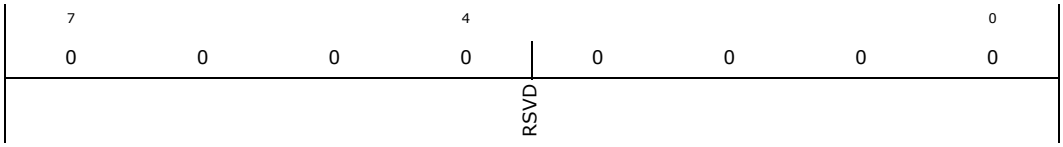
This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

D1TIM: [B:0, D:19, F:0] + 44h

Default: 00h



Bit Range	Default & Access	Description
7:0	0h RW	**RSVD:** Reserved

17.5.24 Synchronous DMA Control (Synchronous_DMA_Control)—Offset 48h

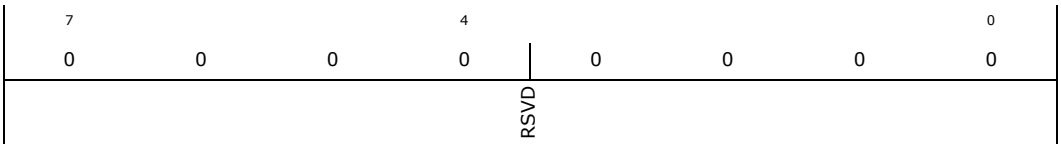
This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Synchronous_DMA_Control: [B:0, D:19, F:0] + 48h

Default: 00h



Bit Range	Default & Access	Description
7:0	0h RW	**RSVD:** Reserved

17.5.25 Synchronous_DMA_Timing—Offset 4Ah

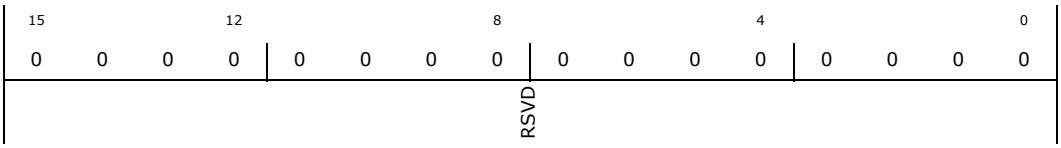
This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Synchronous_DMA_Timing: [B:0, D:19, F:0] + 4Ah

Default: 0000h



Bit Range	Default & Access	Description
15:0	0h RW	**RSVD:** Reserved

17.5.26 IDE I/O Configuration (IIOC)—Offset 54h

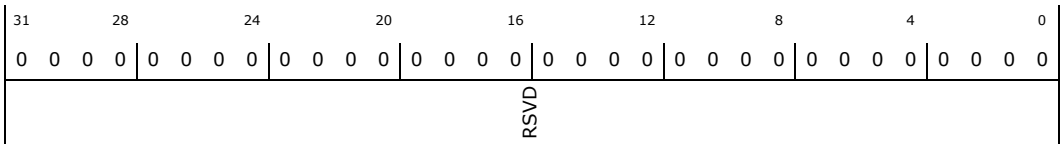
This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IIOC: [B:0, D:19, F:0] + 54h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**RSVD:** Reserved

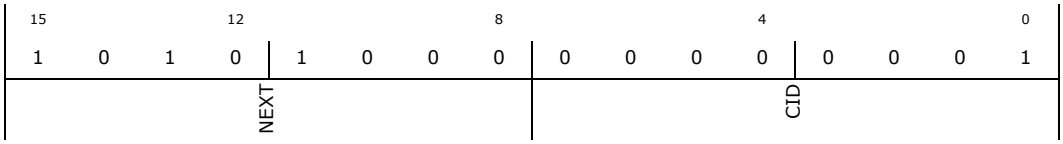
17.5.27 PCI Power Management Capability ID (PID)—Offset 70h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PID: [B:0, D:19, F:0] + 70h

Default: A801h



Bit Range	Default & Access	Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. This is recommended for non-IDE mode. If the controller is to operate in IDE mode, BIOS is requested to program this field to 00h indicating the end (recommended setting). The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	01h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

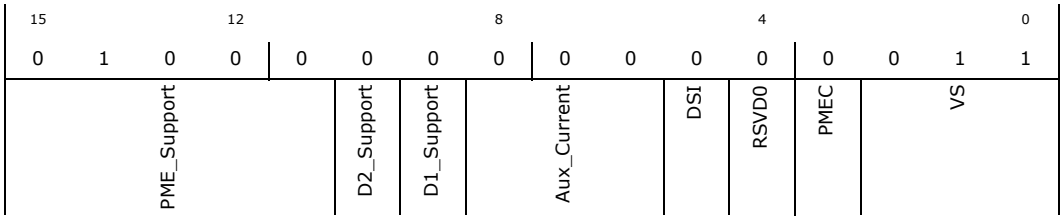
17.5.28 PCI Power Management Capabilities (PC)—Offset 72h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PC: [B:0, D:19, F:0] + 72h

Default: 4003h



Bit Range	Default & Access	Description
15:11	08h RO	**PME_Support:** By default with CC.SCC=01h, the default value is 00000 which indicates no PME Support in IDE mode. When CC.SCC is not 01h in non-IDE mode, the default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	**D2_Support:** The D2 state is not supported.
9	0h RO	**D1_Support:** The D1 state is not supported.
8:6	0h RO	**Aux_Current:** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0b RO	**RSVD0:** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

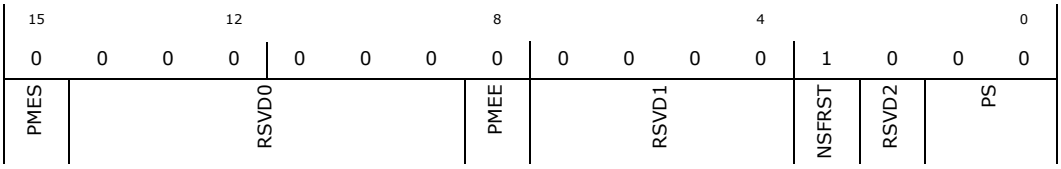
17.5.29 PCI Power Management Control and Status (PMCS)—Offset 74h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PMCS: [B:0, D:19, F:0] + 74h

Default: 0008h



Bit Range	Default & Access	Description
15	0h RW	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. -Note: Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0.
14:9	0b RO	**RSVD0:** Reserved
8	0h RW	**PME Enable (PMEE):** When CC.SCC is not 01h, this bit is RW. When set, the SATA controller generates PME# from D3HOT on a wake event. Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0 since there is no PME Support in IDE mode. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru MAP.SMS.
7:4	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Description
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of Power_State commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the Power_State bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0b RO	**RSVD2:** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to PCI PM specification section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

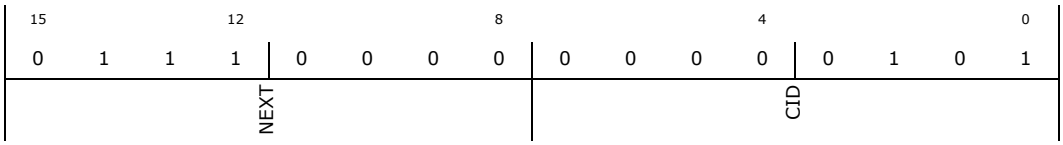
17.5.30 Message Signaled Interrupt Identifier (MID)—Offset 80h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MID: [B:0, D:19, F:0] + 80h

Default: 7005h



Bit Range	Default & Access	Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	05h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

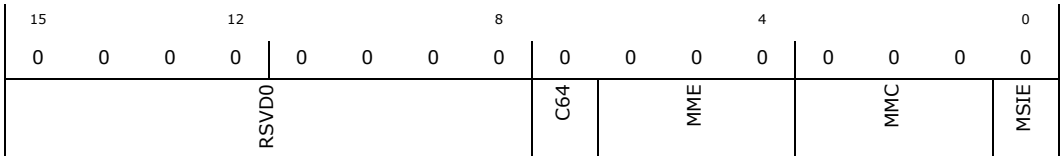
17.5.31 Message Signaled Interrupt Message Control (MC)—Offset 82h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MC: [B:0, D:19, F:0] + 82h

Default: 0000h



Bit Range	Default & Access	Description
15:8	0b RO	**RSVD0:** Reserved
7	0h RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field. Software must also make sure this bit is cleared to 0 when operating in legacy mode (for AHCI SKUs when GHC.AE = 0). This bit is RW when CC.SCC is not 01h and is read-only 0 when CC.SCC is 01h.

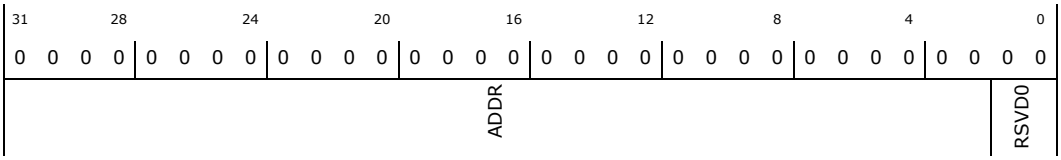
17.5.32 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MA: [B:0, D:19, F:0] + 84h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0b RO	**RSVD0:** Reserved

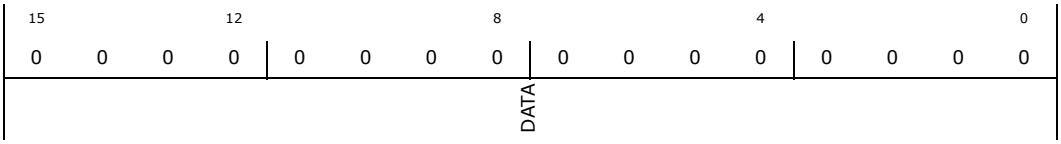
17.5.33 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MD: [B:0, D:19, F:0] + 88h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

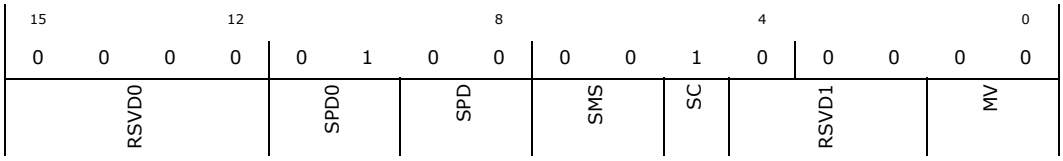
17.5.34 Port Mapping Register (MAP)—Offset 90h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MAP: [B:0, D:19, F:0] + 90h

Default: 0420h



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:10	1h RO	**SATA Port Disable (SPD0):** A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPD. And only then BIOS configures the PCS.PxE.
9:8	0h RO	**SATA Port Disable (SPD):** A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPD. And only then BIOS configures the PCS.PxE.
7:6	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 00b = IDE mode which requires LBC01.LBGE=1 (refer to LBC01, LBC23 and LBC45 register in SIR register space); 01b = AHCI mode; 10b = RAID mode; 11b = Reserved. Notes : SW shall not manipulate MAP.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST. IDE mode can be selected when AHCI and/or RAID are enabled. After switching from AHCI/RAID back to IDE mode, the number of usable ports on SATA Controller 1 shall be reduced to 4, dependent on SKUs. AHCI mode may only be selected when MV = 00b. AHCI mode may be selected when RAID feature is enabled by fuse. VLV does not support RAID mode. Programming these bits with values that are illegal will result in in-deterministic behavior by the HW.
5	1h RW	**SATA Port-to-Controller Configuration (SC):** This bit changes number of SATA port availability within each SATA controller. When MAP.SPD[5] is 1 and MAP.SPD[4] is 1, this bit is reserved and is read-only 1 else it's RW-zero. When this bit is 0: Up to 2 SATA ports are available in the SATA controller 1 with port[1:0]. When this bit to 1: Up to 2 SATA ports are available in the SATA controller 1 with port [1:0]. For SMS=IDE mode, this bit should be 0 (note that this irrespective of the number of SATA ports). The number of port availability in this controller shall be discoverable thru this controller's config PCS.PxE, AHCI CAP.NP and AHCI PI[x] register fields. Prior to changing the state of this bit, all ports must be in quiescent state with no commands outstanding. Refer to Single and Dual Controller Switching Requirement for additional software and hardware requirements.
4:2	0b RO	**RSVD1:** Reserved
1:0	0h RO	**Map Value (MV):** This register is reserved.

17.5.35 Port Control and Status (PCS)—Offset 92h

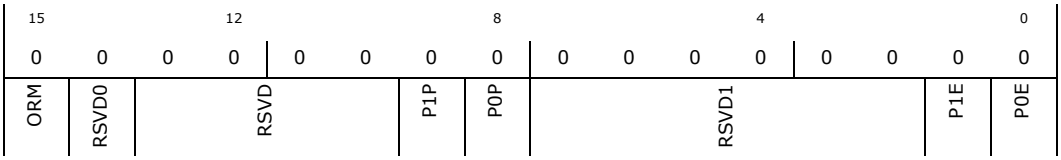
By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == 0) as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to 1 prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PCS: [B:0, D:19, F:0] + 92h

Default: 0000h



Bit Range	Default & Access	Description
15	0h RW	**OOB Retry Mode (ORM):** When cleared, the SATA controller will not retry after an OOB failure. When set, the SATA controller will continue to retry after an OOB failure until successful (infinite retry). BIOS is requested to program this field to 1.
14	0b RO	**RSVD0:** Reserved
13:10	0h RO	**RSVD:** Reserved
9	0h RO	**Port 1 Present (P1P):** Same as P0P, except for port 1.
8	0h RO	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1.
7:2	0b RO	**RSVD1:** Reserved
1	0h RW	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD.

Bit Range	Default & Access	Description
0	0h RW	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 2 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us. (Not for EDS: refer to section 7.9.1 on staggered power sequencing).

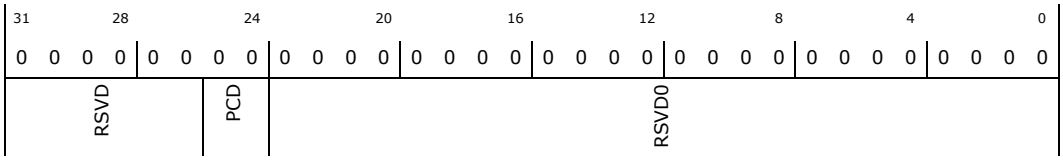
17.5.36 Test Mode Register (TM)—Offset 94h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

TM: [B:0, D:19, F:0] + 94h

Default: 00000000h



Bit Range	Default & Access	Description
31:26	0h RO	**Reserved (RSVD):** Reserved.
25:24	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally.
23:0	0b RO	**RSVD0:** Reserved

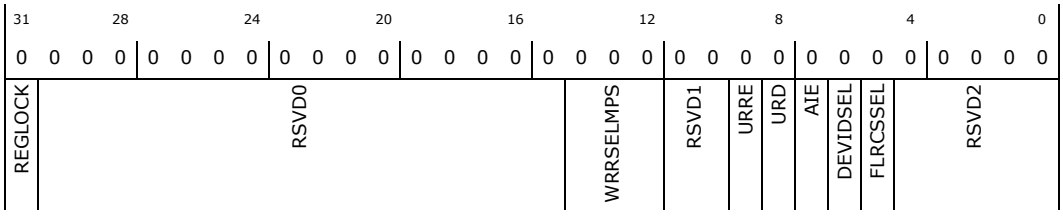
17.5.37 SATA General Configuration (SATAGC)—Offset 9Ch

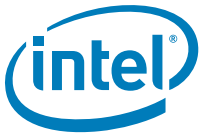
Access Method

Type: PCI Configuration Register (Size: 32 bits)

SATAGC: [B:0, D:19, F:0] + 9Ch

Default: 00000000h





Bit Range	Default & Access	Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is requested to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process.
30:15	0b RO	**RSVD0:** Reserved
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller.
11:10	0b RO	**RSVD1:** Reserved
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. The value is product specific. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by Backbone Reset and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime.
6	0h RW/O	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature Disable Fuse 7 =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h; 1 : 2826h. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse 7 is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is requested to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h.
4:0	0b RO	**RSVD2:** Reserved

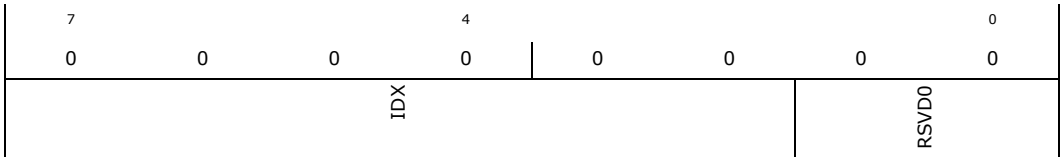
17.5.38 SATA Initialization Register Index (SIRI)—Offset A0h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

SIRI: [B:0, D:19, F:0] + A0h

Default: 00h



Bit Range	Default & Access	Description
7:2	00h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Note that this 256-byte register space setting is applicable to all ports in both SATA controllers 1 and 2 (if supported). Refer to SATA Initialization Register section for detail of the register space.
1:0	0b RO	**RSVD0:** Reserved

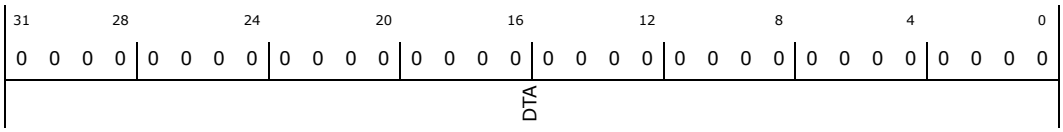
17.5.39 SATA Initialization Register Data (SIRD)—Offset A4h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SIRD: [B:0, D:19, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

17.5.40 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

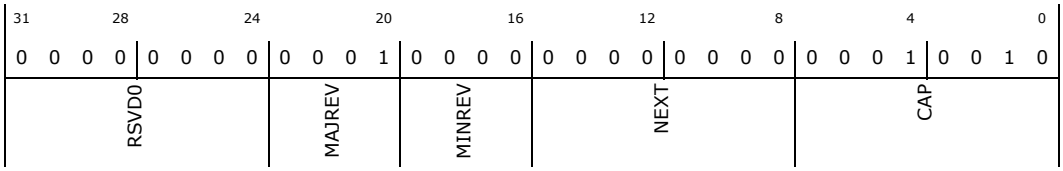
This register shall be read-only 0 when CC.SCC is 01h. Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SATACR0: [B:0, D:19, F:0] + A8h

Default: 00100012h



Bit Range	Default & Access	Description
31:24	0b RO	**RSVD0:** Reserved
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	00h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

17.5.41 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

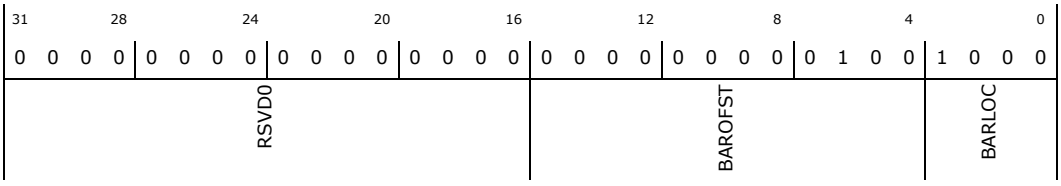
This register shall be read-only 0 when CC.SCC is 01h.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SATACR1: [B:0, D:19, F:0] + ACh

Default: 00000048h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:4	004h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset ... FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h =) BAR0; 0101b = 14h =) BAR1; 0110b = 18h =) BAR2; 0111b = 1Ch =) BAR3; 1000b = 20h =) LBAR; 1001b = 24h =) BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

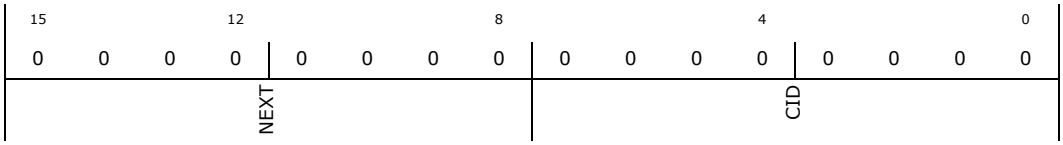
17.5.42 FLR Capability ID (FLRCID)—Offset B0h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

FLRCID: [B:0, D:19, F:0] + B0h

Default: 0000h



Bit Range	Default & Access	Description
15:8	00h RO	**Next Capability (NEXT):** 00h indicating the final item in the Capability List.
7:0	00h RO	**Capability ID (CID):** The value of this field depends on the FLRCSSEL bit. SATAGC.FLRCSSEL = 0, Capability ID = 13h; SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

17.5.43 FLR Control (FLRCTL)—Offset B4h

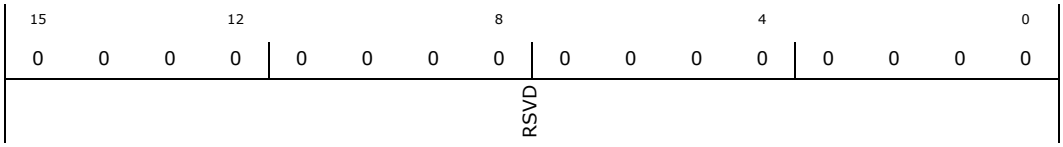
This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

FLRCTL: [B:0, D:19, F:0] + B4h

Default: 0000h



Bit Range	Default & Access	Description
15:0	0h RO	**RSVD:** Reserved

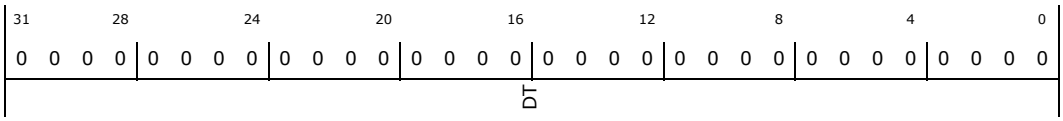
17.5.44 Scratch Pad (SP)—Offset D0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SP: [B:0, D:19, F:0] + D0h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

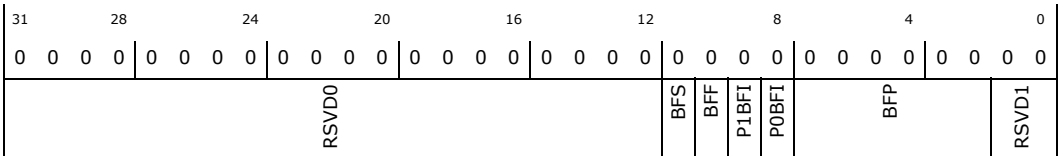
17.5.45 BIST FIS Control/Status (BFCS)—Offset E0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BFCS: [B:0, D:19, F:0] + E0h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11	0h RW	**BIST FIS Successful (BFS):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device
10	0h RW	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0b RO	**RSVD1:** Reserved

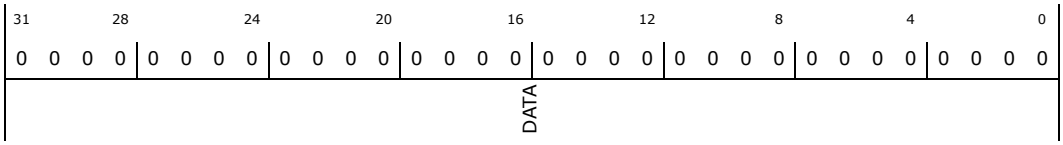
17.5.46 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BFTD1: [B:0, D:19, F:0] + E4h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

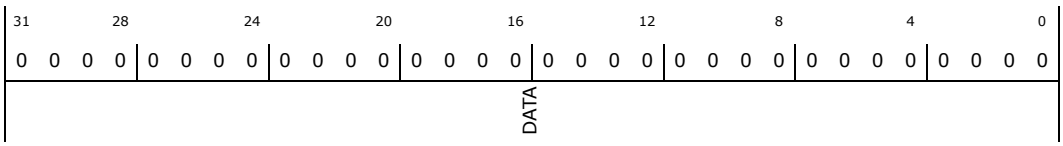
17.5.47 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BFTD2: [B:0, D:19, F:0] + E8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

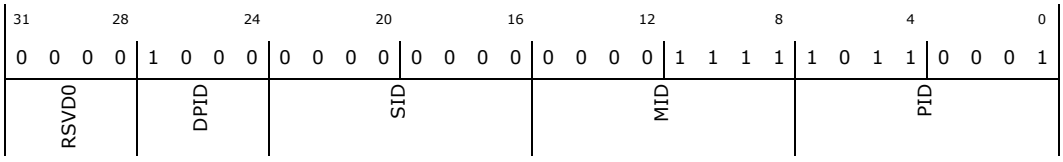
17.5.48 Manufacturing ID (MFID)—Offset F8h

Access Method

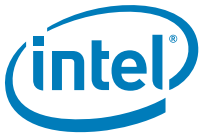
Type: PCI Configuration Register (Size: 32 bits)

MFID: [B:0, D:19, F:0] + F8h

Default: 08000FB1h



Bit Range	Default & Access	Description
31:28	0b RO	**RSVD0:** Reserved



Bit Range	Default & Access	Description
27:24	8h RO	**Dot portion of Process ID (DPID):** Indicates the dot. Process is reflected in bits [7:0]. The value is product specific.
23:16	0h RO	**Stepping Identifier (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. The value is product specific.
15:8	0Fh RO	**Manufacturer Identifier (MID):** Indicates Intel.
7:0	B1h RO	**Process/Dot Identifier (PID):** Indicates the Process. Dot is reflected in bits [27:24]. The value is product specific.

17.6 SATA Legacy IO Registers

Table 183. Summary of SATA Legacy I/O Registers—LBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Primary Command (PCMD)—Offset 0h" on page 1798	00h
2h	1	"Primary Status (PSTS)—Offset 2h" on page 1799	00h
4h	4	"Primary Descriptor Table Pointer (PDTP)—Offset 4h" on page 1799	00000000h
8h	1	"Secondary Command (SCMD)—Offset 8h" on page 1800	00h
Ah	1	"Secondary Status (SSTS)—Offset Ah" on page 1800	00h
Ch	4	"Secondary Descriptor Table Pointer (SDTP)—Offset Ch" on page 1801	00000000h
10h	4	"AHCI Index Register (INDEX)—Offset 10h" on page 1801	00000000h
14h	4	"AHCI Data Register (DATA)—Offset 14h" on page 1802	00000000h

17.6.1 Primary Command (PCMD)—Offset 0h

Access Method

Type: I/O Register (Size: 8 bits)

PCMD: [LBAR] + 0h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0
RSVD0				RWC	RSVD1		START

Bit Range	Default & Access	Description
7:4	0b RO	**RSVD0:** Reserved
3	0h RW	**Read / Write Control (RWC):** Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	**RSVD1:** Reserved
0	0h RW	**Start/Stop Bus Master (START):** Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation. All state information is lost when this bit is written to 0; Master mode operation cannot be stopped and then resumed. If this bit is reset while bus master operation is still active and the device has not yet finished its data transfer, the bus master command is said to be aborted. If this bit is cleared to 0 prior to the DMA data transfer being initiated by the drive in a device to memory data transfer, then not DMAT will be sent to terminate the data transfer. SW intervention (e.g. sending SRST) is required to reset the interface in this condition. This bit is intended to be cleared by software after the data transfer is completed - as indicated by either the ACT bit being cleared in the status register, or the I bit being set in the status register, or both.

17.6.2 Primary Status (PSTS)—Offset 2h

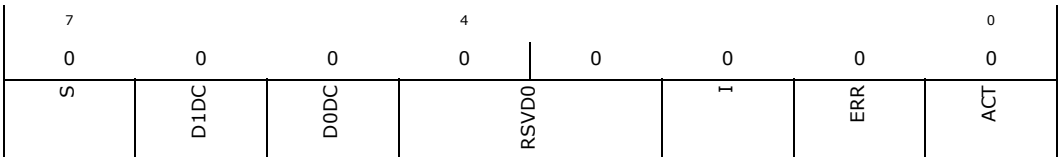
Access Method

Type: I/O Register
(Size: 8 bits)

PSTS: [LBAR] + 2h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h



Bit Range	Default & Access	Description
7	0h RO	**Simplex Only (S):** This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	**Device 1 DMA Capable (D1DC):** A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	**Device 0 DMA Capable (D0DC):** A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	**RSVD0:** Reserved
2	0h RW/1C	**Interrupt (I):** This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	**Error (ERR):** This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	**Active (ACT):** Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

17.6.3 Primary Descriptor Table Pointer (PDTP)—Offset 4h

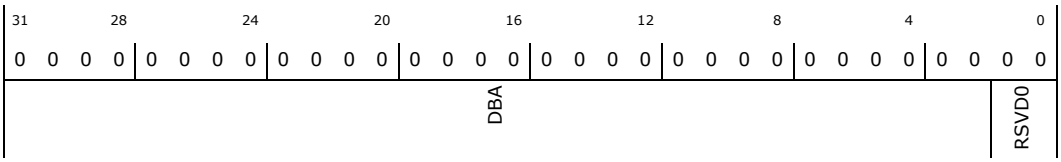
Access Method

Type: I/O Register
(Size: 32 bits)

PDTP: [LBAR] + 4h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RW	**Descriptor Base Address (DBA):** Corresponds to A[31:2]. This table must not cross a 64K boundary in memory. When read, the current value of the pointer is returned
1:0	0b RO	**RSVD0:** Reserved

17.6.4 Secondary Command (SCMD)—Offset 8h

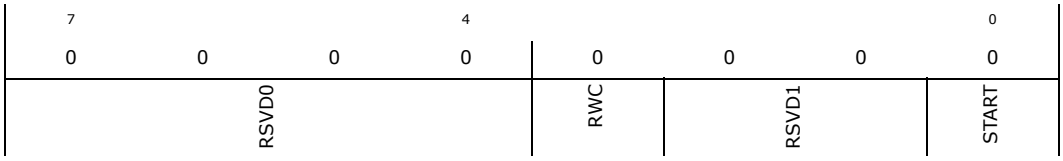
Access Method

Type: I/O Register (Size: 8 bits)

SCMD: [LBAR] + 8h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h



Bit Range	Default & Access	Description
7:4	0b RO	**RSVD0:** Reserved
3	0h RW	**Read / Write Control (RWC):** Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	**RSVD1:** Reserved
0	0h RW	**Start/Stop Bus Master (START):** Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation.

17.6.5 Secondary Status (SSTS)—Offset Ah

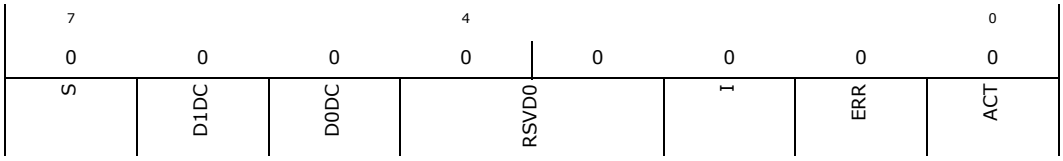
Access Method

Type: I/O Register (Size: 8 bits)

SSTS: [LBAR] + Ah

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h



Bit Range	Default & Access	Description
7	0h RO	**Simplex Only (S):** This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	**Device 1 DMA Capable (D1DC):** A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	**Device 0 DMA Capable (D0DC):** A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	**RSVD0:** Reserved
2	0h RW/1C	**Interrupt (I):** This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	**Error (ERR):** This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	**Active (ACT):** Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

17.6.6 Secondary Descriptor Table Pointer (SDTP)—Offset Ch

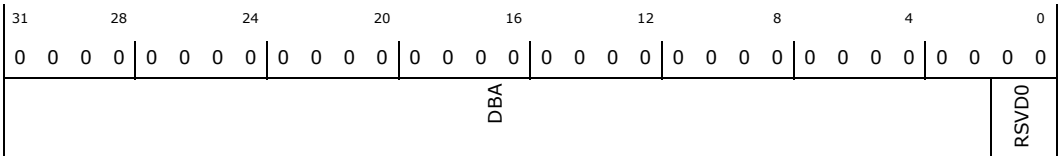
Access Method

Type: I/O Register
(Size: 32 bits)

SDTP: [LBAR] + Ch

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RW	**Descriptor Base Address (DBA):** Corresponds to A[31:2]. This table must not cross a 64K boundary in memory. When read, the current value of the pointer is returned
1:0	0b RO	**RSVD0:** Reserved

17.6.7 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

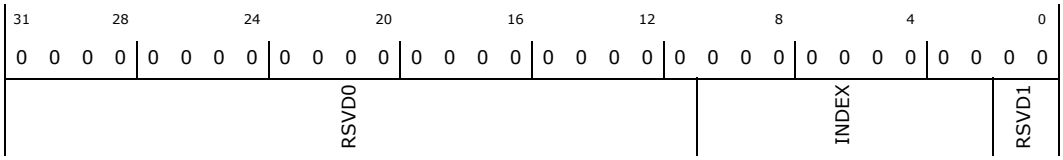
Access Method

Type: I/O Register
(Size: 32 bits)

INDEX: [LBAR] + 10h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h



Bit Range	Default & Access	Description
31:11	0b RO	**RSVD0:** Reserved
10:2	000h RO	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0b RO	**RSVD1:** Reserved

17.6.8 AHCI Data Register (DATA)—Offset 14h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

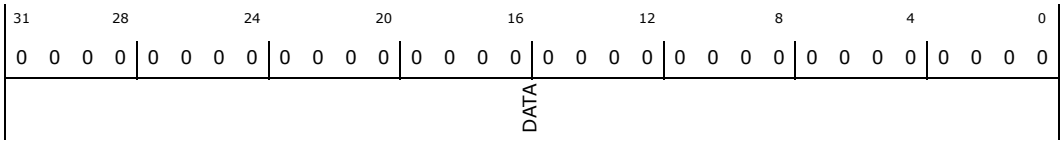
Access Method

Type: I/O Register
(Size: 32 bits)

DATA: [LBAR] + 14h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

17.7 SATA Index Pair IO Registers

Table 184. Summary of SATA Index Pair I/O Registers—ABAR

Offset	Size	Register ID—Description	Default Value
0h	4	"Serial ATA Index (SINDX)—Offset 0h" on page 1803	00000000h
4h	4	"Serial ATA Data (SDATA)—Offset 4h" on page 1804	00000000h

17.7.1 Serial ATA Index (SINDX)—Offset 0h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

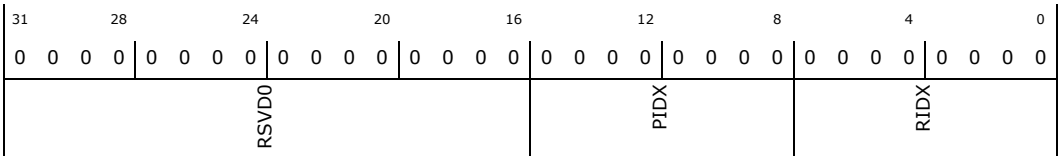
Access Method

Type: I/O Register
(Size: 32 bits)

SINDX: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RW	**Port Index (PIDX):** This index field is used to specify the port of the SATA controller that the port specific SerialATA Status (SSTS), SerialATA Control (SCTL) and SerialATA Error (SERR) registers are to be read from or write to. 00h = Primary Master (Port 0); 01h = Primary Slave (Port 2); 02h = Secondary Master (Port 1); 03h = Secondary Slave (Port 3).
7:0	00h RW	**Register Index (RIDX):** This index field is used to specify one out of three registers currently being indexed into. These three registers are the Serial ATA superset SStatus, SControl and SError memory registers and are port specific, hence for this SATA controller, there are four sets of these registers. Refer to Offset 128h, 1A8h, 228h, 2A8h, 328h, 3A8h: PxSSTS - Port [0-5] Serial ATA Status, Offset 12Ch, 1ACh, 22Ch, 2ACh, 32Ch, 3ACh: PxSCTL - Port [0-5] Serial ATA Control, and Offset 130h, 1B0h, 230h, 2B0h, 330h, 3B0h: PxSERR - Port [0-5] Serial ATA Error for definitions of the SStatus, SControl and SError registers. 00h = SSTS; 01h = SCTL; 02h = SERR.

17.7.2 Serial ATA Data (SDATA)—Offset 4h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

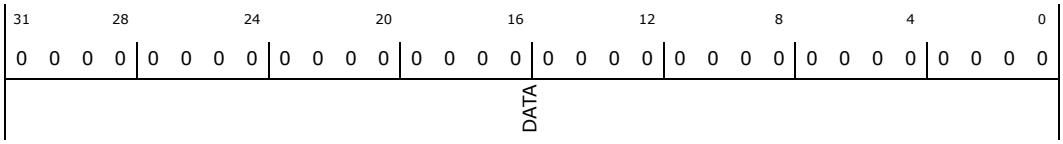
Access Method

Type: I/O Register (Size: 32 bits)

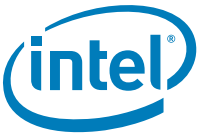
SDATA: [ABAR] + 4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DATA):** This Data register is a window through which data is read or written to from the register pointed to by the Serial ATA Index (SINDX) register above. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by SINDX.RIDX field.



17.8 SATA AHCI Memory Mapped IO Registers

Table 185. Summary of SATA AHCI Memory Mapped I/O Registers—ABAR

Offset	Size	Register ID—Description	Default Value
0h	4	"HBA Capabilities (GHC_CAP)—Offset 0h" on page 1806	DF20FF02h
4h	4	"HBA Capabilities (GHC_CAP)—Offset 0h" on page 1806	00000000h

17.8.1 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

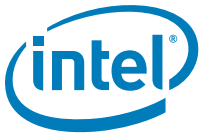
GHC_CAP: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: DF20FF02h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	1	1	1	1	1	0	0	1	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	1	0
S64A	SCQA	SSNTF	SMPS	SSS	SALP	SAL	SCLO	ISS				SNZO	SAM	SMP	FBSS	PMD	SSC	PSC	NCS					CCCS	EMS	SXS	NP				

Bit Range	Default & Access	Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	0h RO	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.



Bit Range	Default & Access	Description
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and its associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue software reset if these bits are still set from a previous operation.
23:20	2h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved.
19	0h RO	**Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3
18	0h RW/O	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	0h RO	**Supports Port Multiplier (SMP):** Not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RO	**Enclosure Management Supported (EMS):** Not supported
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.

Bit Range	Default & Access	Description
4:0	02h RO	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 2 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

17.8.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

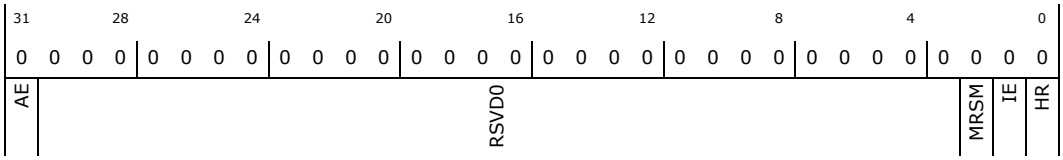
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

GHC: [ABAR] + 4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0b RO	**RSVD0:** Reserved
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME (MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC) 0 (multiple messages requested); MC.MME) 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is leass than the number requested. Value of MRSM is a don't care when GHC.HR=1.

Bit Range	Default & Access	Description
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.

17.8.3 Interrupt Status (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

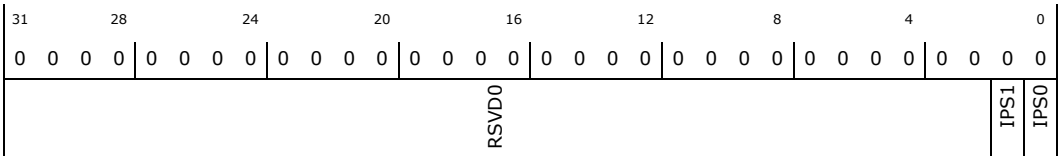
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IS: [ABAR] + 8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	0h RW/1C	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

17.8.4 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

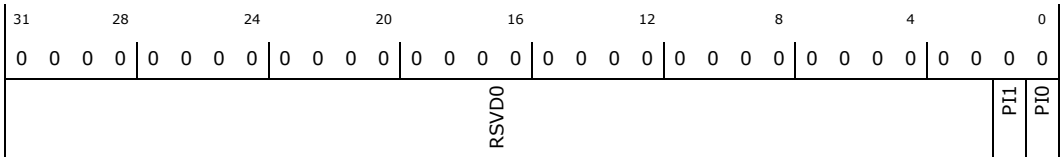
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

GHC_PI: [ABAR] + Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	0h RW/O	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

17.8.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

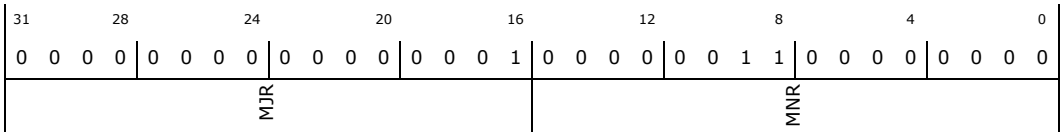
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

VS: [ABAR] + 10h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00010300h



Bit Range	Default & Access	Description
31:16	0001h RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	0300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30

17.8.6 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

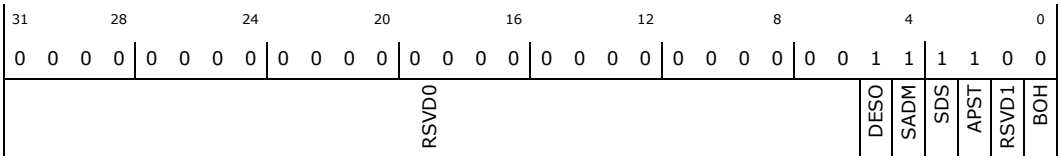
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

GHC_CAP2: [ABAR] + 24h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000003Ch



Bit Range	Default & Access	Description
31:6	0b RO	**RSVD0:** Reserved
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is requested to program this field to 1.
4	1h RW/O	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. Note: If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0b RO	**RSVD1:** Reserved
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

17.8.7 Vendor Specific (VSP)—Offset A0h

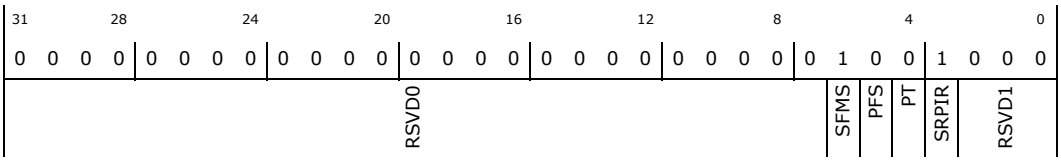
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

VSP: [ABAR] + A0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000048h



Bit Range	Default & Access	Description
31:7	0b RO	**RSVD0:** Reserved
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features. Not for EDS: The state of this bit reflects the opposite state of fuse FFSATA5 and FFSATA 3 (PFS =1 if fuse values=10 or 11, else PFS=0).
4	0h RO	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0b RO	**RSVD1:** Reserved

17.8.8 Vendor Specific Capabilities (VS_CAP)—Offset A4h

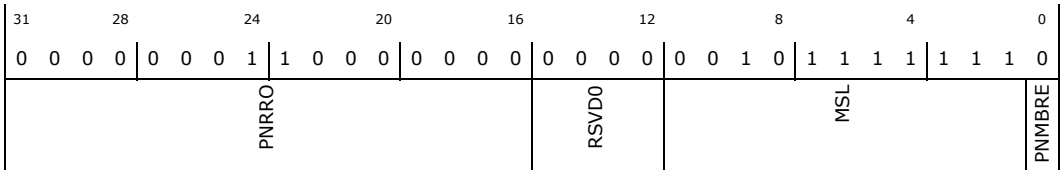
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

VS_CAP: [ABAR] + A4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 018002FEh



Bit Range	Default & Access	Description
31:16	0180h RO	**PCIe NAND Remapped Register Offset (PNRRO):** Specifies the DWORD offset within ABAR as to where the PCIe NAND AHCI BAR register space is remapped. Only valid when PNABRE = 1. This places the start of the PCIe NAND AHCI BAR register space at ABAR + 600h
15:12	0b RO	**RSVD0:** Reserved
11:1	17Fh RW	**Memory Space Limit. (MSL):** This field specifies the size of the remapped memory space for the PCIe NAND device. It is a 0-based field. Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated 2k AHCI memory space of the integrated AHCI controller. The reset default of this field is 17Fh (i.e. bit[11:1] = 00101111111b) which specifies the size of the remapped memory space as 384 bytes.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (PNMBRE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled.

17.8.9 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

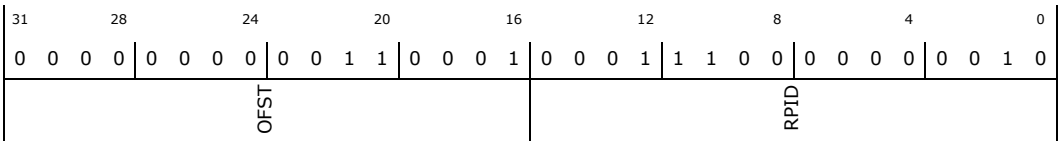
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RPID: [ABAR] + C0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00311C02h



Bit Range	Default & Access	Description
31:16	0031h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

17.8.10 Premium Feature Block (PFB)—Offset C4h

These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

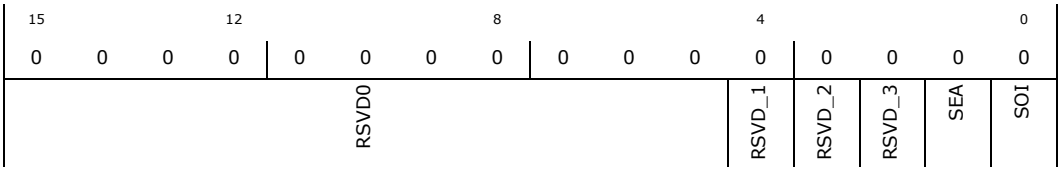
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

PFB: [ABAR] + C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000h



Bit Range	Default & Access	Description
15:5	0b RO	**RSVD0:** Reserved
4	0h RO	**Reserved (RSVD_1):** Read value is the same as VSP.PFS.

Bit Range	Default & Access	Description
3	0h RO	**Reserved (RSVD_2):** Read value is the same as VSP.PFS.
2	0h RO	**Reserved (RSVD_3):** Read value is the same as VSP.PFS.
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

17.8.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW.

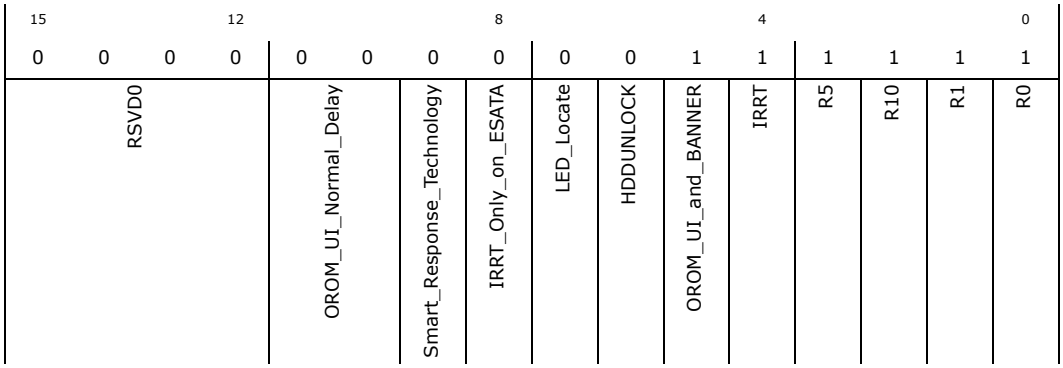
Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SFM: [ABAR] + C8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 003Fh



Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to 1, then Smart Response Technology is enabled. If cleared to 0, the feature is disabled.
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.

Bit Range	Default & Access	Description
6	0h RW/O	**HDDUNLOCK:** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5:** If set to 1, then RAID5 is enabled
2	1h RW/O	**R10:** If set to 1, then RAID10 is enabled
1	1h RW/O	**R1:** If set to 1, then RAID1 is enabled
0	1h RW/O	**R0:** If set to 1, then RAID0 is enabled

17.8.12 Port-Command List Base Address (PxCLB0)—Offset 100h

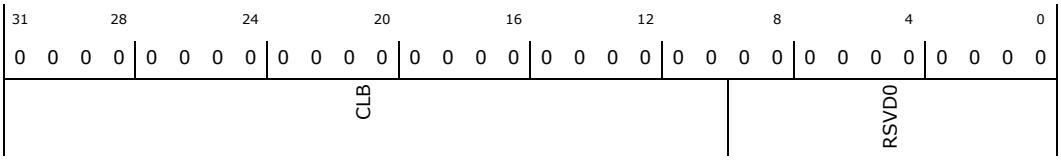
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCLB0: [ABAR] + 100h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0b RO	**RSVD0:** Reserved

17.8.13 Port-Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

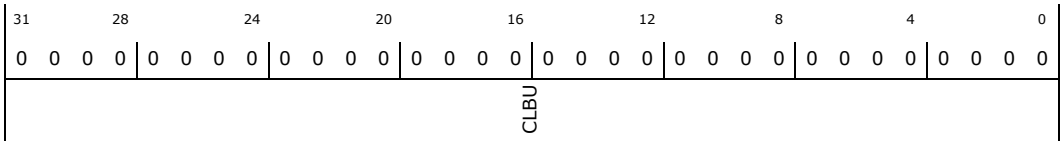
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCLBU0: [ABAR] + 104h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

17.8.14 Port-FIS Base Address (PxFB0)—Offset 108h

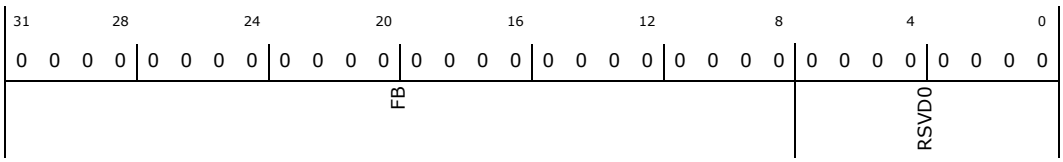
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxFB0: [ABAR] + 108h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0000000h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0b RO	**RSVD0:** Reserved

17.8.15 Port-FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

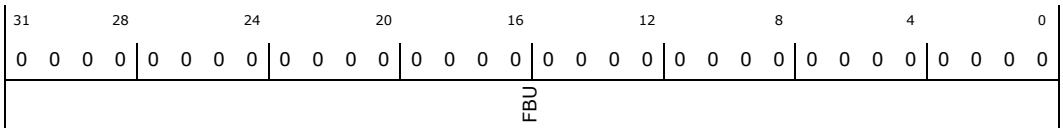
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxFBU0: [ABAR] + 10Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

17.8.16 Port-Interrupt Status (PxIS0)—Offset 110h

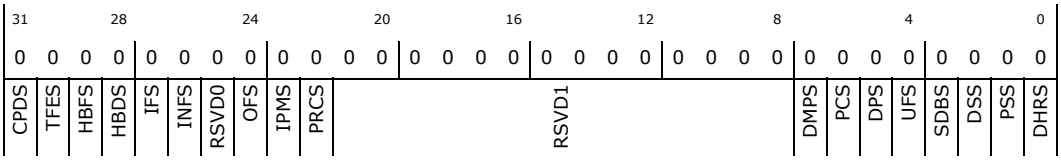
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxIS0: [ABAR] + 110h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	**RSVD0:** Reserved
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Not supported
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).

Bit Range	Default & Access	Description
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.17 Port-Interrupt Enable (PxIE0)—Offset 114h

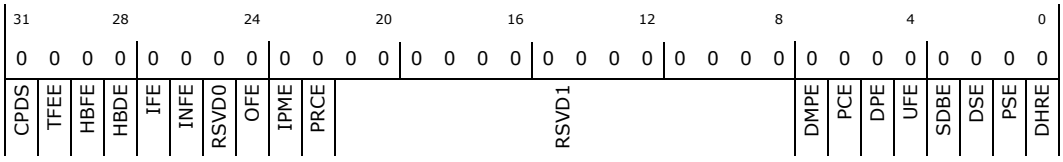
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxIE0: [ABAR] + 114h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	**RSVD0:** Reserved
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

17.8.18 Port-Command (PxCMD0)—Offset 118h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCMD0: [ABAR] + 118h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000004h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

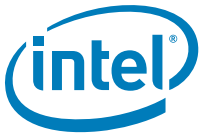
ICC				ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS					RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST

Bit Range	Default & Access	Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleard to 0, software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.



Bit Range	Default & Access	Description
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** Not supported
16	0b RO	**RSVD0:** Reserved
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	00h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	**RSVD1:** Reserved
6	0h RO	**PHYSLP Present (PSP):** If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.
5	0h RW	**Aggressive PHYSLP Enable (APSE):** This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.

Bit Range	Default & Access	Description
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

17.8.19 Port-Task File Data (PxTFD0)—Offset 120h

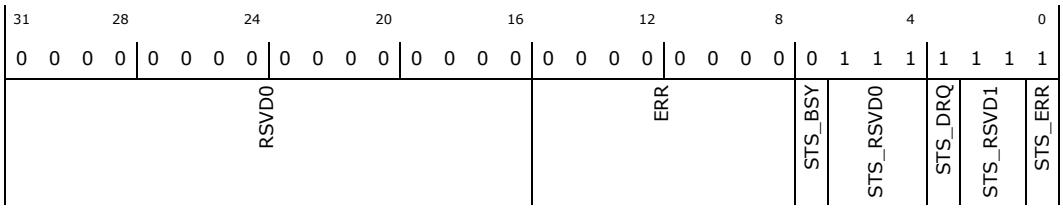
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxTFD0: [ABAR] + 120h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000007Fh



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RO	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

17.8.20 Port-Signature (PxSIG0)—Offset 124h

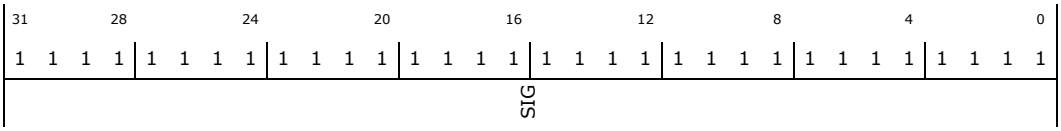
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSIG0: [ABAR] + 124h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:0	FFFFFFFFh RO	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

17.8.21 Port-Serial ATA Status (PxSSTS0)—Offset 128h

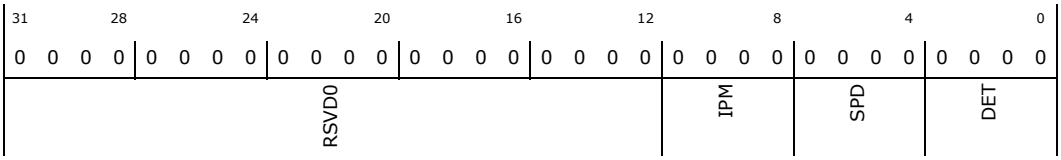
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSSTS0: [ABAR] + 128h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.22 Port-Serial ATA Control (PxSCTL0)—Offset 12Ch

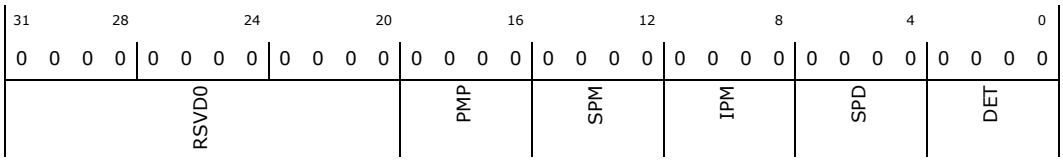
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSCTL0: [ABAR] + 12Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:20	0b RO	**RSVD0:** Reserved
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3hTransitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	**Device Detection Initialization (DET):** Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.23 Port-Serial ATA Error (PxSERR0)—Offset 130h

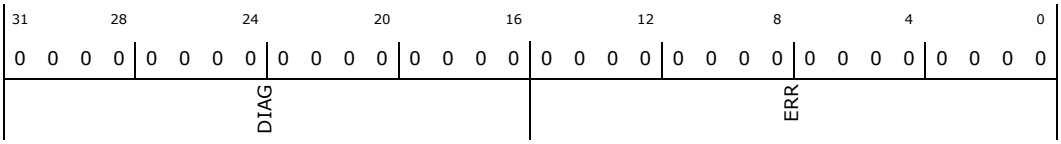
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSERR0: [ABAR] + 130h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCS interrupt status bit and an interrupt will be generated if enabled.
15:0	0000h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

17.8.24 Port-Serial ATA Active (PxSACT0)—Offset 134h

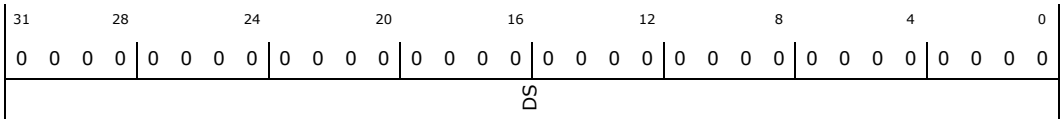
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSACT0: [ABAR] + 134h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

17.8.25 Port-Commands Issued (PxCI0)—Offset 138h

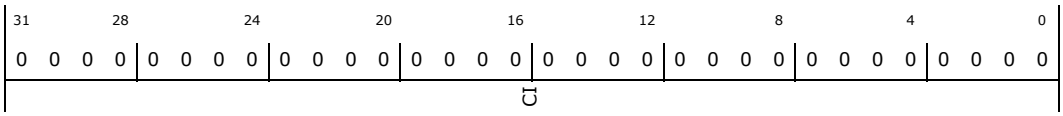
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCI0: [ABAR] + 138h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

17.8.26 Port-Device Sleep (PxDEVSLP0)—Offset 144h

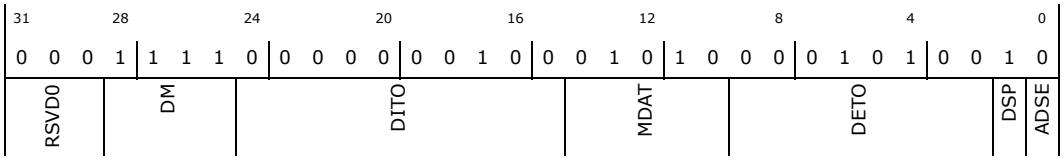
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxDEVSLP0: [ABAR] + 144h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 1E022852h



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	**DEVSLP Present (DSP):** If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

17.8.27 Port-Command List Base Address (PxCLB1)—Offset 180h

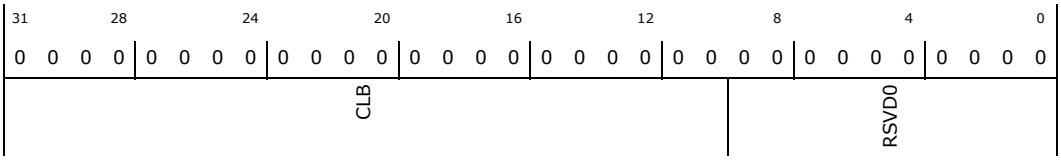
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCLB1: [ABAR] + 180h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0b RO	**RSVD0:** Reserved

17.8.28 Port-Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h

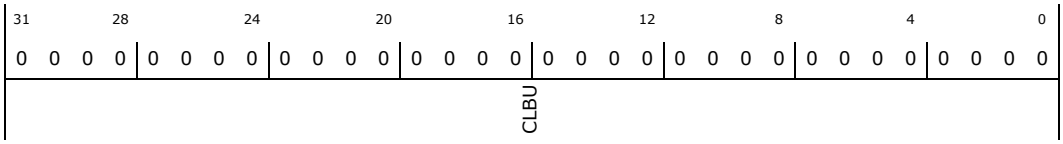
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCLBU1: [ABAR] + 184h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

17.8.29 Port-FIS Base Address (PxFB1)—Offset 188h

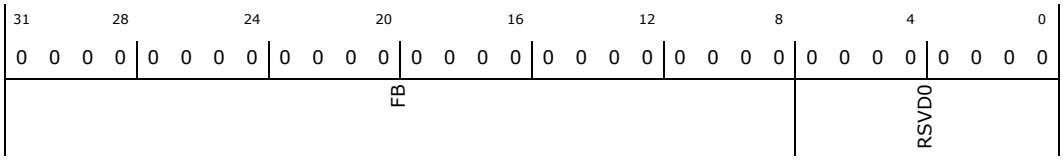
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxFB1: [ABAR] + 188h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0000000h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0b RO	**RSVD0:** Reserved

17.8.30 Port-FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch

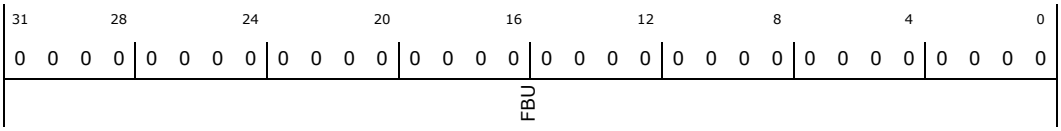
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxFBU1: [ABAR] + 18Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

17.8.31 Port-Interrupt Status (PxIS1)—Offset 190h

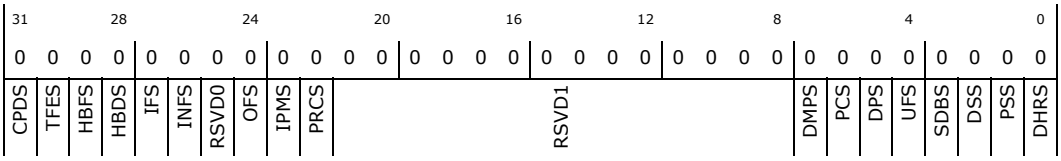
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxIS1: [ABAR] + 190h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	**RSVD0:** Reserved
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Not supported
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Description
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.32 Port-Interrupt Enable (PxIE1)—Offset 194h

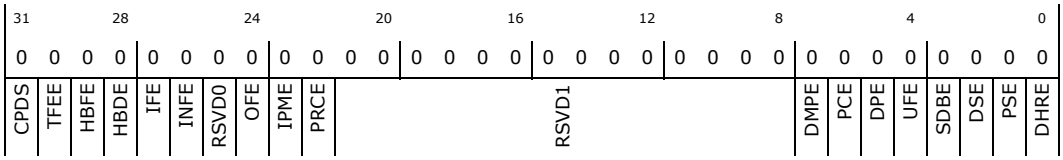
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxIE1: [ABAR] + 194h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	**RSVD0:** Reserved
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

17.8.33 Port-Command (PxCMD1)—Offset 198h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

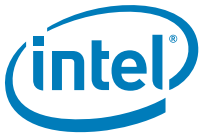
PxCMD1: [ABAR] + 198h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000004h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
ICC				ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS				RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST		

Bit Range	Default & Access	Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleard to 0, software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.



Bit Range	Default & Access	Description
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** Not supported
16	0b RO	**RSVD0:** Reserved
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	00h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	**RSVD1:** Reserved
6	0h RO	**PHYSLP Present (PSP):** If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.
5	0h RW	**Aggressive PHYSLP Enable (APSE):** This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.

Bit Range	Default & Access	Description
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

17.8.34 Port-Task File Data (PxTFD1)—Offset 1A0h

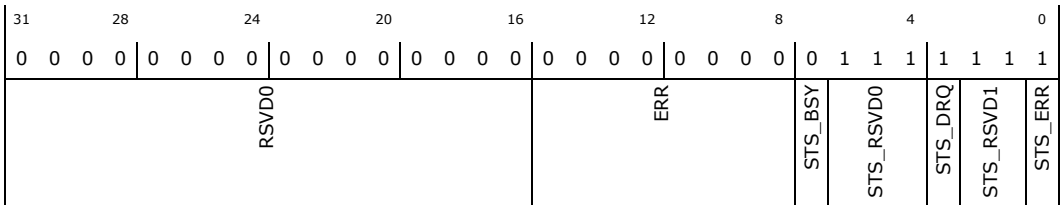
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxTFD1: [ABAR] + 1A0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000007Fh



Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RO	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

17.8.35 Port-Signature (PxSIG1)—Offset 1A4h

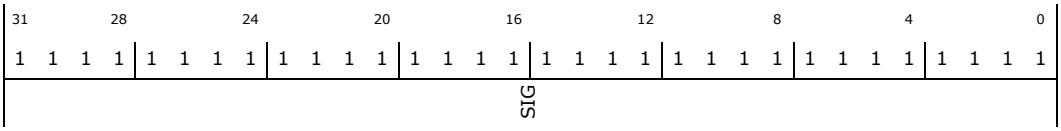
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSIG1: [ABAR] + 1A4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:0	FFFFFFFFh RO	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

17.8.36 Port-Serial ATA Status (PxSSTS1)—Offset 1A8h

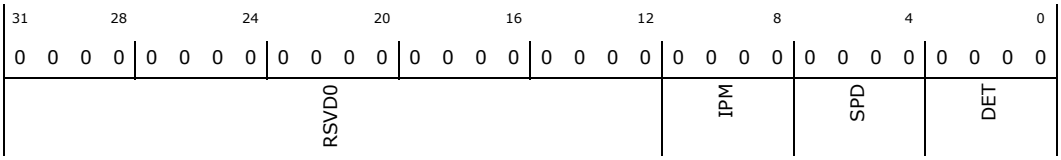
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSSTS1: [ABAR] + 1A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.37 Port-Serial ATA Control (PxSCTL1)—Offset 1ACh

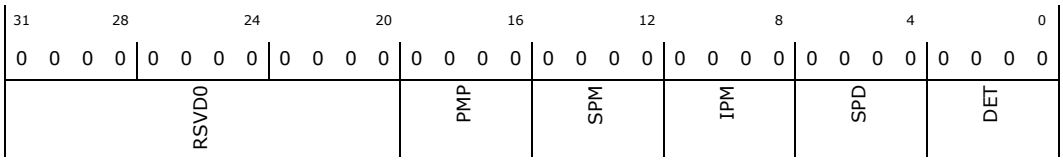
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSCTL1: [ABAR] + 1ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:20	0b RO	**RSVD0:** Reserved
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3hTransitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	**Device Detection Initialization (DET):** Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.38 Port-Serial ATA Error (PxSERR1)—Offset 1B0h

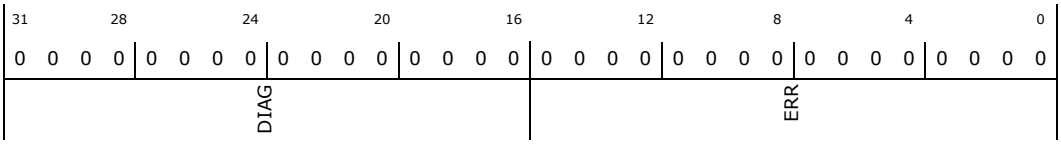
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSERR1: [ABAR] + 1B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCS interrupt status bit and an interrupt will be generated if enabled.
15:0	0000h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

17.8.39 Port-Serial ATA Active (PxSACT1)—Offset 1B4h

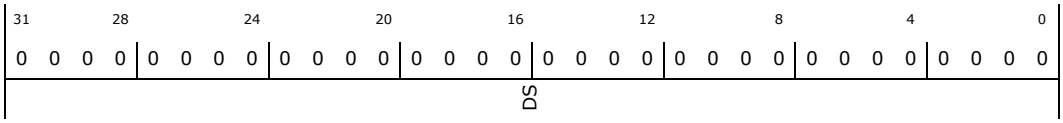
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSACT1: [ABAR] + 1B4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

17.8.40 Port-Commands Issued (PxCI1)—Offset 1B8h

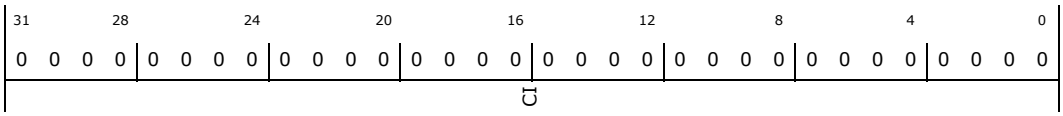
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCI1: [ABAR] + 1B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

17.8.41 Port-Device Sleep (PxDEVSLP1)—Offset 1C4h

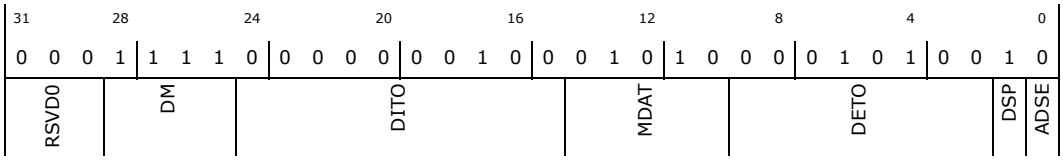
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxDEVSLP1: [ABAR] + 1C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 1E022852h



Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	**DEVSLP Present (DSP):** If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

17.8.42 Enclosure Management Message Format (EM_MF)—Offset 580h

This register is not implemented in VLV.

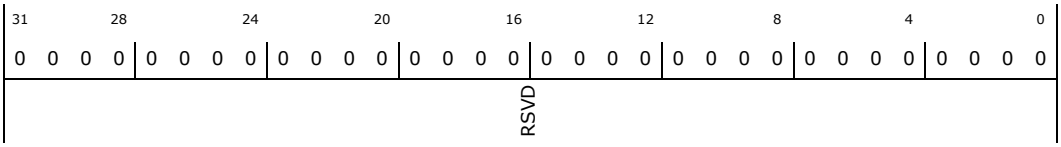
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

EM_MF: [ABAR] + 580h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**RSVD:** Reserved.

17.8.43 Enclosure Management LED (EM_LED)—Offset 584h

This register is not implemented in VLV.

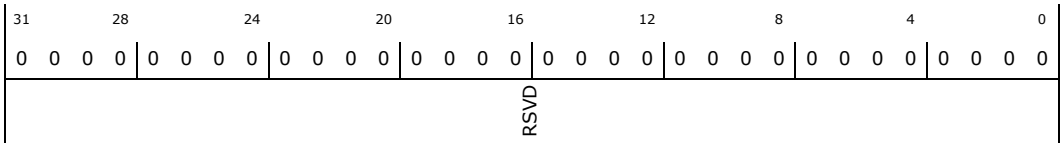
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

EM_LED: [ABAR] + 584h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**RSVD:** Reserved.

17.9 SATA Primary Read Command IO Registers

Table 186. Summary of SATA Primary Read Command I/O Registers—PCMDIDEBA

Offset	Size	Register ID—Description	Default Value
1h	1	"Primary Channel Error register (P_ERROR)—Offset 1h" on page 1841	00h

7h	1	"Primary Channel Status register (P_STATUS)—Offset 7h" on page 1844	00h

17.9.1 Primary Channel Error register (P_ERROR)—Offset 1h

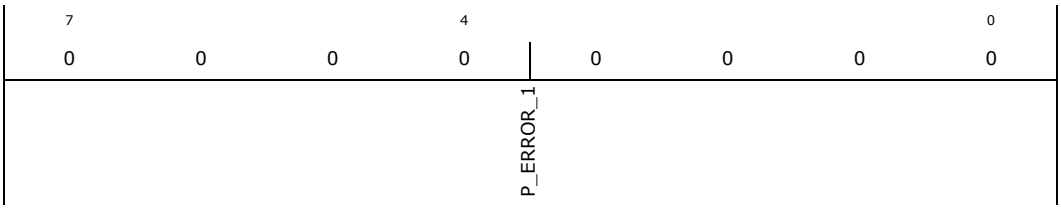
Access Method

Type: I/O Register (Size: 8 bits)

P_ERROR: [PCMDIDEBA] + 1h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Error (P_ERROR_1):** Error.

17.9.2 Primary Channel Sector Count register (P_SECTOR_COUNT)—Offset 2h

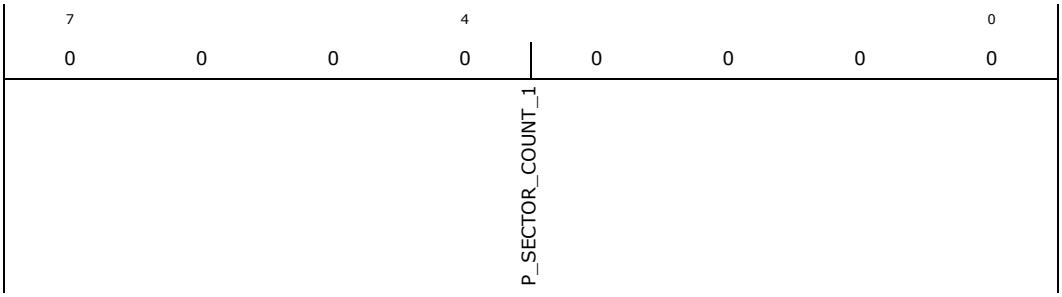
Access Method

Type: I/O Register (Size: 8 bits)

P_SECTOR_COUNT: [PCMDIDEBA] + 2h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Sector Count (P_SECTOR_COUNT_1):** Sector Count.

17.9.3 Primary Channel Sector Number register (P_SECTOR_NUMBER)—Offset 3h

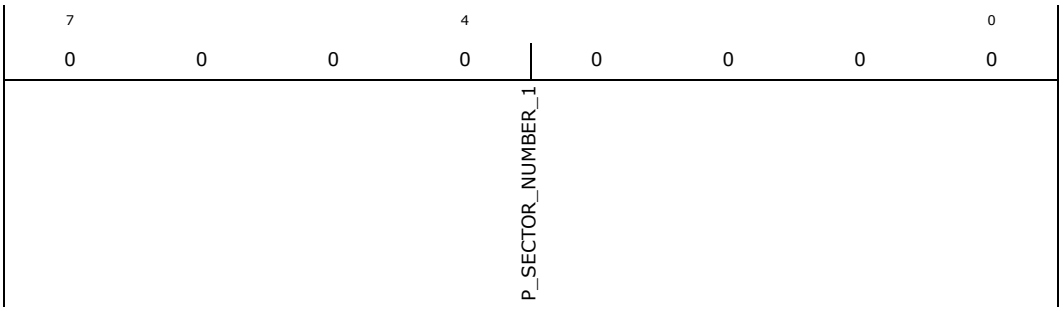
Access Method

Type: I/O Register (Size: 8 bits)

P_SECTOR_NUMBER: [PCMDIDEBA] + 3h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Sector Number (P_SECTOR_NUMBER_1):** Sector Number.

17.9.4 Primary Channel Cylinder Low register (P_CYL_LOW)—Offset 4h

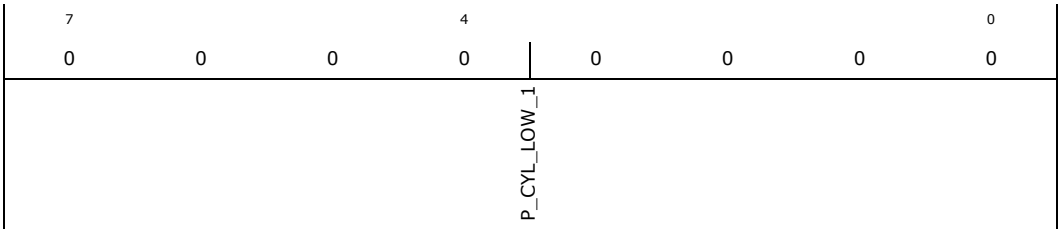
Access Method

Type: I/O Register (Size: 8 bits)

P_CYL_LOW: [PCMDIDEBA] + 4h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder Low (P_CYL_LOW_1):** Cylinder Low.

17.9.5 Primary Channel Cylinder High register (P_CYL_HIGH)—Offset 5h

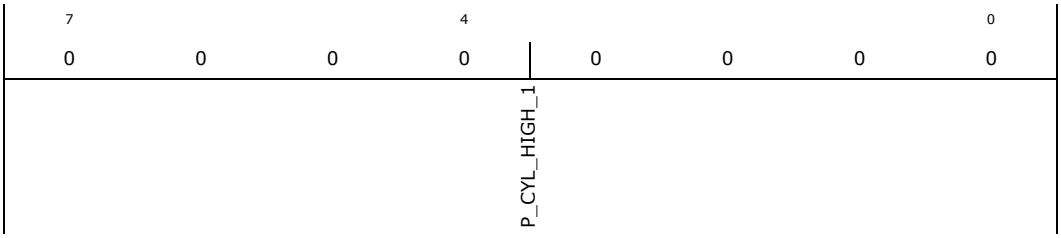
Access Method

Type: I/O Register (Size: 8 bits)

P_CYL_HIGH: [PCMDIDEBA] + 5h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder High (P_CYL_HIGH_1):** Cylinder High.

17.9.6 Primary Channel Device register (P_DRIVE_HEAD)—Offset 6h

Access Method

Type: I/O Register (Size: 8 bits)

P_DRIVE_HEAD: [PCMDIDEBA] + 6h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

7h	1	"Secondary Channel Status register (S_STATUS)—Offset 7h" on page 1853	00h

17.13.1 Secondary Channel Error register (S_ERROR)—Offset 1h

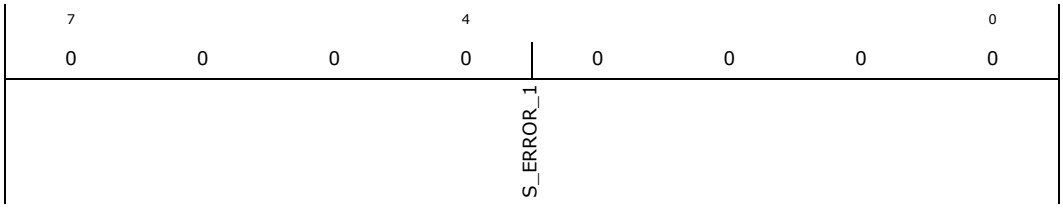
Access Method

Type: I/O Register (Size: 8 bits)

S_ERROR: [SCMDIDEBA] + 1h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Error (S_ERROR_1):** Error.

17.13.2 Secondary Channel Sector Count register (S_SECTOR_COUNT)—Offset 2h

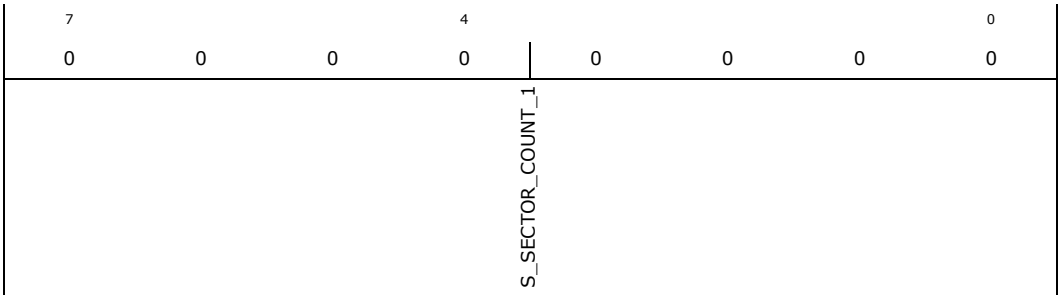
Access Method

Type: I/O Register (Size: 8 bits)

S_SECTOR_COUNT: [SCMDIDEBA] + 2h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Sector Count (S_SECTOR_COUNT_1):** Sector Count.

17.13.3 Secondary Channel Sector Number register (S_SECTOR_NUMBER)—Offset 3h

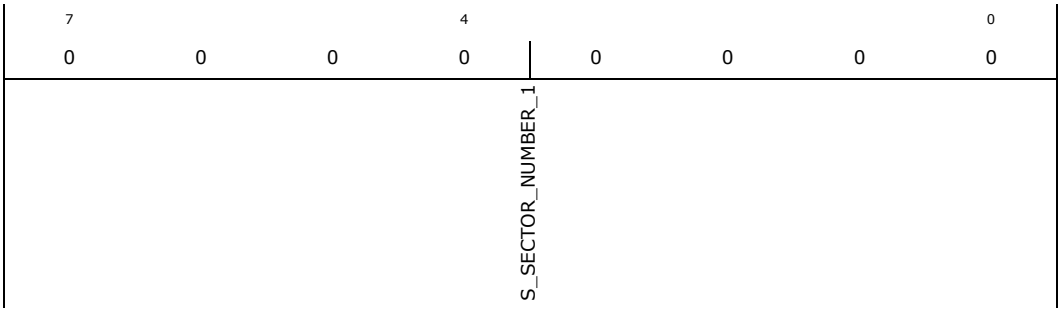
Access Method

Type: I/O Register
(Size: 8 bits)

S_SECTOR_NUMBER: [SCMDIDEBA] + 3h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Sector Number (S_SECTOR_NUMBER_1):** Sector Number.

17.13.4 Secondary Channel Cylinder Low register (S_CYL_LOW)—Offset 4h

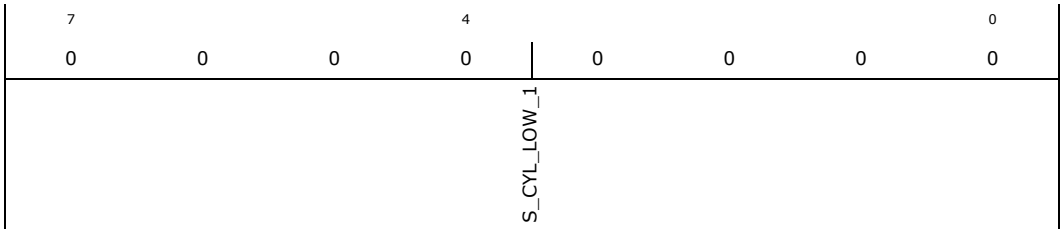
Access Method

Type: I/O Register
(Size: 8 bits)

S_CYL_LOW: [SCMDIDEBA] + 4h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder Low (S_CYL_LOW_1):** Cylinder Low.

17.13.5 Secondary Channel Cylinder High register (S_CYL_HIGH)—Offset 5h

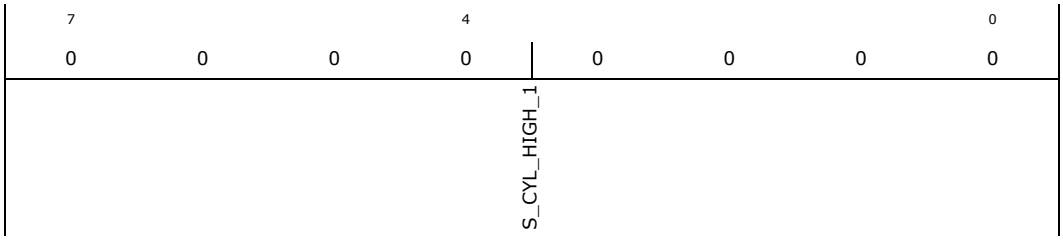
Access Method

Type: I/O Register (Size: 8 bits)

S_CYL_HIGH: [SCMDIDEBA] + 5h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder High (S_CYL_HIGH_1):** Cylinder High.

17.13.6 Secondary Channel Device register (S_DRIVE_HEAD)—Offset 6h

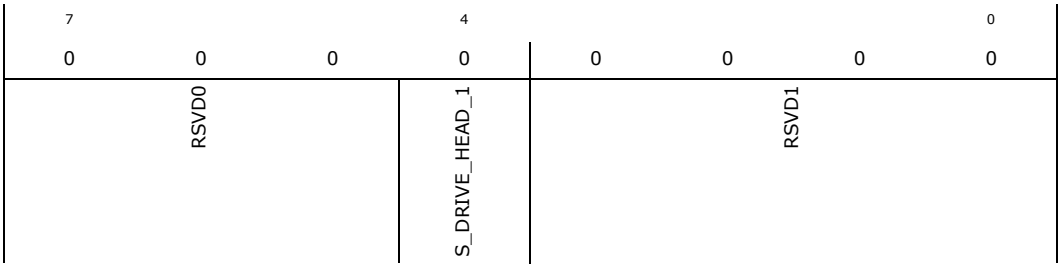
Access Method

Type: I/O Register (Size: 8 bits)

S_DRIVE_HEAD: [SCMDIDEBA] + 6h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:5	0b RO	**RSVD0:** Reserved
4	0h RW	**Device (S_DRIVE_HEAD_1):** Device.
3:0	0b RO	**RSVD1:** Reserved

17.13.7 Secondary Channel Status register (S_STATUS)—Offset 7h

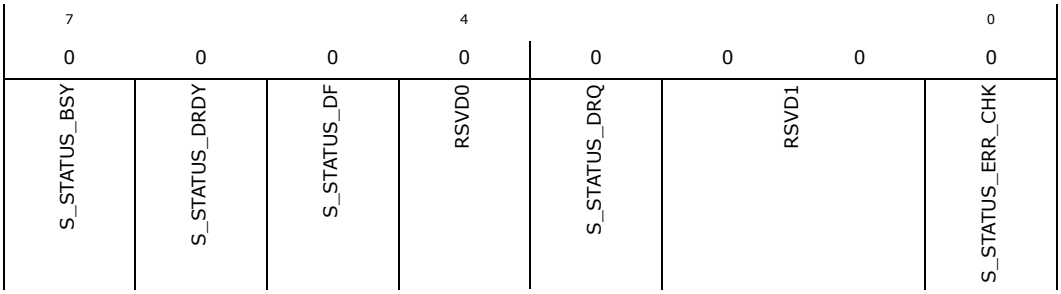
Access Method

Type: I/O Register
(Size: 8 bits)

S_STATUS: [SCMDIDEBA] + 7h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7	0h RW	**BUSY (S_STATUS_BSY):** BUSY.
6	0h RW	**Device Ready (S_STATUS_DRDY):** Device Ready.
5	0h RW	**Device Fault/Stream Error (S_STATUS_DF):** Device Fault/Stream Error.
4	0b RO	**RSVD0:** Reserved
3	0h RW	**Data Request (S_STATUS_DRQ):** Data Request.

Bit Range	Default & Access	Description
2:1	0b RO	**RSVD1:** Reserved
0	0h RW	**ERR/CHK (S_STATUS_ERR_CHK):** ERR/CHK.

17.14 SATA Secondary Write Command IO Registers

Table 191. Summary of SATA Secondary Write Command I/O Registers—SCMDIDEBA

Offset	Size	Register ID—Description	Default Value
1h	1	"Secondary Channel Features register (S_FEATURES)—Offset 1h" on page 1855	00h

17.14.1 Secondary Channel Features register (S_FEATURES)—Offset 1h

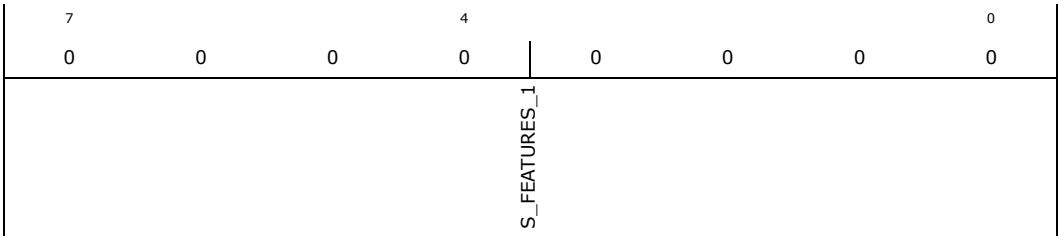
Access Method

Type: I/O Register (Size: 8 bits)

S_FEATURES: [SCMDIDEBA] + 1h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Features (S_FEATURES_1):** Features.

17.14.2 Secondary Channel Command register (S_COMMAND)—Offset 7h

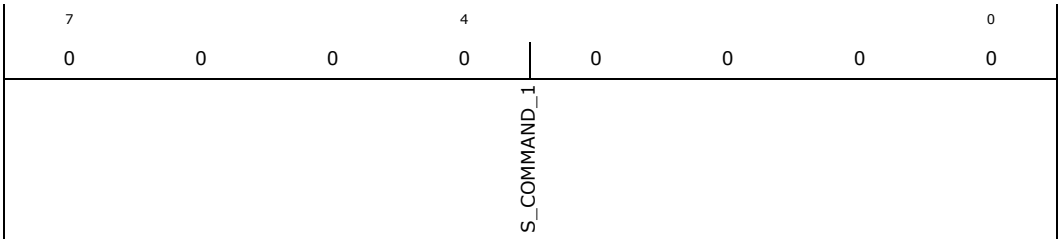
Access Method

Type: I/O Register (Size: 8 bits)

S_COMMAND: [SCMDIDEBA] + 7h

SCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCMDIDEBA Reference: [B:0, D:19, F:0] + 100h

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Command (S_COMMAND_1):** Command.

17.15 SATA Secondary Read Control IO Registers

Table 192. Summary of SATA Secondary Read Control I/O Registers—SCTLIDEBA

Offset	Size	Register ID—Description	Default Value
2h	1	"Secondary Channel Alternate Status register (S_ALT_STATUS)—Offset 2h" on page 1857	00h

17.15.1 Secondary Channel Alternate Status register (S_ALT_STATUS)—Offset 2h

Access Method

Type: I/O Register (Size: 8 bits)

S_ALT_STATUS: [SCTLIDEBA] + 2h

SCTLIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCTLIDEBA Reference: [B:0, D:19, F:0] + 108h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
S_ALT_STATUS_BSY	S_ALT_STATUS_DRDY	S_ALT_STATUS_DF	RSVD0	S_ALT_STATUS_DRQ	RSVD1		S_ALT_STATUS_ERR_CHK

Bit Range	Default & Access	Description
7	0h RW	**BUSY (S_ALT_STATUS_BSY):** BUSY.
6	0h RW	**Device Ready (S_ALT_STATUS_DRDY):** Device Ready.
5	0h RW	**Device Fault/Stream Error (S_ALT_STATUS_DF):** Device Fault/Stream Error.
4	0b RO	**RSVD0:** Reserved
3	0h RW	**Data Request (S_ALT_STATUS_DRQ):** Data Request.
2:1	0b RO	**RSVD1:** Reserved
0	0h RW	**ERR/CHK (S_ALT_STATUS_ERR_CHK):** ERR/CHK.

17.16 SATA Secondary Write Control IO Registers

Table 193. Summary of SATA Secondary Write Control I/O Registers—SCTLIDEBA

Offset	Size	Register ID—Description	Default Value
2h	1	"Secondary Channel Device Control register (S_DEVICE_CTRL)—Offset 2h" on page 1858	00h

17.16.1 Secondary Channel Device Control register (S_DEVICE_CTRL)—Offset 2h

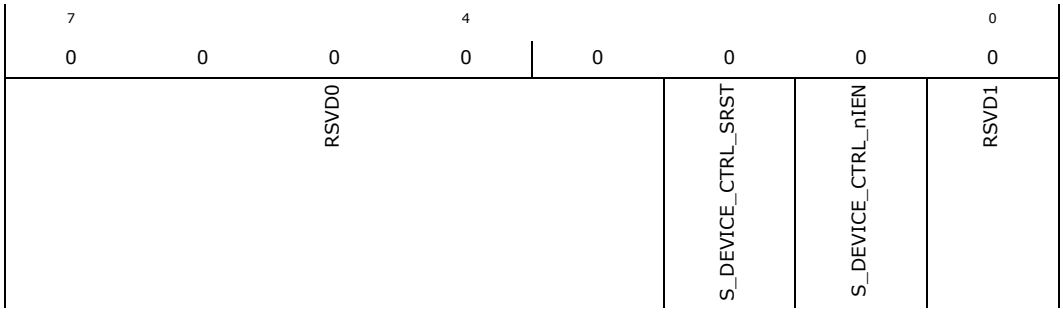
Access Method

Type: I/O Register (Size: 8 bits)

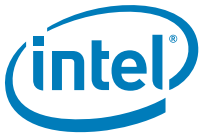
S_DEVICE_CTRL: [SCTLIDEBA] + 2h

SCTLIDEBA Type: PCI Configuration Register (Size: 32 bits)
SCTLIDEBA Reference: [B:0, D:19, F:0] + 108h

Default: 00h



Bit Range	Default & Access	Description
7:3	0b RO	**RSVD0:** Reserved
2	0h RW	**Soft Reset (S_DEVICE_CTRL_SRST):** Soft Reset.
1	0h RW	**Interrupt Enable, Negative Logic (S_DEVICE_CTRL_nIEN):** Interrupt Enable, Negative Logic.
0	0b RO	**RSVD1:** Reserved



17.17 SATA Lane 0 Electrical Register Address Map

Table 194. Summary of SATA Lane 0 Electrical Message Bus Registers—0xA3 (Global Offset 2200h)

Offset	Register ID—Description	Default Value
0h	"PCS_DWORD0 (pcs_dword0)—Offset 0h" on page 1859	00010080h
4h	"PCS_DWORD1 (pcs_dword1)—Offset 4h" on page 1861	00600060h
8h	"PCS_DWORD2 (pcs_dword2)—Offset 8h" on page 1862	00000000h
Ch	"PCS_DWORD3 (pcs_dword3)—Offset Ch" on page 1864	5515ACAAh
10h	"PCS_DWORD4 (pcs_dword4)—Offset 10h" on page 1864	575555C1h
14h	"PCS_DWORD5 (pcs_dword5)—Offset 14h" on page 1865	00003E63h
18h	"PCS_DWORD6 (pcs_dword6)—Offset 18h" on page 1866	FFFFFFFFh
1Ch	"PCS_DWORD7 (pcs_dword7)—Offset 1Ch" on page 1867	00000009h

54h	"PCS_DWORD21 (pcs_dword21)—Offset 54h" on page 1885	80808080h
58h	"PCS_DWORD22 (pcs_dword22)—Offset 58h" on page 1886	00000000h
5Ch	"PCS_DWORD23 (pcs_dword23)—Offset 5Ch" on page 1886	00180888h
60h	"PCS_DWORD24 (pcs_dword24)—Offset 60h" on page 1887	0001C020h

17.17.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

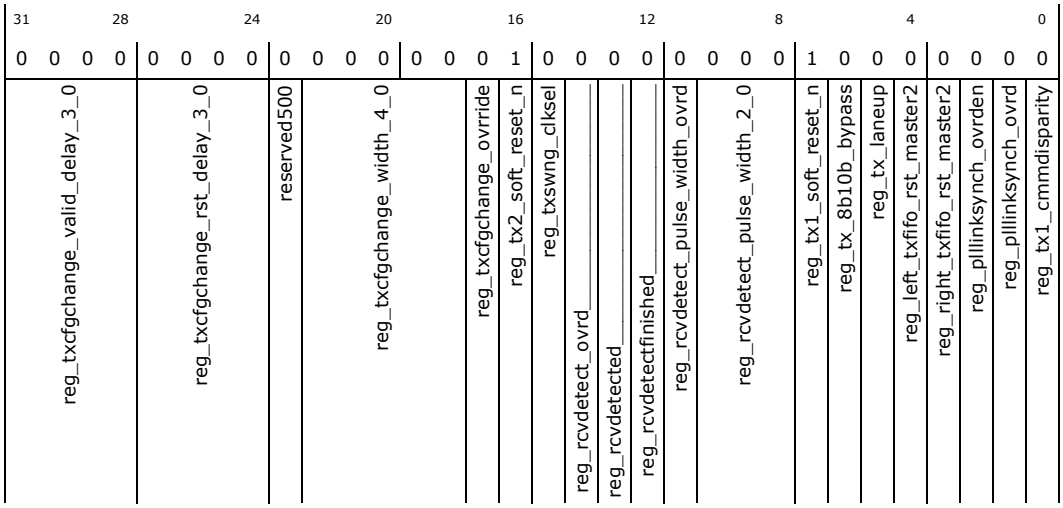
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword0: [Port: 0xA3] + (2200h + 0h)

Op Codes:
0h - Read, 1h - Write

Default: 00010080h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_txcfgchange_valid_delay_3_0:** Controls counter to wait 128ns after txcfgchange asserts when coming out of reset. This will control phystatus de-assertion after reset. Note: Minimum value when programmed has to be 4'b0100 or greater.
27:24	0h RW	**reg_txcfgchange_rst_delay_3_0:** Counter value to delay txcfgchange toggle after coming out of reset.
23	0h RW	**reserved500:** reserved
22:18	0h RW	**reg_txcfgchange_width_4_0:** Tx power fsm output - divider ratio
17	0h RW	**reg_txcfgchange_ovrride:** Override txchfchange related counters. (reg_txcfgchange_width, reg_txcfgchange_valid_delay, reg_txcfgchange_rst_delay)
16	1h RW	**reg_tx2_soft_reset_n:** Active low reset to independently reset Tx lane2 in Display Port
15	0h RW	**reg_txswng_clksel:** When 0 selects divide by 2 version of the ick_plllink clock for Tx swing control logic When 1 selects ick_plllink clock for Tx swing control logic.
14	0h RW	**reg_rcvdetect_ovrd_____:** override enable for rcvdetected and rcvdetectfinished
13	0h RW	**reg_rcvdetected_____:** override for rcvdetected
12	0h RW	**reg_rcvdetectfinished_____:** override for rcvdetectfinished
11	0h RW	**reg_rcvdetect_pulse_width_ovrd:** override enable for rcvdetect_pulse_width
10:8	0h RW	**reg_rcvdetect_pulse_width_2_0:** override value for rcvdetect_pusle_width
7	1h RW	**reg_tx1_soft_reset_n:** Active low reset to independently reset Tx lane1 in Display Port 0: Lane 1 reset 1: Lane 1 active
6	0h RW	**reg_tx_8b10b_bypass:** Bypass 8b10b encoder (for SAPIS etc interface.) 0 = Disable 8b/10b encoder bypass 1 = Enable 8b/10b encoder bypass

Bit Range	Default & Access	Description
5	0h RW	**reg_tx_laneup:** Unused in Tx
4	0h RW	**reg_left_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
3	0h RW	**reg_right_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
2	0h RW	**reg_plllinksynch_ovrden:** Override enable for reg_plllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	**reg_plllinksynch_ovrd:** override value for plllinksynch
0	0h RW	**reg_tx1_cmmdisparity:** Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

17.17.2 PCS_DWORD1 (pcs_dword1)—Offset 4h

Access Method

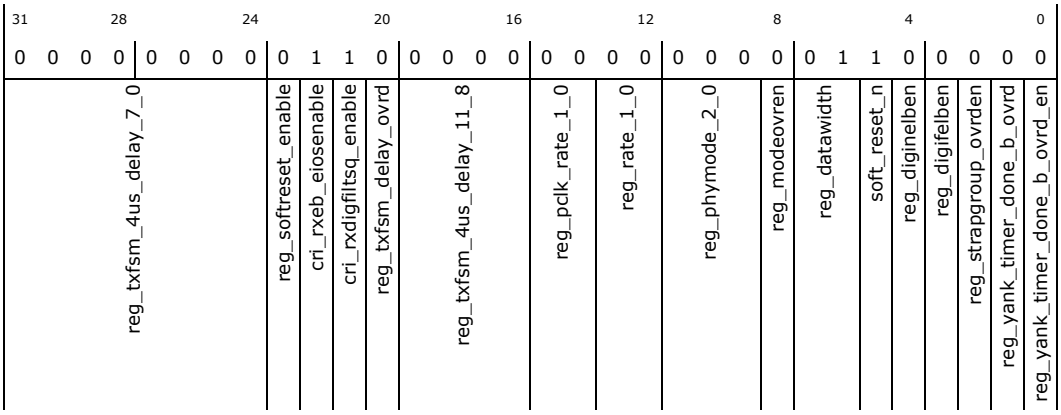
Type: Message Bus Register (Size: 32 bits)

pcs_dword1: [Port: 0xA3] + (2200h + 4h)

Op Codes:

0h - Read, 1h - Write

Default: 00600060h



Bit Range	Default & Access	Description
31:24	0h RW	**reg_txfsm_4us_delay_7_0:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
23	0h RW	**reg_softreset_enable:** When '1' the soft_reset_n bit will contol the lane reset When '0' the hardware reset will control the lane reset Note for DP: In addition to soft_reset_n,which will reset both TX0 and TX 1 in the lane, the reg_tx1_soft_reset_n bit can be used to reset only TX1 in the lane and reg_tx2_soft_reset_n bit can be used to reset only TX2
22	1h RW	**cri_rxeb_eiosenable:** When 1 enables EIOS based Rx power down

Bit Range	Default & Access	Description
21	1h RW	**cri_rxdigfiltsq_enable:** When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	**reg_txfsm_delay_ovrd:** Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	**reg_txfsm_4us_delay_11_8:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	**reg_pclk_rate_1_0:** Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	**reg_rate_1_0:** Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	**reg_phymode_2_0:** Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	**reg_modeovren:** When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	**reg_datawidth:** Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	**soft_reset_n:** Active low soft reset override
4	0h RW	**reg_diginelben:** Override for near end digital loopback.
3	0h RW	**reg_digifelben:** Override for far end digital loopback
2	0h RW	**reg_strapgroup_ovrden:** Override Enable for Strap Group
1	0h RW	**reg_yank_timer_done_b_ovrd:** Override for yank_timer_done_b
0	0h RW	**reg_yank_timer_done_b_ovrd_en:** Override Enable for yank_timer_done_b

17.17.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

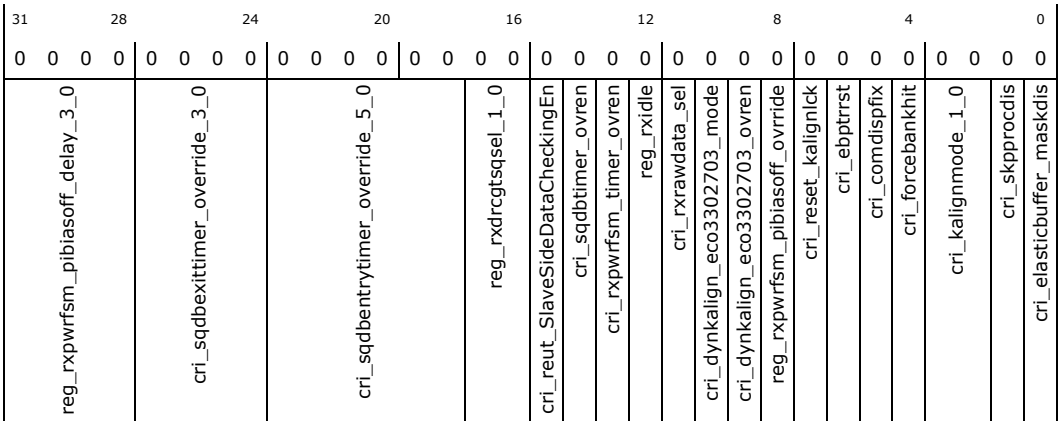
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword2: [Port: 0xA3] + (2200h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_pibiasoff_delay_3_0:** Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	**cri_sqdbexittimer_override_3_0:** Rx squelch exit debounce timer
23:18	0h RW	**cri_sqdbentrytimer_override_5_0:** Rx squelch entry debounce timer
17:16	0h RW	**reg_rxdrcgtsqsel_1_0:** Squelch output select
15	0h RW	**cri_reut_SlaveSideDataCheckingEn:** Enable REUT slave side checking while in loopback slave
14	0h RW	**cri_sqdbtimer_ovren:** Squelch debounce timer override enable
13	0h RW	**cri_rxpwrfsm_timer_ovren:** Rx power management fsm timer override enable
12	0h RW	**reg_rxidle:** Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	**cri_rxrawdata_sel:** When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	**cri_dynkalign_eco3302703_mode:** Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	**cri_dynkalign_eco3302703_ovren:** Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	**reg_rxpwrfsm_pibiasoff_ovrride:** When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	**cri_reset_kalignlck:** When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	**cri_ebptrrst:** Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	**cri_comdispfix:** Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	**cri_forcebankhit:** Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	**cri_kalignmode_1_0:** KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	**cri_skpprocdis:** SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	**cri_elasticbuffer_maskdis:** Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.17.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

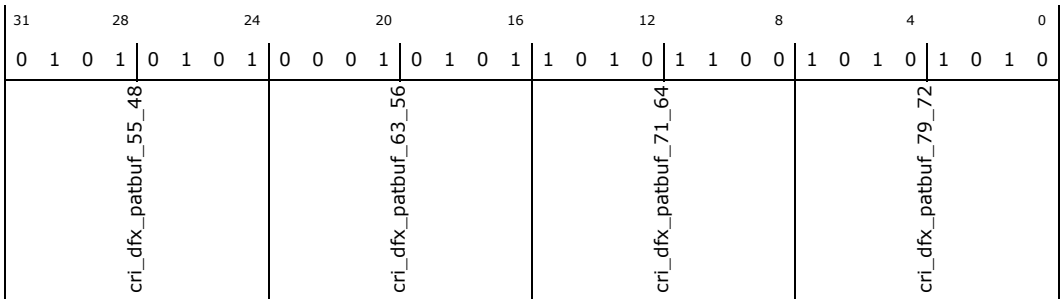
Type: Message Bus Register (Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2200h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh



Bit Range	Default & Access	Description
31:24	55h RW	**cri_dfx_patbuf_55_48:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	15h RW	**cri_dfx_patbuf_63_56:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	ACh RW	**cri_dfx_patbuf_71_64:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	AAh RW	**cri_dfx_patbuf_79_72:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.5 PCS_DWORD4 (pcs_dword4)—Offset 10h

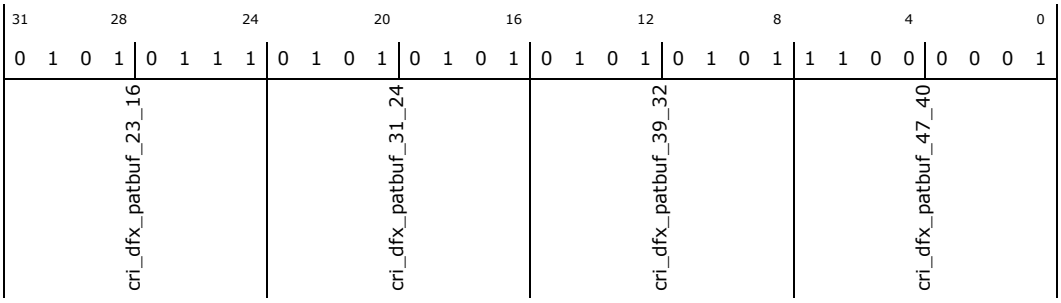
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword4: [Port: 0xA3] + (2200h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 575555C1h



Bit Range	Default & Access	Description
31:24	57h RW	**cri_dfx_patbuf_23_16:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	55h RW	**cri_dfx_patbuf_31_24:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	55h RW	**cri_dfx_patbuf_39_32:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	C1h RW	**cri_dfx_patbuf_47_40:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.6 PCS_DWORD5 (pcs_dword5)—Offset 14h

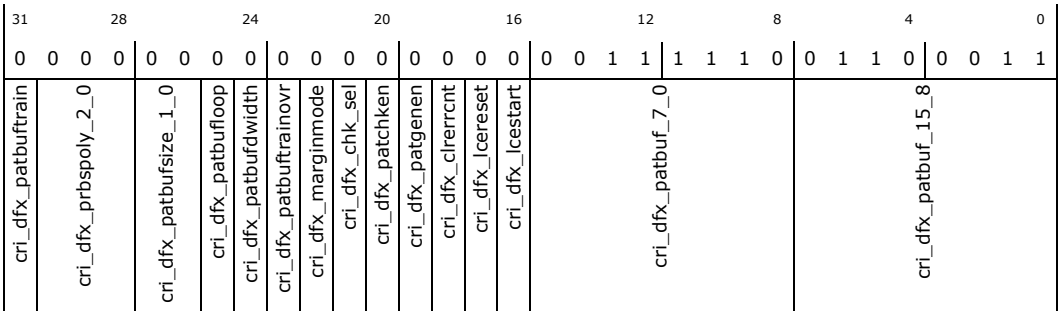
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword5: [Port: 0xA3] + (2200h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00003E63h



Bit Range	Default & Access	Description
31	0h RW	**cri_dfx_patbuftrain:** Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	**cri_dfx_prbspoly_2_0:** PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - x^16 + x^5 + x^4 + x^3 + 1 (USB3/PCIe Scrambler) (8b) 001 - x^16 + x^15 + x^13 + x^4 + 1 (SATA scrambler) (8b) 010 - x^31 + x^28 + 1 (8b) 011 - x^7 + x^6 + 1 (8b) 100 - x^15 + x^14 + 1 (10b) 101 - x^23 + x^18 + 1 (10b) 110 - x^31 + x^28 + 1 (10b) 111 - x^7 + x^6 + 1 (10b)
27:26	0h RW	**cri_dfx_patbufsize_1_0:** Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	**cri_dfx_patbufloop:** Pattern Buffer Looping Enable Enables looping of the Patter Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	**cri_dfx_patbufdwidth:** Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/ retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	**cri_dfx_patbuftrainovr:** Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Patter Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	**cri_dfx_marginmode:** Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	**cri_dfx_chk_sel:** Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	**cri_dfx_patchken:** Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	**cri_dfx_patgenen:** Pattern Generator Enable This will activate the DFx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	**cri_dfx_clrerrcnt:** Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	**cri_dfx_lcereset:** Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	**cri_dfx_lcestart:** Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	**cri_dfx_patbuf_7_0:** Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	**cri_dfx_patbuf_15_8:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

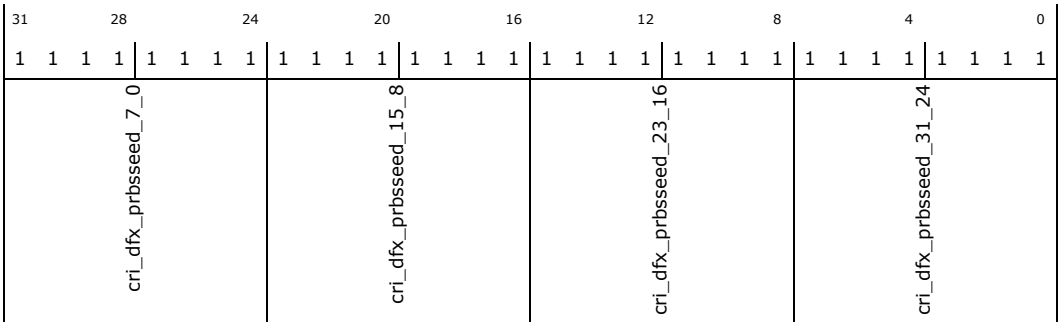
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2200h + 18h)

Op Codes:
0h - Read, 1h - Write

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:24	FFh RW	**cri_dfx_prbsseed_7_0:** PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	**cri_dfx_prbsseed_15_8:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
15:8	FFh RW	**cri_dfx_prbsseed_23_16:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
7:0	FFh RW	**cri_dfx_prbsseed_31_24:** PRBS Seed See cri_dfx_prbsseed[7:0] description.

17.17.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

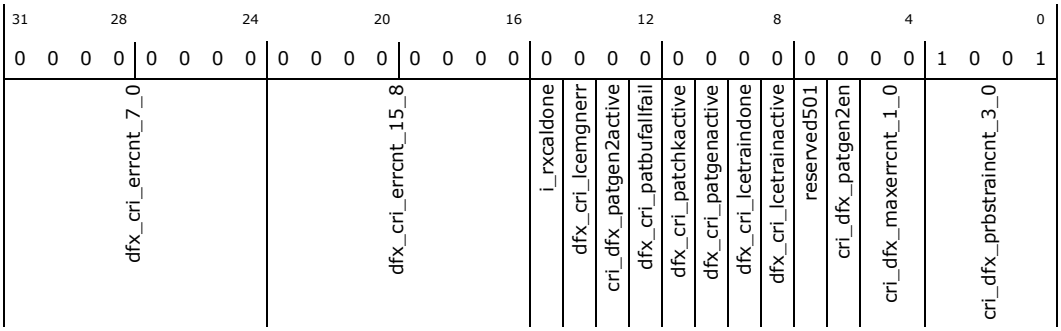
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword7: [Port: 0xA3] + (2200h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00000009h



Bit Range	Default & Access	Description
31:24	X RO	**dfx_cri_errcnt_7_0:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
23:16	X RO	**dfx_cri_errcnt_15_8:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
15	X RO	**i_rxcaldone:** RX Calibration Cycles Complete Indicator
14	X RO	**dfx_cri_lcemgnerr:** Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	**cri_dfx_patgen2active:** Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	**dfx_cri_patbufallfail:** Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occured during training.
11	X RO	**dfx_cri_patchkactive:** Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	**dfx_cri_patgenactive:** Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	**dfx_cri_lcetraindone:** Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	**dfx_cri_lcetrainactive:** Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	**reserved501:** reserved
6	0h RW	**cri_dfx_patgen2en:** Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	**cri_dfx_maxerrcnt_1_0:** Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^16 (default) 01 : 2^10 10 : 2^8 11 : 2^4
3:0	9h RW	**cri_dfx_prbstraincnt_3_0:** PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

17.17.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

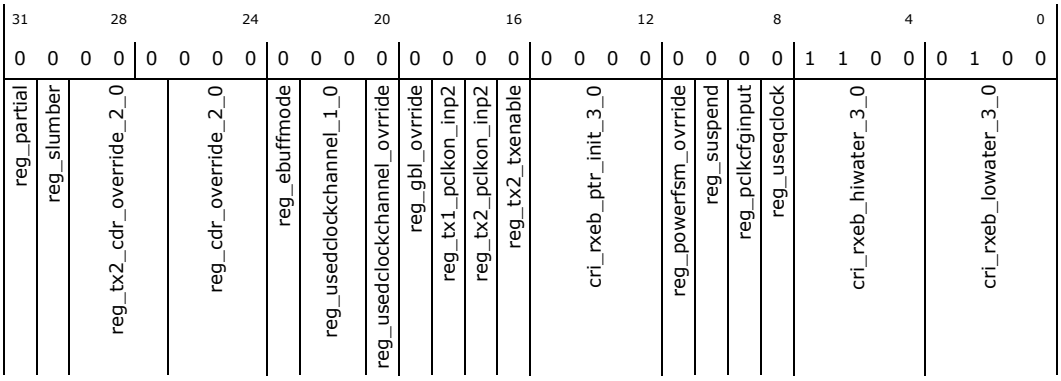
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword8: [Port: 0xA3] + (2200h + 20h)

Op Codes:
0h - Read, 1h - Write

Default: 000000C4h



Bit Range	Default & Access	Description
31	0h RW	**reg_partial:** Override for i_partial
30	0h RW	**reg_slumber:** Override for i_slumber
29:27	0h RW	**reg_tx2_cdr_override_2_0:** Override for cdr_override strap for second tx2
26:24	0h RW	**reg_cdr_override_2_0:** Override for cdr_override strap
23	0h RW	**reg_ebuffmode:** Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	**reg_usedclockchannel_1_0:** Selects the active clock channel
20	0h RW	**reg_usedclockchannel_ovrride:** When asserted selects reg_usedclockchannel[1:0]
19	0h RW	**reg_gbl_ovrride:** Global override select
18	0h RW	**reg_tx1_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	**reg_tx2_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	**reg_tx2_txenable:** Override for i_txenable for tx2
15:12	0h RW	**cri_rxeb_ptr_init_3_0:** Config override for initial value of Rx elastic buffer read pointer
11	0h RW	**reg_powerfsm_ovrride:** When asserted overrides for Tx power fsm are selected
10	0h RW	**reg_suspend:** Override for suspend
9	0h RW	**reg_pclkcfginput:** Override for pclkcfginput strap
8	0h RW	**reg_useqclock:** Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	**cri_rxeb_hiwater_3_0:** Elastic buffer high watermark based on which SKP is removed

Bit Range	Default & Access	Description
3:0	4h RW	**cri_rxeb_lowater_3_0:** Elastic buffer low watermark based on which SKP is added

17.17.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

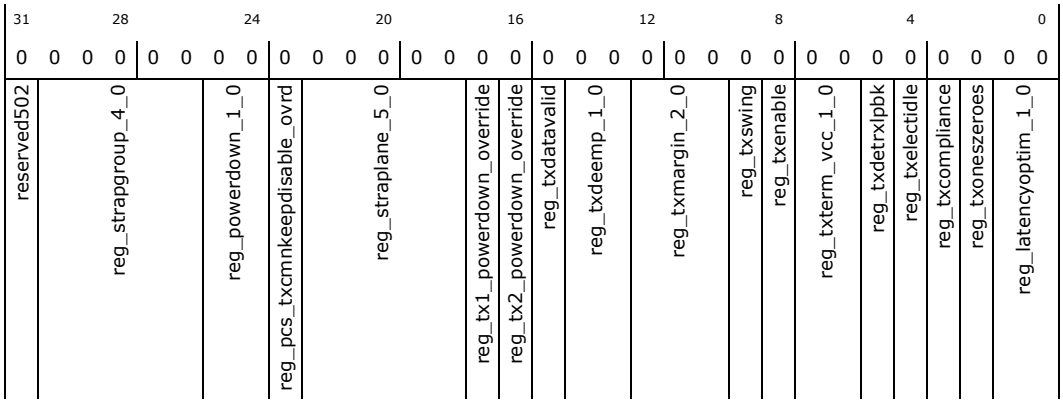
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword9: [Port: 0xA3] + (2200h + 24h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**reserved502:** reserved
30:26	0h RW	**reg_strapgroup_4_0:** Override for i_strapgroup
25:24	0h RW	**reg_powerdown_1_0:** Override for i_powerdown
23	0h RW	**reg_pcs_txcmnkeepdisable_ovrd:** Override for ipcs_txcmnkeepdisable input 0: Use value on ipcs_txcmnkeepdisable input pin to determine o_txgohighz state in P2/ slumber 1: Force pcs_txcmnkeepdisable to 0
22:18	0h RW	**reg_straplane_5_0:** Override for i_straplane
17	0h RW	**reg_tx1_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx1 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
16	0h RW	**reg_tx2_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx2 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
15	0h RW	**reg_txdatavalid:** Override for i_txdatavalid (register is NOT used)
14:13	0h RW	**reg_txdeemp_1_0:** Override for i_txdeemph

Bit Range	Default & Access	Description
12:10	0h RW	**reg_txmargin_2_0:** Override for i_txmargin
9	0h RW	**reg_txswing:** Override for i_txswing
8	0h RW	**reg_txenable:** Override for i_txenable
7:6	0h RW	**reg_txterm_vcc_1_0:** Override for txterm_vcc strap
5	0h RW	**reg_txdetrxlpbk:** Override for i_txdetrxlpbk
4	0h RW	**reg_txelectidle:** Override for i_txelectidle
3	0h RW	**reg_txcompliance:** Override for i_txcompliance
2	0h RW	**reg_txoneszeroes:** Override for i_txoneszeroes
1:0	0h RW	**reg_latencyoptim_1_0:** Override for i_latencyoptim

17.17.11 PCS_DWORD10 (pcs_dword10)—Offset 28h

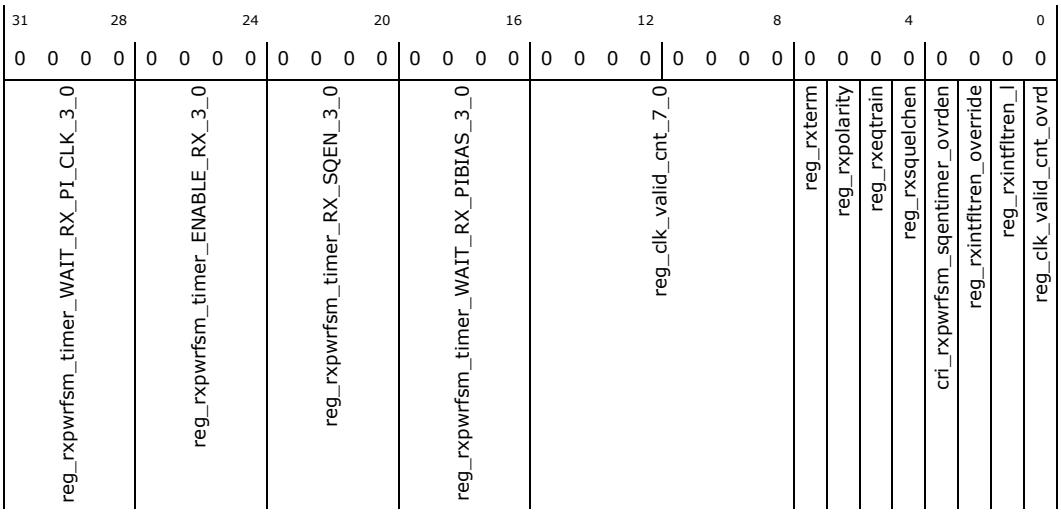
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword10: [Port: 0xA3] + (2200h + 28h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_timer_WAIT_RX_PI_CLK_3_0:** Rx Power state m/c timer value used to enable PI clock
27:24	0h RW	**reg_rxpwrfsm_timer_ENABLE_RX_3_0:** Rx Power state m/c timer value used to enable receivers
23:20	0h RW	**reg_rxpwrfsm_timer_RX_SQEN_3_0:** Rx Power FSM Rx Squelch Enable Timer Override Value Affect squelch enable startup sequence during 'synchronous' squelch startup mode. 0000 - Invalid 0001 - 1 susclk period ... 1111 - 15 susclk period
19:16	0h RW	**reg_rxpwrfsm_timer_WAIT_RX_PIBIAS_3_0:** Rx Power state m/c timer value used to enable PI BIAS
15:8	0h RW	**reg_clk_valid_cnt_7_0:** Over ride value for clock valid delay in clock top block before toggling phystatus.
7	0h RW	**reg_rxterm:** Override for i_rxterm
6	0h RW	**reg_rxpolarity:** Override for i_rxpolarity
5	0h RW	**reg_rxeqtrain:** Override for i_rxeqtrain
4	0h RW	**reg_rxsquelchen:** Override for i_rxsquelchen
3	0h RW	**cri_rxpwrfsm_sqentimer_ovrden:** Squelch Enable Timer Override Enable Used to override the squelch enable timer in PCS with the timer value set by the Rx Squelch Enable timer register (reg_rxpwrfsm_timer_RX_SQEN[3:0]).
2	0h RW	**reg_rxintfltren_override:** Rx Integral Filter Override Select 0: selects i_rxintfltren_l input pin. 1: selects reg_rxintfltren_l register
1	0h RW	**reg_rxintfltren_l:** Override for Rx integral filter enable i_rxintfltren_l
0	0h RW	**reg_clk_valid_cnt_ovrd:** Override enable for reg_clk_valid_cnt

17.17.12 PCS_DWORD11 (pcs_dword11)—Offset 2Ch

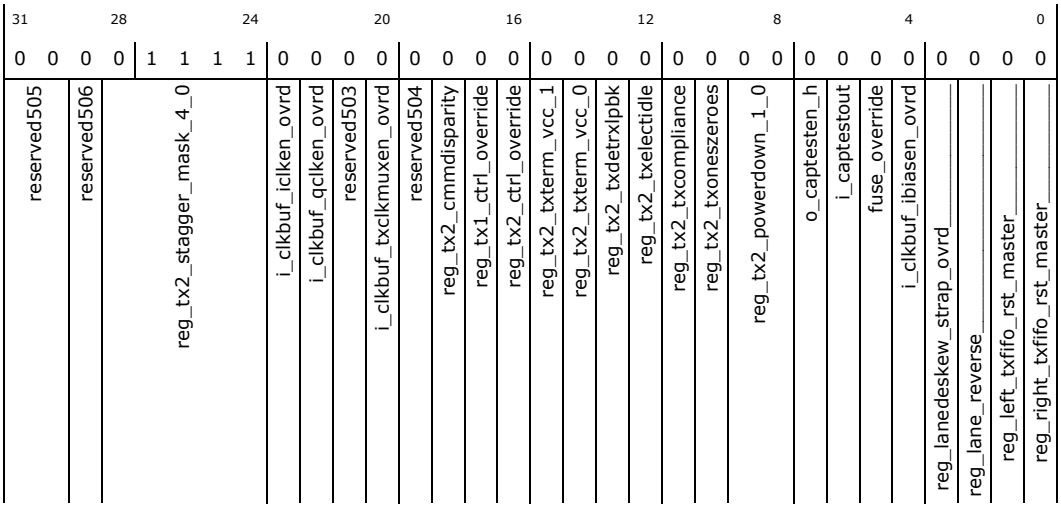
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword11: [Port: 0xA3] + (2200h + 2Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0F000000h



Bit Range	Default & Access	Description
31:30	0h RW	**reserved505:** reserved
29	0h RW	**reserved506:** reserved
28:24	Fh RW	**reg_tx2_stagger_mask_4_0:** Mask bit for lane number. Used to group lanes for staggering. for tx2
23	0h RW	**i_clkbuf_iclken_ovrd:** I-Clock Override for the DataLane
22	0h RW	**i_clkbuf_qclken_ovrd:** Q-Clock Override for the DataLane
21	0h RW	**reserved503:** reserved
20	0h RW	**i_clkbuf_txclkmuxen_ovrd:** TX Clock Selection Mux Override
19	0h RW	**reserved504:** reserved
18	0h RW	**reg_tx2_cmmdisparity:** Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. For TX2 0 = set negative disparity 1 = set positive disparity
17	0h RW	**reg_tx1_ctrl_override:** overrides input parameter/controls for tx1
16	0h RW	**reg_tx2_ctrl_override:** overrides input parameter/controls for tx2
15	0h RW	**reg_tx2_txterm_vcc_1:** Override for txterm_vcc strap[1] for tx2 in DP family. Override enable for inspeccmm for non-DP families (reg_inspeccmm_ovrd_enable).
14	0h RW	**reg_tx2_txterm_vcc_0:** Override for txterm_vcc strap[0] for tx2 in DP family. Override value for inspeccmm for non-DP families (reg_inspeccmm_ovrd_value).
13	0h RW	**reg_tx2_txdetrxlpbk:** Override for i_txdetrxlpbk for tx2

Bit Range	Default & Access	Description
12	0h RW	**reg_tx2_txelectidle:** Override for i_txelectidle for tx2
11	0h RW	**reg_tx2_txcompliance:** Override for i_txcompliance for tx2
10	0h RW	**reg_tx2_txoneszeroes:** Override for i_txoneszeroes for tx2
9:8	0h RW	**reg_tx2_powerdown_1_0:** Override for i_powerdown for tx2
7	0h RW	**o_captesten_h:** Enable testing of capacitors
6	X RO	**i_captestout:** Capacitor test result
5	0h RW	**fuse_override:** Overrides Lane fuses 1: override txterm_vcc, latencyoptim, cdr_override, rxterm_vcc 0: fuses not overridden
4	0h RW	**i_clkbuf_ibiasen_ovrd:** Override i_clkbuf_ibiasen value RX CML driver bias enable
3	0h RW	**reg_lanedeskew_strap_ovrd_____:** reserved
2	0h RW	**reg_lane_reverse_____:** reserved
1	0h RW	**reg_left_txfifo_rst_master_____:** reserved
0	0h RW	**reg_right_txfifo_rst_master_____:** reserved

17.17.13 PCS_DWORD12 (pcs_dword12)—Offset 30h

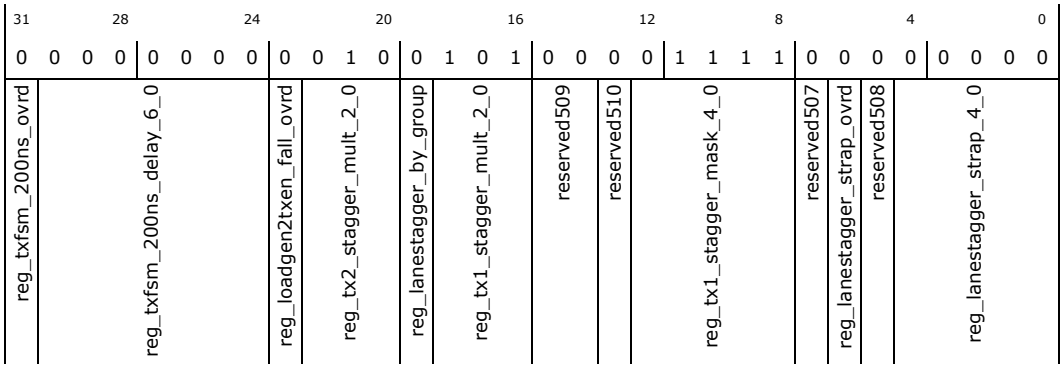
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword12: [Port: 0xA3] + (2200h + 30h)

Op Codes:
0h - Read, 1h - Write

Default: 00250F00h



Bit Range	Default & Access	Description
31	0h RW	**reg_txfsm_200ns_ovrd:** Override reg_txfsm_200ns_delay+G2
30:24	0h RW	**reg_txfsm_200ns_delay_6_0:** Override value of counter for 200ns delay between txen and txloadgenen
23	0h RW	**reg_loadgen2txen_fall_ovrd:** reserved
22:20	2h RW	**reg_tx2_stagger_mult_2_0:** Stagger multiplier for Rx (or Tx1) (Same decoding as tx1_stagger_mult[2:0]) For Display, this multiplier applies to Tx2. For non-Display PHYs, this multiplier applies to the Rx. The multiplier limit for the Rx is 8x (3'b100); anything beyond that is invalid.
19	0h RW	**reg_lanestagger_by_group:** When = 1, uses group number for lane staggering, by devalues lane number is used.
18:16	5h RW	**reg_tx1_stagger_mult_2_0:** Stagger multiplier for Tx (or Tx1) These bits set the lane staggering multiplier for the transmitter based on the 'linkclk' period. 000 - 0x 001 - 1x 010 - 2x 011 - 4x 100 - 8x 101 - 16x 110 - 32x 111 - 64x For Display, this multiplier applies to Tx1.
15:14	0h RW	**reserved509:** reserved
13	0h RW	**reserved510:** reserved
12:8	Fh RW	**reg_tx1_stagger_mask_4_0:** Mask bit for lane number. Used to group lanes for staggering
7	0h RW	**reserved507:** reserved
6	0h RW	**reg_lanestagger_strap_ovrd:** When 1 config override for lane stagger strap (bits [4:0] of this register) is selected
5	0h RW	**reserved508:** reserved
4:0	0h RW	**reg_lanestagger_strap_4_0:** Override for lane stagger strap

17.17.14 PCS_DWORD13 (pcs_dword13)—Offset 34h

Access Method

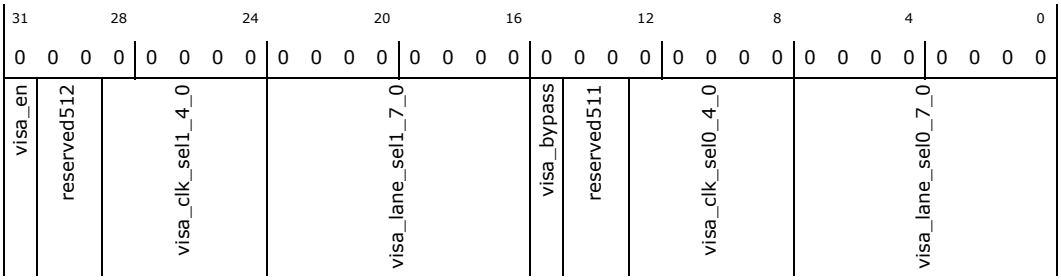
Type: Message Bus Register (Size: 32 bits)

pcs_dword13: [Port: 0xA3] + (2200h + 34h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**visa_en:** VISA Enable for PCS VISA logic
30:29	0h RW	**reserved512:** reserved
28:24	0h RW	**visa_clk_sel1_4_0:** VISA Clock Select for Lane1. Selects the source synchronous clock to be used for data being sent on lane1.
23:16	0h RW	**visa_lane_sel1_7_0:** VISA Lane Select for Lane1. Selects the byte of data to be sent out on lane0.
15	0h RW	**visa_bypass:** VISA Bypass. Allows for signals to be passed asynchronously through VISA block. Applies to both lane0 and lane1. 0 : Flop signals in local VISA block (default) 1 : Bypass flops in local VISA block
14:13	0h RW	**reserved511:** reserved
12:8	0h RW	**visa_clk_sel0_4_0:** VISA Clock Select for Lane0. Selects the source synchronous clock to be used for data being sent on lane0.
7:0	0h RW	**visa_lane_sel0_7_0:** VISA Lane Select for Lane0. Selects the byte of data to be sent out on lane0.

17.17.15 PCS_DWORD14 (pcs_dword14)—Offset 38h

Access Method

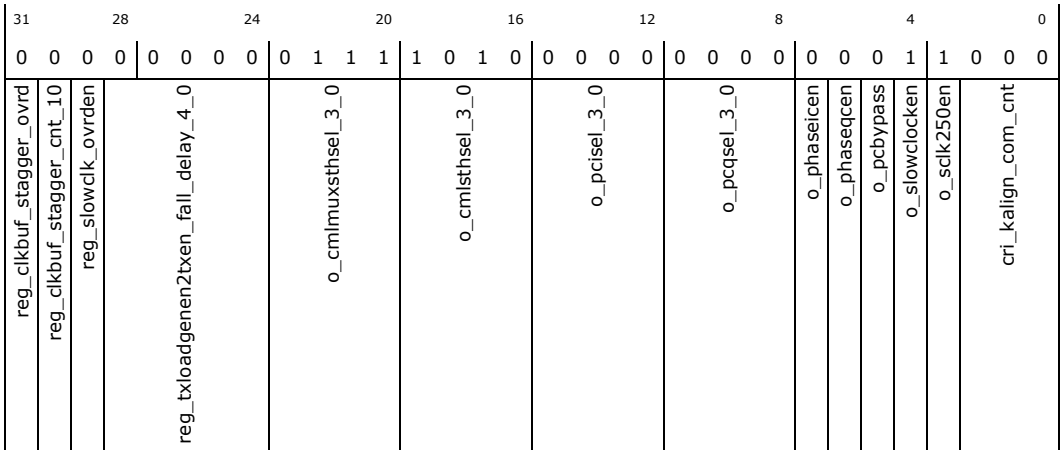
Type: Message Bus Register (Size: 32 bits)

pcs_dword14: [Port: 0xA3] + (2200h + 38h)

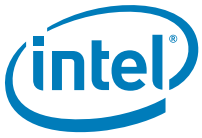
Op Codes:

0h - Read, 1h - Write

Default: 007A0018h



Bit Range	Default & Access	Description
31	0h RW	**reg_clkbuf_stagger_ovrd:** Override enable for reg_clkbuf_stagger_cnt
30	0h RW	**reg_clkbuf_stagger_cnt_10:** Counter override value for staggering delay of clock buffer control signals.



Bit Range	Default & Access	Description
29	0h RW	**reg_slowclk_ovrden:** Slow Clock Override Enable When set 1'b1, reg_slowclocken and reg_sclk250en are valid. When cleared 1'b0, output of FSM will drive slow clock enable.
28:24	0h RW	**reg_txloadgenen2txen_fall_delay_4_0:** reserved
23:20	7h RW	**o_cmlmuxsthsel_3_0:** CML Mux strength control
19:16	Ah RW	**o_cmlsthsel_3_0:** RX CML driver strength
15:12	0h RW	**o_pcisel_3_0:** I clk phase correction control
11:8	0h RW	**o_pcqsel_3_0:** Q clk phase correction control
7	0h RW	**o_phaseicen:** Iclk phase correction enable.
6	0h RW	**o_phaseqcen:** Qclk phase correction enabled.
5	0h RW	**o_pcbypass:** Phase correction bypass.
4	1h RW	**o_slowclocken:** Slow clock 1 enable Only valid if slow clock override enable is set 1'b1
3	1h RW	**o_sclk250en:** Slow clock 2 enable Only valid if slow clock override enable is set 1'b1
2:0	0h RW	**cri_kalign_com_cnt:** Upper 3 bits of a 7-bit counter that counts number of COM characters found. Used for special SAPIS mode where spread spectrum clocking can be utilized. Note: This register is used in conjunction with another PCS register cri_kalignmode[1:0] = 10 Register value Minimum COM count to achieve symbol lock 000 - 18 001 - 34 010 - 50 011 - 66 100 - 82 101 - 98 110 - 114 111 - 130

17.17.16 PCS_DWORD15 (pcs_dword15)—Offset 3Ch

Access Method

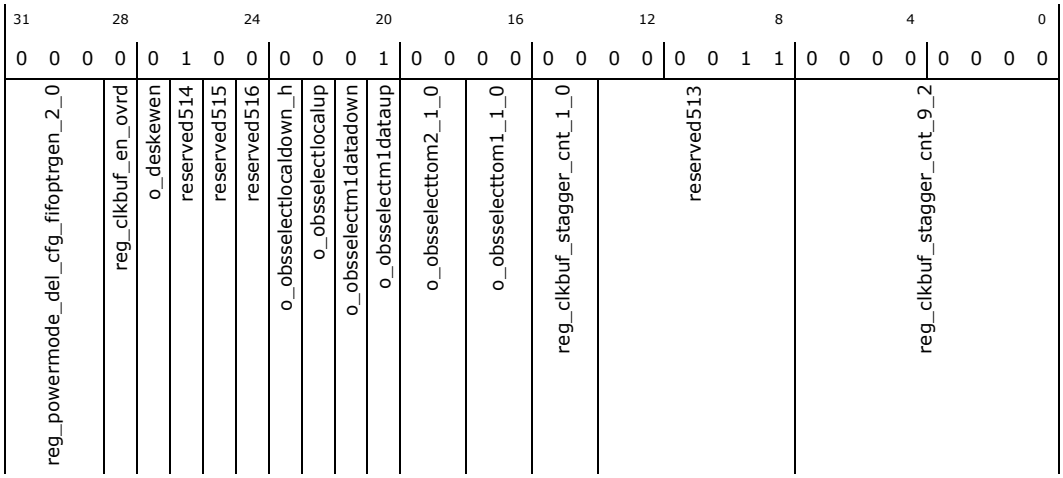
Type: Message Bus Register (Size: 32 bits)

pcs_dword15: [Port: 0xA3] + (2200h + 3Ch)

Op Codes:

0h - Read, 1h - Write

Default: 04100300h



Bit Range	Default & Access	Description
31:29	0h RW	**reg_powermode_del_cfg_fifoptrgen_2_0:** Controls the delay from powermode change to Tx PCS data fifo pointer de-assertion 000 = 'd280 001 = 'd20 010 = 'd48 011 = 'd80 100 = 'd144 101 = 'd538 110 = 'd800 111 = 'd1023
28	0h RW	**reg_clkbuf_en_ovrd:** ClkBuf Override Enable When asserted, the overrides for the CLKBUF (i_clkbuf_*_ovrd) are selected. Enable TX clock selection MUX
27	0h RW	**o_deskewen:** DFT output deskew enable
26	1h RW	**reserved514:** reserved
25	0h RW	**reserved515:** reserved
24	0h RW	**reserved516:** reserved
23	0h RW	**o_obsselectlocaldown_h:** N/N+1 Abut Obs-UP output control Selects local 'down' signals from current lane Tx1 (M1) and Rx/Tx2 (M2) or the iabut_obsup inputs to be driven on oabut_obsup outputs. 0: select signals from the iabut_obsup inputs 1: select 'down' signals from the current lane
22	0h RW	**o_obsselectlocalup:** N/N+1 Abut Obs DOWN output control Selects local 'up' signals from current lane Tx1 (M1) and Rx/Tx2 (M2) or the iabut_obsdown inputs to be driven on oabut_obsdown outputs and to the current lane's Tx1 or Tx2. 0: select signals from the iabut_obsdown inputs 1: select 'up' signals from the current lane
21	0h RW	**o_obsselectm1datadown:** N/N+1 M1-M2 Down data control Selects local 'down' data input signals from M1 (Tx1) or M2 (Tx2 or Rx) to be sent to the obsselectlocaldown muxes that are controlled by bit 7. 0: select M2 (Tx2 or Rx) 1. select M1 (Tx1)
20	1h RW	**o_obsselectm1dataup:** N/N+1 M1-M2 Up data control Selects local 'up' data input signals from M1 (Tx1) or M2 (Tx2 or Rx) to be sent to the obsselectlocalup muxes that are controlled by bit 6. 0: select M2 (Tx2 or Rx) 1. select M1 (Tx1)
19:18	0h RW	**o_obsselecttom2_1_0:** N/N+1 M2 Output Select This controls which signals are sent to Tx2. These outputs are not used when M2 is a Receiver. 00: iabut_obsdown 01: iabut_obsup 10: output of local 'up' select muxes that are controlled by bit 6 11: GND
17:16	0h RW	**o_obsselecttom1_1_0:** N/N+1 M1 Output Select This controls which signals are sent to Tx1. 00: iabut_obsdown 01: iabut_obsup 10: output of local 'up' select muxes that are controlled by bit 6 11: GND
15:14	0h RW	**reg_clkbuf_stagger_cnt_1_0:** Counter override value for staggering delay of clock buffer control signals.

Bit Range	Default & Access	Description
13:8	3h RW	**reserved513:** reserved
7:0	0h RW	**reg_clkbuf_stagger_cnt_9_2:** Counter override value for staggering delay of clock buffer control signals.

17.17.17 PCS_DWORD16 (pcs_dword16)—Offset 40h

Access Method

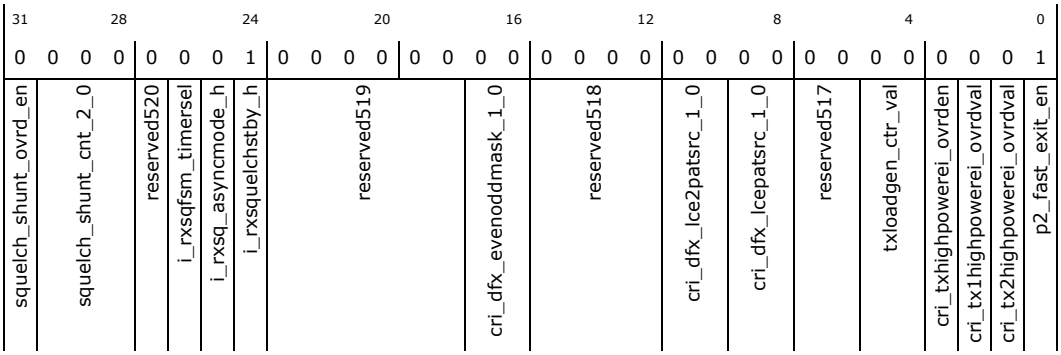
Type: Message Bus Register (Size: 32 bits)

pcs_dword16: [Port: 0xA3] + (2200h + 40h)

Op Codes:

0h - Read, 1h - Write

Default: 01000001h



Bit Range	Default & Access	Description
31	0h RW	**squelch_shunt_ovrd_en:** Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	**squelch_shunt_cnt_2_0:** Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	**reserved520:** reserved
26	0h RW	**i_rxsqfsm_timersel:** Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	**i_rxsq_asyncmode_h:** Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualfiy it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	**i_rxsquelchstby_h:** Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
23:18	0h RW	**reserved519:** reserved
17:16	0h RW	**cri_dfx_evenoddmask_1_0:** Pattern Checker Even/Odd Bit Error Mask Select 00 : no masking; all errors will be counted 01: select odd path, mask even path; only errors on bits [1,3,5,7,9] are counted 10: select even path, mask odd path; only errors on bits [0,2,4,6,8] are counted 11: reserved;
15:12	0h RW	**reserved518:** reserved
11:10	0h RW	**cri_dfx_lce2patsrc_1_0:** Local Compare Engine 2 Pattern Source In a lane with two Tx paths, this selects between using Pattern Buffer or PRBS as source of LCE patterns for the second LCE. The DFXLCEPATSRC selects for the first LCE. 0 : Pattern Buffer (default) 1 : PRBS
9:8	0h RW	**cri_dfx_lcepatsrc_1_0:** Local Compare Engine Pattern Source. Selects between using Pattern Buffer or PRBS as source of LCE patterns. 00 : Pattern Buffer; use LCE default training pattern; 01: Pattern Buffer; use the first 40b of pattern buffer for training. 10: PRBS; use LCE default training pattern; 11: PRBS; use the first 40b of pattern buffer for training.
7:6	0h RW	**reserved517:** reserved
5:4	0h RW	**txloadgen_ctr_val:** TxLoadGen Pulse Width Control Controls the pulse width of txloadgenen from PCS to Tx upar. This is used in MAC inititated digital far end loopback mode in PCIE family. 00 - txloadgenen pulse width is 4 symbol clocks (default) 01- txloadgenen pulse width is 2 symbol clocks 10 - txloadgenen pulse not generated 11 - txloadgenen pulse width is 6 symbol clocks
3	0h RW	**cri_txhighpowerei_ovrden:** TxHighPowerEI Override Mode Enable 0 - TxHighPowerEI to TxuPAR driven by Logic 1 - TxHighPowerEI to TxuPAR driven by override register value(s).
2	0h RW	**cri_tx1highpowerei_ovrdval:** Tx1HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx1HighPowerEI disabled 1 - Tx1HighPowerEI enabled
1	0h RW	**cri_tx2highpowerei_ovrdval:** Tx2HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx2HighPowerEI disabled 1 - Tx2HighPowerEI enabled
0	1h RW	**p2_fast_exit_en:** P2 Fast Exit Mode Enable Common Mode sustainer will be enabled during P2 when this bit is asserted. 1: P2 Fast Exit Mode Enable 0: P2 Fast Exit Mode Disable

17.17.18 PCS_DWORD17 (pcs_dword17)—Offset 44h

Access Method

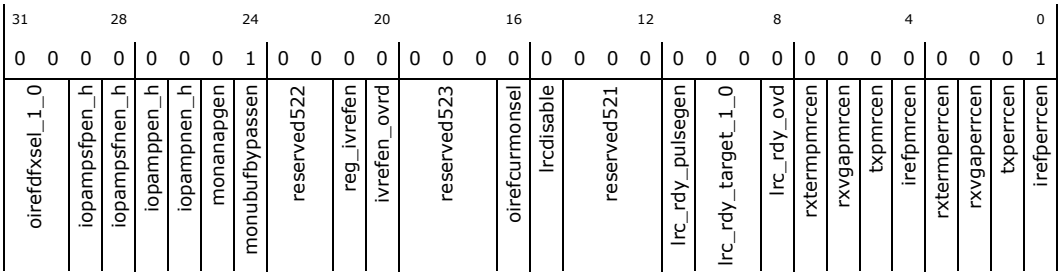
Type: Message Bus Register (Size: 32 bits)

pcs_dword17: [Port: 0xA3] + (2200h + 44h)

Op Codes:

0h - Read, 1h - Write

Default: 01000001h



Bit Range	Default & Access	Description
31:30	0h RW	**oirefdfxsel_1_0:** IREF Voltage Monitor Select Selects voltage to monitor within the IREF block. 00 - vref 01 - pgate 10 - vbc 11 - vref loop
29	0h RW	**iopampsfpen_h:** (NOT USED - noconned)
28	0h RW	**iopampsfnen_h:** (NOT USED - noconned)
27	0h RW	**iopamppen_h:** DC Monitor Unity-Gain Buffer Enable 0: disable (default) 1: enable
26	0h RW	**iopampnen_h:** (NOT USED - noconned)
25	0h RW	**monanapgen:** DC Monitor to Monitor Port Enable Enables DC monitor passgate to monitor port via analog observability abutment.
24	1h RW	**monubufbypassen:** DC Monitor Unity-Gain Buffer Bypass 0: no bypass 1: bypass (default - required for LRC)
23:22	0h RW	**reserved522:** reserved
21	0h RW	**reg_ivrefen:** IvrefEn Override Value Register is valid when override mode is enabled (ivrefen_ovrd). During this mode, this register will have direct control to enable/disable the ivref opamp. 0 - Disable ivref opamp 1 - Enable ivref opamp
20	0h RW	**ivrefen_ovrd:** IvrefEn Override Select 0 - the enable for the ivref opamp (ivrefen) is driven by the FSM. 1 - the ivrefen is driven by the register (reg_ivrefen).
19:17	0h RW	**reserved523:** reserved
16	0h RW	**oirefcurmonsel:** IREF Current Monitor Select Enables current mirror from the IREF block to the 'shared' analog monitor port.
15	0h RW	**lrcdisable:** LRC Disable This bit disables the LRC. Any token received is passed to the next lane.
14:12	0h RW	**reserved521:** reserved
11	0h RW	**lrc_rdy_pulsegen:** LRC Ready PulseGen Generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal to all four targets; does not recompute local Rcomp code. Values in DWD 0x14 (*rccodes[7:0]) will be latched into targets. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
10:9	0h RW	**lrc_rdy_target_1_0:** LRC Ready Pulse Target Indicates which lrc target to recompute when lrc_rdy_ovd is strobed 00: irefrccode 01: txrccode 10: rxtermrccode 11: rxvgarccode

Bit Range	Default & Access	Description
8	0h RW	**lrc_rdy_ovd:** LRC Ready Override Recomputes the selected local rcomp code and generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal that is selected in bits [2:1]. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
7	0h RW	**rxtermpmrcen:** PM RCOMP Enable for Rx Termination 1 - Enables the RCOMP update to occur while RX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
6	0h RW	**rxvgapmrcen:** PM RCOMP Enable for Rx VGA (Same description as the RxTerm PM Rcomp Enable.)
5	0h RW	**txpmrcen:** PM RCOMP Enable for Tx 1 - Enables the RCOMP update to occur while TX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
4	0h RW	**irefpmrcen:** IREF PM RCOMP Enable 1 - Enables the RCOMP update to occur while TX/RX is in the P1 or P2 (partial or slumber) power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
3	0h RW	**rxtermperrcen:** Periodic RCOMP Enable for Rx Termination 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
2	0h RW	**rxvgaperrcen:** Periodic RCOMP Enable for Rx VGA 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
1	0h RW	**txperrcen:** Periodic RCOMP Enable for Tx 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
0	1h RW	**irefperrcen:** Periodic RCOMP Enable for Iref 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.

17.17.19 PCS_DWORD18 (pcs_dword18)—Offset 48h

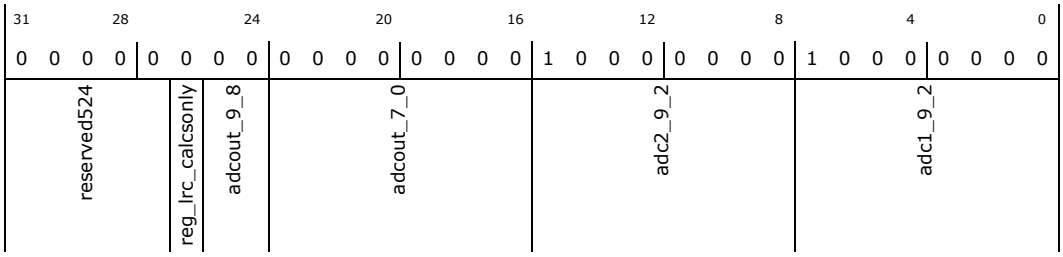
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword18: [Port: 0xA3] + (2200h + 48h)

Op Codes:
0h - Read, 1h - Write

Default: 00008080h



Bit Range	Default & Access	Description
31:27	0h RW	**reserved524:** reserved
26	0h RW	**reg_lrc_calcsonly:** Determines whether LRC ADC1/2 sequence will be bypassed when crireset_l goes from asserted to de-asserted state 0: Full LRC sequence will run (both ADC1/2 and calculations) 1: Do not run LRC ADC1/2. Only LRC calculations sequence will run. It is expected that ADC1/2 config registers will be overridden with desired values when using this mode
25:24	X RO	**adcout_9_8:** ADC Output Value2 Output of the ADC decimation filter; 2 upper bits out of 10.
23:16	X RO	**adcout_7_0:** ADC Output Value1 Output of the ADC decimation filter; 8 lower bits out of 10.
15:8	80h RW	**adc2_9_2:** LRC ADC2 Value Values in this register will be used by LRC_FSM to compute and cancel out IR drop. If register is written prior to LRC cycle, values will be overridden by FSM. If registers are written after LRC cycle, the original values are overridden and the new values will be applicable and will be used for subsequent cycle.
7:0	80h RW	**adc1_9_2:** LRC ADC1 Value Values in this register will be used by LRC_FSM to compute and cancel out IR drop. If register is written prior to LRC cycle, values will be overridden by FSM. If registers are written after LRC cycle, the original values are overridden and the new values will be applicable and will be used for subsequent cycle.

17.17.20 PCS_DWORD19 (pcs_dword19)—Offset 4Ch

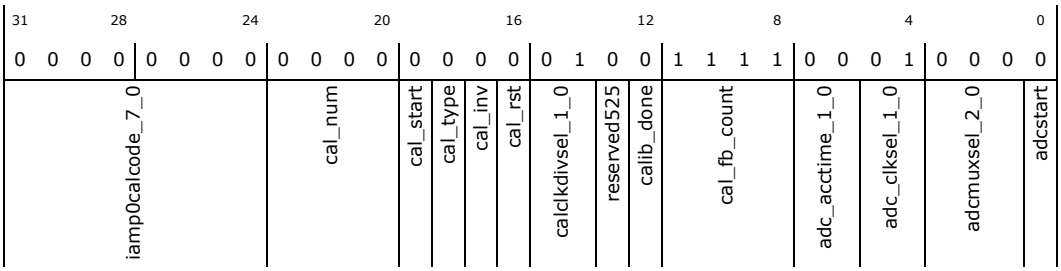
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword19: [Port: 0xA3] + (2200h + 4Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00004F10h



Bit Range	Default & Access	Description
31:24	0h RW	**iamp0calcode_7_0:** IREF Opamp Calibration Codes These bits are written by the calibration state machine. Bit7 - Calibration enable that configures the target into a calibration mode Bit6 - Calibration sign bit Bit[5:0] - Calibration magnitude [lyonel to check bit7 functionality].
23:20	0h RW	**cal_num:** Calibration Number or Address numbers of cal targets or address for specific cal target if cal_type = 1
19	0h RW	**cal_start:** Calibration Start This bit is used to start a Cal cycle vias IOSF-SB. The cal cycle will follow the normal cal cycle as set by cal_num, cal_type, cal_inv and cal_rst. The Cal cycle starts when this bit transitions 0 1 1 = Run Cal. 0 = wait (default)
18	0h RW	**cal_type:** Calibration Type Enable calibration of one cal target defined by cal_num 0 = multi 1 = single

Bit Range	Default & Access	Description
17	0h RW	**cal_inv:** Calibration Feedback Invert Inverse the logic of counter increment decrement depends on the FB
16	0h RW	**cal_rst:** Calibration Reset Reset state machine
15:14	1h RW	**calclkdivsel_1_0:** Calibration Clock Divider Select 00 - div2 of CRICLK 01 - div4 of CRICLK 10 - div8 of CRICLK 11 - div16 of CRICLK Note: Calibration clock period target is 160nS
13	0h RO	**reserved525:** reserved
12	0h RO	**calib_done:** Calibration Completion Indicator
11:8	Fh RW	**cal_fb_count:** Calibration Cycle Count Limit per target Each calibration target is clocked for 16 * cal_fb_count clock cycles. Max is 240 clock cycles (default)
7:6	0h RW	**adc_acctime_1_0:** ADC Accumulation Time Select This selects the conversion time for the Analog to Digital Converter. ADC clock frequency is set by bits [5:4] in this register. 00: 1024 ADC clocks (default) 01: 512 ADC clocks 10: 256 ADC clocks 11: Infinite (ADC in continuous accumulation) Note: If LRC mode and set to '11', then adctime = 1024cycles.
5:4	1h RW	**adc_clksel_1_0:** ADC Clock Frequency Select This selects the input clock frequency to the Analog to Digital Converter. 00: CRI clock div2 01: CRI clock div1 10: CRI clock div4 11: CRI clock div8 NOTE: Target is 50Mhz.
3:1	0h RW	**adcmuxsel_2_0:** ADC Analog Mux Select This selects the analog voltage input to the Analog to Digital Converter. 000: Vss 001: Vcc 010: LRC R1 voltage divider 011: LRC sense net 100: input from Tx 101: input from Rx (or Tx #2) 110: input from Clock 111: input from reference generator Note: Mux select is controlled by the FSM during LRC.
0	0h RW	**adcstart:** ADC start This bit resets the ADC counter and starts a new acquisition. This bit should remain 1'b1 while the ADC is active and acquiring data. 0: Disable ADC logic and analog circuitry 1: Enable ADC and start A2D conversion.

17.17.21 PCS_DWORD20 (pcs_dword20)—Offset 50h

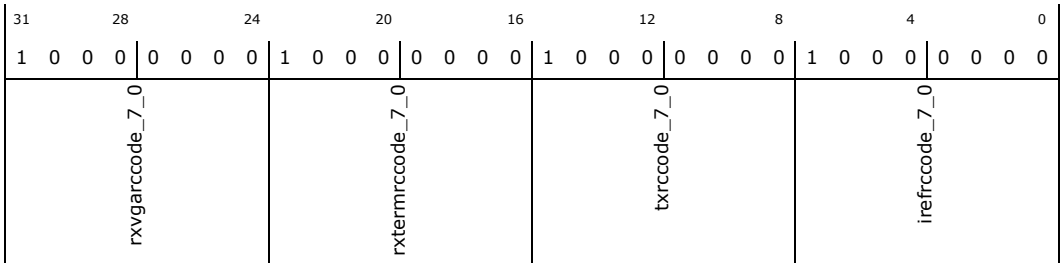
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword20: [Port: 0xA3] + (2200h + 50h)

Op Codes:
0h - Read, 1h - Write

Default: 80808080h



Bit Range	Default & Access	Description
31:24	80h RW	**rxvgarccode_7_0:** Rx VGA Rcomp Codes These bits are the final binary code used by the Rx VGA. This block only uses the X upper MSBs of this value. Writing to this register will override the rcomp code to the Rx VGA. An LRC Ready pulse must be generated to the Rx VGA target for this value to take effect. [7:n] - compensation code sent to Iref [n-1:0] - remaining LSBs from scaling and offset calculation
23:16	80h RW	**rxtermrccode_7_0:** Rx Termination Rcomp Codes These bits are the final binary code used by the Rx termination. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to Rxterm. An LRC Ready pulse must be generated to the Rxterm target for this value to take effect. [7:1] - compensation code sent to Rxterm [0] - remaining LSB from scaling and offset calculation
15:8	80h RW	**txrccode_7_0:** Tx Rcomp Codes These bits are the final binary code used by the Tx. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to the Tx. An LRC Ready pulse must be generated to the Tx target for this value to take effect. [7:1] - compensation code sent to Tx [0] - remaining LSB from scaling and offset calculation
7:0	80h RW	**irefrccode_7_0:** Iref Rcomp Codes These bits are the final binary code used by the Iref block. This block only uses the 6 upper MSBs of this value. Writing to this register will override the rcomp code to the Iref block. An LRC Ready pulse must be generated to the Iref target for this value to take effect. [7:2] - compensation code sent to Iref [1:0] - remaining LSBs from scaling and offset calculation

17.17.22 PCS_DWORD21 (pcs_dword21)—Offset 54h

Access Method

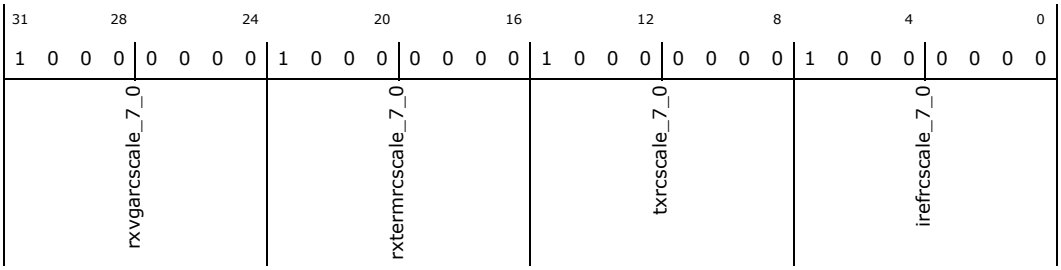
Type: Message Bus Register (Size: 32 bits)

pcs_dword21: [Port: 0xA3] + (2200h + 54h)

Op Codes:

0h - Read, 1h - Write

Default: 80808080h



Bit Range	Default & Access	Description
31:24	80h RW	**rxvgarcscale_7_0:** Rx VGA Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final rxvgarccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
23:16	80h RW	**rxtermrcscale_7_0:** Rx Termination Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final rxtermrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
15:8	80h RW	**txrcscale_7_0:** Tx Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final txrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
7:0	80h RW	**irefrcscale_7_0:** Iref Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final irefrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0

17.17.23 PCS_DWORD22 (pcs_dword22)—Offset 58h

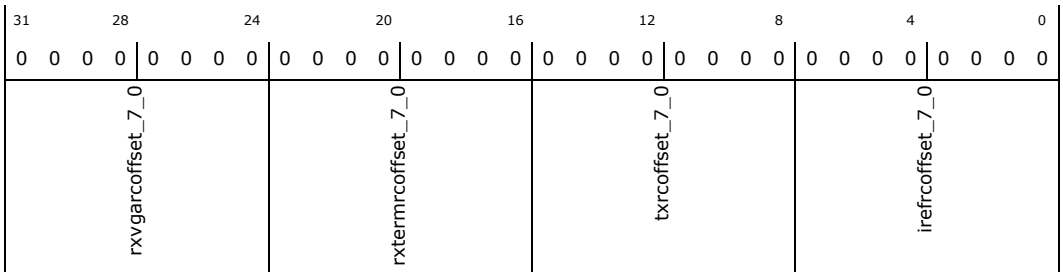
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword22: [Port: 0xA3] + (2200h + 58h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**rxvgarcoffset_7_0:** Rx VGA Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxVGA Rcomp.
23:16	0h RW	**rxtermrcoffset_7_0:** Rx Termination Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxTerm Rcomp.
15:8	0h RW	**txrcoffset_7_0:** Tx Rcomp Offset Same description as IREF Rcomp Offset, but applies to Tx Rcomp.
7:0	0h RW	**irefrcoffset_7_0:** Iref Rcomp Offset This value is added to the scaled LRC code to determine the final calibration code used by the Iref block. 2's complement format. The full 8-bit offset is used with the scale multiplier to determine the final 8-bit value, but the Iref target only uses the upper MSBs of the final value. 0x00: Offset = 0 0x01: Offset = +1 0x7F: Offset = +127 0xFF: Offset = -1 0x80: Offset = -128 Note: The final rcomp code has rollover protection so the final rcomp code + offset will not exceed the min/max range.

17.17.24 PCS_DWORD23 (pcs_dword23)—Offset 5Ch

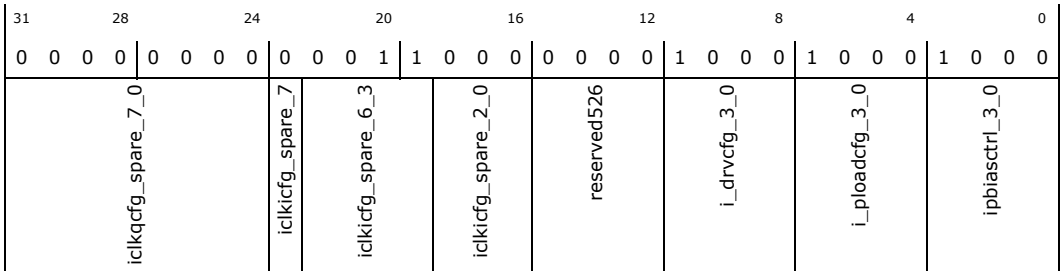
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword23: [Port: 0xA3] + (2200h + 5Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00180888h



Bit Range	Default & Access	Description
31:24	0h RW	**iclkqcfg_spare_7_0:** (Bonus bits for Data Lane Clk Distrubtion block)
23	0h RW	**iclkicfg_spare_7:** Repurposed for IREF backup mode in DL Select bit to enable diode based IREF in DL 0 - functional mode, use IREFGEN loop output 1 - bypass IREF loop, use diode connected PMOS output Ensure IREF loop amp is enabled by forcing reg_ivrefen and ivrefen_ovrd to 1
22:19	3h RW	**iclkicfg_spare_6_3:** TX MUX tail current strength setting
18:16	0h RW	**iclkicfg_spare_2_0:** CLK Distribution Monitor MUX Select
15:12	0h RW	**reserved526:** reserved
11:8	8h RW	**i_drvcfg_3_0:** CLK: Driver Tail Current Control
7:4	8h RW	**i_ploadcfg_3_0:** CLK: Pbias Ref Current Selection
3:0	8h RW	**ipbiasctrl_3_0:** CLK: Pmos-Load Pbias Voltage Control

17.17.25 PCS_DWORD24 (pcs_dword24)—Offset 60h

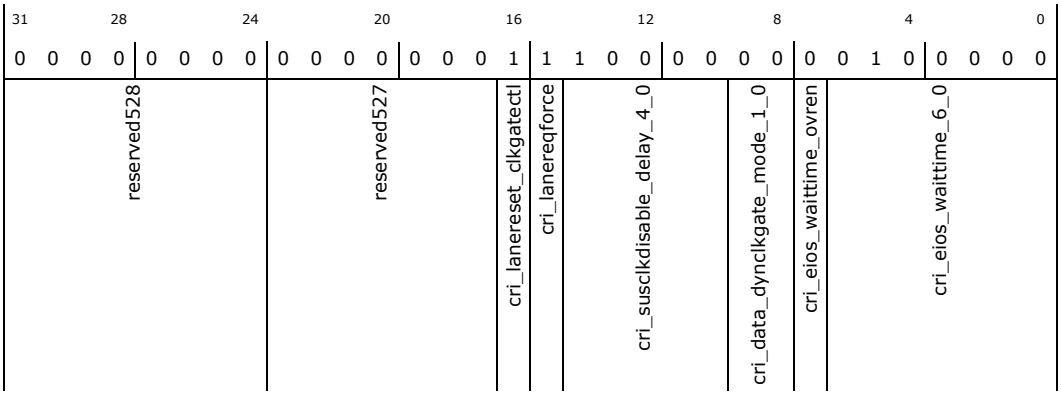
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword24: [Port: 0xA3] + (2200h + 60h)

Op Codes:
0h - Read, 1h - Write

Default: 0001C020h



Bit Range	Default & Access	Description
31:24	0h RW	**reserved528:** reserved
23:17	0h RW	**reserved527:** reserved

Bit Range	Default & Access	Description
16	1h RW	**cri_lanereset_clkgatectl:** 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	**cri_lanereqforce:** Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	**cri_susclkdisable_delay_4_0:** This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay ..... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	**cri_data_dynclkgate_mode_1_0:** Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	**cri_eios_waittime_ovren:** EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]
6:0	20h RW	**cri_eios_waittime_6_0:** EIOS Wait Time for Rx Turn OFF Represents override value timer in PCS that comes into play during EIOS based turn off Rx (Rx L0s) 0000000 - Timer is bypassed 0000001 - 1 PLL link clock period delay (2ns) 0000010 - 2 PLL link clock period delay (4ns) ... 0100000 - 32 PLL link clock periods delay (64ns) - default

5:0	0h RW	**ofrcr2short0_5_0:** number of slices in R2 for swing 0 (FS) MSB has no effect.

17.18.3 TX_DWORD2 (tx_dword2)—Offset 8h

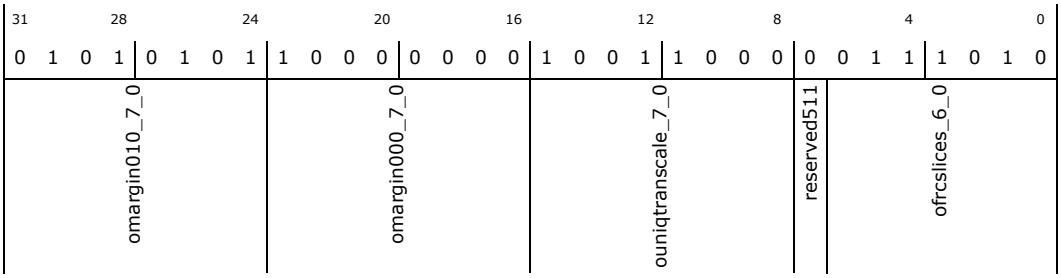
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword2: [Port: 0xA3] + (2280h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 5580983Ah



Bit Range	Default & Access	Description
31:24	55h RW	**omargin010_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~2/3Vp2p
23:16	80h RW	**omargin000_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p. To be used in Gen2 mode (Gen1/Gen2 depend on dataratefit and downscaleamp register)
15:8	98h RW	**ouniqtranscale_7_0:** scales the number of slices defined the ref circuit (or R-comp circuit) by factor of ouniqtranscale[7:0]/128 The scaled amount of slices might be used in the full-swing Uis according to ouniqetrangenmethod[1:0] The scaled amount of slices might be used in the full-swing Uis according to oscaledcompmethod[1:0]
7	0h RO	**reserved511:** reserved
6:0	3Ah RW	**ofrcslices_6_0:** number of used slices if forced Used in compensated GPIO mode

17.18.4 TX_DWORD3 (tx_dword3)—Offset Ch

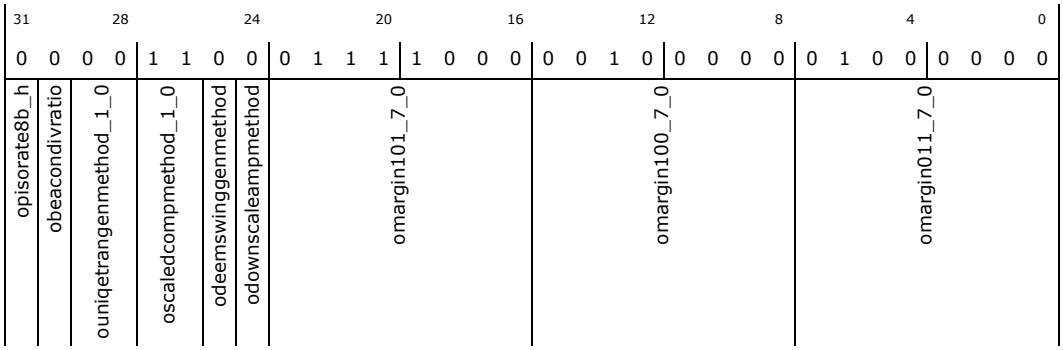
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword3: [Port: 0xA3] + (2280h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0C782040h



Bit Range	Default & Access	Description
31	0h RW	**opisorate8b_h:** if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	**obeacondivratio:** Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	**ouniqetrangenmethod_1_0:** Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	**oscaledcompmethod_1_0:** Used to define if we use scaling of the compansation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	**odeemswinggenmethod:** Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	**odownscaleampmethod:** when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	**omargin101_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	**omargin100_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p
7:0	40h RW	**omargin011_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

17.18.5 TX_DWORD4 (tx_dword4)—Offset 10h

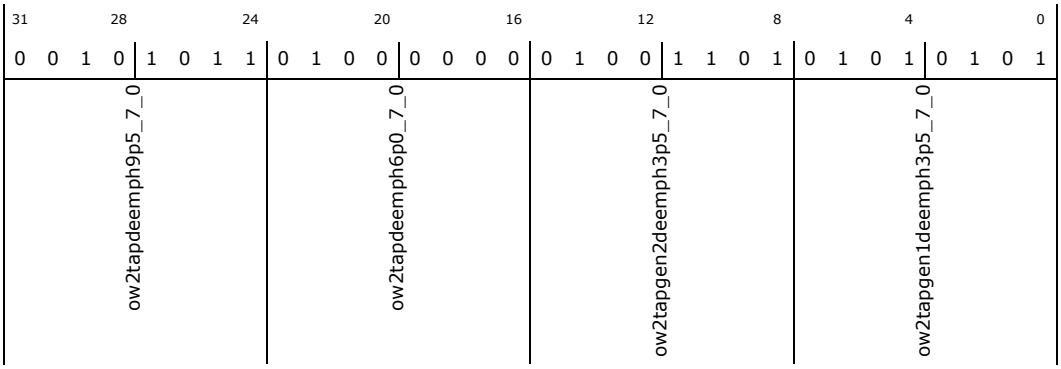
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword4: [Port: 0xA3] + (2280h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 2B404D55h



Bit Range	Default & Access	Description
31:24	2Bh RW	**ow2tapdeemph9p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 9.5dB deemphais
23:16	40h RW	**ow2tapdeemph6p0_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 6.0dB deemphais
15:8	4Dh RW	**ow2tapgen2deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais
7:0	55h RW	**ow2tapgen1deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais

17.18.6 TX_DWORD5 (tx_dword5)—Offset 14h

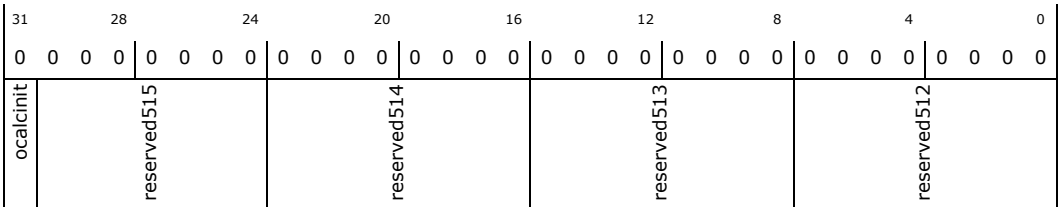
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword5: [Port: 0xA3] + (2280h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**ocalcinit:** initiate calculation of swing-cotrol circuit. rewrite to '0' and '1' to reinitiate the calculation

Bit Range	Default & Access	Description
30:24	0h RO	**reserved515:** reserved
23:16	0h RO	**reserved514:** reserved
15:8	0h RO	**reserved513:** reserved
7:0	0h RO	**reserved512:** reserved

17.18.7 TX_DWORD6 (tx_dword6)—Offset 18h

Access Method

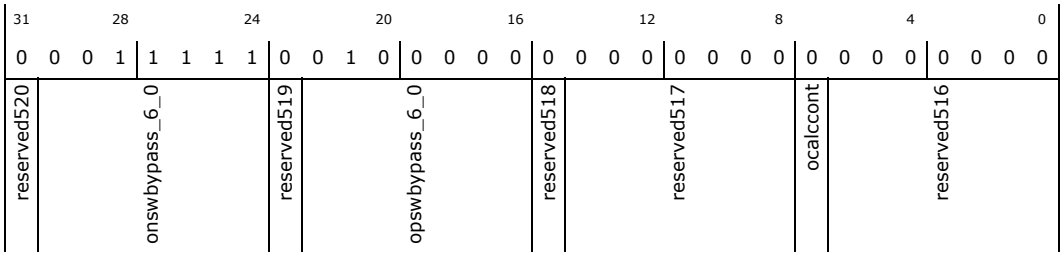
Type: Message Bus Register (Size: 32 bits)

tx_dword6: [Port: 0xA3] + (2280h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: 1F200000h



Bit Range	Default & Access	Description
31	0h RO	**reserved520:** reserved
30:24	1Fh RW	**onswbypass_6_0:** Determines # of slices activated in N-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) same slices canot be opend for P-drv and for N-drv. Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted. In these DFT modes pswpass can be set to the same value as nswbypass
23	0h RO	**reserved519:** reserved
22:16	20h RW	**opswbypass_6_0:** Determines # of slices activated in P-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted.
15	0h RO	**reserved518:** reserved
14:8	0h RO	**reserved517:** reserved
7	0h RW	**ocalccont:** initiate calculation of swing-cotrol circuit. While this signal is '1' the calculation is beeing done consecutively
6:0	0h RO	**reserved516:** reserved

17.18.8 TX_DWORD7 (tx_dword7)—Offset 1Ch

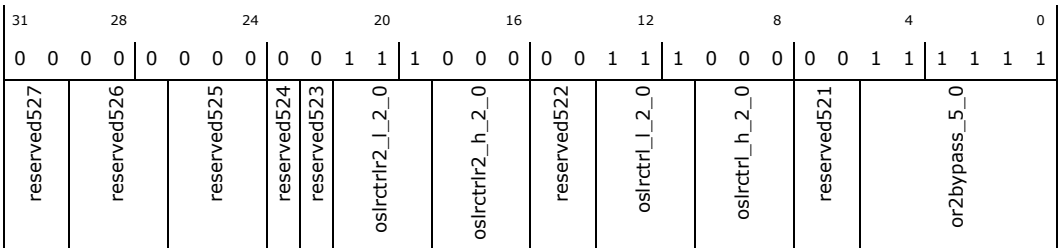
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword7: [Port: 0xA3] + (2280h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0038383Fh



Bit Range	Default & Access	Description
31:30	0h RO	**reserved527:** reserved
29:27	0h RO	**reserved526:** reserved
26:24	0h RO	**reserved525:** reserved
23	0h RO	**reserved524:** reserved
22	0h RO	**reserved523:** reserved
21:19	7h RW	**oslrctrlr2_l_2_0:** Slew rate trimming of driver in R2 resistor for gen1. '000' - disabled '001' - slowest '111' - fastest
18:16	0h RW	**oslrctrlr2_h_2_0:** Slew rate trimming of driver in R2 resistor for gen1 '111' - disabled (emulates suspend mode) '110' - slowest '000' - fastest
15:14	0h RO	**reserved522:** reserved
13:11	7h RW	**oslrctrl_l_2_0:** Slew rate trimming of driver in R1 resistor for gen1. '000' - disabled '001' - slowest '111' - fastest
10:8	0h RW	**oslrctrl_h_2_0:** Slew rate trimming of driver in R1 resistor for gen1 '111' - disabled (emulates suspend mode) '110' - slowest '000' - fastest
7:6	0h RO	**reserved521:** reserved
5:0	3Fh RW	**or2bypass_5_0:** Number of open R2s in normal EI (electrical idle) Used in DFTs with other values (leg connectivity scan all power of 2s) read also notes on obypbycomp. MSB has no effect.

17.18.9 TX_DWORD8 (tx_dword8)—Offset 20h

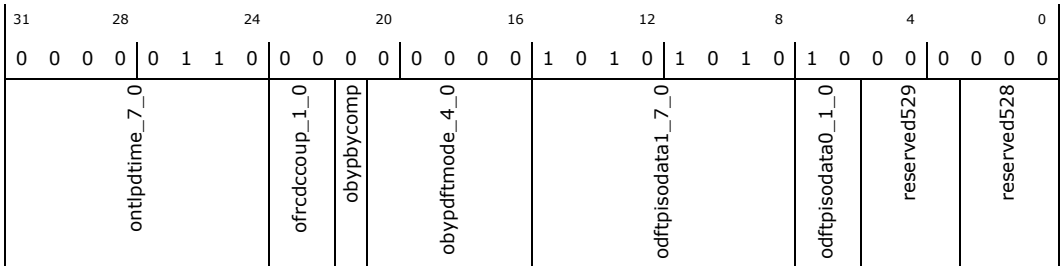
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword8: [Port: 0xA3] + (2280h + 20h)

Op Codes:
0h - Read, 1h - Write

Default: 0600AA80h



Bit Range	Default & Access	Description
31:24	6h RW	**ontlpdtime_7_0:** [after step 1 of pullup] time (ick_susslow cycles) to wait (step 2) and let the pads leak downwards before comparing pads to Vref to detemine if the pad exceeded Vref as a result of leakage.
23:22	0h RW	**ofrcdccoup_1_0:** 00
21	0h RW	**obypbycomp:** 0' the amount of slices used in dftbypmode is by 'nswbypass', 'pswbypass' and 'r2bypass' registers '1' the amount of slices used is by 'slices' from swing-control block. Number of slices in R2 in EI - is also affected by this bit
20:16	0h RW	**obypdftmode_4_0:** selects the DFT mode. 5'h00 - DFT_OFF 5'h01 - DFTHIZ 5'h02 - DFTEI 5'h03 - DFTFELB 5'h04 - DFTALL1DIF 5'h05 - DFTALL0DIF 5'h06 - DFTALL1SE 5'h07 - DFTALL0SE 5'h08 - DFTDAC 5'h09 - DFTFRCBEAC 5'h0a - DFTOBS 5'h0c - DFT ASYNC MODE OFF 5'h0d - DFT ASYNC MODE Tx (output) 5'h0e - DFT ASYNC MODE Rx (input) 5'h0f - DFT ASYNC MODE Both (inout) 5'h10 - DFTPISOLOAD 5'h12 - DFTEISTRNG
15:8	AAh RW	**odftpisodata1_7_0:** 8 MSB of alternative data input to PISO Load of this data is enabled when bypdftmode=DFTPISOLOAD
7:6	2h RW	**odftpisodata0_1_0:** 2 LSB of alternative data input to PISO Load of this data is enabled when bypdftmode=DFTPISOLOAD
5:3	0h RO	**reserved529:** reserved
2:0	0h RO	**reserved528:** reserved

17.18.10 TX_DWORD9 (tx_dword9)—Offset 24h

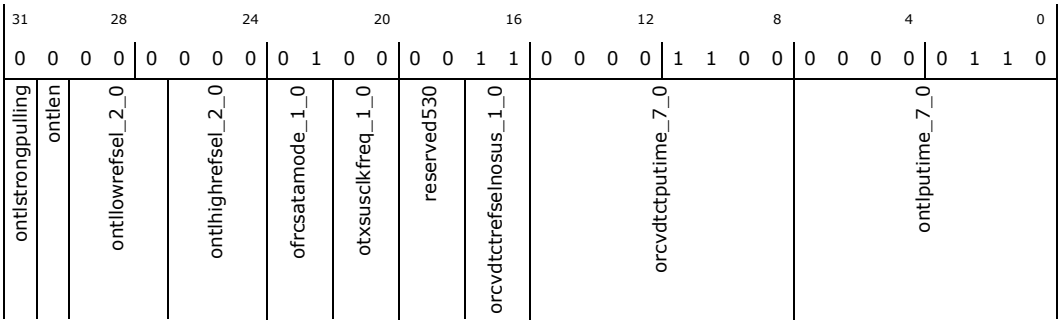
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword9: [Port: 0xA3] + (2280h + 24h)

Op Codes:
0h - Read, 1h - Write

Default: 00430C06h



Bit Range	Default & Access	Description
31	0h RW	**ontlstrongpulling:** Make the NTL pulling resistors with stronger pulling. It will be required if leakage will be higher than expected
30	0h RW	**ontlen:** No-touch-leakage test enable
29:27	0h RW	**ontllowrefsel_2_0:** Selects reference voltage for use when pads where pulled-down and were left to leak upwards
26:24	0h RW	**ontlhighrefsel_2_0:** Selects reference voltage for use when pads where pulled-up and were left to leak downwards
23:22	1h RW	**ofrcsatamode_1_0:** 00
21:20	0h RW	**otxsusclkfreq_1_0:** Determines the clock frequency expected on ick_susslow clock pin. 00: in the range of 25MHz to 27MHz (default) 01: in the range of 25MHz - 62.5MHz 10: in the range of 37.5MHz - 100MHz 11: in the range of 62.5MHz - 125MHz
19:18	0h RO	**reserved530:** reserved
17:16	3h RW	**orcvdtctrefselnosus_1_0:** 2-LSBs of reference level for receive detect comparator to be used when core supply is active
15:8	Ch RW	**orcvdtctputime_7_0:** Time (ick_susslow cycles) to wait (a.k.a. step 2) before comparing pads to Vref to detemine if there is a receiver on the far end. Value should be by the following Table: Sus-clock rate P1269.8 P1271.x 25MHz - 27MHz 9 12 25MHz - 62.5MHz 35 43 37.5MHz - 100MHz 64 76 62.5MHz - 125MHz 83 98
7:0	6h RW	**ontlputime_7_0:** [after step 1 of pulldown] time (ick_susslow cycles) to wait (step 2) and let the pads leak upwards before comparing pads to Vref to detemine if the pad exceeded Vref as a result of leakage.

17.18.11 TX_DWORD10 (tx_dword10)—Offset 28h

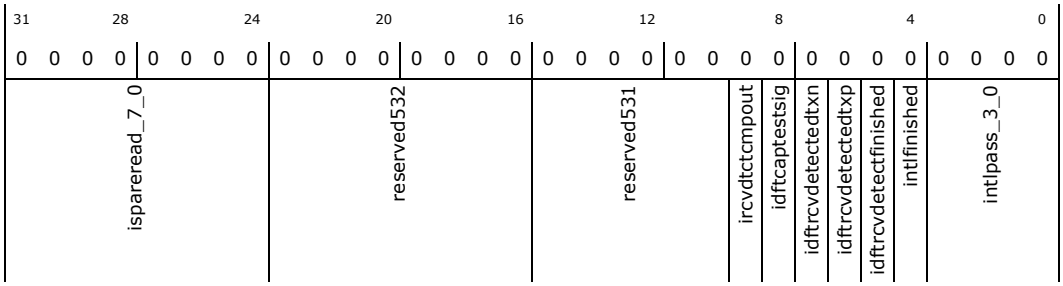
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword10: [Port: 0xA3] + (2280h + 28h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:24	X RO	**ispareread_7_0:** spare reg read
23:16	0h RO	**reserved532:** reserved
15:10	0h RO	**reserved531:** reserved
9	0h RO	**ircvdtctcmpout:** Flash Comparator Output Value
8	X RO	**idftcaptestsig:** reserved
7	0h RO	**idftrcvdetectedtxn:** Receive Detect Result for Txn
6	0h RO	**idftrcvdetectedtxp:** Receive Detect Result for Txp
5	0h RO	**idftrcvdetectfinished:** Receive Detect Process status
4	X RO	**intlfinished:** indication of NTL finished
3:0	X RO	**intlpass_3_0:** the four outputs of NTL test

17.18.12 TX_DWORD11 (tx_dword11)—Offset 2Ch

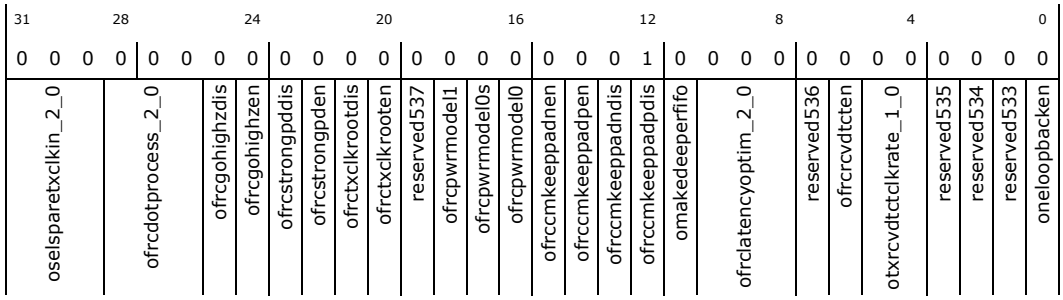
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword11: [Port: 0xA3] + (2280h + 2Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00001000h



Bit Range	Default & Access	Description
31:29	0h RW	**oselsparetxclkin_2_0:** Selects data to be used as alternative to fast clock. 000: DAC clock if in DAC mode - Default. 001: cri100m clock 010: i_obsontx_psg 011: i_obsontx_nsg 100: ick_txsymbclk 101: icksusslow 110: ick_dac 111: spare
28:26	0h RW	**ofrcdotprocess_2_0:** forces the dotprocess information 0XX - information of dot process comes from i_dotprocess[1:0] input bus. 100: p1271 dot1 101: p1271 dot4 110: p1271 dot8 111: NA
25	0h RW	**ofrcgohighzdis:** forces disabling of high-z output
24	0h RW	**ofrcgohighzen:** forces enabing of high-z output
23	0h RW	**ofrcstrongpddis:** forces disabling of strong pull-down
22	0h RW	**ofrcstrongpden:** forces enabing of strong pull-down
21	0h RW	**ofrctxclkrootdis:** forces disable of tx-clock output.
20	0h RW	**ofrctxclkrooten:** forces tx-clock to operate and drive clock out.
19	0h RO	**reserved537:** reserved
18	0h RW	**ofrcpwrmodel1:** when aserted. Forces L1 state
17	0h RW	**ofrcpwrmodel0s:** when aserted. Forces L0s state
16	0h RW	**ofrcpwrmodel0:** when aserted. Forces L0 state
15	0h RW	**ofrccmkeeppadnen:** Forces enabling of common-mode keeping of PadN
14	0h RW	**ofrccmkeeppadpen:** Forces enabling of common-mode keeping of PadP
13	0h RW	**ofrccmkeeppadndis:** Forces disabling of common-mode keeping of PadN
12	1h RW	**ofrccmkeeppadpdis:** Forces disabling of common-mode keeping of PadP
11	0h RW	**omakedeeperfifo:** Make FIFO deeper by 1 symbol clock cycle. Still not implemented. Implementation costs 10 flops in symb clock domain. Implementation is required for 8bits PISO only which is in next phase of products.

Bit Range	Default & Access	Description
10:8	0h RW	**ofrclatencyoptim_2_0:** Changes the latency from loadgenen assertion to the sampling of 10bits data into fast-clock domain. The latency is determined by Fuses (through i_latencyoptim[1:0]) + ... 0XX =) + 0 (Not changing the latency.) 100 =) - 4UI 101 =) - 2UI 110 =) + 2UI 111 =) + 4UI Important Note: When changing the latency too high or too low is will wrap-around what might cause data loss on beginning or end of transmitting. If you decide to plan with the latency consider changing 'omakedeeperfifo' too
7	0h RO	**reserved536:** reserved
6	0h RW	**ofrcrcvdtcten:** force initiation of Tx-detect-Rx procedure
5:4	0h RW	**otxrcvdtctclkrate_1_0:** determines the clock rate in the flash comparator. 00 - use sus-clock as is (25MHz in phase2) default 01 - use sus-clock by 4 10 - use sus-clock by 2 11 - reserved In phase1 the rate was 2'b10 susfreq125MHz
3	0h RO	**reserved535:** reserved
2	0h RO	**reserved534:** reserved
1	0h RO	**reserved533:** reserved
0	0h RW	**oneloopbacken:** Near-End LoopBack enable

17.18.13 TX_DWORD12 (tx_dword12)—Offset 30h

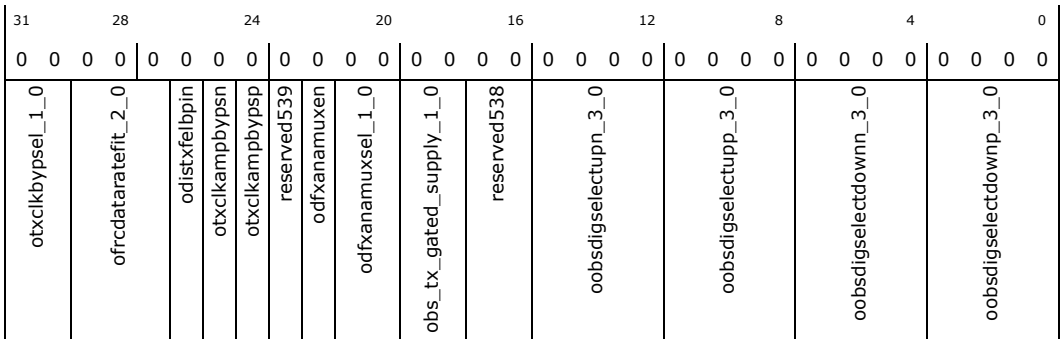
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword12: [Port: 0xA3] + (2280h + 30h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**otxclkbypsel_1_0:** Select if to bypass the divided normal clock with some other clock. 2'b00: Don't bypass. Regular clock. 2'b01: bypass the RX clock - datarateFit must be '11' 2'b10: Reserved 2'b11: bypass the sparetxclk clock - datarateFit must be '11'

Bit Range	Default & Access	Description
29:27	0h RW	**ofrcdataratefit_2_0:** Forces TX data rate 3'b0XX - don't force a velue. get it from the I/F pin 3'b100 - no divide (2UIs per clock cyc) 3'b101 - divide by 2 3'b110 - divide by 4 3'b111 - divide by 8 - used also for bypassing with other clocks
26	0h RW	**odistxfelbpin:** when asserted - disables the i_txfelben pin at the interface and force it 0. (needed in case the pin is asserted in KX or sata1 mode)
25	0h RW	**otxclkampbypsn:** 0': Normal operation '1': Enable of the passgate connected from the analog clock N to the control of the DC correction cell. The feedback OTA is disabled.
24	0h RW	**otxclkampbypsp:** 0': Normal operation '1': Enable of the passgate connected from the analog clock P to the control of the DC correction cell. The feedback OTA is disabled.
23	0h RO	**reserved539:** reserved
22	0h RW	**odfxanamuxen:** Enables analog signals probing mux out. When enabled the Vref of Tx-detect-Rx circuit is observed. Note that only one lane is allowed to have a the analog mux enabled to avoid collisions.
21:20	0h RW	**odfxanamuxsel_1_0:** selects analog signal to be sent to analog port in common lane. This bus has no affect at all currently because there is only one analog signal for observation which is observed by odfxanamuxen
19:18	0h RW	**obs_tx_gated_supply_1_0:** Monitor gated vcc supply to Tx upar
17:16	0h RO	**reserved538:** reserved
15:12	0h RW	**oobsdigselectupn_3_0:** selects data to be sent to observability port output 'o_obsup_nsg'. Same mapping as oobsdigselectdownn[3:0]
11:8	0h RW	**oobsdigselectupp_3_0:** selects data to be sent to observability port output 'o_obsup_psg'. Same mapping as oobsdigselectdownp[3:0]
7:4	0h RW	**oobsdigselectdownn_3_0:** Reserved.
3:0	0h RW	**oobsdigselectdownp_3_0:** Reserved.

17.18.14 TX_DWORD13 (tx_dword13)—Offset 34h

Access Method

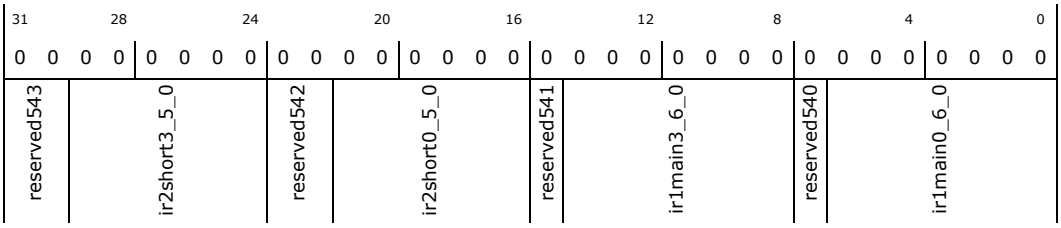
Type: Message Bus Register (Size: 32 bits)

tx_dword13: [Port: 0xA3] + (2280h + 34h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RO	**reserved543:** reserved
29:24	X RO	**ir2short3_5_0:** The slices used in R2 for DE (sub-DE in 3tap FIR) (PstC=Y,C=Y,PreC=Y)
23:22	0h RO	**reserved542:** reserved
21:16	X RO	**ir2short0_5_0:** The slices used in R2 for FS (sub-FS in 3tap FIR) (PstC=Y,C=Y,PreC=X)
15	0h RO	**reserved541:** reserved
14:8	X RO	**ir1main3_6_0:** The slices used in R1 for DE (sub-DE in 3tap FIR) (PstC=Y,C=Y,PreC=Y)
7	0h RO	**reserved540:** reserved
6:0	X RO	**ir1main0_6_0:** The slices used in R1 for FS (sub-FS in 3tap FIR) (PstC=Y,C=Y,PreC=X)

17.18.15 TX_DWORD14 (tx_dword14)—Offset 38h

Access Method

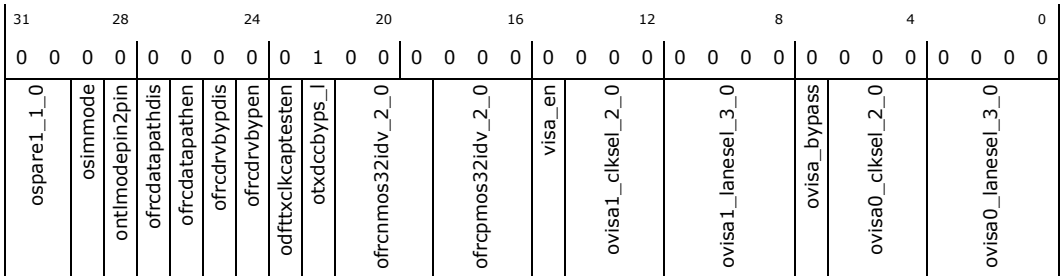
Type: Message Bus Register (Size: 32 bits)

tx_dword14: [Port: 0xA3] + (2280h + 38h)

Op Codes:

0h - Read, 1h - Write

Default: 00400000h



Bit Range	Default & Access	Description
31:30	0h RW	**ospare1_1_0:** reserved
29	0h RW	**osimmode:** Counter threshold of receive-detect, NTL, strong-common-mode is shortened dramatically for fast simulation porpuses. (does not impose risk to circuitly but electrical spec will not met)
28	0h RW	**ontlmodepin2pin:** 0 - NTL procedure will be done per pad while both pads are pulled to the same rail. 1 - NTL procedure will be done per pad while the pads are pulled to opposite rails.
27	0h RW	**ofrcdatapathdis:** DFT feature to optionaly be used with other registers

Bit Range	Default & Access	Description
26	0h RW	**ofrcdatapathen:** DFT feature to optionaly be used with other registers
25	0h RW	**ofrcdrvbypdis:** DFT feature to optionaly be used with other registers
24	0h RW	**ofrcdrvbypen:** DFT feature to optionaly be used with other registers
23	0h RW	**odfttxclkcaptesten:** Enables the finger capacitor quality check in the DCC block in Tx-clock block. The test is for shorts between the capacitor terminals.
22	1h RW	**otxdccbyps_l:** Tx DCC Bypass Override Puts DCC (duty cycle correction) circuit in bypass mode 0 - clock's duty cycle is not fixed
21:19	0h RW	**ofrcnmos32idv_2_0:** change the value iabut_idvpmos32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
18:16	0h RW	**ofrcpmos32idv_2_0:** change the value iabut_idvpmos32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
15	0h RW	**visa_en:** VISA Enable for the Tx VISA logic
14:12	0h RW	**ovisa1_clksel_2_0:** VISA Clock Select for Lane1. Selects the source synchronous clock to be used for data being sent on lane1.
11:8	0h RW	**ovisa1_lanesel_3_0:** VISA Lane Select for Lane1. Selects the byte of data to be sent out on lane1.
7	0h RW	**ovisa_bypass:** VISA Bypass. Allows for signals to be passed asynchronously through VISA block. Applies to both lane0 and lane1. 0 : Flop signals in local VISA block (default) 1 : Bypass flops in local VISA block
6:4	0h RW	**ovisa0_clksel_2_0:** VISA Clock Select for Lane0. Selects the source synchronous clock to be used for data being sent on lane0.
3:0	0h RW	**ovisa0_lanesel_3_0:** VISA Lane Select for Lane0. Selects data byte to be driven out of VISA-0 byte. Can be either clocked or unclocked data

17.18.16 TX_DWORD15 (tx_dword15)—Offset 3Ch

Access Method

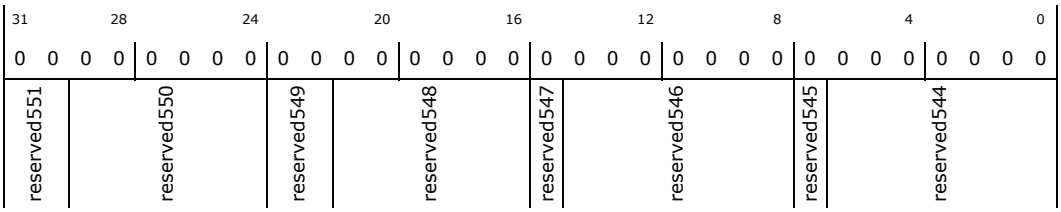
Type: Message Bus Register (Size: 32 bits)

tx_dword15: [Port: 0xA3] + (2280h + 3Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RO	**reserved551:** reserved
29:24	0h RO	**reserved550:** The slices used in R2 for DE (PstC=X,C=Y,PreC=Y)
23:22	0h RO	**reserved549:** reserved
21:16	0h RO	**reserved548:** The slices used in R2 for FS (PstC=X,C=Y,PreC=X)
15	0h RO	**reserved547:** reserved
14:8	0h RO	**reserved546:** The slices used in R1 for DE (PstC=X,C=Y,PreC=Y)
7	0h RO	**reserved545:** reserved
6:0	0h RO	**reserved544:** The slices used in R1 for FS (PstC=X,C=Y,PreC=X)

17.18.17 TX_DWORD16 (tx_dword16)—Offset 40h

Access Method

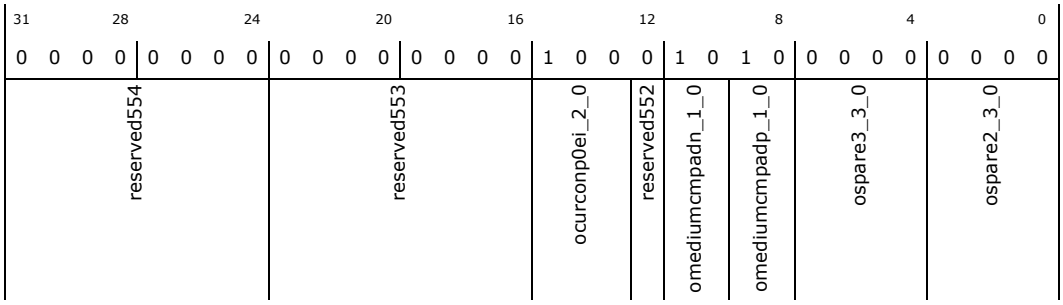
Type: Message Bus Register (Size: 32 bits)

tx_dword16: [Port: 0xA3] + (2280h + 40h)

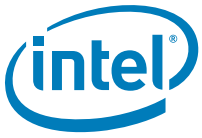
Op Codes:

0h - Read, 1h - Write

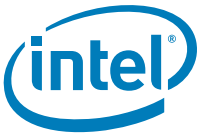
Default: 00008A00h



Bit Range	Default & Access	Description
31:24	0h RO	**reserved554:** reserved
23:16	0h RO	**reserved553:** reserved
15:13	4h RW	**ocurconp0ei_2_0:** current consumed (typically) 00X - 0.0mA - not active 01X - 0.9mA 10X - 1.8mA 11X - 2.7mA
12	0h RO	**reserved552:** reserved



Bit Range	Default & Access	Description
11:10	2h RW	**omediumcmpadn_1_0:** During P0-EI pad-N will be on medium strength CM and will cause the following current consumption: 00 - 0.00mA (disable) 01 - 2.45mA 10 - 4.87mA 11 -9.73mA
9:8	2h RW	**omediumcmpadp_1_0:** During P0-EI pad-P will be on medium strength CM and will cause the following current consumption: 00 - 0.00mA (disable) 01 - 2.45mA 10 - 4.87mA 11 - 9.73mA
7:4	0h RW	**ospare3_3_0:** 4 spare CRI register bits
3:0	0h RW	**ospare2_3_0:** 4 spare CRI register bits



17.19 SATA Lane 1 Electrical Register Address Map

Table 196. Summary of SATA Lane 1 Electrical Message Bus Registers—0xA3 (Global Offset 2400h)

Offset	Register ID—Description	Default Value
0h	"PCS_DWORD0 (pcs_dword0)—Offset 0h" on page 1907	00010080h
4h	"PCS_DWORD1 (pcs_dword1)—Offset 4h" on page 1909	00600060h
8h	"PCS_DWORD2 (pcs_dword2)—Offset 8h" on page 1910	00000000h

17.19.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

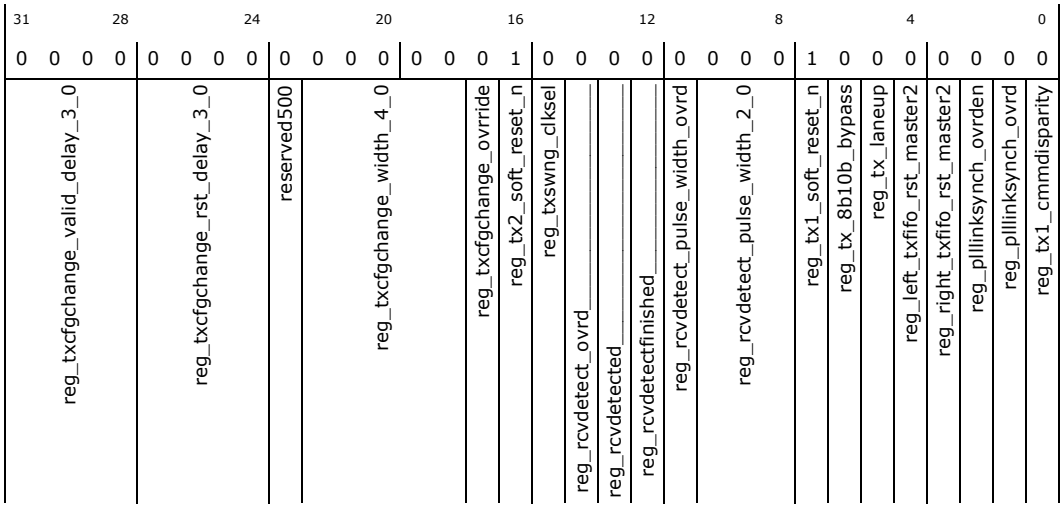
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword0: [Port: 0xA3] + (2400h + 0h)

Op Codes:
0h - Read, 1h - Write

Default: 00010080h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_txcfgchange_valid_delay_3_0:** Controls counter to wait 128ns after txcfgchange asserts when coming out of reset. This will control phystatus de-assertion after reset. Note: Minimum value when programmed has to be 4'b0100 or greater.
27:24	0h RW	**reg_txcfgchange_rst_delay_3_0:** Counter value to delay txcfgchange toggle after coming out of reset.
23	0h RW	**reserved500:** reserved
22:18	0h RW	**reg_txcfgchange_width_4_0:** Tx power fsm output - divider ratio
17	0h RW	**reg_txcfgchange_ovrride:** Override txchfchange related counters. (reg_txcfgchange_width, reg_txcfgchange_valid_delay, reg_txcfgchange_rst_delay)
16	1h RW	**reg_tx2_soft_reset_n:** Active low reset to independently reset Tx lane2 in Display Port
15	0h RW	**reg_txswng_clksel:** When 0 selects divide by 2 version of the ick_plllink clock for Tx swing control logic When 1 selects ick_plllink clock for Tx swing control logic.
14	0h RW	**reg_rcvdetect_ovrd_____:** override enable for rcvdetected and rcvdetectfinished
13	0h RW	**reg_rcvdetected_____:** override for rcvdetected
12	0h RW	**reg_rcvdetectfinished_____:** override for rcvdetectfinished
11	0h RW	**reg_rcvdetect_pulse_width_ovrd:** override enable for rcvdetect_pulse_width
10:8	0h RW	**reg_rcvdetect_pulse_width_2_0:** override value for rcvdetect_pusle_width
7	1h RW	**reg_tx1_soft_reset_n:** Active low reset to independently reset Tx lane1 in Display Port 0: Lane 1 reset 1: Lane 1 active
6	0h RW	**reg_tx_8b10b_bypass:** Bypass 8b10b encoder (for SAPIS etc interface.) 0 = Disable 8b/10b encoder bypass 1 = Enable 8b/10b encoder bypass

Bit Range	Default & Access	Description
5	0h RW	**reg_tx_laneup:** Unused in Tx
4	0h RW	**reg_left_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
3	0h RW	**reg_right_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
2	0h RW	**reg_plllinksynch_ovrden:** Override enable for reg_plllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	**reg_plllinksynch_ovrd:** override value for plllinksynch
0	0h RW	**reg_tx1_cmmdisparity:** Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

17.19.2 PCS_DWORD1 (pcs_dword1)—Offset 4h

Access Method

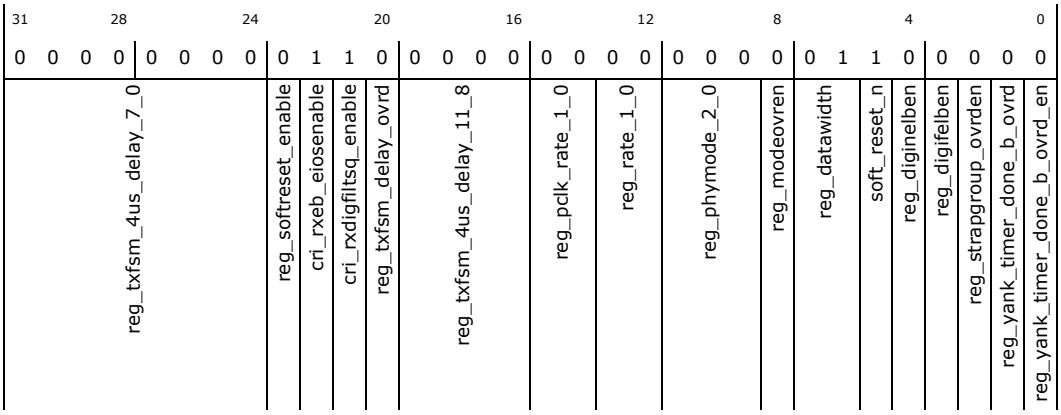
Type: Message Bus Register (Size: 32 bits)

pcs_dword1: [Port: 0xA3] + (2400h + 4h)

Op Codes:

0h - Read, 1h - Write

Default: 00600060h



Bit Range	Default & Access	Description
31:24	0h RW	**reg_txfsm_4us_delay_7_0:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
23	0h RW	**reg_softreset_enable:** When '1' the soft_reset_n bit will contol the lane reset When '0' the hardware reset will control the lane reset Note for DP: In addition to soft_reset_n,which will reset both TX0 and TX 1 in the lane, the reg_tx1_soft_reset_n bit can be used to reset only TX1 in the lane and reg_tx2_soft_reset_n bit can be used to reset only TX2
22	1h RW	**cri_rxeb_eiosenable:** When 1 enables EIOS based Rx power down

Bit Range	Default & Access	Description
21	1h RW	**cri_rxdigfiltsq_enable:** When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	**reg_txfsm_delay_ovrd:** Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	**reg_txfsm_4us_delay_11_8:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	**reg_pclk_rate_1_0:** Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	**reg_rate_1_0:** Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	**reg_phymode_2_0:** Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	**reg_modeovren:** When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	**reg_datawidth:** Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	**soft_reset_n:** Active low soft reset override
4	0h RW	**reg_diginelben:** Override for near end digital loopback.
3	0h RW	**reg_digifelben:** Override for far end digital loopback
2	0h RW	**reg_strapgroup_ovrden:** Override Enable for Strap Group
1	0h RW	**reg_yank_timer_done_b_ovrd:** Override for yank_timer_done_b
0	0h RW	**reg_yank_timer_done_b_ovrd_en:** Override Enable for yank_timer_done_b

17.19.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

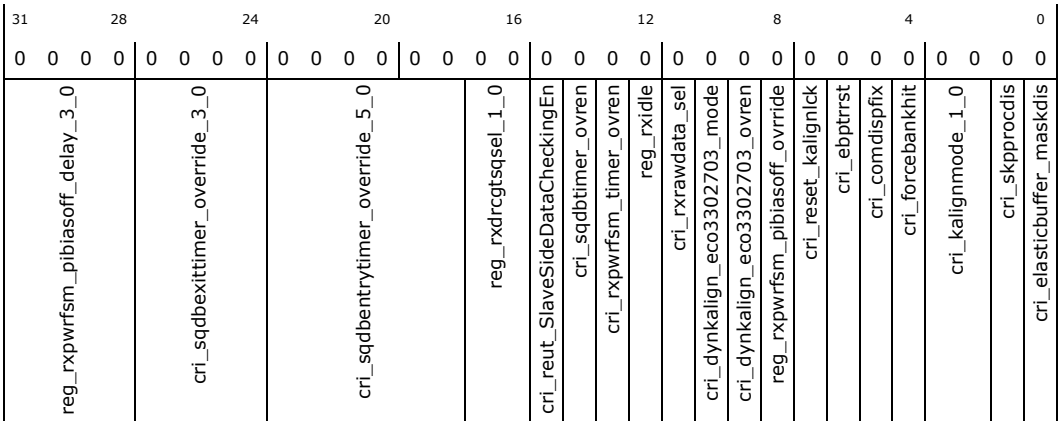
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword2: [Port: 0xA3] + (2400h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_pibiasoff_delay_3_0:** Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	**cri_sqdbexittimer_override_3_0:** Rx squelch exit debounce timer
23:18	0h RW	**cri_sqdbentrytimer_override_5_0:** Rx squelch entry debounce timer
17:16	0h RW	**reg_rxdrcgtsqsel_1_0:** Squelch output select
15	0h RW	**cri_reut_SlaveSideDataCheckingEn:** Enable REUT slave side checking while in loopback slave
14	0h RW	**cri_sqdbtimer_ovren:** Squelch debounce timer override enable
13	0h RW	**cri_rxpwrfsm_timer_ovren:** Rx power management fsm timer override enable
12	0h RW	**reg_rxidle:** Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	**cri_rxrawdata_sel:** When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	**cri_dynkalign_eco3302703_mode:** Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	**cri_dynkalign_eco3302703_ovren:** Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	**reg_rxpwrfsm_pibiasoff_ovrride:** When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	**cri_reset_kalignlck:** When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	**cri_ebptrrst:** Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	**cri_comdispfix:** Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	**cri_forcebankhit:** Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	**cri_kalignmode_1_0:** KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	**cri_skpprocdis:** SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	**cri_elasticbuffer_maskdis:** Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.19.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

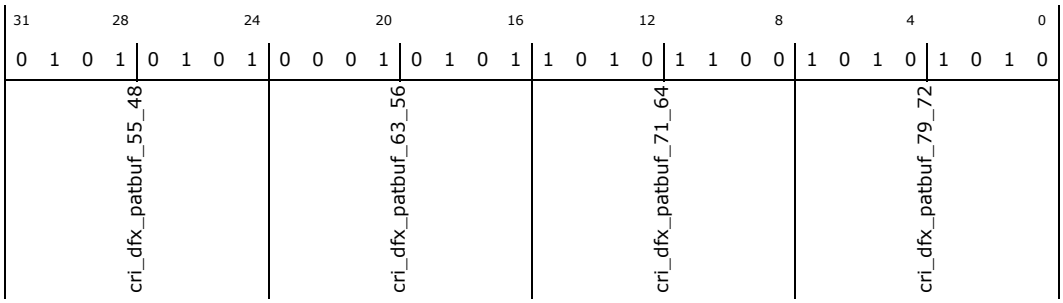
Type: Message Bus Register (Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2400h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh



Bit Range	Default & Access	Description
31:24	55h RW	**cri_dfx_patbuf_55_48:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	15h RW	**cri_dfx_patbuf_63_56:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	ACh RW	**cri_dfx_patbuf_71_64:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	AAh RW	**cri_dfx_patbuf_79_72:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.5 PCS_DWORD4 (pcs_dword4)—Offset 10h

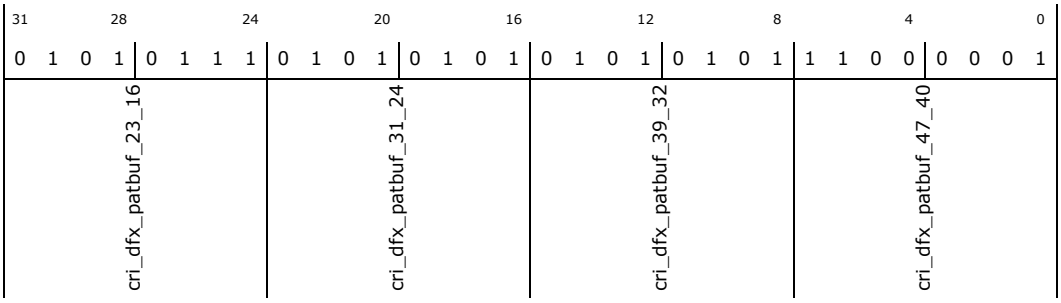
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword4: [Port: 0xA3] + (2400h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 575555C1h



Bit Range	Default & Access	Description
31:24	57h RW	**cri_dfx_patbuf_23_16:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	55h RW	**cri_dfx_patbuf_31_24:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	55h RW	**cri_dfx_patbuf_39_32:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	C1h RW	**cri_dfx_patbuf_47_40:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.6 PCS_DWORD5 (pcs_dword5)—Offset 14h

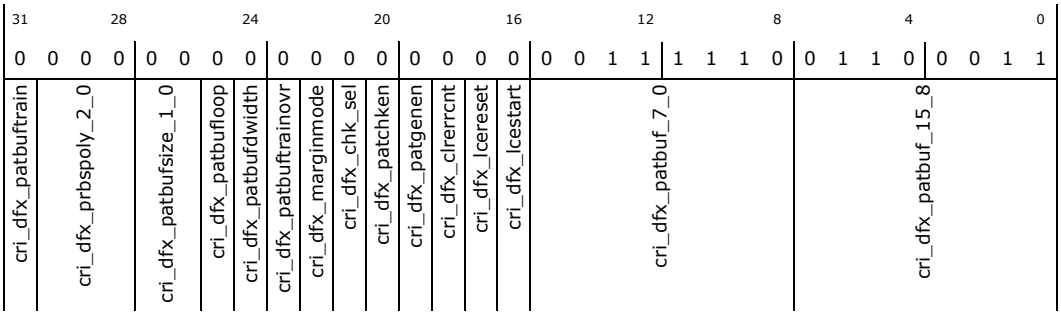
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword5: [Port: 0xA3] + (2400h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00003E63h



Bit Range	Default & Access	Description
31	0h RW	**cri_dfx_patbuftrain:** Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	**cri_dfx_prbspoly_2_0:** PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - x^16 + x^5 + x^4 + x^3 + 1 (USB3/PCIe Scrambler) (8b) 001 - x^16 + x^15 + x^13 + x^4 + 1 (SATA scrambler) (8b) 010 - x^31 + x^28 + 1 (8b) 011 - x^7 + x^6 + 1 (8b) 100 - x^15 + x^14 + 1 (10b) 101 - x^23 + x^18 + 1 (10b) 110 - x^31 + x^28 + 1 (10b) 111 - x^7 + x^6 + 1 (10b)
27:26	0h RW	**cri_dfx_patbufsize_1_0:** Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	**cri_dfx_patbufloop:** Pattern Buffer Looping Enable Enables looping of the Patter Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	**cri_dfx_patbufdwidth:** Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/ retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	**cri_dfx_patbuftrainovr:** Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Patter Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	**cri_dfx_marginmode:** Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	**cri_dfx_chk_sel:** Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	**cri_dfx_patchken:** Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	**cri_dfx_patgenen:** Pattern Generator Enable This will activate the DFx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	**cri_dfx_clrerrcnt:** Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	**cri_dfx_lcereset:** Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	**cri_dfx_lcestart:** Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	**cri_dfx_patbuf_7_0:** Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	**cri_dfx_patbuf_15_8:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

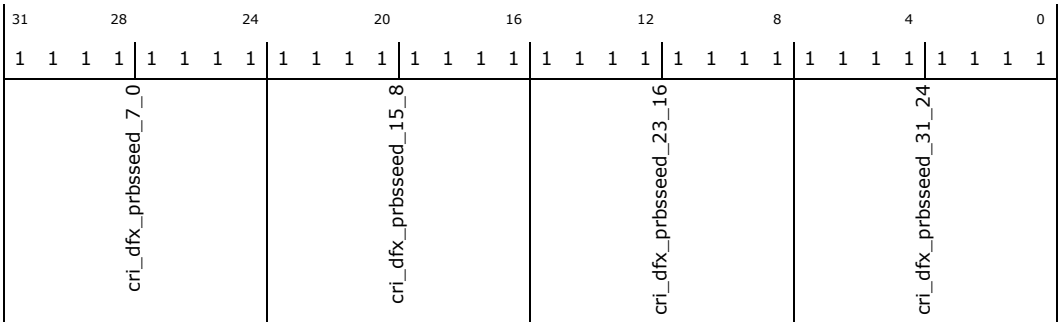
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2400h + 18h)

Op Codes:
0h - Read, 1h - Write

Default: FFFFFFFFh



Bit Range	Default & Access	Description
31:24	FFh RW	**cri_dfx_prbsseed_7_0:** PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	**cri_dfx_prbsseed_15_8:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
15:8	FFh RW	**cri_dfx_prbsseed_23_16:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
7:0	FFh RW	**cri_dfx_prbsseed_31_24:** PRBS Seed See cri_dfx_prbsseed[7:0] description.

17.19.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

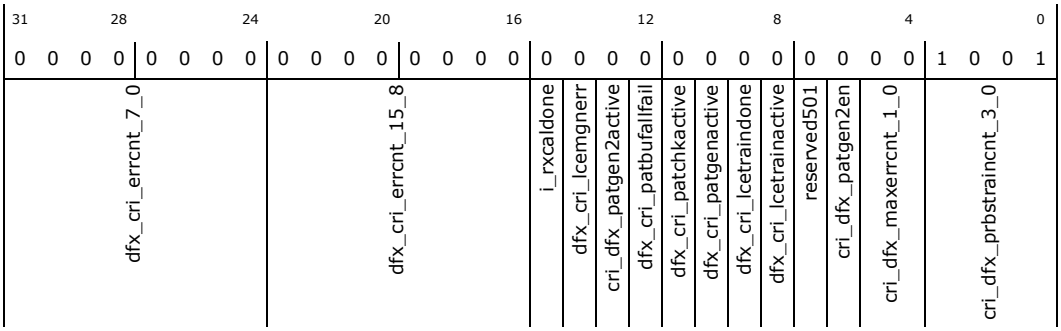
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword7: [Port: 0xA3] + (2400h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00000009h



Bit Range	Default & Access	Description
31:24	X RO	**dfx_cri_errcnt_7_0:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
23:16	X RO	**dfx_cri_errcnt_15_8:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
15	X RO	**i_rxcaldone:** RX Calibration Cycles Complete Indicator
14	X RO	**dfx_cri_lcemgnerr:** Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	**cri_dfx_patgen2active:** Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	**dfx_cri_patbufallfail:** Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occured during training.
11	X RO	**dfx_cri_patchkactive:** Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	**dfx_cri_patgenactive:** Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	**dfx_cri_lcetraindone:** Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	**dfx_cri_lcetrainactive:** Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	**reserved501:** reserved
6	0h RW	**cri_dfx_patgen2en:** Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	**cri_dfx_maxerrcnt_1_0:** Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^16 (default) 01 : 2^10 10 : 2^8 11 : 2^4
3:0	9h RW	**cri_dfx_prbstraincnt_3_0:** PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

17.19.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

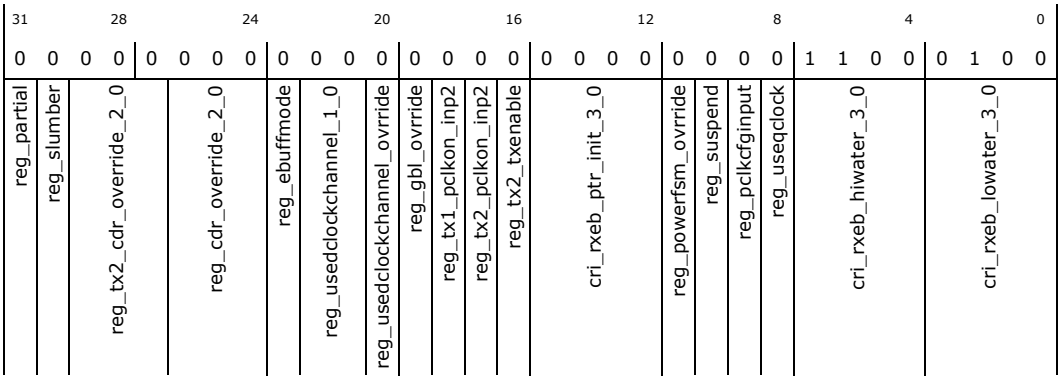
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword8: [Port: 0xA3] + (2400h + 20h)

Op Codes:
0h - Read, 1h - Write

Default: 000000C4h



Bit Range	Default & Access	Description
31	0h RW	**reg_partial:** Override for i_partial
30	0h RW	**reg_slumber:** Override for i_slumber
29:27	0h RW	**reg_tx2_cdr_override_2_0:** Override for cdr_override strap for second tx2
26:24	0h RW	**reg_cdr_override_2_0:** Override for cdr_override strap
23	0h RW	**reg_ebuffmode:** Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	**reg_usedclockchannel_1_0:** Selects the active clock channel
20	0h RW	**reg_usedclockchannel_ovrride:** When asserted selects reg_usedclockchannel[1:0]
19	0h RW	**reg_gbl_ovrride:** Global override select
18	0h RW	**reg_tx1_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	**reg_tx2_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	**reg_tx2_txenable:** Override for i_txenable for tx2
15:12	0h RW	**cri_rxeb_ptr_init_3_0:** Config override for initial value of Rx elastic buffer read pointer
11	0h RW	**reg_powerfsm_ovrride:** When asserted overrides for Tx power fsm are selected
10	0h RW	**reg_suspend:** Override for suspend
9	0h RW	**reg_pclkcfginput:** Override for pclkcfginput strap
8	0h RW	**reg_useqclock:** Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	**cri_rxeb_hiwater_3_0:** Elastic buffer high watermark based on which SKP is removed

Bit Range	Default & Access	Description
3:0	4h RW	**cri_rxeb_lowater_3_0:** Elastic buffer low watermark based on which SKP is added

17.19.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

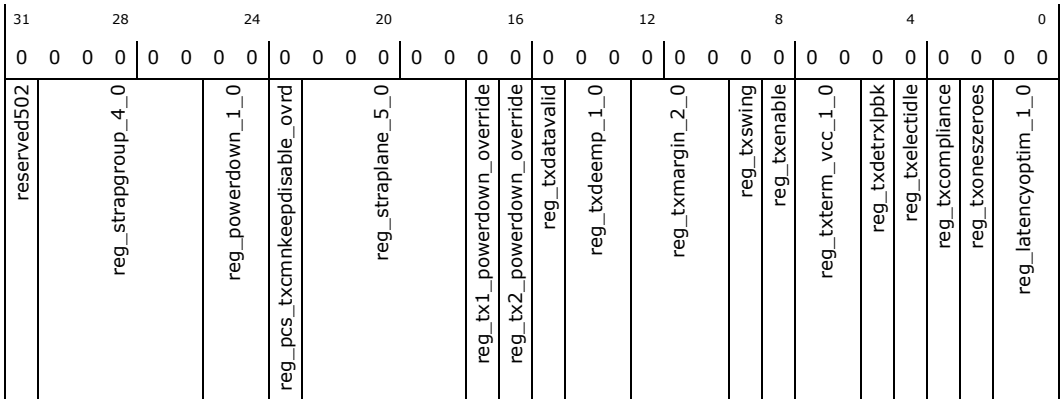
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword9: [Port: 0xA3] + (2400h + 24h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**reserved502:** reserved
30:26	0h RW	**reg_strapgroup_4_0:** Override for i_strapgroup
25:24	0h RW	**reg_powerdown_1_0:** Override for i_powerdown
23	0h RW	**reg_pcs_txcmnkeepdisable_ovrd:** Override for ipcs_txcmnkeepdisable input 0: Use value on ipcs_txcmnkeepdisable input pin to determine o_txgohighz state in P2/ slumber 1: Force pcs_txcmnkeepdisable to 0
22:18	0h RW	**reg_straplane_5_0:** Override for i_straplane
17	0h RW	**reg_tx1_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx1 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
16	0h RW	**reg_tx2_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx2 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
15	0h RW	**reg_txdatavalid:** Override for i_txdatavalid (register is NOT used)
14:13	0h RW	**reg_txdeemp_1_0:** Override for i_txdeemph

Bit Range	Default & Access	Description
12:10	0h RW	**reg_txmargin_2_0:** Override for i_txmargin
9	0h RW	**reg_txswing:** Override for i_txswing
8	0h RW	**reg_txenable:** Override for i_txenable
7:6	0h RW	**reg_txterm_vcc_1_0:** Override for txterm_vcc strap
5	0h RW	**reg_txdetrxlpbk:** Override for i_txdetrxlpbk
4	0h RW	**reg_txelectidle:** Override for i_txelectidle
3	0h RW	**reg_txcompliance:** Override for i_txcompliance
2	0h RW	**reg_txoneszeroes:** Override for i_txoneszeroes
1:0	0h RW	**reg_latencyoptim_1_0:** Override for i_latencyoptim

17.19.11 PCS_DWORD10 (pcs_dword10)—Offset 28h

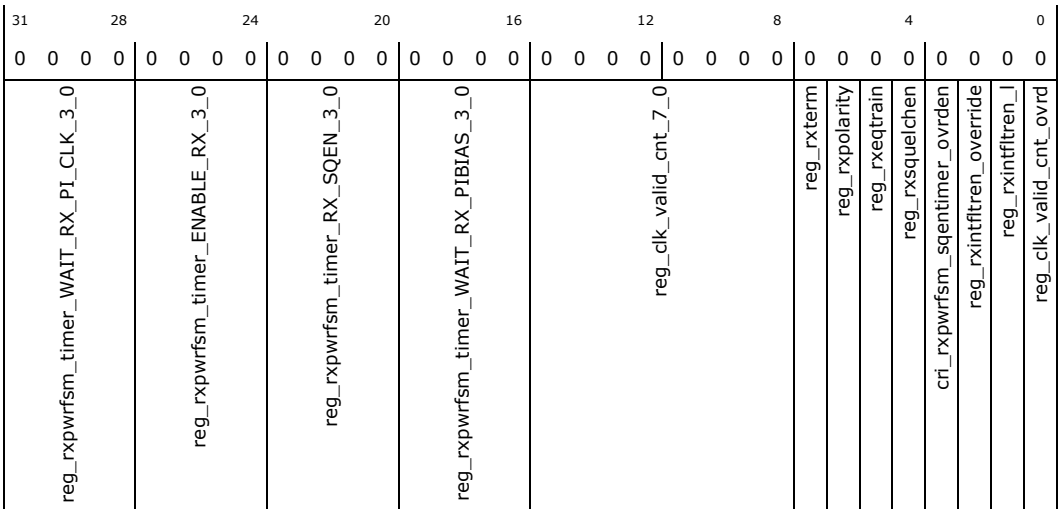
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword10: [Port: 0xA3] + (2400h + 28h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_timer_WAIT_RX_PI_CLK_3_0:** Rx Power state m/c timer value used to enable PI clock
27:24	0h RW	**reg_rxpwrfsm_timer_ENABLE_RX_3_0:** Rx Power state m/c timer value used to enable receivers
23:20	0h RW	**reg_rxpwrfsm_timer_RX_SQEN_3_0:** Rx Power FSM Rx Squelch Enable Timer Override Value Affect squelch enable startup sequence during 'synchronous' squelch startup mode. 0000 - Invalid 0001 - 1 susclk period ... 1111 - 15 susclk period
19:16	0h RW	**reg_rxpwrfsm_timer_WAIT_RX_PIBIAS_3_0:** Rx Power state m/c timer value used to enable PI BIAS
15:8	0h RW	**reg_clk_valid_cnt_7_0:** Over ride value for clock valid delay in clock top block before toggling phystatus.
7	0h RW	**reg_rxterm:** Override for i_rxterm
6	0h RW	**reg_rxpolarity:** Override for i_rxpolarity
5	0h RW	**reg_rxeqtrain:** Override for i_rxeqtrain
4	0h RW	**reg_rxsquelchen:** Override for i_rxsquelchen
3	0h RW	**cri_rxpwrfsm_sqentimer_ovrden:** Squelch Enable Timer Override Enable Used to override the squelch enable timer in PCS with the timer value set by the Rx Squelch Enable timer register (reg_rxpwrfsm_timer_RX_SQEN[3:0]).
2	0h RW	**reg_rxintfltren_override:** Rx Integral Filter Override Select 0: selects i_rxintfltren_l input pin. 1: selects reg_rxintfltren_l register
1	0h RW	**reg_rxintfltren_l:** Override for Rx integral filter enable i_rxintfltren_l
0	0h RW	**reg_clk_valid_cnt_ovrd:** Override enable for reg_clk_valid_cnt

7:0	0h RW	**reg_clkbuf_stagger_cnt_9_2:** Counter override value for staggering delay of clock buffer control signals.

17.19.17 PCS_DWORD16 (pcs_dword16)—Offset 40h

Access Method

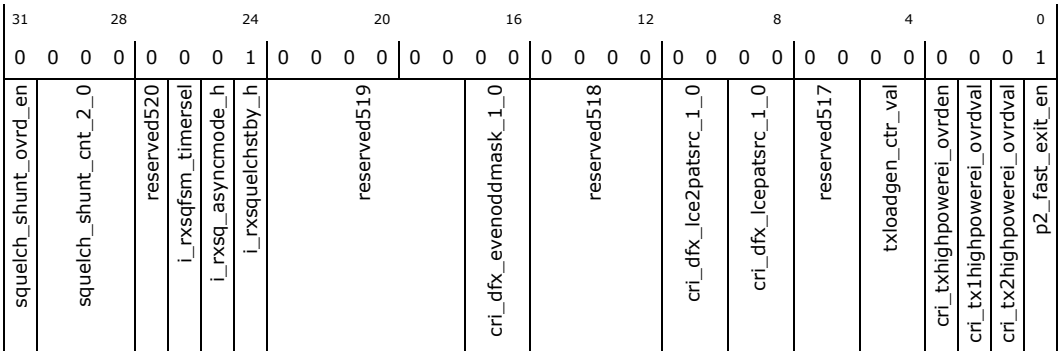
Type: Message Bus Register (Size: 32 bits)

pcs_dword16: [Port: 0xA3] + (2400h + 40h)

Op Codes:

0h - Read, 1h - Write

Default: 01000001h



Bit Range	Default & Access	Description
31	0h RW	**squelch_shunt_ovrd_en:** Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	**squelch_shunt_cnt_2_0:** Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	**reserved520:** reserved
26	0h RW	**i_rxsqfsm_timersel:** Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	**i_rxsq_asyncmode_h:** Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualfiy it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	**i_rxsquelchstby_h:** Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
23:18	0h RW	**reserved519:** reserved
17:16	0h RW	**cri_dfx_evenoddmask_1_0:** Pattern Checker Even/Odd Bit Error Mask Select 00 : no masking; all errors will be counted 01: select odd path, mask even path; only errors on bits [1,3,5,7,9] are counted 10: select even path, mask odd path; only errors on bits [0,2,4,6,8] are counted 11: reserved;

26	0h RW	**iopampnen_h:** (NOT USED - noconned)
25	0h RW	**monanapgen:** DC Monitor to Monitor Port Enable Enables DC monitor passgate to monitor port via analog observability abutment.
24	1h RW	**monubufbypassen:** DC Monitor Unity-Gain Buffer Bypass 0: no bypass 1: bypass (default - required for LRC)
23:22	0h RW	**reserved522:** reserved
21	0h RW	**reg_ivrefen:** IvrefEn Override Value Register is valid when override mode is enabled (ivrefen_ovrd). During this mode, this register will have direct control to enable/disable the ivref opamp. 0 - Disable ivref opamp 1 - Enable ivref opamp
20	0h RW	**ivrefen_ovrd:** IvrefEn Override Select 0 - the enable for the ivref opamp (ivrefen) is driven by the FSM. 1 - the ivrefen is driven by the register (reg_ivrefen).
19:17	0h RW	**reserved523:** reserved
16	0h RW	**oirefcurmonsel:** IREF Current Monitor Select Enables current mirror from the IREF block to the 'shared' analog monitor port.
15	0h RW	**lrcdisable:** LRC Disable This bit disables the LRC. Any token received is passed to the next lane.
14:12	0h RW	**reserved521:** reserved
11	0h RW	**lrc_rdy_pulsegen:** LRC Ready PulseGen Generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal to all four targets; does not recompute local Rcomp code. Values in DWD 0x14 (*rccodes[7:0]) will be latched into targets. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
10:9	0h RW	**lrc_rdy_target_1_0:** LRC Ready Pulse Target Indicates which lrc target to recompute when lrc_rdy_ovd is strobed 00: irefrccode 01: txrccode 10: rxtermrccode 11: rxvgarccode

Bit Range	Default & Access	Description
8	0h RW	**lrc_rdy_ovd:** LRC Ready Override Recomputes the selected local rcomp code and generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal that is selected in bits [2:1]. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
7	0h RW	**rxtermpmrcen:** PM RCOMP Enable for Rx Termination 1 - Enables the RCOMP update to occur while RX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
6	0h RW	**rxvgapmrcen:** PM RCOMP Enable for Rx VGA (Same description as the RxTerm PM Rcomp Enable.)
5	0h RW	**txpmrcen:** PM RCOMP Enable for Tx 1 - Enables the RCOMP update to occur while TX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
4	0h RW	**irefpmrcen:** IREF PM RCOMP Enable 1 - Enables the RCOMP update to occur while TX/RX is in the P1 or P2 (partial or slumber) power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
3	0h RW	**rxtermperrcen:** Periodic RCOMP Enable for Rx Termination 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
2	0h RW	**rxvgaperrcen:** Periodic RCOMP Enable for Rx VGA 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
1	0h RW	**txperrcen:** Periodic RCOMP Enable for Tx 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
0	1h RW	**irefperrcen:** Periodic RCOMP Enable for Iref 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.

17.19.19 PCS_DWORD18 (pcs_dword18)—Offset 48h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword18: [Port: 0xA3] + (2400h + 48h)

Op Codes:

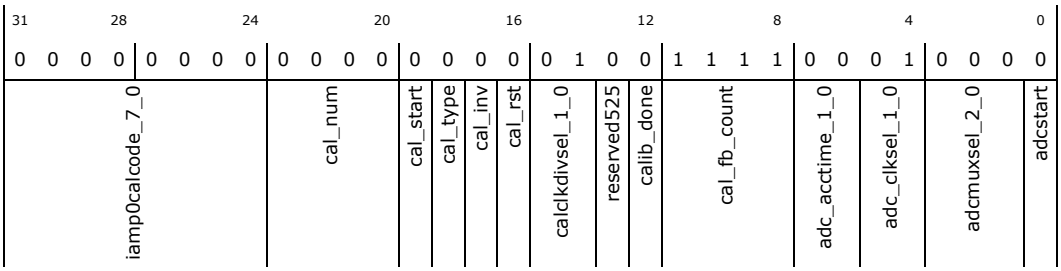
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword19: [Port: 0xA3] + (2400h + 4Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00004F10h



Bit Range	Default & Access	Description
31:24	0h RW	**iamp0calcode_7_0:** IREF Opamp Calibration Codes These bits are written by the calibration state machine. Bit7 - Calibration enable that configures the target into a calibration mode Bit6 - Calibration sign bit Bit[5:0] - Calibration magnitude [lyonel to check bit7 functionality].
23:20	0h RW	**cal_num:** Calibration Number or Address numbers of cal targets or address for specific cal target if cal_type = 1
19	0h RW	**cal_start:** Calibration Start This bit is used to start a Cal cycle vias IOSF-SB. The cal cycle will follow the normal cal cycle as set by cal_num, cal_type, cal_inv and cal_rst. The Cal cycle starts when this bit transitions 0 1 1 = Run Cal. 0 = wait (default)
18	0h RW	**cal_type:** Calibration Type Enable calibration of one cal target defined by cal_num 0 = multi 1 = single

Bit Range	Default & Access	Description
17	0h RW	**cal_inv:** Calibration Feedback Invert Inverse the logic of counter increment decrement depends on the FB
16	0h RW	**cal_rst:** Calibration Reset Reset state machine
15:14	1h RW	**calclkdivsel_1_0:** Calibration Clock Divider Select 00 - div2 of CRICLK 01 - div4 of CRICLK 10 - div8 of CRICLK 11 - div16 of CRICLK Note: Calibration clock period target is 160nS
13	0h RO	**reserved525:** reserved
12	0h RO	**calib_done:** Calibration Completion Indicator
11:8	Fh RW	**cal_fb_count:** Calibration Cycle Count Limit per target Each calibration target is clocked for 16 * cal_fb_count clock cycles. Max is 240 clock cycles (default)
7:6	0h RW	**adc_acctime_1_0:** ADC Accumulation Time Select This selects the conversion time for the Analog to Digital Converter. ADC clock frequency is set by bits [5:4] in this register. 00: 1024 ADC clocks (default) 01: 512 ADC clocks 10: 256 ADC clocks 11: Infinite (ADC in continuous accumulation) Note: If LRC mode and set to '11', then adctime = 1024cycles.
5:4	1h RW	**adc_clksel_1_0:** ADC Clock Frequency Select This selects the input clock frequency to the Analog to Digital Converter. 00: CRI clock div2 01: CRI clock div1 10: CRI clock div4 11: CRI clock div8 NOTE: Target is 50Mhz.
3:1	0h RW	**adcmuxsel_2_0:** ADC Analog Mux Select This selects the analog voltage input to the Analog to Digital Converter. 000: Vss 001: Vcc 010: LRC R1 voltage divider 011: LRC sense net 100: input from Tx 101: input from Rx (or Tx #2) 110: input from Clock 111: input from reference generator Note: Mux select is controlled by the FSM during LRC.
0	0h RW	**adcstart:** ADC start This bit resets the ADC counter and starts a new acquisition. This bit should remain 1'b1 while the ADC is active and acquiring data. 0: Disable ADC logic and analog circuitry 1: Enable ADC and start A2D conversion.

17.19.21 PCS_DWORD20 (pcs_dword20)—Offset 50h

Access Method

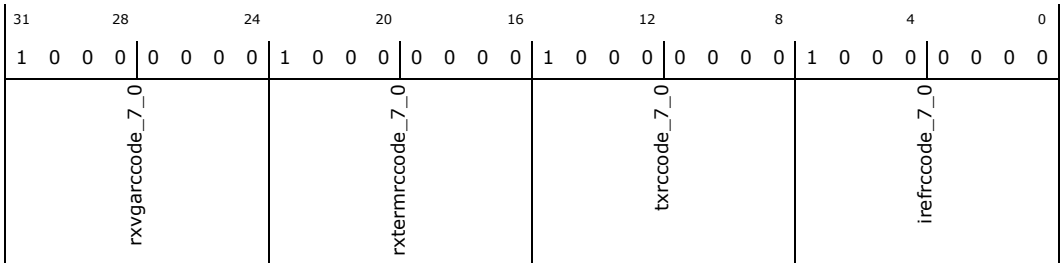
Type: Message Bus Register (Size: 32 bits)

pcs_dword20: [Port: 0xA3] + (2400h + 50h)

Op Codes:

0h - Read, 1h - Write

Default: 80808080h



Bit Range	Default & Access	Description
31:24	80h RW	**rxvgarccode_7_0:** Rx VGA Rcomp Codes These bits are the final binary code used by the Rx VGA. This block only uses the X upper MSBs of this value. Writing to this register will override the rcomp code to the Rx VGA. An LRC Ready pulse must be generated to the Rx VGA target for this value to take effect. [7:n] - compensation code sent to Iref [n-1:0] - remaining LSBs from scaling and offset calculation
23:16	80h RW	**rxtermrccode_7_0:** Rx Termination Rcomp Codes These bits are the final binary code used by the Rx termination. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to Rxterm. An LRC Ready pulse must be generated to the Rxterm target for this value to take effect. [7:1] - compensation code sent to Rxterm [0] - remaining LSB from scaling and offset calculation
15:8	80h RW	**txrccode_7_0:** Tx Rcomp Codes These bits are the final binary code used by the Tx. This block only uses the 7 upper MSBs of this value. Writing to this register will override the rcomp code to the Tx. An LRC Ready pulse must be generated to the Tx target for this value to take effect. [7:1] - compensation code sent to Tx [0] - remaining LSB from scaling and offset calculation
7:0	80h RW	**irefrccode_7_0:** Iref Rcomp Codes These bits are the final binary code used by the Iref block. This block only uses the 6 upper MSBs of this value. Writing to this register will override the rcomp code to the Iref block. An LRC Ready pulse must be generated to the Iref target for this value to take effect. [7:2] - compensation code sent to Iref [1:0] - remaining LSBs from scaling and offset calculation

17.19.22 PCS_DWORD21 (pcs_dword21)—Offset 54h

Access Method

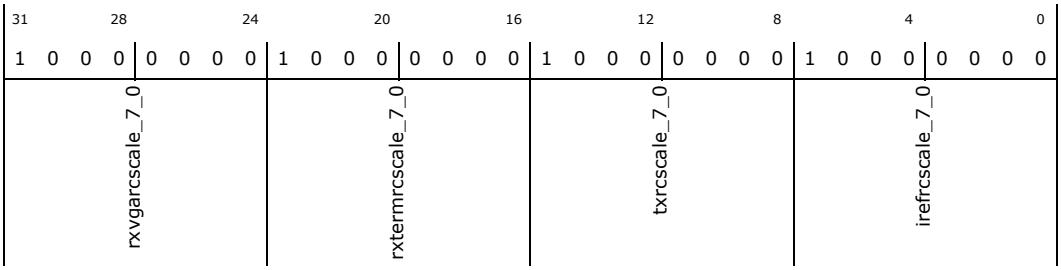
Type: Message Bus Register (Size: 32 bits)

pcs_dword21: [Port: 0xA3] + (2400h + 54h)

Op Codes:

0h - Read, 1h - Write

Default: 80808080h



Bit Range	Default & Access	Description
31:24	80h RW	**rxvgarcscale_7_0:** Rx VGA Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final rxvgarccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
23:16	80h RW	**rxtermrcscale_7_0:** Rx Termination Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final rxtermrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
15:8	80h RW	**txrcscale_7_0:** Tx Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final txrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0
7:0	80h RW	**irefrcscale_7_0:** Iref Rcomp Scale Multiplier The LRC code is multiplied by this value before applying the offset to generate the final irefrccode. 0xFF: Scale=1.99219 0xC0: Scale=1.5 0x80: Scale=1.0 0x40: Scale=0.5 0x00: Scale=0

17.19.23 PCS_DWORD22 (pcs_dword22)—Offset 58h

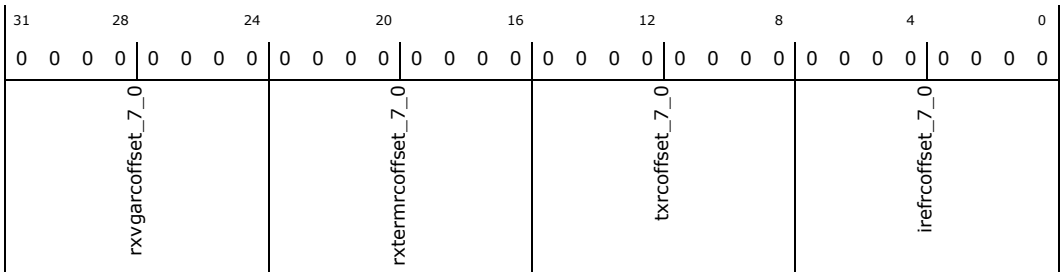
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword22: [Port: 0xA3] + (2400h + 58h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**rxvgarcoffset_7_0:** Rx VGA Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxVGA Rcomp.
23:16	0h RW	**rxtermrcoffset_7_0:** Rx Termination Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxTerm Rcomp.
15:8	0h RW	**txrcoffset_7_0:** Tx Rcomp Offset Same description as IREF Rcomp Offset, but applies to Tx Rcomp.
7:0	0h RW	**irefrcoffset_7_0:** Iref Rcomp Offset This value is added to the scaled LRC code to determine the final calibration code used by the Iref block. 2's complement format. The full 8-bit offset is used with the scale multiplier to determine the final 8-bit value, but the Iref target only uses the upper MSBs of the final value. 0x00: Offset = 0 0x01: Offset = +1 0x7F: Offset = +127 0xFF: Offset = -1 0x80: Offset = -128 Note: The final rcomp code has rollover protection so the final rcomp code + offset will not exceed the min/max range.

17.19.24 PCS_DWORD23 (pcs_dword23)—Offset 5Ch

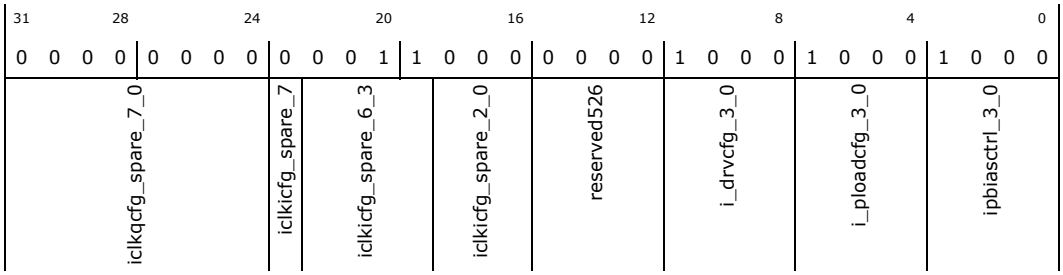
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword23: [Port: 0xA3] + (2400h + 5Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00180888h



Bit Range	Default & Access	Description
31:24	0h RW	**iclkqcfg_spare_7_0:** (Bonus bits for Data Lane Clk Distrubtion block)
23	0h RW	**iclkicfg_spare_7:** Repurposed for IREF backup mode in DL Select bit to enable diode based IREF in DL 0 - functional mode, use IREFGEN loop output 1 - bypass IREF loop, use diode connected PMOS output Ensure IREF loop amp is enabled by forcing reg_ivrefen and ivrefen_ovrd to 1
22:19	3h RW	**iclkicfg_spare_6_3:** TX MUX tail current strength setting
18:16	0h RW	**iclkicfg_spare_2_0:** CLK Distribution Monitor MUX Select

17.19.25 PCS_DWORD24 (pcs_dword24)—Offset 60h

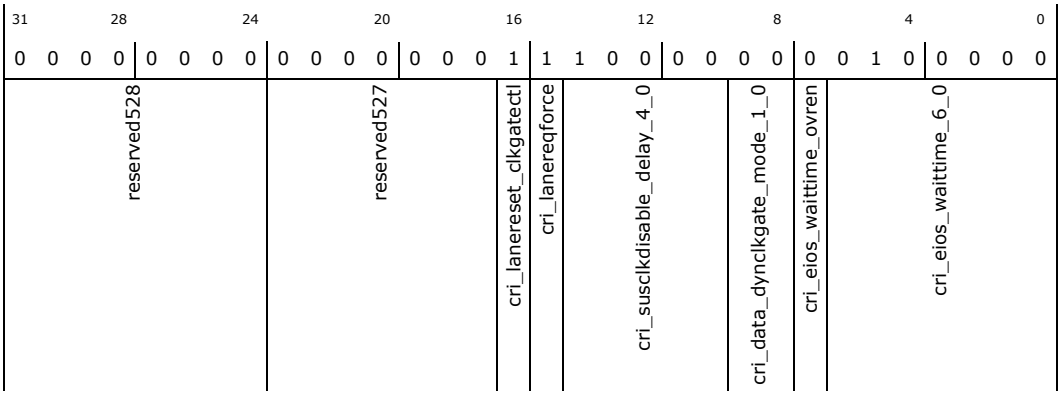
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword24: [Port: 0xA3] + (2400h + 60h)

Op Codes:
0h - Read, 1h - Write

Default: 0001C020h



Bit Range	Default & Access	Description
31:24	0h RW	**reserved528:** reserved
23:17	0h RW	**reserved527:** reserved

Bit Range	Default & Access	Description
16	1h RW	**cri_lanereset_clkgatectl:** 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	**cri_lanereqforce:** Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	**cri_susclkdisable_delay_4_0:** This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay ..... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	**cri_data_dynclkgate_mode_1_0:** Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	**cri_eios_waittime_ovren:** EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]
6:0	20h RW	**cri_eios_waittime_6_0:** EIOS Wait Time for Rx Turn OFF Represents override value timer in PCS that comes into play during EIOS based turn off Rx (Rx L0s) 0000000 - Timer is bypassed 0000001 - 1 PLL link clock period delay (2ns) 0000010 - 2 PLL link clock period delay (4ns) ... 0100000 - 32 PLL link clock periods delay (64ns) - default

17.20.3 TX_DWORD2 (tx_dword2)—Offset 8h

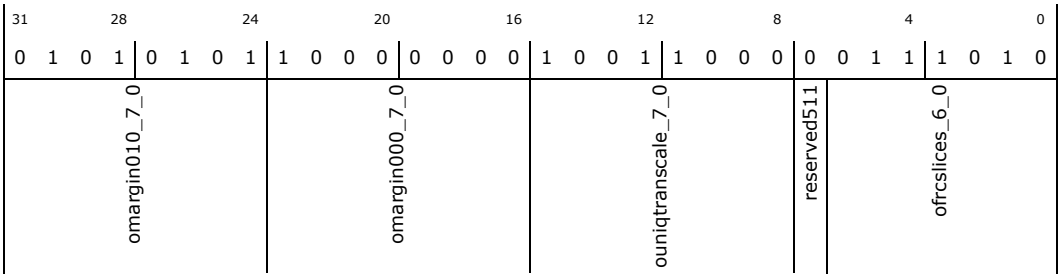
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword2: [Port: 0xA3] + (2480h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 5580983Ah



Bit Range	Default & Access	Description
31:24	55h RW	**omargin010_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~2/3Vp2p
23:16	80h RW	**omargin000_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p. To be used in Gen2 mode (Gen1/Gen2 depend on dataratefit and downscaleamp register)
15:8	98h RW	**ouniqtranscale_7_0:** scales the number of slices defined the ref circuit (or R-comp circuit) by factor of ouniqtranscale[7:0]/128 The scaled amount of slices might be used in the full-swing Uis according to ouniqetrangenmethod[1:0] The scaled amount of slices might be used in the full-swing Uis according to oscaledcompmethod[1:0]
7	0h RO	**reserved511:** reserved
6:0	3Ah RW	**ofrcslices_6_0:** number of used slices if forced Used in compensated GPIO mode

17.20.4 TX_DWORD3 (tx_dword3)—Offset Ch

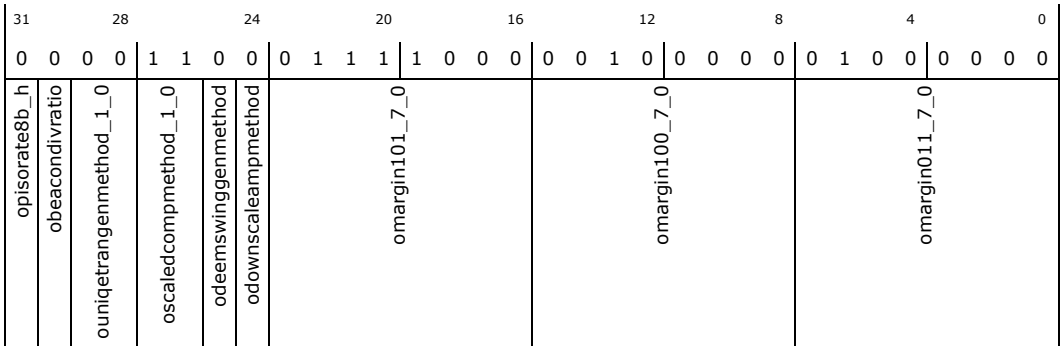
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword3: [Port: 0xA3] + (2480h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0C782040h



Bit Range	Default & Access	Description
31	0h RW	**opisorate8b_h:** if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	**obeacondivratio:** Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	**ouniqetrangenmethod_1_0:** Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	**oscaledcompmethod_1_0:** Used to define if we use scaling of the compansation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	**odeemswinggenmethod:** Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	**odownscaleampmethod:** when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	**omargin101_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	**omargin100_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p
7:0	40h RW	**omargin011_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

17.20.5 TX_DWORD4 (tx_dword4)—Offset 10h

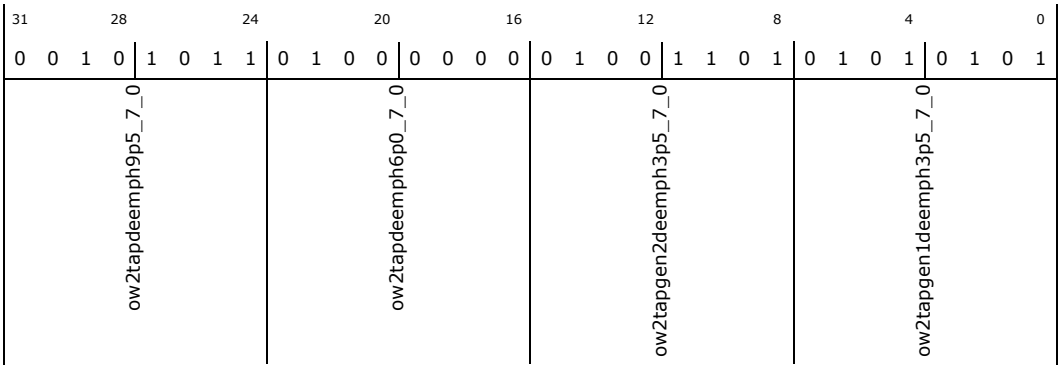
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword4: [Port: 0xA3] + (2480h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 2B404D55h



Bit Range	Default & Access	Description
31:24	2Bh RW	**ow2tapdeemph9p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 9.5dB deemphais
23:16	40h RW	**ow2tapdeemph6p0_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 6.0dB deemphais
15:8	4Dh RW	**ow2tapgen2deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais
7:0	55h RW	**ow2tapgen1deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais

17.20.6 TX_DWORD5 (tx_dword5)—Offset 14h

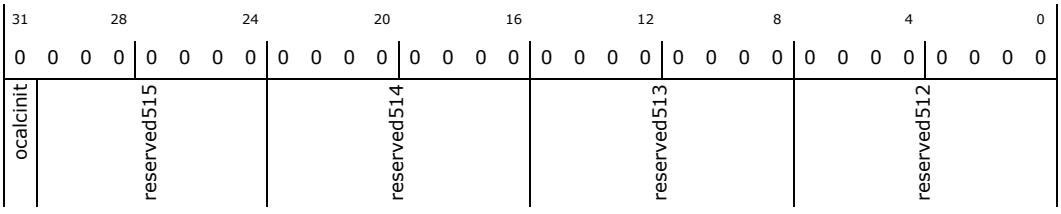
Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword5: [Port: 0xA3] + (2480h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**ocalcinit:** initiate calculation of swing-cotrol circuit. rewrite to '0' and '1' to reinitiate the calculation

Bit Range	Default & Access	Description
30:24	0h RO	**reserved515:** reserved
23:16	0h RO	**reserved514:** reserved
15:8	0h RO	**reserved513:** reserved
7:0	0h RO	**reserved512:** reserved

17.20.7 TX_DWORD6 (tx_dword6)—Offset 18h

Access Method

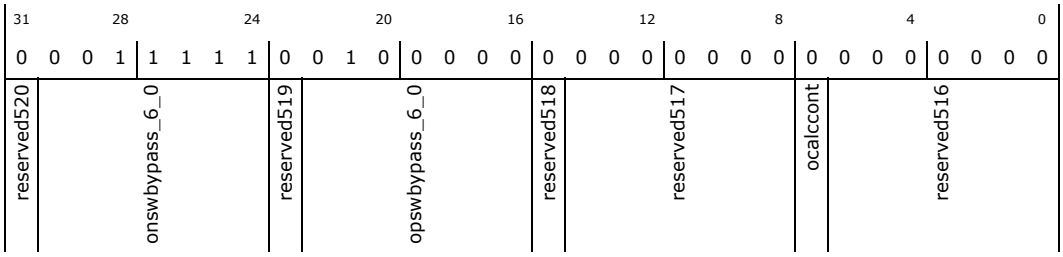
Type: Message Bus Register (Size: 32 bits)

tx_dword6: [Port: 0xA3] + (2480h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: 1F200000h



Bit Range	Default & Access	Description
31	0h RO	**reserved520:** reserved
30:24	1Fh RW	**onswbypass_6_0:** Determines # of slices activated in N-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) same slices canot be opend for P-drv and for N-drv. Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted. In these DFT modes pswpass can be set to the same value as nswbypass
23	0h RO	**reserved519:** reserved
22:16	20h RW	**opswbypass_6_0:** Determines # of slices activated in P-drv when in strong pulling to CM (after Rx-dtct/ gohighz / stongPD) Determines # of slices for P-drv in All1/All0 DFTs when bypbycomp is not asserted.
15	0h RO	**reserved518:** reserved
14:8	0h RO	**reserved517:** reserved
7	0h RW	**ocalccont:** initiate calculation of swing-cotrol circuit. While this signal is '1' the calculation is beeing done consecutively
6:0	0h RO	**reserved516:** reserved

17.20.8 TX_DWORD7 (tx_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register (Size: 32 bits)

tx_dword7: [Port: 0xA3] + (2480h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0038383Fh

6:0	X RO	**ir1main0_6_0:** The slices used in R1 for FS (sub-FS in 3tap FIR) (PstC=Y,C=Y,PreC=X)

17.20.15 TX_DWORD14 (tx_dword14)—Offset 38h

Access Method

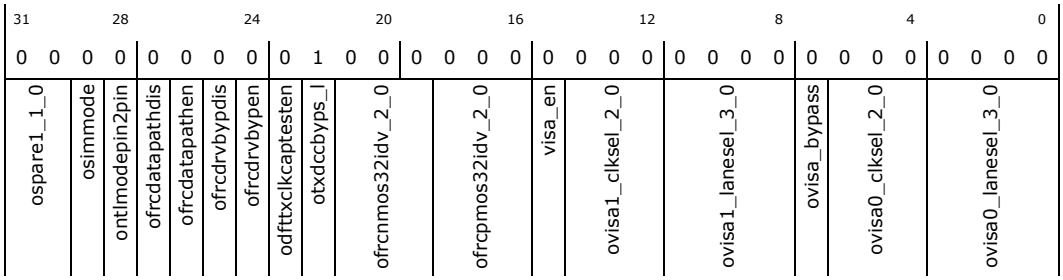
Type: Message Bus Register (Size: 32 bits)

tx_dword14: [Port: 0xA3] + (2480h + 38h)

Op Codes:

0h - Read, 1h - Write

Default: 00400000h



Bit Range	Default & Access	Description
31:30	0h RW	**ospare1_1_0:** reserved
29	0h RW	**osimmode:** Counter threshold of receive-detect, NTL, strong-common-mode is shortened dramatically for fast simulation porpuses. (does not impose risk to circuitly but electrical spec will not met)
28	0h RW	**ontlmodepin2pin:** 0 - NTL procedure will be done per pad while both pads are pulled to the same rail. 1 - NTL procedure will be done per pad while the pads are pulled to opposite rails.
27	0h RW	**ofrcdatapathdis:** DFT feature to optionaly be used with other registers

Bit Range	Default & Access	Description
26	0h RW	**ofrcdatapathen:** DFT feature to optionaly be used with other registers
25	0h RW	**ofrcdrvbypdis:** DFT feature to optionaly be used with other registers
24	0h RW	**ofrcdrvbypen:** DFT feature to optionaly be used with other registers
23	0h RW	**odfttxclkcaptesten:** Enables the finger capacitor quality check in the DCC block in Tx-clock block. The test is for shorts between the capacitor terminals.
22	1h RW	**otxdccbyps_l:** Tx DCC Bypass Override Puts DCC (duty cycle correction) circuit in bypass mode 0 - clock's duty cycle is not fixed
21:19	0h RW	**ofrcnmos32idv_2_0:** change the value iabut_idvpmos32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
18:16	0h RW	**ofrcpmos32idv_2_0:** change the value iabut_idvpmos32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
15	0h RW	**visa_en:** VISA Enable for the Tx VISA logic
14:12	0h RW	**ovisa1_clksel_2_0:** VISA Clock Select for Lane1. Selects the source synchronous clock to be used for data being sent on lane1.
11:8	0h RW	**ovisa1_lanesel_3_0:** VISA Lane Select for Lane1. Selects the byte of data to be sent out on lane1.
7	0h RW	**ovisa_bypass:** VISA Bypass. Allows for signals to be passed asynchronously through VISA block. Applies to both lane0 and lane1. 0 : Flop signals in local VISA block (default) 1 : Bypass flops in local VISA block
6:4	0h RW	**ovisa0_clksel_2_0:** VISA Clock Select for Lane0. Selects the source synchronous clock to be used for data being sent on lane0.
3:0	0h RW	**ovisa0_lanesel_3_0:** VISA Lane Select for Lane0. Selects data byte to be driven out of VISA-0 byte. Can be either clocked or unclocked data

17.20.16 TX_DWORD15 (tx_dword15)—Offset 3Ch

Access Method

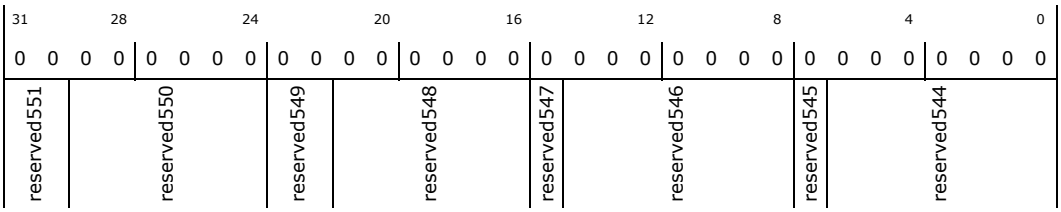
Type: Message Bus Register (Size: 32 bits)

tx_dword15: [Port: 0xA3] + (2480h + 3Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RO	**reserved551:** reserved
29:24	0h RO	**reserved550:** The slices used in R2 for DE (PstC=X,C=Y,PreC=Y)
23:22	0h RO	**reserved549:** reserved
21:16	0h RO	**reserved548:** The slices used in R2 for FS (PstC=X,C=Y,PreC=X)
15	0h RO	**reserved547:** reserved
14:8	0h RO	**reserved546:** The slices used in R1 for DE (PstC=X,C=Y,PreC=Y)
7	0h RO	**reserved545:** reserved
6:0	0h RO	**reserved544:** The slices used in R1 for FS (PstC=X,C=Y,PreC=X)

17.20.17 TX_DWORD16 (tx_dword16)—Offset 40h

Access Method

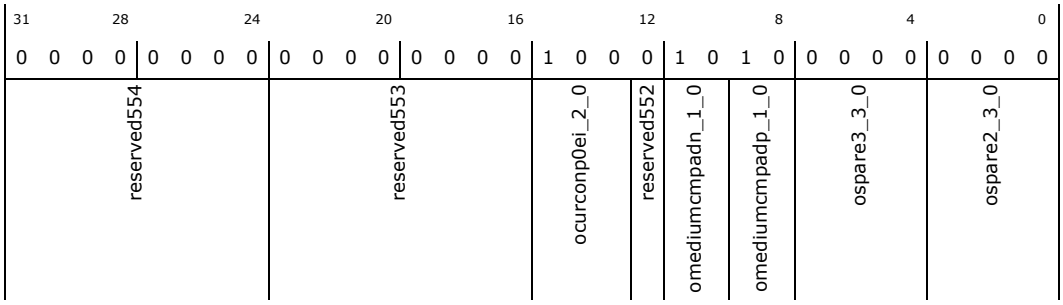
Type: Message Bus Register (Size: 32 bits)

tx_dword16: [Port: 0xA3] + (2480h + 40h)

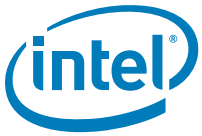
Op Codes:

0h - Read, 1h - Write

Default: 00008A00h



Bit Range	Default & Access	Description
31:24	0h RO	**reserved554:** reserved
23:16	0h RO	**reserved553:** reserved
15:13	4h RW	**ocurconp0ei_2_0:** current consumed (typically) 00X - 0.0mA - not active 01X - 0.9mA 10X - 1.8mA 11X - 2.7mA
12	0h RO	**reserved552:** reserved



Bit Range	Default & Access	Description
11:10	2h RW	**omediumcmpadn_1_0:** During P0-EI pad-N will be on medium strength CM and will cause the following current consumption: 00 - 0.00mA (disable) 01 - 2.45mA 10 - 4.87mA 11 -9.73mA
9:8	2h RW	**omediumcmpadp_1_0:** During P0-EI pad-P will be on medium strength CM and will cause the following current consumption: 00 - 0.00mA (disable) 01 - 2.45mA 10 - 4.87mA 11 - 9.73mA
7:4	0h RW	**ospare3_3_0:** 4 spare CRI register bits
3:0	0h RW	**ospare2_3_0:** 4 spare CRI register bits

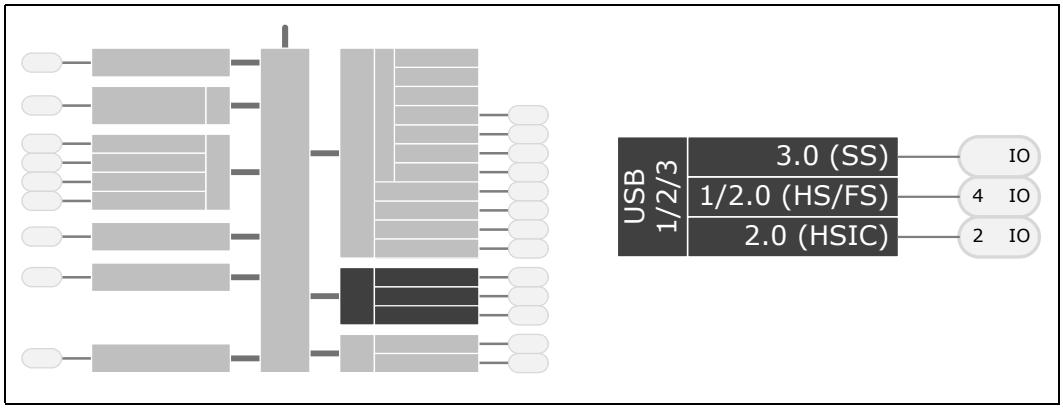
18 USB Host Controller Interfaces (xHCI, EHCI)

The USB Host Controllers (xHCI, EHCI) supports:

- One (1) Super Speed (SS) port on xHCI
- Four (4) Full Speed (FS)/High Speed (HS) ports on xHCI or EHCI
- Two (2) High Speed (HS) High Speed Inter-Chip (HSIC) ports on xHCI

Note: The SS port must share a FS/HS port to have a full SS connector leaving three FS/HS ports available.

Note: Only one host controller (xHCI or ECHI) can be used. To enable HSIC and SS ports, xHCI must be used.



18.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

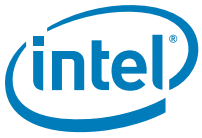


Table 198. USB 3 SS Signals

Signal Name	Direction Plat Power	Description
USB3_TXP/N[0]	O V1P0A	**Data Out:** High speed serialized data outputs. Used for debug mode in xHCI operation.
USB3_RXP/N[0]	I V1P0A	**Data In:** High speed serialized data inputs. Used for debug mode in xHCI operation.
USB3_REXT[0]	I	**Resistor Compensation:** An external resistor must be connected between this pin and package ground. Please contact your Intel representative for details.

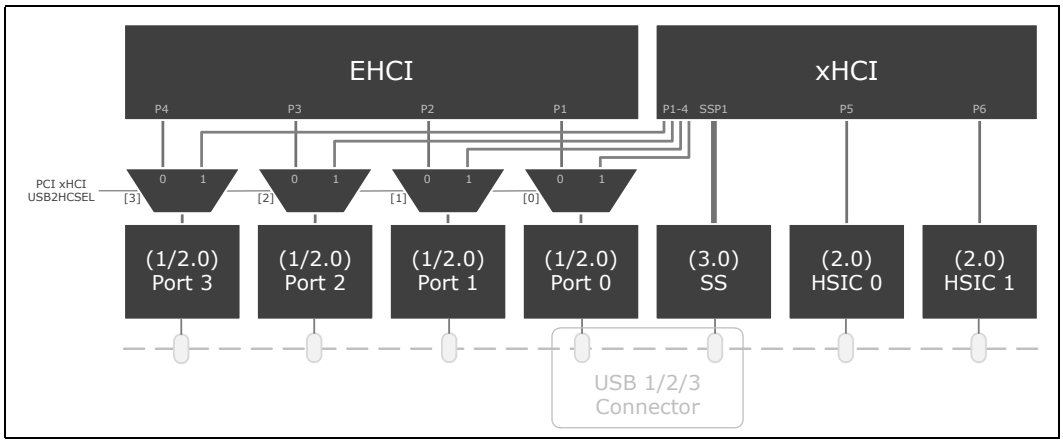
Table 199. USB 2 FS/HS Signals

Signal Name	Direction Plat. Power	Description
USB_DP/N[0:3]	I/O VUSB2	**USB Data:** High speed serialized data I/O. **Note:** USB_DP/N[1] used for debug mode in EHCI operation only. SS port must be implemented to have debug mode during xHCI operation.
USB_OC[0:1]#	I V1P8A	**Over-Current Protection:** Over-current notification for all USB ports (SS/FS/HS).
USB_RCOMPI	I	**Resistor Compensation:** An external resistor must be connected. Please contact your Intel representative for details.
USB_RCOMPO	O	**Resistor Compensation:** An external resistor must be connected. Please contact your Intel representative for details.

Table 200. USB 2 HSIC Signals

Signal Name	Direction Plat. Power	Description
USB_HSIC[0:1]_DATA	I/O V1P24A	**HSIC Data:** High speed serialized data.
USB_HSIC[0:1]_STROBE	I/O V1P24A	**HSIC Strobe:** Strobe reference for data.
USB_HSIC_RCOMP	I	**Resistor Compensation:** An external resistor must be connected. Please contact your Intel representative for details.

Figure 106.xHCI and EHCI Port Mapping



18.2 USB 3.0 xHCI (Extensible Host Controller Interface)

The xHCI compliant host controller can control up to 7 USB host ports. It supports devices conforming to USB 1.x to 3.0 at bit rates up to 5 Gbps.

18.2.1 Features of USB 3.0 Host

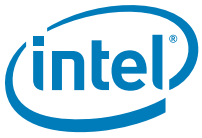
The USB 3.0 Super Speed data interface is a four wire differential (TX and RX pairs) interface that supports simultaneous bi-directional data transmission. The interface supports a bit rate of 5 Gbps with a maximum theoretical data throughput over 3.2 Gbps due to 8b/10b symbol encoding scheme and protocol overhead (link flow control, packet framing and protocol overhead).

Low Frequency Periodic signaling (LFPS) is used to communicate initialization, training and power management information across a link that is in low power link state without using Super Speed signaling. This reduces power consumption.

The USB3.0 port may be paired with any USB2 port at the connector – selection of any USB2 port other than port 0 will require the appropriate mapping.Figure 106 shows the USB3 port paired with USB2 port.

USB3.0 Controller Features

- Supported by xHCI software host controller interface
- USB3 port disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 3.0 LPM (U0, U1, U2, and U3) and also a SS Disabled low power state
- Support for USB3 Debug Device



Note: Recommended not to disconnect the connection when a debug session is in progress.

18.2.2 Features of USB HSIC

HSIC is a 2-signal (strobe and data) source synchronous serial interface for on board inter-chip USB communication. The interface uses 240 MHz DDR signaling to provide High-Speed 480 Mb/s USB transfers which are 100% host driver compatible with traditional USB cable connected topologies. Full Speed (FS) and Low Speed (LS) USB transfers are not directly supported by the HSIC interface.

For details of HSIC applications supported, please contact local Intel Sales office.

Major feature and performance highlights are as follows:

- Supported by xHCI software host controller interface
- High-Speed 480 Mb/s data rate only
- Source-synchronous serial interface
- Interface Power is only consumed when a transfer is in progress
- No hot plug removal/attach at HSIC pins
- Signals driven at 1.2V standard LVCMOS levels
- Designed for low power applications
- Support for two host ports compliant to High Speed Inter-Chip Supplement (HSIC) to the USB 2.0 Specification. (USB 2.0)

18.3 USB 2.0 Enhanced Host Controller Interface (EHCI)

The EHCI compliant host controller supports up to 4 USB 2.0 ports in legacy mode. USB 2.0 allows data transfers up to 480 Mbps. The controller integrates a Root Matching Hub (RMH) to support USB 1.1 devices.

Note: The EHCI is not used when the xHCI is used. The EHCI is primarily present for legacy usage, in cases when xHCI support is not available.

Note: Intel recommends using the xHCI controller for the USB2.0 ports irrespective of whether USB3.0 ports are implemented. The EHCI controller is provided for legacy OS/ driver compatibility which is generally not required for tablet platforms. Using the xHCI controller will deliver significant power and performance benefits.

When following this recommendation on a platform with no USB3.0 support, the Windows logo requirement of USB debug port may not be met. Please consult with Intel regarding the impact of this.

Note: Unlike the xHCI, bandwidth of all four ports on the EHCI is shared across a single HS (480 Mbps) internal link.

18.3.1 Features of EHCI USB 2.0 Controller

The EHCI USB2.0 Controller supports the following features:

- Compliant with the specification for: USB 1.x, 2.0 (1.5 Mbps, 12 Mbps, 480 Mbps).
- 4 Ports shared with xHCI controller
- Enhanced EHCI descriptor caching
- All ports provided through USB Rate Matching Hubs (RMH) to support FS/LS devices
- Supports one Debug port at USB2 transfer rates
- Supports of USB suspend mode including PLL turn off in S0/S0ix.
- Supports wakeup from suspend states S5 and remote-suspend wakeup
- All USB2 ports provide support for HS/FS/LS devices
- Per port USB disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 2.0 LPM (L0, L1 and L2 low power states)

18.6.1 Vendor ID (VID)—Offset 0h

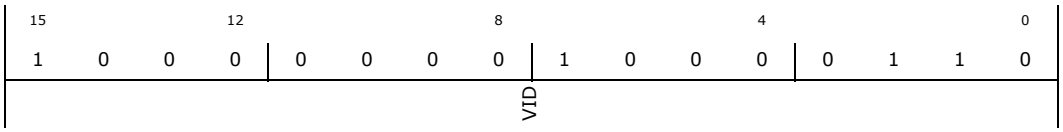
Access Method

Type: PCI Configuration Register (Size: 16 bits)

VID: [B:0, D:20, F:0] + 0h

Power Well: Core

Default: 8086h



Bit Range	Default & Access	Description
15:0	8086h RO	**Vendor ID (VID):** Reserved.

18.6.2 Device ID (DID)—Offset 2h

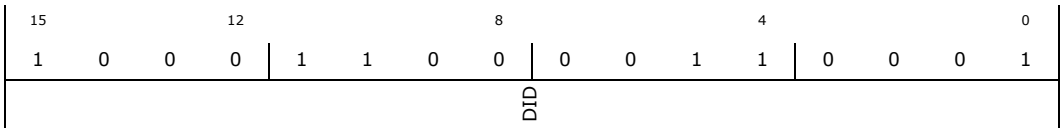
Access Method

Type: PCI Configuration Register (Size: 16 bits)

DID: [B:0, D:20, F:0] + 2h

Power Well: Core

Default: 8C31h



Bit Range	Default & Access	Description
15:0	8C31h RO/V	**Device ID (DID):** See Global Device ID table in Chap. 6 for value

18.6.3 Command (CMD)—Offset 4h

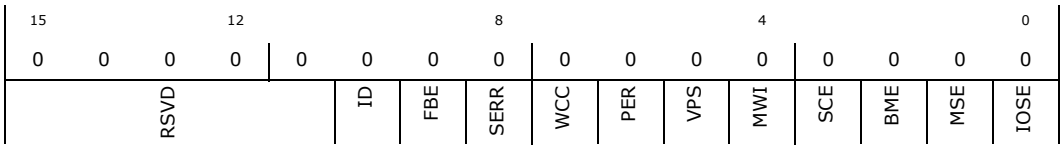
Access Method

Type: PCI Configuration Register (Size: 16 bits)

CMD: [B:0, D:20, F:0] + 4h

Power Well: Core

Default: 0000h



Bit Range	Default & Access	Description
15:11	00h RO	**Reserved (RSVD):** Reserved.
10	0b RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0b RO	**Fast Back to Back Enable (FBE):** Reserved.
8	0b RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling.
7	0b RO	**Wait Cycle Control (WCC):** Reserved.
6	0b RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0b RO	**VGA Palette Snoop (VPS):** Reserved.
4	0b RO	**Memory Write Invalidate (MWI):** Reserved.

Bit Range	Default & Access	Description
3	0b RO	**Special Cycle Enable (SCE):** Reserved.
2	0b RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0b RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0b RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

18.6.4 Device Status (STS)—Offset 6h

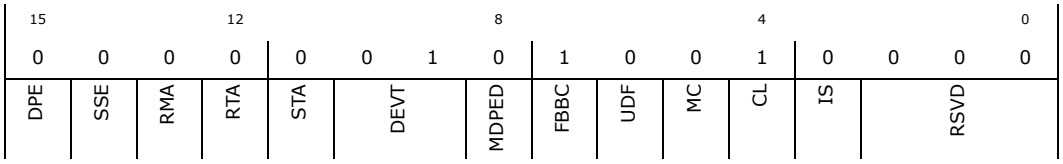
Access Method

Type: PCI Configuration Register (Size: 16 bits)

STS: [B:0, D:20, F:0] + 6h

Power Well: Core

Default: 0290h



Bit Range	Default & Access	Description
15	0b RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0b RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location.
13	0b RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0b RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0b RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	01b RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0b RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1b RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.

Bit Range	Default & Access	Description
6	0b RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0b RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1b RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0b RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	000b RO	**Reserved (RSVD):** Reserved.

18.6.5 Revision ID (RID)—Offset 8h

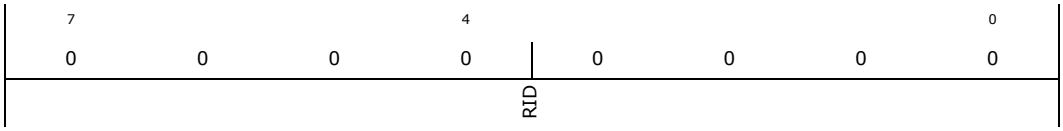
Access Method

Type: PCI Configuration Register (Size: 8 bits)

RID: [B:0, D:20, F:0] + 8h

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO/V	**Revision ID (RID):** See Chap 6 for value.

18.6.6 Programming Interface (PI)—Offset 9h

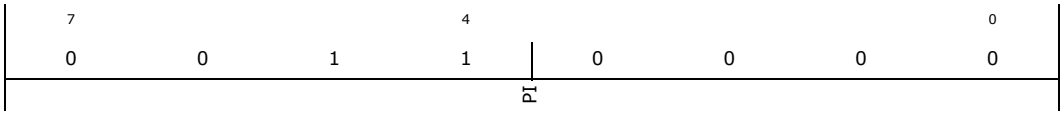
Access Method

Type: PCI Configuration Register (Size: 8 bits)

PI: [B:0, D:20, F:0] + 9h

Power Well: Core

Default: 30h



Bit Range	Default & Access	Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

18.6.7 Sub Class Code (SCC)—Offset Ah

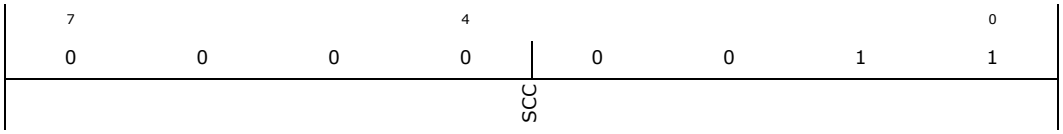
Access Method

Type: PCI Configuration Register (Size: 8 bits)

SCC: [B:0, D:20, F:0] + Ah

Power Well: Core

Default: 03h



Bit Range	Default & Access	Description
7:0	03h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

18.6.8 Base Class Code (BCC)—Offset Bh

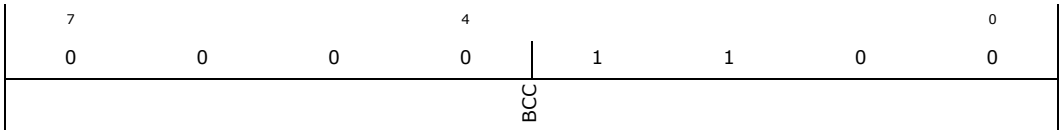
Access Method

Type: PCI Configuration Register (Size: 8 bits)

BCC: [B:0, D:20, F:0] + Bh

Power Well: Core

Default: 0Ch



Bit Range	Default & Access	Description
7:0	0Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

18.6.9 Master Latency Timer (MLT)—Offset Dh

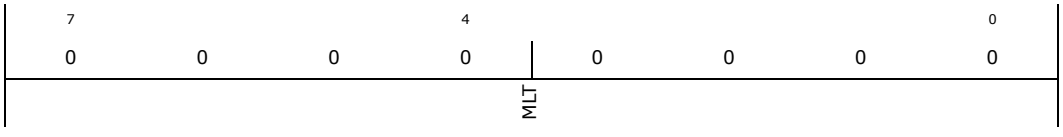
Access Method

Type: PCI Configuration Register (Size: 8 bits)

MLT: [B:0, D:20, F:0] + Dh

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

18.6.10 Header Type (HT)—Offset Eh

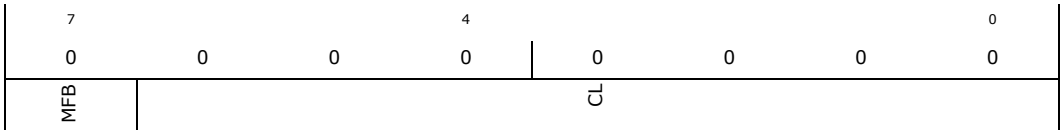
Access Method

Type: PCI Configuration Register (Size: 8 bits)

HT: [B:0, D:20, F:0] + Eh

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7	0b RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	00h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

18.6.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

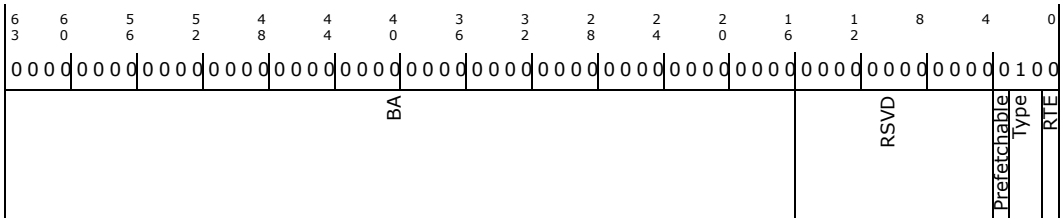
Access Method

Type: PCI Configuration Register (Size: 64 bits)

MBAR: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0000000000000004h



Bit Range	Default & Access	Description
63:16	0000000000000h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	000h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.

Bit Range	Default & Access	Description
3	0b RO	**Prefetchable:** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	10b RO	**Type:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0b RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

18.6.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

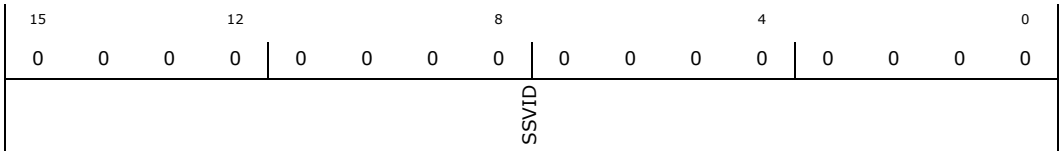
Access Method

Type: PCI Configuration Register (Size: 16 bits)

SSVID: [B:0, D:20, F:0] + 2Ch

Power Well: Core

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. NOT for EDS:Writes to this register are controlled by the Access Control bit (ACCTRL).

18.6.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

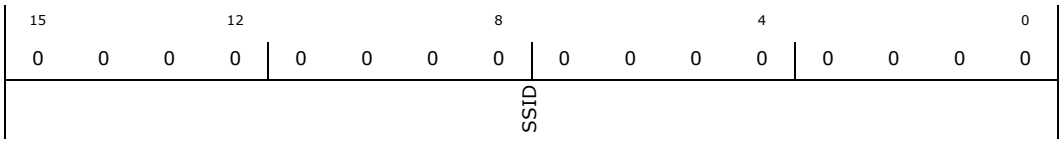
Access Method

Type: PCI Configuration Register (Size: 16 bits)

SSID: [B:0, D:20, F:0] + 2Eh

Power Well: Core

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). NOT for EDS: Writes to this register are controlled by the Access Control bit (ACCTRL).

18.6.14 Capabilities Pointer (CAP_PTR)—Offset 34h

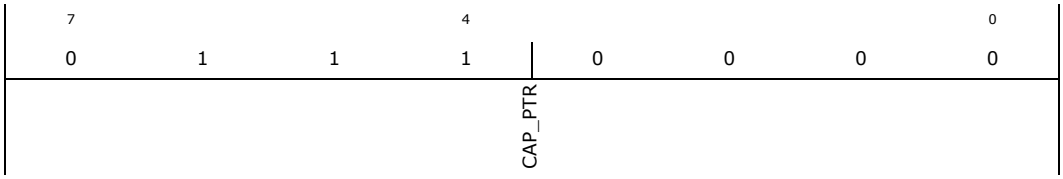
Access Method

Type: PCI Configuration Register (Size: 8 bits)

CAP_PTR: [B:0, D:20, F:0] + 34h

Power Well: Core

Default: 70h



Bit Range	Default & Access	Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

18.6.15 Interrupt Line (ILINE)—Offset 3Ch

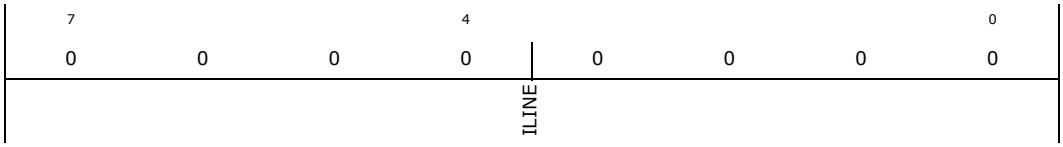
Access Method

Type: PCI Configuration Register (Size: 8 bits)

ILINE: [B:0, D:20, F:0] + 3Ch

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

18.6.16 Interrupt Pin (IPIN)—Offset 3Dh

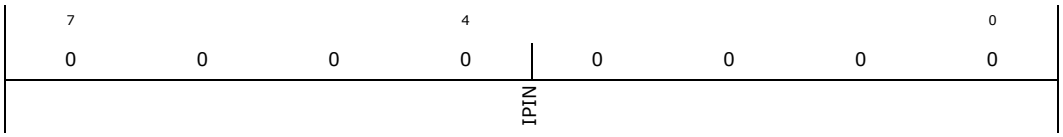
Access Method

Type: PCI Configuration Register (Size: 8 bits)

IPIN: [B:0, D:20, F:0] + 3Dh

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO/V	**Interrupt pin (IPIN):** Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. See Chap 6 for value.

18.6.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

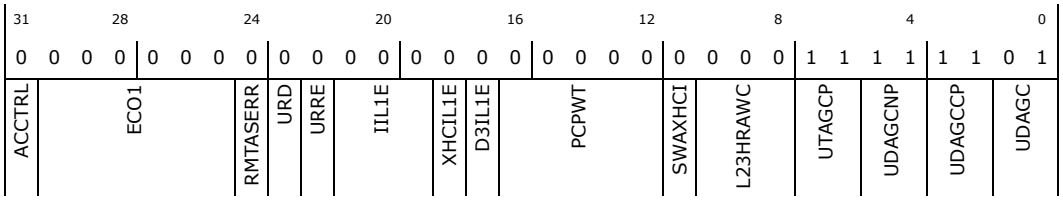
Access Method

Type: PCI Configuration Register (Size: 32 bits)

XHCC1: [B:0, D:20, F:0] + 40h

Power Well: Core

Default: 000000FDh



Bit Range	Default & Access	Description
31	0b RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	00h RW	**ECO1:** ECO bits are used during silicon bringup for FIBing. NOT for EDS
24	0b RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0b RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0b RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	000b RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk

Bit Range	Default & Access	Description
18	0b RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled.
17	0b RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set.
16:12	00h RW	**Periodic Complete Pre Wake Time (PCPWT):** signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	000b RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	11b RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	11b RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	11b RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	01b RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

18.6.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

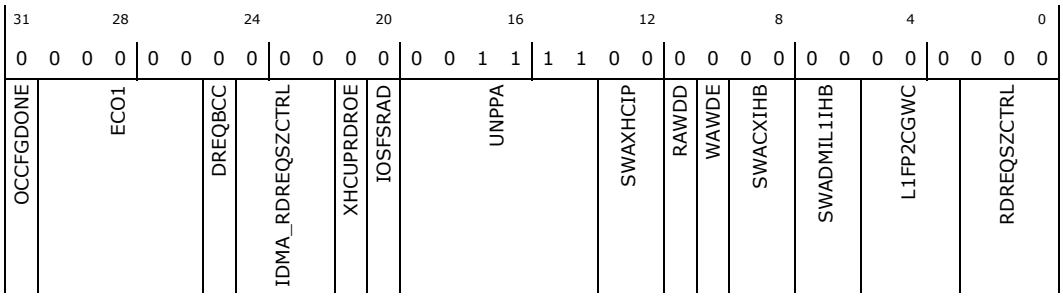
Access Method

Type: PCI Configuration Register (Size: 32 bits)

XHCC2: [B:0, D:20, F:0] + 44h

Power Well: SUS

Default: 0003C000h



Bit Range	Default & Access	Description
31	0b RW/O	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	00h RW	**ECO1:** NOT for EDS ECO bits are used during silicon bringup for FIBing.
25	0b RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0b RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0b RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	0Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	00b RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk

18.6.19 Clock Gating (XHCLKGTEN)—Offset 50h

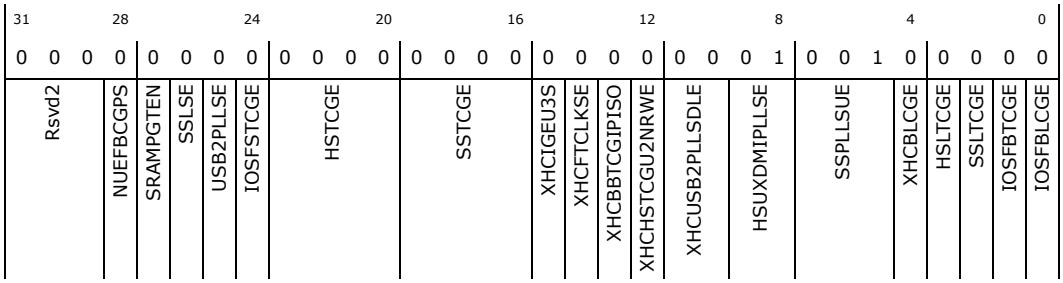
Access Method

Type: PCI Configuration Register (Size: 32 bits)

XHCLKGTEN: [B:0, D:20, F:0] + 50h

Power Well: Core

Default: 00000120h



Bit Range	Default & Access	Description
31:29	0h RO	**Rsvd2:** Reserved
28	0b RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0b RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.

Bit Range	Default & Access	Description
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	01b RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	001b RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0b RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0b RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
2	0b RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0b RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0b RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

18.6.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

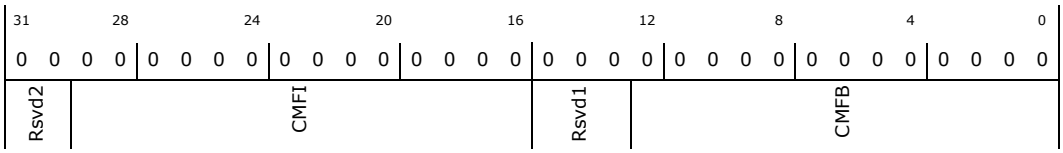
Access Method

Type: PCI Configuration Register (Size: 32 bits)

AUDSYNC: [B:0, D:20, F:0] + 58h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RO	**Rsvd2:** Reserved.
29:16	0000h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1:** Reserved.
12:0	0000h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

18.6.21 Serial Bus Release Number (SBRN)—Offset 60h

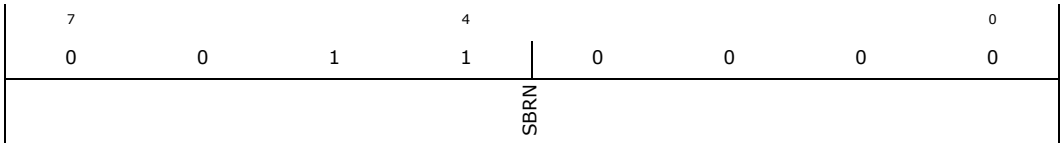
Access Method

Type: PCI Configuration Register (Size: 8 bits)

SBRN: [B:0, D:20, F:0] + 60h

Power Well: SUS

Default: 30h



Bit Range	Default & Access	Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

18.6.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register

should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

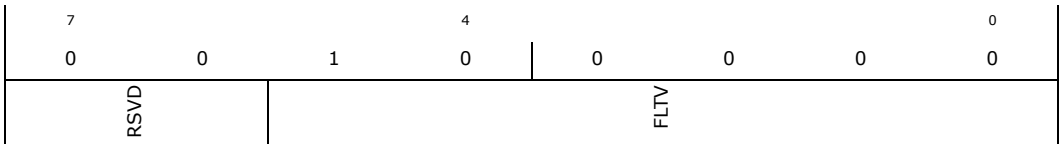
Access Method

Type: PCI Configuration Register (Size: 8 bits)

FLADJ: [B:0, D:20, F:0] + 61h

Power Well: SUS

Default: 20h



Bit Range	Default & Access	Description
7:6	00b RO	**Reserved (RSVD):** .
5:0	20h RW	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

18.6.23 Best Effort Service Latency (BESL)—Offset 62h

Bset Effort Service Latency.

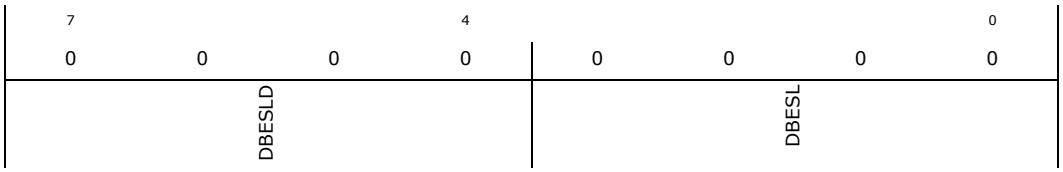
Access Method

Type: PCI Configuration Register (Size: 8 bits)

BESL: [B:0, D:20, F:0] + 62h

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

18.6.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

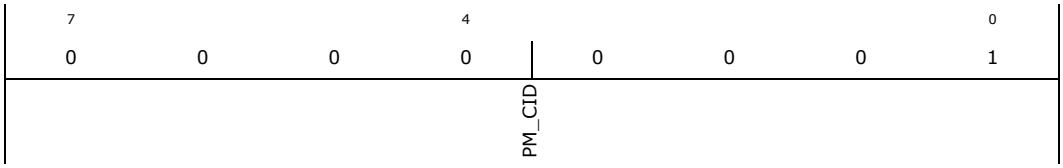
Access Method

Type: PCI Configuration Register (Size: 8 bits)

PM_CID: [B:0, D:20, F:0] + 70h

Power Well: Core

Default: 01h



Bit Range	Default & Access	Description
7:0	01h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

18.6.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

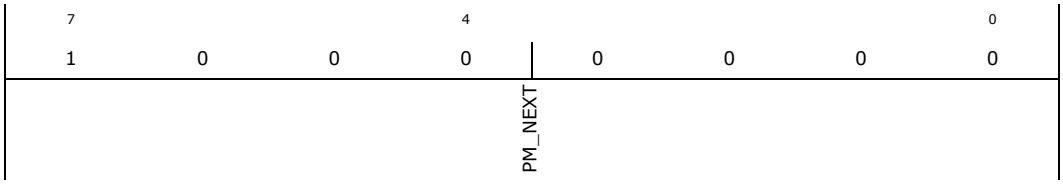
Access Method

Type: PCI Configuration Register (Size: 8 bits)

PM_NEXT: [B:0, D:20, F:0] + 71h

Power Well: Core

Default: 80h



Bit Range	Default & Access	Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

18.6.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

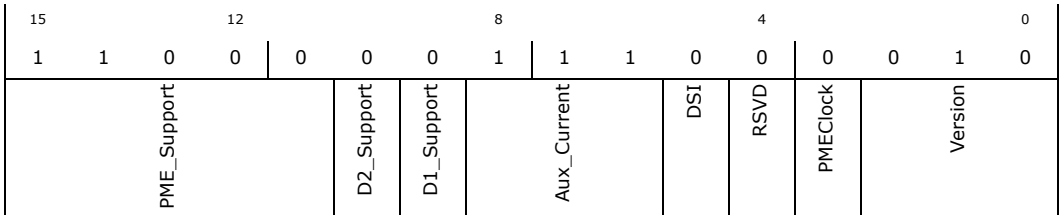
Access Method

Type: PCI Configuration Register (Size: 16 bits)

PM_CAP: [B:0, D:20, F:0] + 72h

Power Well: Core

Default: C1C2h



Bit Range	Default & Access	Description
15:11	11000b RW/L	**PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field. NOT for EDS: However, the ability to change this field may prove useful for some systems.
10	0b RW/L	**D2_Support:** The D2 state is not supported.
9	0b RW/L	**D1_Support:** The D1 state is not supported.
8:6	111b RW/L	**Aux_Current:** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0b RW/L	**DSI:** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0b RO	**Reserved (RSVD):** Reserved.
3	0b RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	010b RW/L	**Version:** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

18.6.27 Power Management Control/Status (PM_CS)—Offset 74h

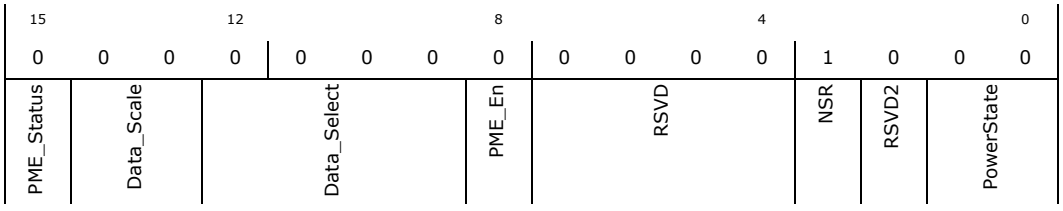
Access Method

Type: PCI Configuration Register (Size: 16 bits)

PM_CS: [B:0, D:20, F:0] + 74h

Power Well: SUS

Default: 0008h



Bit Range	Default & Access	Description
15	0b RW/1C	**PME_Status:** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	00b RO	**Data_Scale:** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select:** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0b RW	**PME_En:** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD):** Reserved.
3	1b RO	**No Soft Reset (NSR):**), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0b RO	**Reserved (RSVD2):** Reserved.
1:0	00b RW	**PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

18.6.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

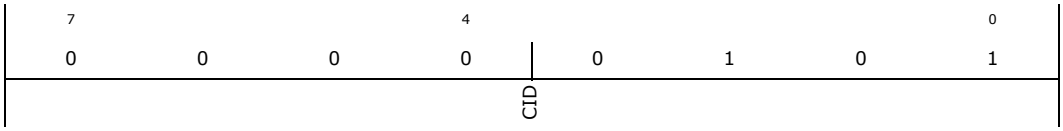
Access Method

Type: PCI Configuration Register (Size: 8 bits)

MSI_CID: [B:0, D:20, F:0] + 80h

Power Well: Core

Default: 05h



Bit Range	Default & Access	Description
7:0	05h RO	**Capability ID (CID):** Indicates that this is an MSI capability

18.6.29 Next item pointer (MSI_NEXT)—Offset 81h

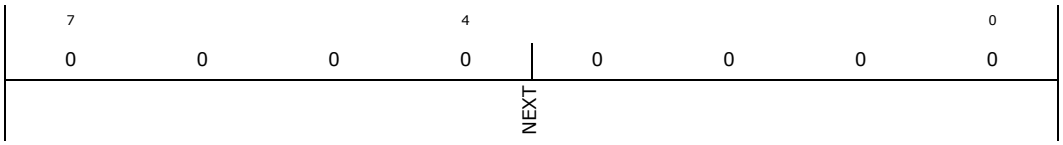
Access Method

Type: PCI Configuration Register (Size: 8 bits)

MSI_NEXT: [B:0, D:20, F:0] + 81h

Power Well: Core

Default: 00h



Bit Range	Default & Access	Description
7:0	00h RO	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

18.6.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

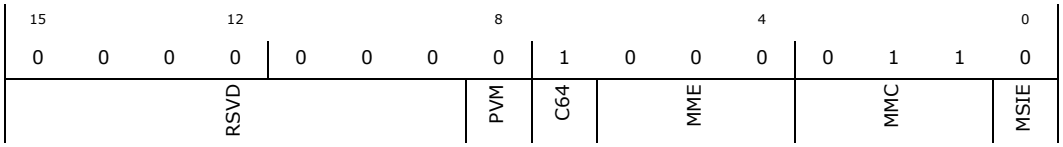
Access Method

Type: PCI Configuration Register (Size: 16 bits)

MSI_MCTL: [B:0, D:20, F:0] + 82h

Power Well: Core

Default: 0086h



Bit Range	Default & Access	Description
15:9	00h RO	**Reserved (RSVD):** Reserved.
8	0b RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1b RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	011b RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0b RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

18.6.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

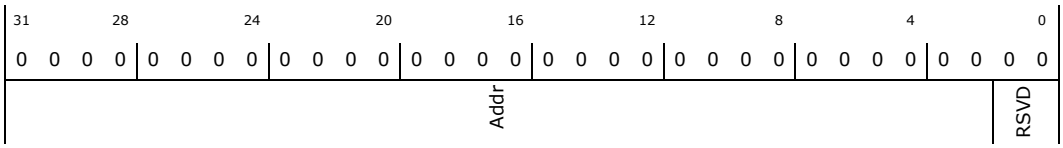
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MSI_MAD: [B:0, D:20, F:0] + 84h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RW	**Addr:** Lower DW of system specified message address, always DWORD aligned
1:0	00b RO	**Reserved (RSVD):** Reserved.

18.6.32 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

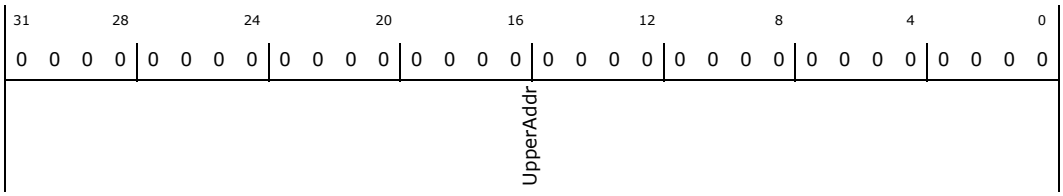
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MSI_MUAD: [B:0, D:20, F:0] + 88h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

18.6.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

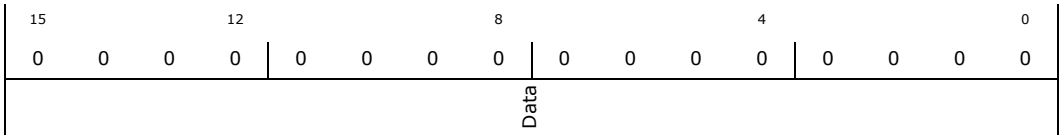
Access Method

Type: PCI Configuration Register (Size: 16 bits)

MSI_MD: [B:0, D:20, F:0] + 8Ch

Power Well: Core

Default: 0000h



Bit Range	Default & Access	Description
15:0	0000h RW	**Data:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

18.6.34 High Speed Configuration 1 (HSCFG1)—Offset A0h

Not for EDS

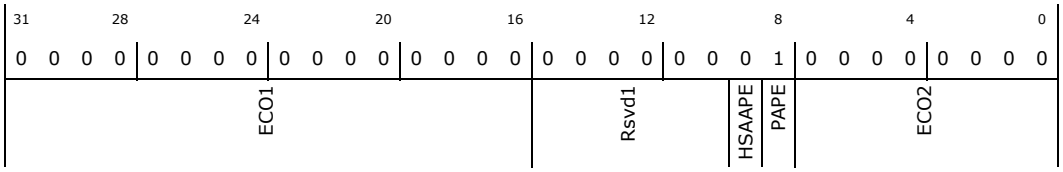
Access Method

Type: PCI Configuration Register (Size: 32 bits)

HSCFG1: [B:0, D:20, F:0] + A0h

Power Well: Core

Default: 00000100h



Bit Range	Default & Access	Description
31:16	0000h RW	**ECO bits Core (ECO1):** ECO bits are used during silicon bringup for FIBing.
15:10	00h RO	**Rsvd1:** Reserved.
9	0h RW	**xHC HS Async Active Propogation Enable (HSAAPE):** This register controls the hs async active exposusre to PMC via the xHC active indication 0 HS Async Active is not propogated to PMC 1 HS Async Active is propogated to PMC
8	1h RW	**xHC Periodic Active Propogation Enable (PAPE):** This register controls the periodic active exposusre to PMC via the xHC active indication 0 Periodic Active is not propogated to PMC 1 Periodic Active is propogated to PMC
7:0	00h RW	**ECO bits SUS (ECO2):** ECO bits are used during silicon bringup for FIBing.

18.6.35 High Speed Configuration 2 (HSCFG2)—Offset A4h

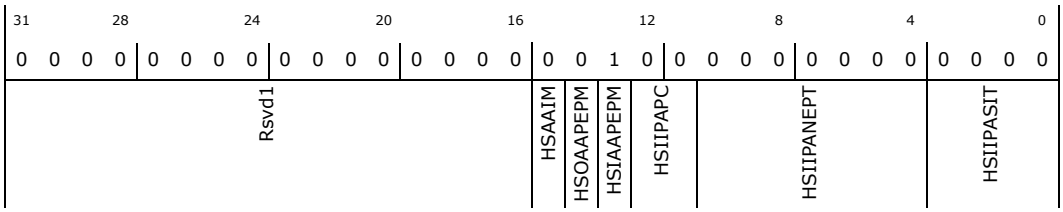
Access Method

Type: PCI Configuration Register (Size: 32 bits)

HSCFG2: [B:0, D:20, F:0] + A4h

Power Well: Core

Default: 00002000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	00h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

18.6.36 Super Speed Configuration 1 (SSCFG1)—Offset B0h

Refer to the switching flows section of this document. Not for EDS

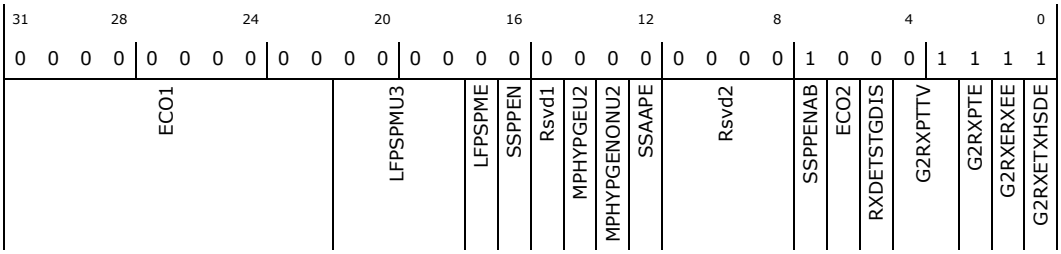
Access Method

Type: PCI Configuration Register (Size: 32 bits)

SSCFG1: [B:0, D:20, F:0] + B0h

Power Well: Core

Default: 0000008Fh



Bit Range	Default & Access	Description
31:22	000h RW	**ECO1:** ECO bits are used during silicon bringup for FIBing.
21:18	0h RW	**LFPS Power Management in U3 Enable (LFPSPMU3):** This field allows xHC to turn off LFPS Receiver when the port is in U3. This allows the Host Controller to save some extra power (about 50W per port) in idle states if device connected on a port is not Resume capable or Resume enabled. This choice has to be done by BIOS and based on platform knowledge. For example, if an in-box device is not Resume Capable, BIOS could allow xHC to turn-off Rx LFPS when the port is in U3. Each bit represents a port. Bit (16) is for USB3.0 Port 0, Bit (17) is for USB3.0 Port 1 and so on. 0 in a bit position: LFPS Receiver shall be kept enabled when the port is in U3. 1 in a bit position: LFPS Receiver shall be disabled when the port is in U3.
17	0b RW	**LFPS Power Management Enable (LFPSPME):** This field provides programmability of LFPS Receiver power management capability when USB3.0 ports are Disabled or in Disconnected state. 0: Do not power manage LFPS receiver. LFPS receivers are enabled in all states. 1: Power manage LFPS receiver. LFPS receivers will be turned off if USB3.0 port is Disabled or Disconnected. Note: Default value is being kept at 0 in case EXI architecture/design takes the path of not doing dynamic Rx LFPS enabling for EXI signature detect and disable LFPS Power Management to keep Rx LFPS buffer on for debug.
16	0b RW	**USB3 SS Port Polling Enable (SSPPEN):** 0: Prevent USB3 Super-speed port to start Polling.LFPS. 1: Allow USB3 Super-speed port to start Polling.LFPS. NOTE: This bit will take effect in allowing/preventing USB3 SS port from starting Polling.LFPS only if SSPPENAB is cleared.
15	0b RO	**Rsvd1:** Reserved.
14	0b RW	**MODPHY Power Gate Enable for U2 (MPHYPGEU2):** This bit controls whether LPT-LPT xHC will allow modPHY power gating or not when a port is in U2 state. Note that this single bit controls all ports of xHC. 0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met.
13	0b RW	**MODPHY Power Gate Enable for non-U2 states (MPHYPGENONU2):** This bit controls whether LPT-LPT xHC will allow modPHY power gating or not when a port is in states other than U2. Note that this single bit controls all ports of xHC. 0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met.
12	0h RW	**xHC SS Async Active Propogation Enable (SSAAPE):** This register controls the ss async active exposusre to PMC via the xHC active indication 0 SS Async Active is not propogated to PMC 1 SS Async Active is propogated to PMC
11:8	0h RO	**Rsvd2:** Reserved
7	1b RW	**USB3 SS Port Polling Enable Active (SSPPENAB):** 0: Allow blocking of USB3 Super-speed port from starting Polling.LFPS. 1: Disallow blocking of USB3 Super-speed port from starting Polling.LFPS (A stepping behavior). NOTE: When this bit is cleared, Polling.LFPS blocking is controlled by SSPPEN bit.

Bit Range	Default & Access	Description
6	0h RW	**ECO2:** ECO bits are used during silicon bringup for FIBing.
5	0h RW	**Receiver Detect Staggering Disable (RXDETSTGDIS):** When set, this regiter bit disables receiver detect staggering between all 6 USB3 lanes Note that the bit is ONLY meant for SW to disable the staggering if desired. Once it is set to disabled, SW is not allowed to re-enable the staggering by clearing the bit.
4:3	1h RW	**Gotorxelecidle Polling Timer Timeout Value (G2RXPTTV):** Timeout value for Gotorxelecidle Polling Timer: 00: 1 to 2 us (Simulation speed up mode only). 01: 19 to 20 us (Default). 10: 23 to 24 us. 11: 199 to 200 us. This register needs to be programmed when G2RXPOLLTMREN = 0.
2	1b RW	**Gotorxelecidle Polling Timer Enable (G2RXPTE):** If enabled (1), Gasket starts a timer after transmitting high speed data AND not receiving LFPS, and will only de-assert GoToRxElecIdle after timer expires during Polling. If disabled (0), Gasket will assert / de-assert GoToRxElecIdle purely based on Gotorxelecidle assertion upon RxElecIdle de-assertion (LFPS detected) enable bit (G2RXERXEE) and Gotorxelecidle assertion when not transmitting high speed data enable bit (G2RXETXHSDE)
1	1b RW	**GotoRxElecidle Assertion Upon RxElecIdle Exit Enable (G2RXERXEE):** When enabled (set to '1'), allow Gasket to assert GoToRxElecIdle to UAFE to turn off its receiver upon the de-assertion of GoToRxElecIdle (LFPS detected). This bit needs to be programmed when the USB3 port is not enabled.
0	1b RW	**GotoRxElecidle Assertion When Transmitting High Speed Data Enable (G2RXETXHSDE):** When enabled (set to '1'), allow Gaskets to assert GoToRxElecIdle to UAFE to turn off its receiver when not transmitting high speed data: P0 and TxElecIdle = 1. This bit needs to be programmed when the USB3 port is not enabled.

18.6.37 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset C0h

The RW/L property of this register is controlled by OCCFGDONE bit.

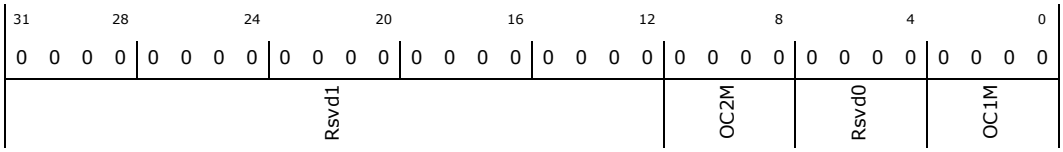
Access Method

Type: PCI Configuration Register (Size: 32 bits)

U2OCM1: [B:0, D:20, F:0] + C0h

Power Well: SUS

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RO	**Rsvd1:** Reserved
11:8	0h RW/L	**OC2 Mapping (OC2M):** Each bit position maps OC2 to a set of ports as follows: The OC2 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. Bit 15 14 13 12 11 10 9 8 Port 8 7 6 5 4 3 2 1
7:4	0h RO	**Rsvd0:** Reserved

Bit Range	Default & Access	Description
3:0	0h RW/L	**OC1 Mapping (OC1M):** Each bit position maps OC1 to a set of ports as follows: The OC1 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin Bit 7 6 5 4 3 2 1 0 Port 8 7 6 5 4 3 2 1

18.6.38 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2)—Offset C4h

Reserved

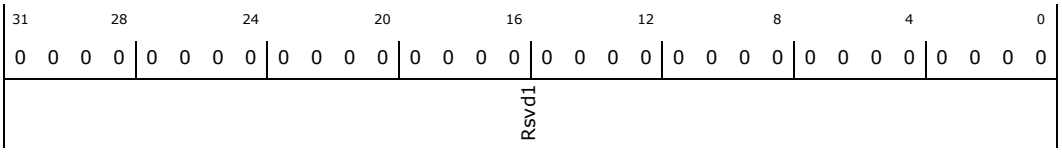
Access Method

Type: PCI Configuration Register (Size: 32 bits)

U2OCM2: [B:0, D:20, F:0] + C4h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**Rsvd1:** Reserved

18.6.39 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset C8h

The RW/L property of this register is controlled by OCCFGDONE bit.

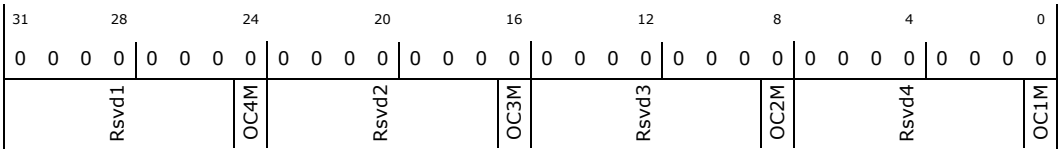
Access Method

Type: PCI Configuration Register (Size: 32 bits)

U3OCM1: [B:0, D:20, F:0] + C8h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:25	00h RO	**Rsvd1:** Reserved.
24	0b RW/L	**OC4 Mapping (OC4M):** Each bit position maps OC4 to a set of ports as follows: The OC4 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. Bit 27 26 25 24 Port 4 3 2 1

Bit Range	Default & Access	Description
23:17	00h RO	**Rsvd2:** Reserved.
16	0b RW/L	**OC3 Mapping (OC3M):** Each bit position maps OC3 to a set of ports as follows: The OC3 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. Bit 19 18 17 16 Port 4 3 2 1
15:9	00h RO	**Rsvd3:** Reserved.
8	0b RW/L	**OC2 Mapping (OC2M):** Each bit position maps OC2 to a set of ports as follows: The OC2 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. Bit 11 10 9 8 Port 4 3 2 1
7:1	00h RO	**Rsvd4:** Reserved.
0	0b RW/L	**OC1 Mapping (OC1M):** Each bit position maps OC1 to a set of ports as follows: The OC1 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin Bit 3 2 1 0 Port 4 3 2 1

18.6.40 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset CCh

The RW/L property of this register is controlled by OCCFGDONE bit. Note: U3OCM2 allows the OC pins 8:5 to be mapped to the same 6 SS ports that U3OCM1 allows. This a llows flexibility in pairing SS ports with HS ports at the connector. Care must be taken to make s ure OC pin assignment is consistent across USB3 and USB2 ports (depending upon the pairing).

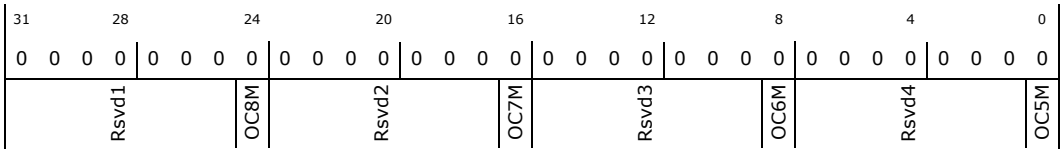
Access Method

Type: PCI Configuration Register (Size: 32 bits)

U3OCM2: [B:0, D:20, F:0] + CCh

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:25	00h RO	**Rsvd1:** Reserved.
24	0b RW/L	**OC8 Mapping (OC8M):** Each bit position maps OC8 to a set of ports as follows: The OC8 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to e nsure that a given port's bit map is set only for one OC pin. Bit 24 Port 1
23:17	00h RO	**Rsvd2:** Reserved.

Bit Range	Default & Access	Description
16	0b RW/L	**OC7 Mapping (OC7M):** Each bit position maps OC7 to a set of ports as follows: The OC7 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to e nsure that a given port's bit map is set only for one OC pin. Bit 16 Port 1
15:9	00h RO	**Rsvd3:** Reserved.
8	0b RW/L	**OC6 Mapping (OC6M):** Each bit position maps OC6 to a set of ports as follows: The OC6 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to e nsure that a given port's bit map is set only for one OC pin. Bit 8 Port 1
7:1	00h RO	**Rsvd4:** Reserved.
0	0b RW/L	**OC5 Mapping (OC5M):** Each bit position maps OC5 to a set of ports as follows: The OC5 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to e nsure that a given port's bit map is set only for one OC pin Bit 0 Port 1

18.6.41 USB2 Port Routing (USB2PR)—Offset D0h

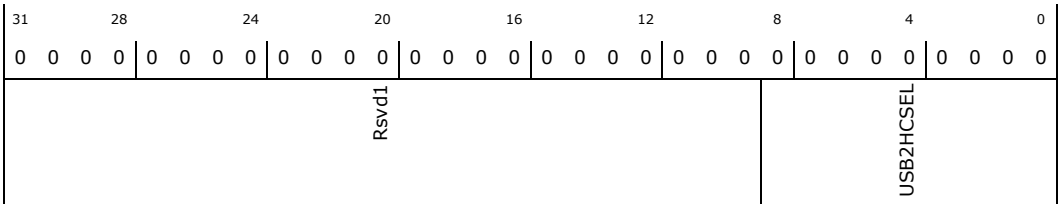
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB2PR: [B:0, D:20, F:0] + D0h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:9	000000h RO	**Rsvd1:** Reserved.
8:0	000h RW	**USB2 HC Selector (USB2HCSEL):** This field maps the USB2 port between the XHCI and EHCI controller (it has no effect on USB3). When set to 1, Routes USB2 pins to the XHCI controller. Routes OC pin to XHCI (based on the mapping in the OC register). Masks the USB2 port from the EHCI. Masks OC pin from ECHI. When set to 0, Routes all the USB2 pins to the legacy EHCI. Routes OC pin to EHCI (based on the mapping in the OC register). Masks the USB2 port from the XHCI. Masks OC pin from XHCI. Port to bit mapping is in one-hot encoding, i.e. bit 0 controls port 1 and so on.

18.6.42 USB2 Port Routing Mask (USB2PRM)—Offset D4h

The RW/L property of this register is controlled by the ACCTRL bit.

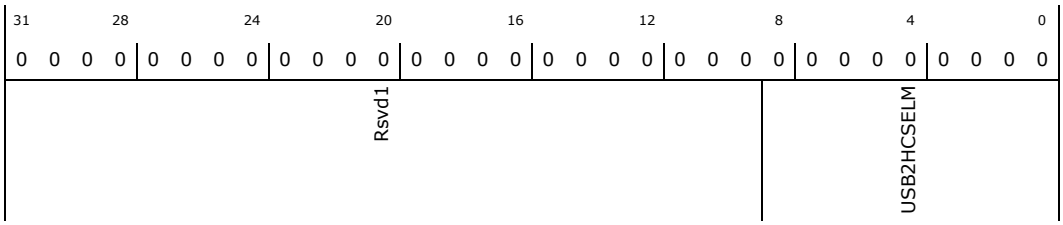
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB2PRM: [B:0, D:20, F:0] + D4h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:9	000000h RO	**Rsvd1:** Reserved.
8:0	000h RW/L	**USB2 HC Selector Mask (USB2HCSELM):** This field allows the BIOS to communicate to the OS which USB 2.0 ports can be switched from the EHCI controller to the xHCI controller. When set to 1, The OS may switch the USB 2.0 port between the EHCI and xHCI host controllers by modifying the corresponding USB2HCSEL bit. When set to 0, The OS shall not modify the corresponding USB2HCSEL bit. BIOS shall set this bit to a '1' if the corresponding USB2HCSEL bit is RW, unless it knows an internal USB 2.0 device attached to that port will not work under xHCI. Port to bit mapping is in one-hot encoding, i.e. bit 0 controls port 1 and so on.

18.6.43 USB3 Port Routing (USB3PR)—Offset D8h

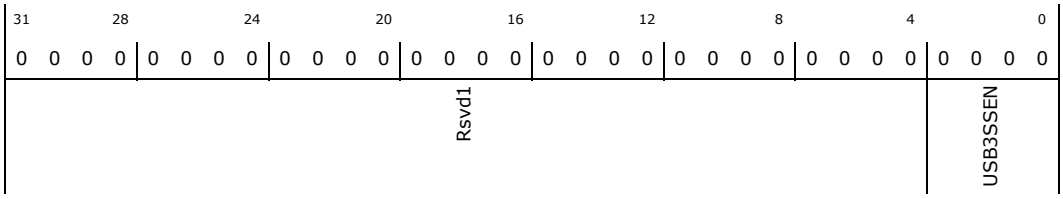
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB3PR: [B:0, D:20, F:0] + D8h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RO	**Rsvd1:** Reserved.
3:0	0h RW	**USB3 SS Enable (USB3SSEN):** This field controls whether SuperSpeed capability is enabled for a given USB3 port. When set to 1, Enables SS termination Enables PORTSC to to see the connects on the ports. When set to 0, Disables SS termination Blocks PORTSC from reporting attach/connect. Places port in the lowest power state.

18.6.44 USB3 Port Routing Mask (USB3PRM)—Offset DCh

The RW/L property of this register is controlled by the ACCTRL bit.

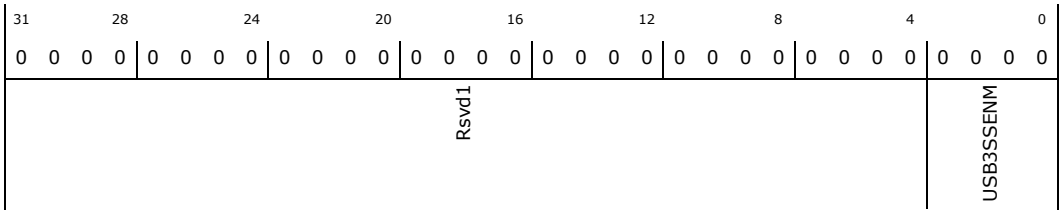
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB3PRM: [B:0, D:20, F:0] + DCh

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RO	**Rsvd1:** Reserved.
3:0	0h RW/L	**USB3 SS Enable Mask (USB3SSENM):** This field allows the BIOS to communicate to the OS which USB 3.0 ports can have the SuperSpeed capabilities enabled. When set to 1, The OS may enable or disable the SuperSpeed capabilities by modifying the corresponding USB3SSEN bit. When set to 0, The OS shall not modify the corresponding USB3SSEN bit. BIOS shall set this bit to a '1' if the corresponding USB3SSEN bit is RW, unless the BIOS has cleared the USB2HCSELM bit for a USB 2.0 port and the BIOS wishes the OS to disable the corresponding SuperSpeed terminations for that physical connector. Port to bit mapping is in one-hot encoding, i.e. bit 0 controls port 1 and so on.

18.6.45 Fuse and Strap (FUS)—Offset E0h

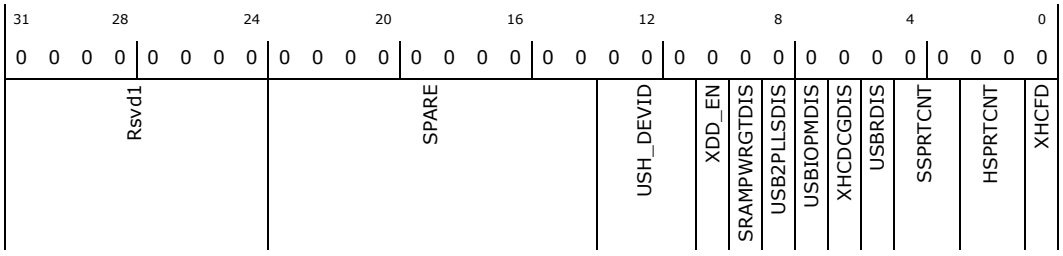
Access Method

Type: PCI Configuration Register (Size: 32 bits)

FUS: [B:0, D:20, F:0] + E0h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Rsvd1:** Reserved.
23:14	000h RO/V	**Spare Fuses (SPARE):** Will be used for VLV2.
13:11	000b RO/V	**USH DevID (USH_DEVID):** LSB bits of USH PCIe Device ID The 3 LSB bits enable defining up to 8 separate USH SKUs if required

Bit Range	Default & Access	Description
10	0b RO/V	**Debug Device Enable (XDD_EN):** 0 : Debug Device is Enabled 1: Debug Device is Disabled
9	0h RO/V	**SRAM Power Gating Disable (SRAMPWRGTDIS):** 0: SRAM Power Gating Enabled 1: SRAM Power Gating Disabled
8	0h RO/V	**USB2 PLL Shutdown Disable (USB2PLLSDIS):** 0: USB2 PLL shutdown enabled 1: USB2 PLL shutdown disabled
7	0h RO/V	**USB I/O Power Management Disable (USBIOPMDIS):** 0: USB2 HW LPM and USB3 HW Ux under XHC enabled 1: USB2 HW LPM and USB3 HW Ux under XHC disabled
6	0h RO/V	**XHC Dynamic Clock Gating Disable (XHCDCGDIS):** 0: USB3 (XHC) dynamic clock gating enabled 1: USB3 (XHC) dynamic clock gating disabled
5	0h RO/V	**USBr Disable (USBRDIS):** 0: USBr enabled 1: USBr disabled
4:3	0h RO/V	**SS Port Count (SSPRTCNT):** This field specifies number of SS ports present. Supported combinations are: 00: 6 SS ports 01: 4 SS ports 10: 2 SS ports 11: 0 SS ports
2:1	0h RO/V	**HS Port Count (HSPRTCNT):** This field specifies number HS ports present. Supported combinations are: 00: 14 HS ports 01: 12 HS ports 10: 10 HS ports 11: N/A (reserved)
0	0h RO/V	**XHCI Function Disable (XHCFD):** When asserted, it indicates the XHCI is fused to function disabled.

18.6.46 USB2 Port Disable Override (USB2PDO)—Offset E4h

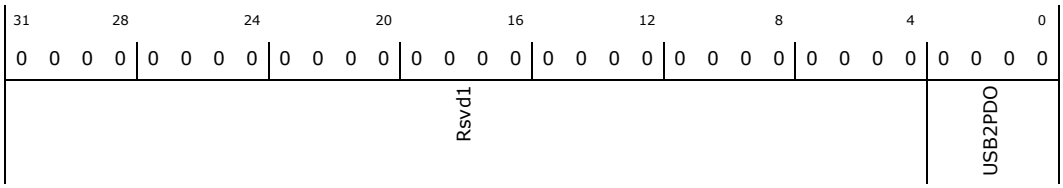
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB2PDO: [B:0, D:20, F:0] + E4h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	000000h RO	**Rsvd1:** Reserved.
3:0	000h RW/O	**USB2 Port Disable Override (USB2PDO):** A '1' in a bit position prevents the corresponding USB2 port from reporting a Device Connection to the XHC.

18.6.47 USB3 Port Disable Override (USB3PDO)—Offset E8h

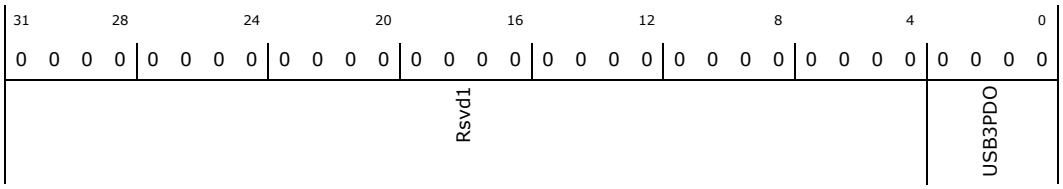
Access Method

Type: PCI Configuration Register (Size: 32 bits)

USB3PDO: [B:0, D:20, F:0] + E8h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RO	**Rsvd1:** Reserved.
3:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** A '1' in a bit position prevents the corresponding USB3 port from reporting a Device Connection to the XHC.

18.6.48 USB2 FS/LS Port Staggering Control (FSLSPS)—Offset ECh

The host controller provides a programmable time offset for each FS/LS port. Based on the value programmed in these registers, the controller will inject a fixed delay on each FS or LS transaction initiated on that port.

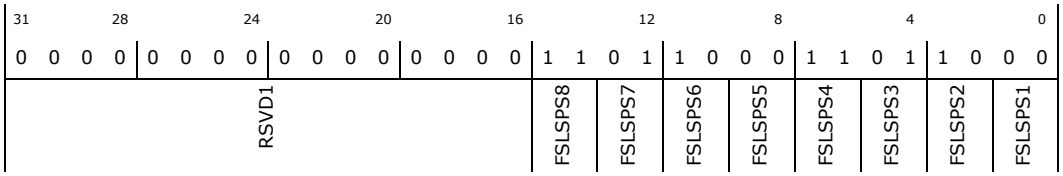
Access Method

Type: PCI Configuration Register (Size: 32 bits)

FSLSPS: [B:0, D:20, F:0] + ECh

Power Well: Core

Default: 0000D8D8h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1 (RSVD1):** Reserved for Future Use
15:14	11b RW	**FS/LS Stagger Offset for USB2 Port 8 (FSLSPS8):** FS/LS Stagger Offset for USB2 Port 8 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
13:12	01b RW	**FS/LS Stagger Offset for USB2 Port 7 (FSLSPS7):** FS/LS Stagger Offset for USB2 Port 7 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
11:10	10b RW	**FS/LS Stagger Offset for USB2 Port 6 (FSLSPS6):** FS/LS Stagger Offset for USB2 Port 6 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
9:8	00b RW	**FS/LS Stagger Offset for USB2 Port 5 (FSLSPS5):** FS/LS Stagger Offset for USB2 Port 5 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
7:6	11b RW	**FS/LS Stagger Offset for USB2 Port 4 (FSLSPS4):** FS/LS Stagger Offset for USB2 Port 4 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset

Bit Range	Default & Access	Description
5:4	01b RW	**FS/LS Stagger Offset for USB2 Port 3 (FSLSPS3):** FS/LS Stagger Offset for USB2 Port 3 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
3:2	10b RW	**FS/LS Stagger Offser for USB2 Port 2 (FSLSPS2):** FS/LS Stagger Offset for USB2 Port 2 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset
1:0	00b RW	**FS/LS Stagger Offset for USB2 Port 1 (FSLSPS1):** FS/LS Stagger Offset for USB2 Port 1 00: No time offset / Staggering disabled 01: 4ns time offset 10: 8ns time offset 11: 12ns time offset

18.6.49 DFT 1 (DFT1)—Offset F0h

Not for EDS

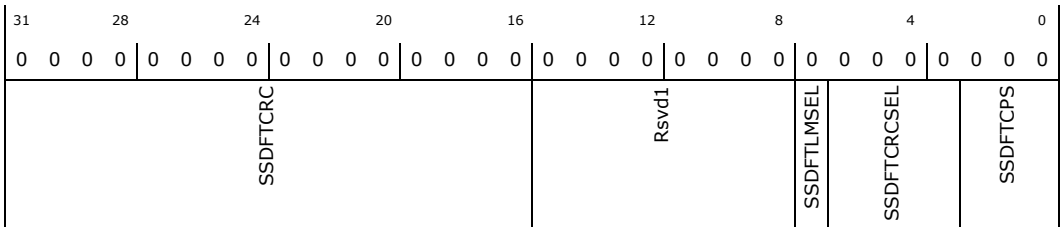
Access Method

Type: PCI Configuration Register (Size: 32 bits)

DFT1: [B:0, D:20, F:0] + F0h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Super Speed DFT CRC (SSDFTCRC):** These register bits contain the value of Super Speed DFT CRC
15:8	00h RO	**Rsvd1:** Reserved.
7	0h RW	**Super Speed DFT LFPS Mode Select (SSDFTLMSEL):** This bit selects the Super Speed DFT LFPS mode, and will only take effect when Super Speed HBP mode is enabled. 0b: HBP logic will internally loopback TX LFPS as RX LFPS and AFE RX LFPS path to the controller is disconnected. 1b: RX LFPS path works normally
6:3	0h RW	**Super Speed DFT CRC Select (SSDFTCRCSEL):** Super Speed DFT CRC Select (SSDFTCRCSEL): These bits select which Super Speed DFT CRC value is reflected in SSDFTCRC bits. In addition, these bits also select which SuperSpeed DFT CRC MSB value is sent to GPIO monitor pin, i.e. sata3gp_gp37 to aid silicon debug. Live version of selected CRC's MSB will be sent to GPIO monitor pin, i.e. sata3gp_gp37. 0h (default): No SuperSpeed DFT CRC is selected. 1h: Data Payload CRC 2h: Link Management Packet CRC 3h: Transaction Packet CRC 4h: Isochronous Timestamp Packet CRC 5h: Data Packet Header CRC 6h: Link Command Packet CRC Others: Reserved
2:0	0h RW	**Super Speed DFT CRC Port Select (SSDFTCPS):** One CRC per packet type is shared for all the Super Speed ports. These bits select the Super Speed port for which CRC data will be updated. 000b: (default) No SuperSpeed Port is selected 001b: Super Speed Port 0 010b: Super Speed Port 1 011b: Super Speed Port 2 100b: Super Speed Port 3 101b: Super Speed Port 4 110b: Super Speed Port 5 Others: Reserved

18.6.50 DFT 2 (DFT2)—Offset F4h

Not for EDS

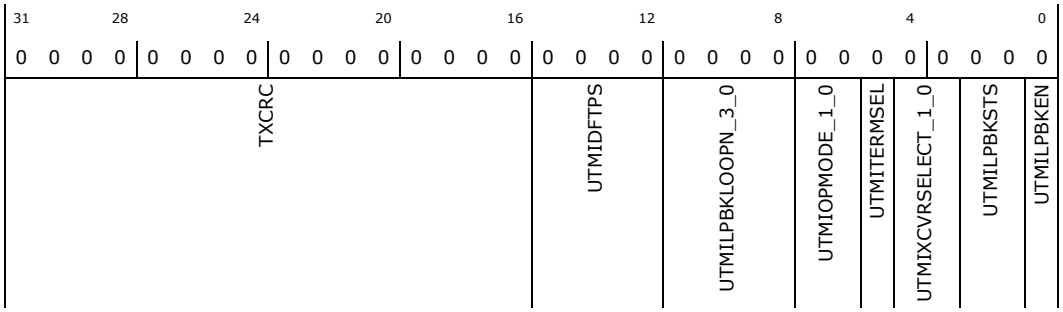
Access Method

Type: PCI Configuration Register (Size: 32 bits)

DFT2: [B:0, D:20, F:0] + F4h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**TX CRC (TXCRC):** These register bits contain the value of TX CRC. This TX CRC is placed right after the 480MHz XCLKQ.
15:12	0h RW	**UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved
11:8	0h RW	**Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max)
7:6	0h RW	**Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved
5	0h RW	**Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled
4:3	0h RW	**Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved
2:1	0h RO	**UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.
0	0h RW	**Loopback Enable (UTMILPBKEN):** Enable loopback test mode. If asserted, loopback test mode is enabled

18.6.51 Manufacturing Process ID (MANID)—Offset F8h

Not for EDS

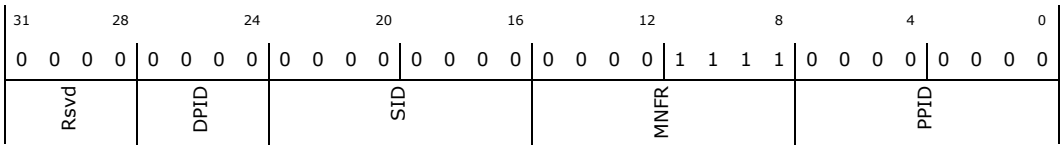
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:20, F:0] + F8h

Power Well: Core

Default: 00000F00h



Bit Range	Default & Access	Description
31:28	0h RO	**Reserved (Rsvd):** Reserved.
27:24	0h RO/V	**Dot Portion Process ID (DPID):** See Chap 6 for value
23:16	00h RO/V	**Stepping ID (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate stepping when the Revision ID may not change. See Chap 6 for value
15:8	0Fh RO	**Manufacturer (MNFR):** 0Fh = Intel.
7:0	00h RO/V	**Process Portion Process ID (PPID):** See Chap 6 for value

18.6.52 DFT 3 (DFT3)—Offset FCh

Not for EDS

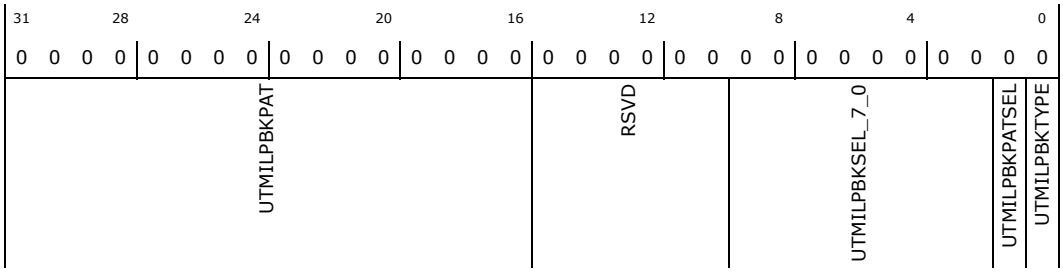
Access Method

Type: PCI Configuration Register (Size: 32 bits)

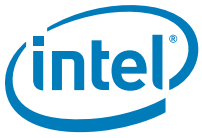
DFT3: [B:0, D:20, F:0] + FCh

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern
15:10	00h RO	**Reserved (RSVD):** Reserved
9:2	00h RW	**Loopback Lane Select (UTMILPBKSEL_7_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0
1	0b RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet
0	0b RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported



18.7 USB xHCI Memory Mapped I/O Registers

Table 202. Summary of USB xHCI Memory Mapped I/O Registers—MBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Capability Registers Length (CAPLENGTH)—Offset 0h" on page 2004	80h

18.7.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is used as an offset to add to register base, to find the beginning of the Operational Register Space. This register is modified and maintained by BIOS.

Access Method

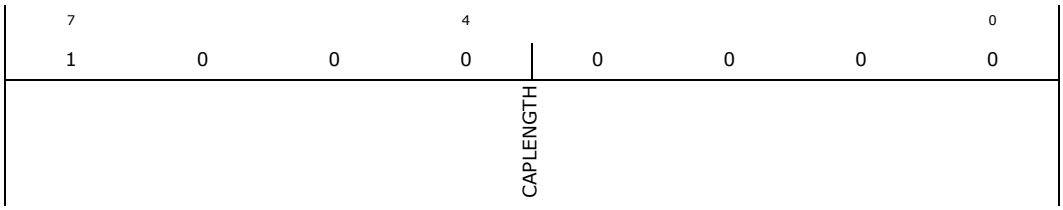
Type: Memory Mapped I/O Register (Size: 8 bits)

CAPLENGTH: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 80h



Bit Range	Default & Access	Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH):** This field is used as an offset to add to register base, to find the beginning of the Operational Register Space.

18.7.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. This register is modified and maintained by BIOS.

Access Method

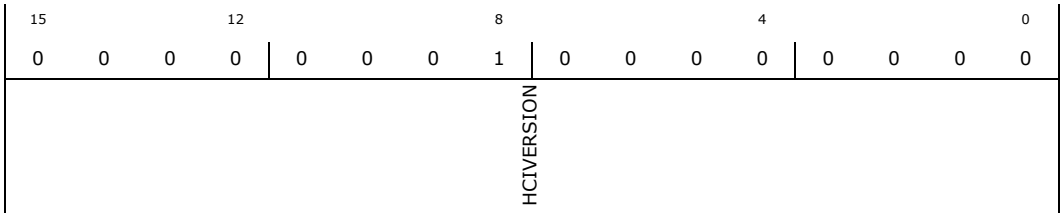
Type: Memory Mapped I/O Register (Size: 16 bits)

HCIVERSION: [MBAR] + 2h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0100h



Bit Range	Default & Access	Description
15:0	0100h RO	**Host Controller Interface Version Number (HCIVERSION):** This is a two-byte field containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this field represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0.

18.7.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register defines basic structural parameters supported by this xHC implementation: Number of Device Slots support, Interrupters, Root Hub ports, etc. This register is modified and maintained by BIOS.

Access Method

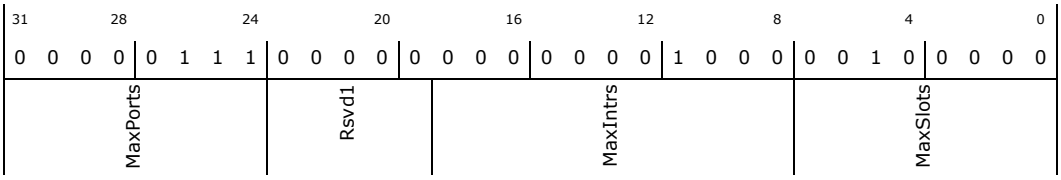
Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS1: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 07000820h



Bit Range	Default & Access	Description
31:24	07h RO	**Number of Ports (MaxPorts):** This field specifies the maximum Port Number value, i.e the highest number of Port Register Sets that are addressable in the Operational Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an *xHCI Supported Protocol Capability*, described in the xHCI for USB specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.
23:19	00h RW/L	**Rsvd1:** Reserved.
18:8	008h RW/L	**Number of Interrupters (MaxIntrs):** This field specifies the number of Interrupters implemented on this host controller. Each Interrupter is allocated to a vector of MSI-X, and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to 400h. A '0' in this field is undefined.
7:0	20h RW/L	**Number of Device Slots (MaxSlots):** This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1h to 400h. A '0' in this field is undefined.

18.7.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register defines additional xHC structural parameters. This register is modified and maintained by BIOS.

Access Method

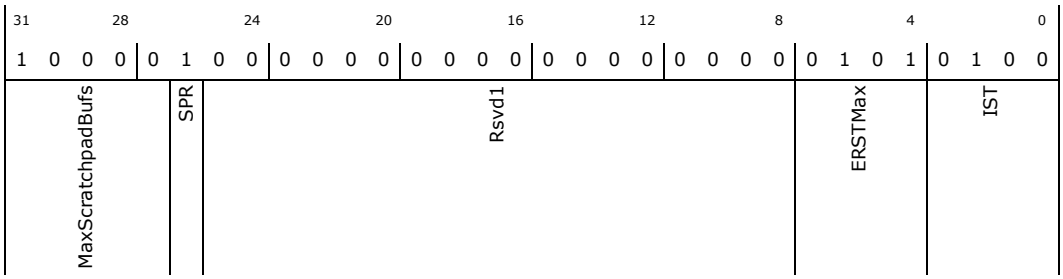
Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS2: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 84000054h



Bit Range	Default & Access	Description
31:27	10h RW/L	**Max Scratchpad Buffers (MaxScratchpadBufs):** Valid values are 0-31. This field indicates the number of Scratchpad Buffers system software shall reserve for the xHC. Refer to xHCI for USB specification for more information.
26	1b RW/L	**Scratchpad Restore (SPR):** If *Max Scratchpad Buffers* is greater than '0' then this flag indicates whether the xHC uses the Scratchpad Buffers for saving state when executing Save and Restore State operations. If *Max Scratchpad Buffers* is = '0', then this flag shall be '0'. Refer to the xHCI for USB specification for more information. A value of '1' indicates that the xHC requires the integrity of the Scratchpad Buffer space to be maintained across power events. A value of '0' indicates that the Scratchpad Buffer space may be freed and reallocated between power events.
25:8	00000h RW/L	**Rsvd1:** Reserved.
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax):** Valid values are 0-15. This field determines the maximum value supported by the *Event Ring Segment Table Base Size* registers (5.5.2.3.1), where The maximum number of Event Ring Segment Table entries = 2^(ERST Max) e.g. if the ERST Max = 7, then the xHC *Event Ring Segment Table(s)* supports up to 128 entries, if ERST Max = 15, then 32K entries, etc.

Bit Range	Default & Access	Description
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST):** The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes. If bit [3] of IST is cleared to '0', software can add a TRB no later than IST[2.0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to '1', software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed. Refer to the xHCI for USB specification for details on how software uses this information for scheduling isochronous transfers.

18.7.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register defines link exit latency related structural parameters. This register is modified and maintained by BIOS.

Access Method

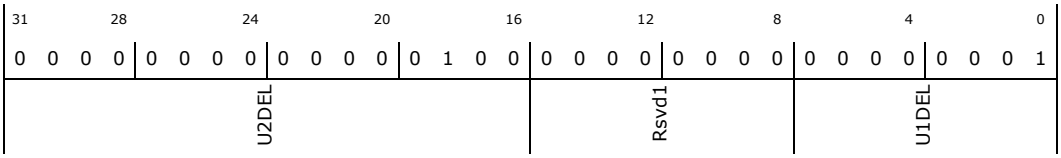
Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS3: [MBAR] + Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00040001h



Bit Range	Default & Access	Description
31:16	0004h RW/L	**U2 Device Exit Latency (U2DEL):** Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: • 0000h = Zero • 0001h = Less than 1 s • 0002h = Less than 2 s • • 07FFh = Less than 2047 s. • 0800-FFFFh = Reserved
15:8	00h RW/L	**Rsvd1:** Reserved.

Bit Range	Default & Access	Description
7:0	01h RW/L	**U1 Device Exit Latency (U1DEL):** Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: • 01h = Less than 1 s • 02h = Less than 2 s • ... • 0Ah = Less than 10 s • 0B-FFh = Reserved

18.7.6 Capability Parameters (HCCPARAMS)—Offset 10h

The default values for all fields in this register are implementation dependent. This register defines optional capabilities supported by the xHCI. This register is modified and maintained by BIOS.

Access Method

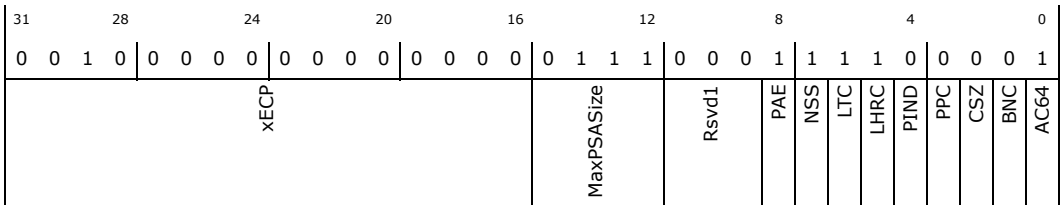
Type: Memory Mapped I/O Register (Size: 32 bits)

HCCPARAMS: [MBAR] + 10h

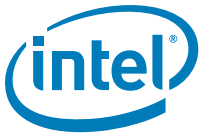
MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 200071E1h



Bit Range	Default & Access	Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP):** This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability. For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h ((2) -) 1000h + 01A0h -) 11A0h a. This is not tightly coupled with the USBBASE address register mapping control.
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize):** This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2^(MaxPSASize+1). Valid MaxPSASize values are 0 to 15, where 0 indicates that Streams are not supported.
11:9	0h RW/L	**Rsvd1:** Reserved.



Bit Range	Default & Access	Description
8	1b RW/L	**Parse All Event Data (PAE):** This flag indicates whether the host controller implementation parses all Event Data TRBs while advancing to the next TD after a Short Packet, or skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed. Refer to the xHCI for USB specification.
7	1b RW/L	**No Secondary SID Support (NSS):** This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. Refer to the xHCI for USB specification.
6	1b RW/L	**Latency Tolerance Messaging Capability (LTC):** This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to the xHCI for USB specification.
5	1b RW/L	**Light HC Reset Capability (LHRC):** This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the *Light Host Controller Reset* (LHCRST) flag in the USBCMD register. Refer to the xHCI for USB specification.
4	0b RW/L	**Port Indicators (PIND):** This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/ writeable field for controlling the state of the port indicator. Refer to the xHCI for USB specification for the definition of the *Port Indicator Control* field.
3	0b RO	**Port Power Control (PPC):** This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port does not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register. See the xHCI for USB specification.
2	0b RW/L	**Context Size (CSZ):** If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does *not* apply to Stream Contexts.
1	0b RW/L	**BW Negotiation Capability (BNC):** This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: • 0 = BW Negotiation not implemented • 1 = BW Negotiation implemented Refer to the xHCI for USB specification for more information on Bandwidth Negotiation.
0	1b RW/L	**64-bit Addressing Capability (AC64):** This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: • 0 = 32-bit address memory pointers implemented • 1 = 64-bit address memory pointers implemented If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.

18.7.7 Doorbell Offset (DBOFF)—Offset 14h

This register defines the offset of the Doorbell Array base address from the Base.

Access Method

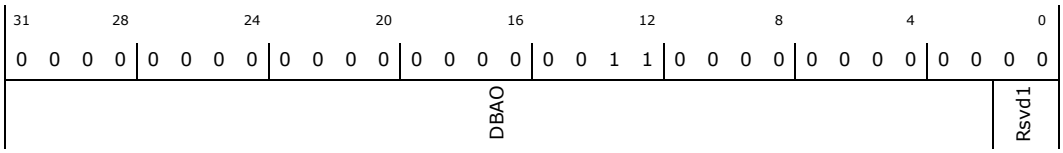
Type: Memory Mapped I/O Register (Size: 32 bits)

DBOFF: [MBAR] + 14h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00003000h



Bit Range	Default & Access	Description
31:2	00000C00h RO	**Doorbell Array Offset (DBAO):** This field defines the offset in Dwords of the Doorbell Array base address from the Base i.e. the base address of the xHCI Capability register address space.
1:0	0h RO	**Rsvd1:** Reserved.

18.7.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

This register defines the offset of the HCI Runtime Registers from the Base.

Access Method

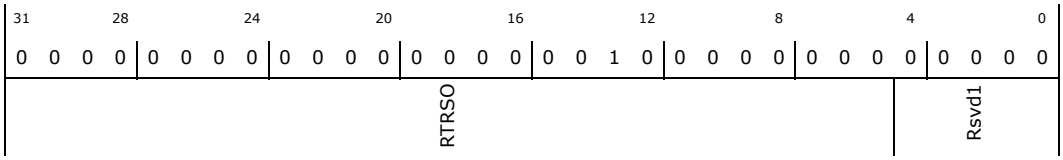
Type: Memory Mapped I/O Register (Size: 32 bits)

RTSOFF: [MBAR] + 18h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00002000h



Bit Range	Default & Access	Description
31:5	0000100h RO	**Runtime Register Space Offset (RTRSO):** This field defines the 32-byte offset of the xHCI Runtime Registers from the Base, i.e. Runtime Register Base Address = Base + Runtime Register Set Offset.
4:0	00h RO	**Rsvd1:** Reserved.

18.7.9 USB Command (USBCMD)—Offset 80h

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Access Method

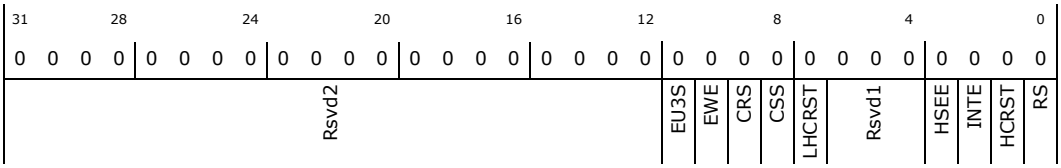
Type: Memory Mapped I/O Register (Size: 32 bits)

USBCMD: [MBAR] + 80h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RO	**Rsvd2:** Reserved.
11	0b RW	**Enable U3 MFINDEX Stop (EU3S):** When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to the xHCI for USB specification for more information.
10	0b RW	**Enable Wrap Event (EWE):** When set to 1, the xHC shall generate an MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.
9	0b RW	**Controller Restore State (CRS):** When set to 1, and HCHalted (HCH) = 1, then the xHC shall perform a Restore State operation and restore its internal state. When set to 1 and *Run/Stop* (R/S) = 1 or *HCHalted* (HCH) = 0, or when cleared to 0, no Restore State operation shall be performed. This flag always returns 0 when read. Refer to the *Restore State Status* (RSS) flag in the USBSTS register for information on Restore State completion. Refer to the xHCI for USB specification, for more information. Note that undefined behavior may occur if a Restore State operation is initiated while *Save State Status* (SSS) = 1. When this register is exposed by a Virtual Function (VF), this bit only controls restoring the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.
8	0b RW	**Controller Save State (CSS):** When written by software with 1 and HCHalted (HCH) = 1, then the xHC shall save any internal state that may be restored by asubsequent Restore State operation. When written by software with 1 and HCHalted (HCH) =0, or written with 0, no Save State operation shall be performed. This flag always returns 0 when read. Refer to the Save State Status (SSS) flag in the USBSTS register for information on Save State completion. Refer to the xHCI for USB specification for more information on xHC Save/ Restore operation. Note that undefined behavior may occur if a Save State operation is initiated while Restore State Status (RSS) = 1. When this register is exposed by a Virtual Function (VF), this bit only controls saving the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.

Bit Range	Default & Access	Description
7	0b RW	**Light Host Controller Reset (LHCRST):** Optional normative. If the *Light HC Reset Capability* (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the *Light Host Controller Reset* has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the *Light Host Controller Reset* has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. (Refer to the xHCI for USB specification for more information.) When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. disabling the VF's device slots and setting the associated VF Run bit to Stopped. Refer to the xHCI for USB specification for more information.
6:4	0h RO	**Rsvd1:** Reserved.
3	0b RW	**Host System Error Enable (HSEE):** When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to the xHCI for USB specification for more information.
2	0b RW	**Interrupter Enable (INTE):** This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, i.e. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSIX, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF.
1	0b RW	**Host Controller Reset (HCRST):** This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reseta shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller, as described in the xHCI for USB specification, in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.

Bit Range	Default & Access	Description
0	0b RW	**Run/Stop (RS):** • 1 = Run • 0 = Stop When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may yield undefined resultsresult in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF.

18.7.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to '0' in this register by writing a '1' to it (RW1C). Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)* for additional information concerning USB interrupt conditions.

Access Method

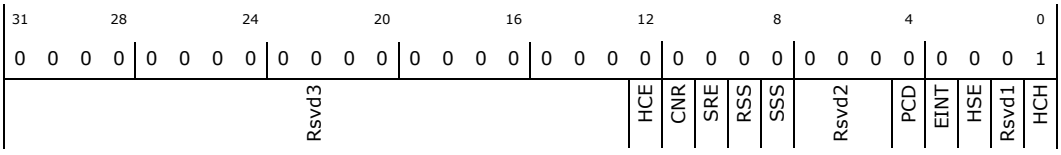
Type: Memory Mapped I/O Register (Size: 32 bits)

USBSTS: [MBAR] + 84h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000001h



Bit Range	Default & Access	Description
31:13	00000h RO	**Rsvd3:** Reserved.
12	0b RO	**Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.
11	0b RO	**Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.

Bit Range	Default & Access	Description
10	0b RW/C	**Save/Restore Error (SRE):** If an error occurs during a Save or Restore operation, this bit shall be set to 1. This bit shall be cleared to 0 when a Save or Restore operation is initiated or when written with 1. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to the xHCI for USB specification for more information.
9	0b RO	**Restore State Status (RSS):** When the Controller Restore State (CRS) flag in the USBCMD register is written with 1 this bit shall be set to 1 and remain 1 while the xHC restores its internal state. When the Restore State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the restoring the state for the selected VF. Refer to the xHCI for USB specification for more information.
8	0b RO	**Save State Status (SSS):** When the *Controller Save State* (CSS) flag in the USBCMD register is written with 1, this bit shall be set to 1 and remain 1 while the xHC saves its internal state. When the Save State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the saving the state for the selected VF. Refer to the xHCI for USB specification for more information.
7:5	0h RO	**Rsvd2:** Reserved.
4	0b RW/C	**Port Change Detect (PCD):** The xHC sets this bit to a 1 when any port has a change bit transition from a 0 to a 1. This bit is allowed to be maintained in the Aux Power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits. Refer to the xHCI for USB specification for more information. This bit provides system software an efficient means of determining if there has been Root Hub port activity. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Root Hub Ports associated with the Device Slots assigned to the selected VF. Refer to the xHCI for USB specification for more information.
3	0b RW/C	**Event Interrupt (EINT):** The xHC sets this bit to 1 when the *Interrupt Pending* (IP) bit of any Interrupter transitions from 0 to 1. Refer to the xHCI for USB specification for usage information. Software that uses *EINT* shall clear it prior to clearing any IP flags. A race condition may occur if software clears the *IP* flags, then clears the *EINT* flag, and between the operations another *IP* 0 to '1' transition occurs. In this case, the new IP transition shall be lost. When this register is exposed by a Virtual Function (VF), this bit is the logical 'OR' of the IP bits for the Interrupters assigned to the selected VF. And it shall be cleared to 0 when all associated interrupter IP bits are cleared, i.e. all the VFs Interrupter Event Ring(s) are empty. Refer to the xHCI for USB specification for more information.
2	0b RW/C	**Host System Error (HSE):** The xHC sets this bit to 1 when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. (In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort.) When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is a 1, the xHC shall also assert out-of-band error signaling to the host. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the assertion of this bit affects all VFs and reflects the Host System Error state of the Physical Function (PF0). Refer to the xHCI for USB specification for more information.

Bit Range	Default & Access	Description
1	0b RO	**Rsvd1:** Reserved.
0	1b RO	**HCHalted (HCH):** This bit is a 0 whenever the *Run/Stop* (R/S) bit is a 1. The xHC sets this bit to 1 after it has stopped executing as a result of the *Run/Stop* (R/S) bit being cleared to 0, either by software or by the xHC hardware (e.g. internal error). If this bit is '1', then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC, and any received Transaction Packet shall be dropped. When this register is exposed by a Virtual Function (VF), this bit only reflects the Halted state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.

18.7.11 Page Size (PAGESIZE)—Offset 88h

The default value for this register is implementation dependent.

Access Method

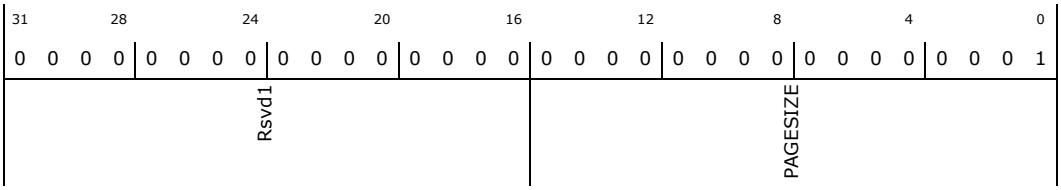
Type: Memory Mapped I/O Register (Size: 32 bits)

PAGESIZE: [MBAR] + 88h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000001h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0001h RO	**Page Size (PAGESIZE):** This field defines the page size supported by the xHC implementation. This xHC supports a page size of 2^(n+12) if bit n is Set. For example, if bit 0 is Set, the xHC supports 4k byte page sizes. For a Virtual Function, this register reflects the page size selected in the *System Page Size* field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size. Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M.

18.7.12 Device Notification Control (DNCTRL)—Offset 94h

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A *Notification Enable* (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated

when the respective notification packet is received. After reset, all notifications are disabled. Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)*.

This register shall be written as a Dword. Byte writes produce undefined results.

Access Method

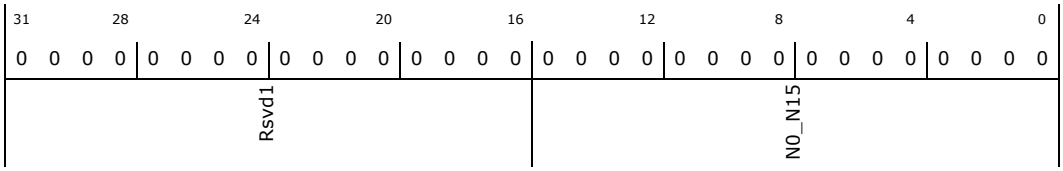
Type: Memory Mapped I/O Register (Size: 32 bits)

DNCTRL: [MBAR] + 94h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RW	**Notification Enable (N0_N15):** When a Notification Enable bit is set, a Device Notification Event shall be generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to '1' enables Device Notification Event generation if a Device Notification TP is received with a Notification Type field set to '1' (FUNCTIONAL_WAKE), etc.

18.7.13 Command Ring Low (CRCR_LO)—Offset 98h

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.

Access Method

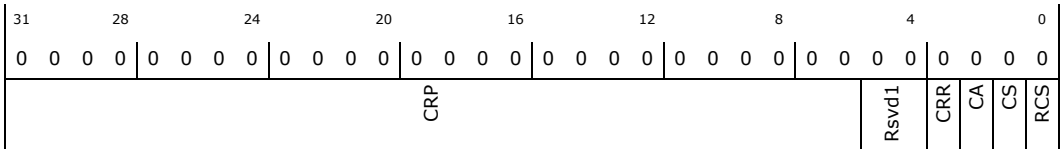
Type: Memory Mapped I/O Register (Size: 32 bits)

CRCR_LO: [MBAR] + 98h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Command Ring Pointer (CRP):** This field defines low order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when *Command Ring Running* (CCR) = '1'. If the CRCR is written while the Command Ring is stopped (CCR = '0'), the value of this field shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the DB Reason field set to Host Controller Command. If the CRCR is *not* written while the Command Ring is stopped (CRR = '0') then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns '0'.
5:4	0h RO	**Rsvd1:** Reserved.
3	0b RO	**Command Ring Running (CRR):** This flag is set to '1' if the *Run/Stop* (R/S) bit is '1' and the *Host Controller Doorbell* register is written with the *DB Reason* field set to *Host Controller Command*. It is cleared to '0' when the Command Ring is 'stopped' after writing a '1' to the *Command Stop* (CS) or *Command Abort*)CA) flags, or if the *R/S* bit is cleared to '0'
2	0b RW/S	**Command Abort (CA):** Writing a '1' to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to the xHCI for USB specification for more information on aborting a command. The next write to the *Host Controller Doorbell* with *DB Reason* field set to *Host Controller Command* shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if *Command Ring Running* (CCR) = '0'. Reading this bit always returns '0'.
1	0b RW/S	**Command Stop (CS):** Writing a '1' to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a *Command Completion Event* with the *Completion Code* set to *Command Ring Stopped* and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to the xHCI for USB specification for more information on stopping a command. The next write to the *Host Controller Doorbell* with *DB Reason* field set to *Host Controller Command* shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if *Command Ring Running* (CCR) = '0'. Reading this bit shall always return '0'.

Bit Range	Default & Access	Description
0	0b RW	**Ring Cycle State (RCS):** This bit identifies the value of the xHC *Consumer Cycle State* (CCS) flag for the TRB referenced by the *Command Ring Pointer*. Refer to the xHCI for USB specification for more information. Writes to this flag are ignored if *Command Ring Running* is '1'. If the CRCR is written while the Command Ring is stopped (CCR = '0'), then the value of this flag shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the *DB Reason* field set to *Host Controller Command*. If the CRCR is *not* written while the Command Ring is stopped (CRR = '0'), then the Command Ring shall begin fetching Command TRBs using the current value of the Internal Command Ring CCS flag. Reading this flag always returns '0 '.

18.7.14 Command Ring High (CRCR_HI)—Offset 9Ch

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.

Access Method

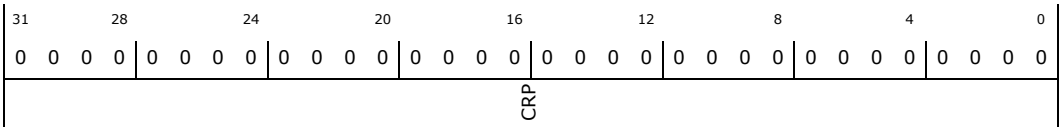
Type: Memory Mapped I/O Register (Size: 32 bits)

CRCR_HI: [MBAR] + 9Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Command Ring Pointer (CRP):** This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when *Command Ring Running* (CCR) = '1'. If the CRCR is written while the Command Ring is stopped (CCR = '0'), the value of this field shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the DB Reason field set to Host Controller Command. If the CRCR is *not* written while the Command Ring is stopped (CRR = '0') then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns '0'.

18.7.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

The Device Context Base Address Array Pointer Register identifies the base address of the Device Context Base Address Array. The memory structure referenced by this physical memory pointer is assumed to be physically contiguous and 64-byte aligned.

Access Method

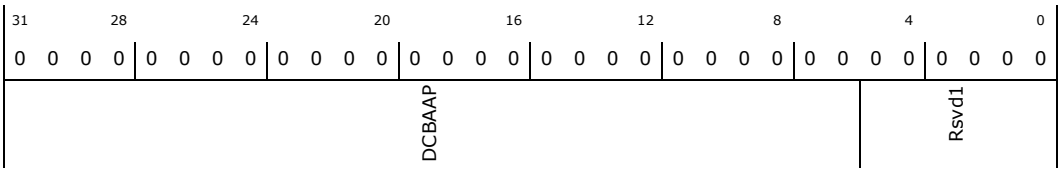
Type: Memory Mapped I/O Register (Size: 32 bits)

DCBAAP_LO: [MBAR] + B0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines low order bits of the 64-bit base address of the Device Context Pointer Array, which is a table of address pointers that reference Device Context structures for the devices attached to the host.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

The Device Context Base Address Array Pointer Register identifies the base address of the Device Context Base Address Array. The memory structure referenced by this physical memory pointer is assumed to be physically contiguous and 64-byte aligned.

Access Method

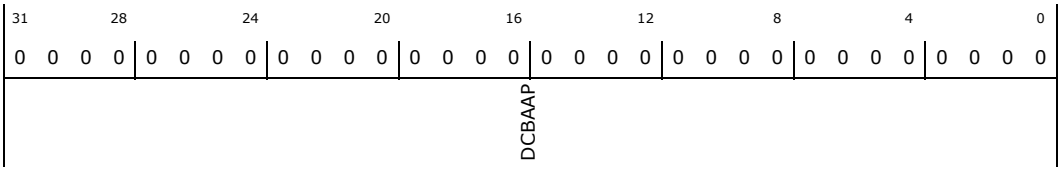
Type: Memory Mapped I/O Register (Size: 32 bits)

DCBAAP_HI: [MBAR] + B4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines high order bits of the 64-bit base address of the Device Context Pointer Array, which is a table of address pointers that reference Device Context structures for the devices attached to the host.

18.7.17 Configure (CONFIG)—Offset B8h

This register defines runtime xHC configuration parameters.

Access Method

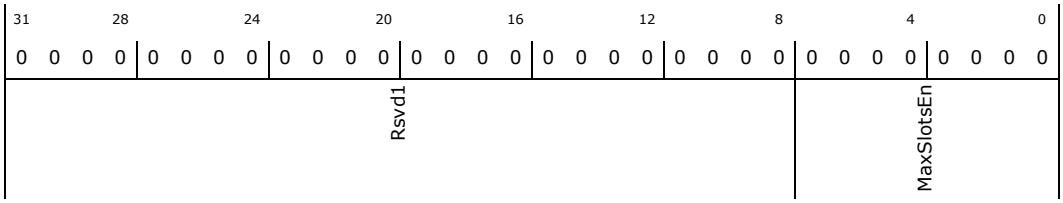
Type: Memory Mapped I/O Register (Size: 32 bits)

CONFIG: [MBAR] + B8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**Rsvd1:** Reserved.
7:0	00h RW	**Max Device Slots Enabled (MaxSlotsEn):** This field specifies the maximum number of enabled Device Slots. Valid values are in the range of 0 to MaxSlots. Enabled Devices Slots are allocated contiguously, e.g. a value of 16 specifies that Device Slots 1 to 16 are active. A value of '0' disables all Device Slots. A disabled Device Slot shall not respond to Doorbell Register references. This field shall not be modified by software if the xHC is running (Run/Stop (R/S) = '1').

18.7.18 Port 1 Status and Control USB3 (PORTSC1USB2)—Offset 480h

Access Method

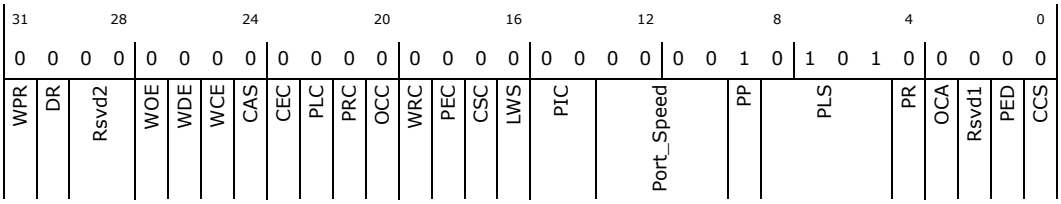
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC1USB2: [MBAR] + 480h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 000002A0h



Bit Range	Default & Access	Description
31	0b RW/S	**Warm Port Reset (WPR):** Reserved.
30	0b RO	**Device Removable (DR):** Reserved.

23	0b RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0b RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0b RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0b RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0b RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0b RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0b RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0b RW	**Port Link State Write Strobe (LWS):** Reserved.
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (Port_Speed):** Note: This register is sticky.
9	1b RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.

Bit Range	Default & Access	Description
4	0b RW/S	**Port Reset (PR):** Reserved.
3	0b RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0b RO	**Rsvd1:** Reserved.
1	0b RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0b RW	**Current Connect Status (CCS):** Note: This register is sticky.

18.7.19 Port 1 Power Management Status and Control USB2 (PORTPMSC1USB2)—Offset 484h

This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a *Host Controller Reset* (HCRST)

.

The USB2 Port Power Management Status and Control register provides the USB2 LPM parameters necessary for the xHC to generate a LPM Token to the downstream device.

Access Method

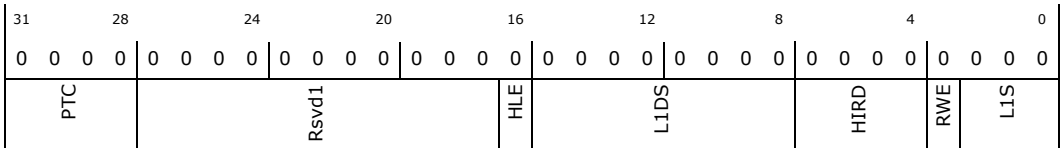
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTPMSC1USB2: [MBAR] + 484h

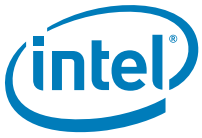
MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	000h RO	**Rsvd1:** Reserved.
16	0b RO	**Hardware LPM Enable (HLE):** Reserved.
15:8	00h RW	**L1 Device Slot (L1DS):** Note: This register is sticky. System software sets this field to indicate the ID of the Device Slot associated with the device directly attached to the Root Hub port. A value of 0 indicates no device is present. The xHC uses this field to lookup information necessary to generate the LPM Token packet.



Bit Range	Default & Access	Description
7:4	0h RW	**Best Effort Service Latency (HIRD):** Note: This register is sticky. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. For more information about *BESL* value encoding, refer to the xHCI for USB specification. Note that the *BESL* field is used by both software and hardware controlled LPM. Refer to the xHCI for USB specification for more information on *BESL* use and how *DBESL* may be used to establish an initial value for BESL.
3	0b RW	**Remote Wake Enable (RWE):** Note: This register is sticky. System software sets this flag to enable or disable the device for remote wake from L1. The value of this flag shall temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky. This field is used by software to determine whether an L1- based suspend request (LPM transaction) was successful, specifically: • 0 = Invalid - This field shall be ignored by software. • 1 = Success - Port successfully transitioned to L1 (ACK) • 2 = Not Yet - Device is unable to enter L1 at this time (NYET) • 3 = Not Supported - Device does not support L1 transitions (STALL) • 4 = Timeout/Error - Device failed to respond to the LPM Transaction or an error occurred • 5-7 = Reserved The value of this field is only valid when the port resides in the L0 or L1 state (*PLS* = 0 or 2). Refer to the xHCI for USB specification for more information.

18.7.20 Port X Hardware LPM Control Register (PORTHLPM1)—Offset 48Ch

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch.

This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST).

The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

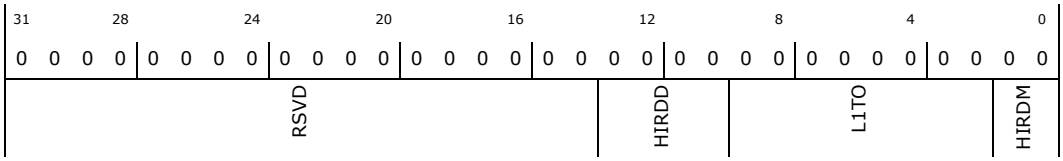
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTHLPM1: [MBAR] + 48Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:14	00000h RO	**RESERVED (RSVD):** Reserved.
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume upon exit from L1. The HIRDD value is is encoded as follows: • 0h = 50 us (default) • 1h = 125 us • 2h = 200 us • ... • Fh = 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	00h RW	**L1 Timeout (L1TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. The following are permissible values: • 0 = Initiate L1 using HIRD only time out (default) • 1 = Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD • 2,3 = Reserved Note: This register is sticky.

18.7.21 Port 2 Status and Control USB3 (PORTSC2USB2)—Offset 490h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC2USB2: [MBAR] + 490h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	000h RO	**Rsvd1:** Reserved.
16	0b RO	**Hardware LPM Enable (HLE):** Reserved.
15:8	00h RW	**L1 Device Slot (L1DS):** Note: This register is sticky.

Bit Range	Default & Access	Description
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0b RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

18.7.38 Port 1 Link Info (PORTLI1)—Offset 4E8h

Access Method

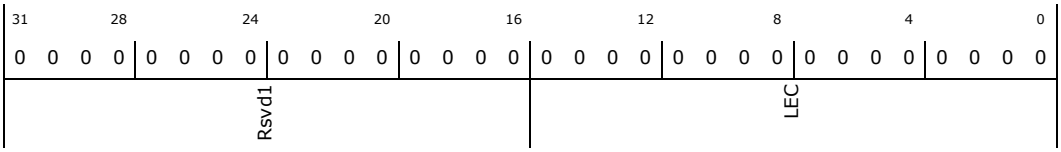
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTLI1: [MBAR] + 4E8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RO	**Link Error Count (LEC):** Reserved.

18.7.39 Microframe Index (MFINDEX)—Offset 2000h

This register is used by the system software to determine the current periodic frame. The register value is incremented every 125 microseconds (once each microframe).

This register is only incremented while *Run/Stop* = '1'.

The value of this register affects the SOF value generated by USB2 Bus Instances.

Access Method

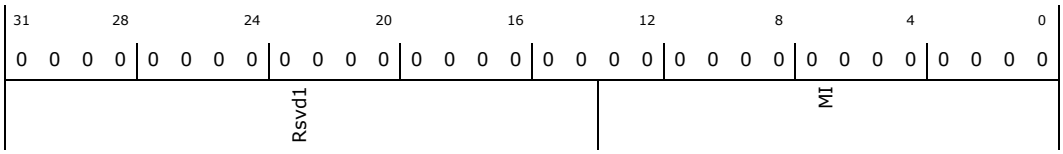
Type: Memory Mapped I/O Register (Size: 32 bits)

MFINDEX: [MBAR] + 2000h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:14	00000h RO	**Rsvd1:** Reserved.
13:0	0000h RO	**Microframe Index (MI):** Reserved.

18.7.40 Interrupter 1 Management (IMAN1)—Offset 2020h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

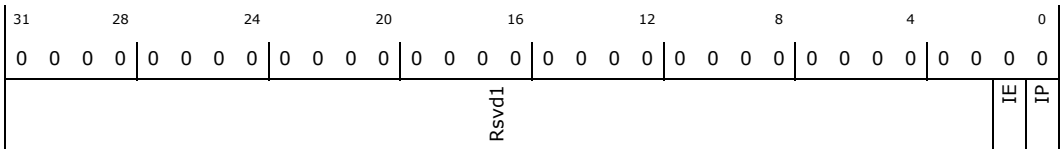
Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN1: [MBAR] + 2020h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.41 Interrupter 1 Moderation (IMOD1)—Offset 2024h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

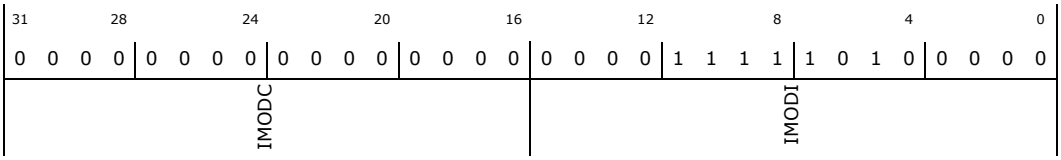
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD1: [MBAR] + 2024h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags both equal '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.42 Event Ring Segment Table Size 1 (ERSTSZ1)—Offset 2028h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

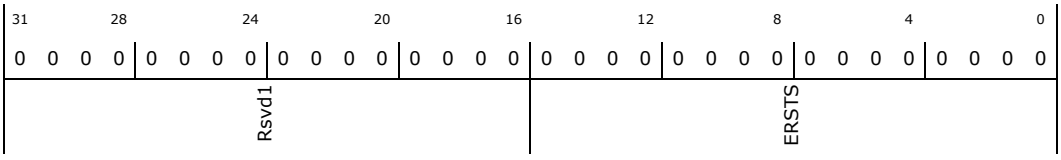
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ1: [MBAR] + 2028h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.43 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO1)—Offset 2030h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

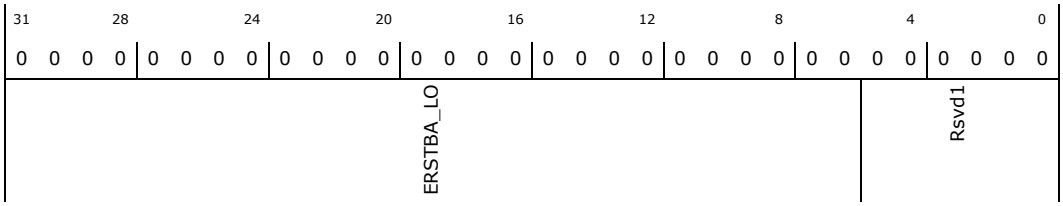
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO1: [MBAR] + 2030h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.44 Event Ring Segment Table Base Address High 1 (ERSTBA_HI1)—Offset 2034h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

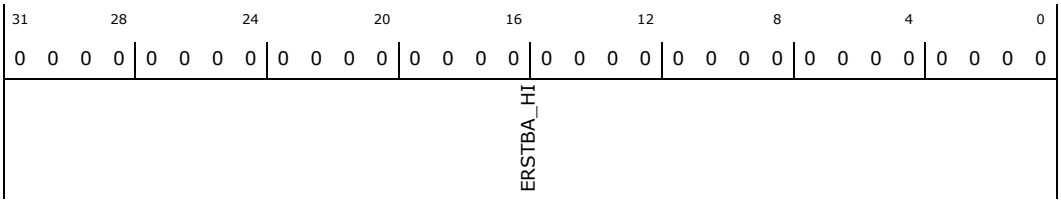
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI1: [MBAR] + 2034h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.45 Event Ring Dequeue Pointer Low 1 (ERDP_LO1)—Offset 2038h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

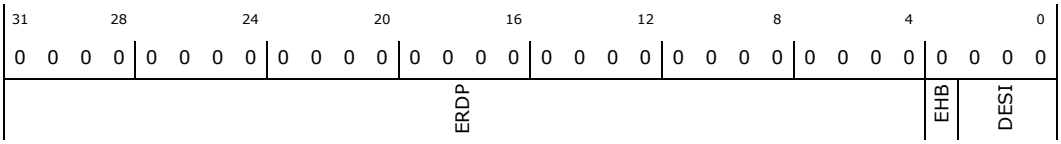
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO1: [MBAR] + 2038h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.46 Event Ring Dequeue Pointer High 1 (ERDP_HI1)—Offset 203Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

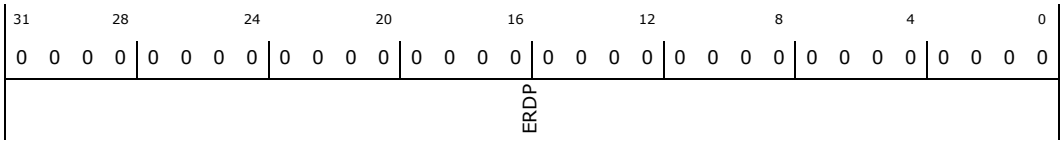
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI1: [MBAR] + 203Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.47 Interrupter 2 Management (IMAN2)—Offset 2040h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

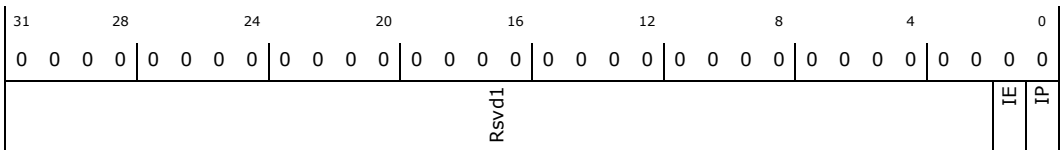
Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN2: [MBAR] + 2040h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.48 Interrupter 2 Moderation (IMOD2)—Offset 2044h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

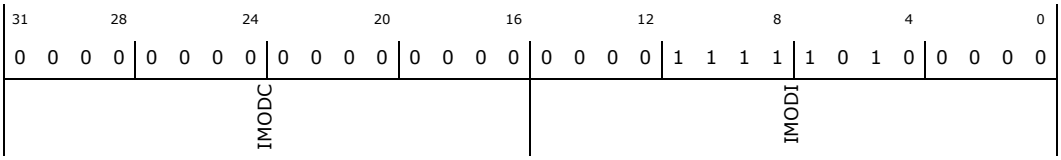
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD2: [MBAR] + 2044h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Default undefined. Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.49 Event Ring Segment Table Size 2 (ERSTSZ2)—Offset 2048h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

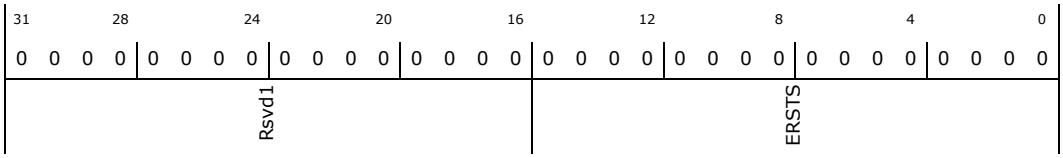
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ2: [MBAR] + 2048h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.50 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO2)—Offset 2050h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

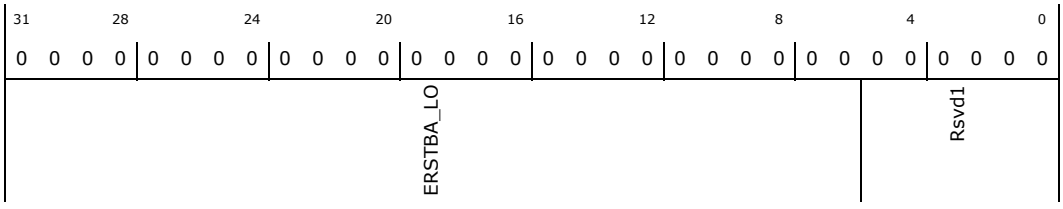
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO2: [MBAR] + 2050h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.51 Event Ring Segment Table Base Address High 2 (ERSTBA_HI2)—Offset 2054h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

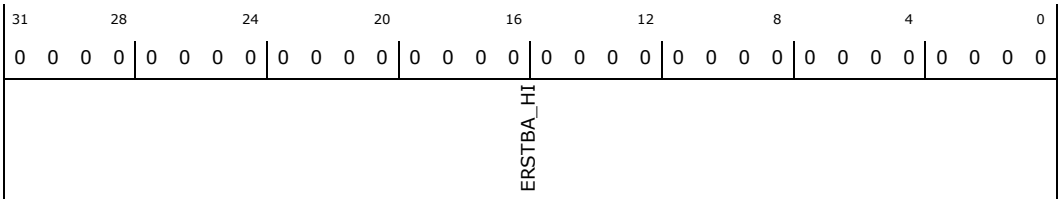
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI2: [MBAR] + 2054h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.52 Event Ring Dequeue Pointer Low 2 (ERDP_LO2)—Offset 2058h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

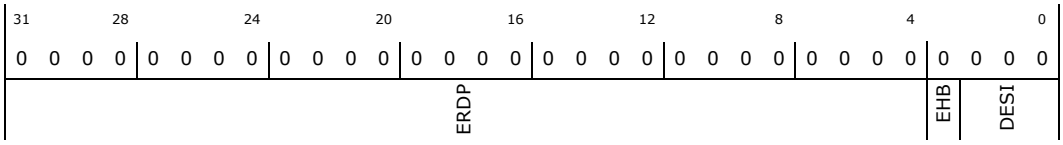
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO2: [MBAR] + 2058h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.53 Event Ring Dequeue Pointer High 2 (ERDP_HI2)—Offset 205Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI2: [MBAR] + 205Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.62 Interrupter 4 Moderation (IMOD4)—Offset 2084h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

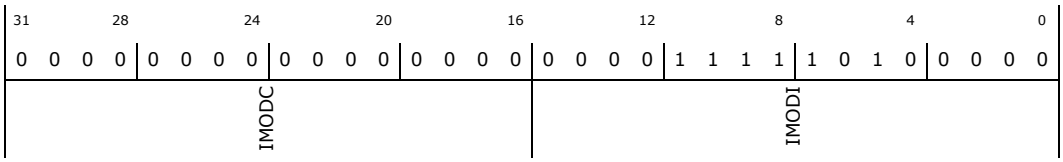
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD4: [MBAR] + 2084h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.63 Event Ring Segment Table Size 4 (ERSTSZ4)—Offset 2088h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

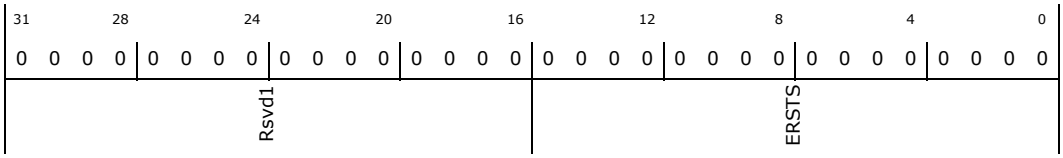
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ4: [MBAR] + 2088h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.64 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO4)—Offset 2090h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

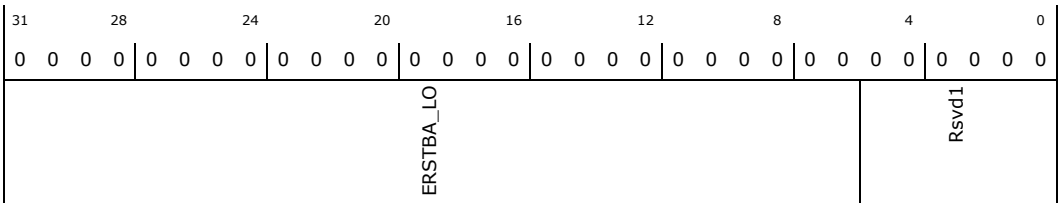
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO4: [MBAR] + 2090h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.65 Event Ring Segment Table Base Address High 4 (ERSTBA_HI4)—Offset 2094h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

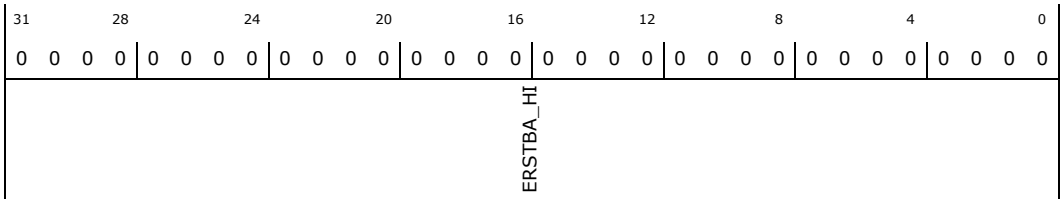
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI4: [MBAR] + 2094h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.66 Event Ring Dequeue Pointer Low 4 (ERDP_LO4)—Offset 2098h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

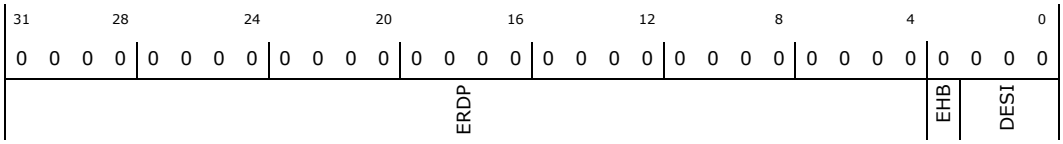
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO4: [MBAR] + 2098h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.67 Event Ring Dequeue Pointer High 4 (ERDP_HI4)—Offset 209Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

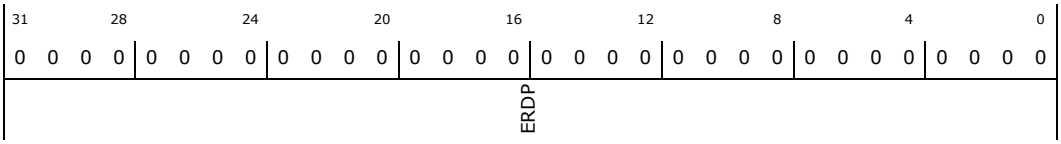
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI4: [MBAR] + 209Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.68 Interrupter 5 Management (IMAN5)—Offset 20A0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

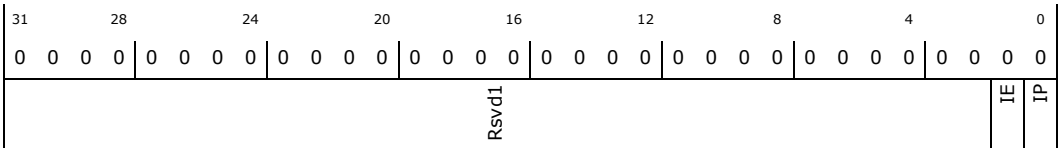
Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN5: [MBAR] + 20A0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.69 Interrupter 5 Moderation (IMOD5)—Offset 20A4h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

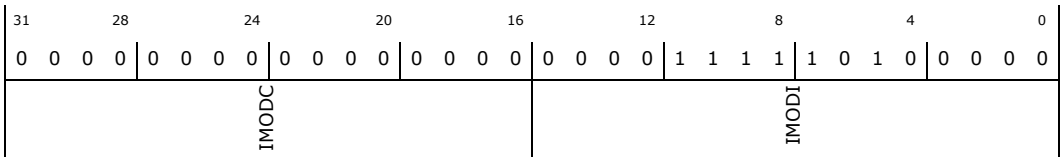
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD5: [MBAR] + 20A4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.70 Event Ring Segment Table Size 5 (ERSTSZ5)—Offset 20A8h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

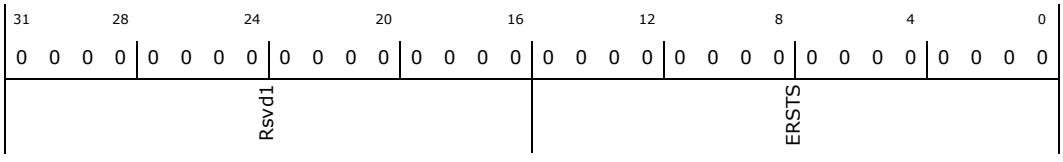
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ5: [MBAR] + 20A8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.

Bit Range	Default & Access	Description
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.71 Event Ring Segment Table Base Address Low 5 (ERSTBA_LO5)—Offset 20B0h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

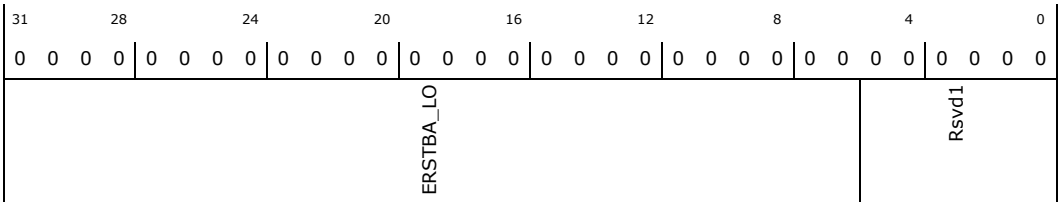
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO5: [MBAR] + 20B0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.72 Event Ring Segment Table Base Address High 5 (ERSTBA_HI5)—Offset 20B4h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

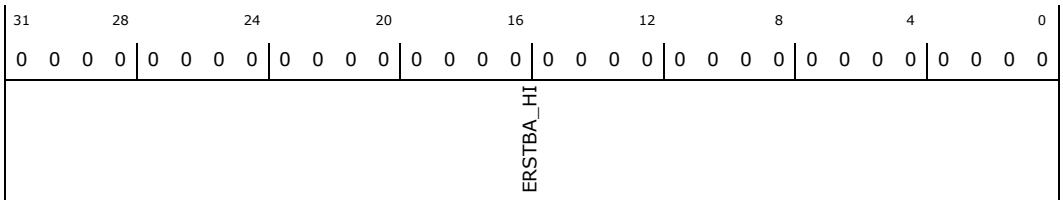
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI5: [MBAR] + 20B4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.73 Event Ring Dequeue Pointer Low 5 (ERDP_LO5)—Offset 20B8h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

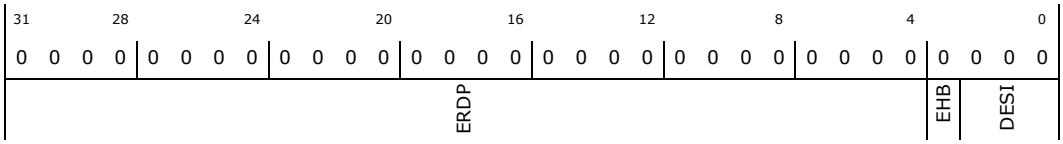
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO5: [MBAR] + 20B8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.74 Event Ring Dequeue Pointer High 5 (ERDP_HI5)—Offset 20BCh

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

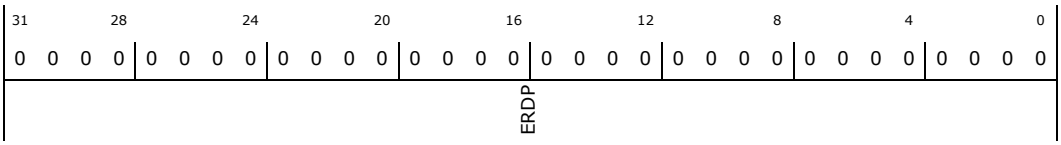
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI5: [MBAR] + 20BCh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.75 Interrupter 6 Management (IMAN6)—Offset 20C0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

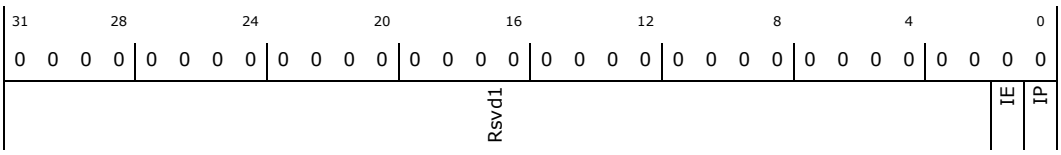
Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN6: [MBAR] + 20C0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.76 Interrupter 6 Moderation (IMOD6)—Offset 20C4h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

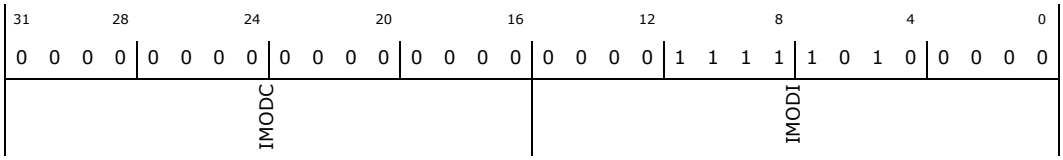
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD6: [MBAR] + 20C4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.77 Event Ring Segment Table Size 6 (ERSTSZ6)—Offset 20C8h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

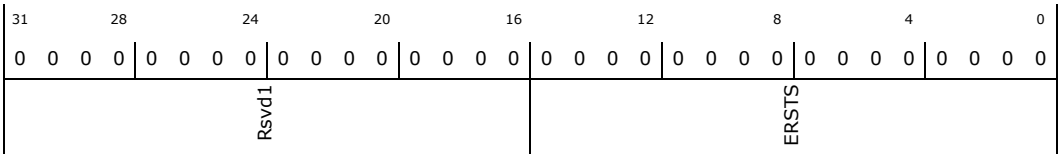
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ6: [MBAR] + 20C8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see xHCI for USB specification). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.78 Event Ring Segment Table Base Address Low 6 (ERSTBA_LO6)—Offset 20D0h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

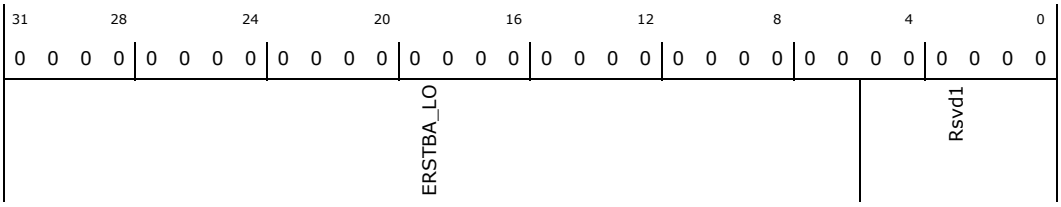
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO6: [MBAR] + 20D0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. 5:0	00h RO	**Rsvd1:** Reserved.

18.7.79 Event Ring Segment Table Base Address High 6 (ERSTBA_HI6)—Offset 20D4h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

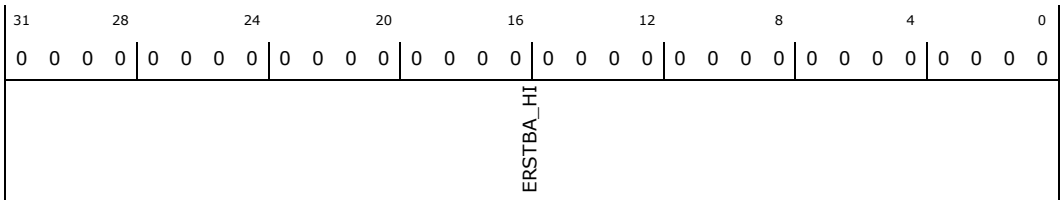
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI6: [MBAR] + 20D4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.80 Event Ring Dequeue Pointer Low 6 (ERDP_LO6)—Offset 20D8h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

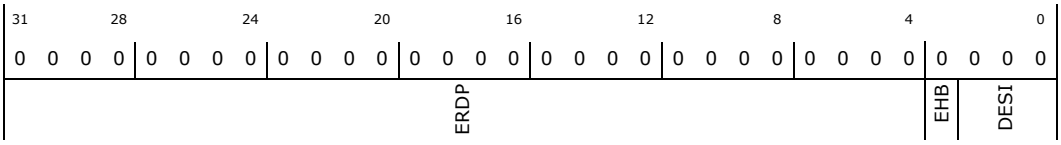
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO6: [MBAR] + 20D8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.81 Event Ring Dequeue Pointer High 6 (ERDP_HI6)—Offset 20DCh

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

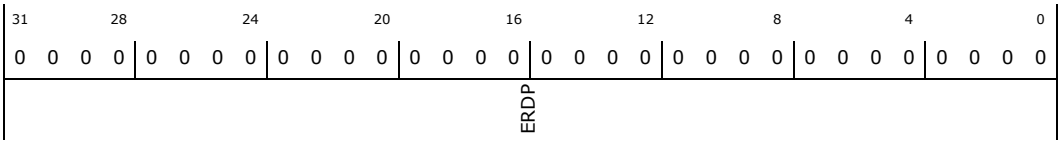
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI6: [MBAR] + 20DCh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.82 Interrupter 7 Management (IMAN7)—Offset 20E0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN7: [MBAR] + 20E0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h

This field shall not be modified if HCHalted (HCH) = 0.

18.7.87 Event Ring Dequeue Pointer Low 7 (ERDP_LO7)—Offset 20F8h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

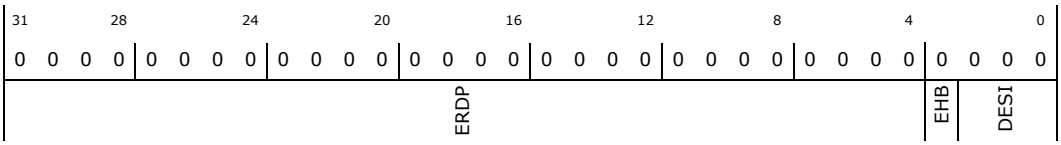
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO7: [MBAR] + 20F8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.88 Event Ring Dequeue Pointer High 7 (ERDP_HI7)—Offset 20FCh

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

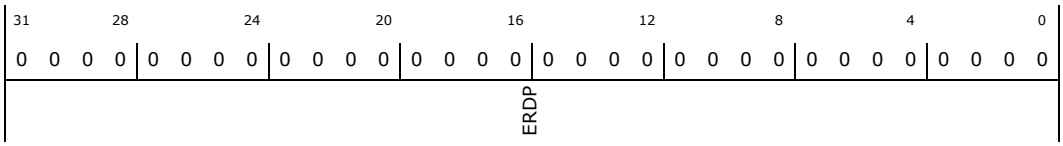
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI7: [MBAR] + 20FCh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.89 Interrupter 8 Management (IMAN8)—Offset 2100h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

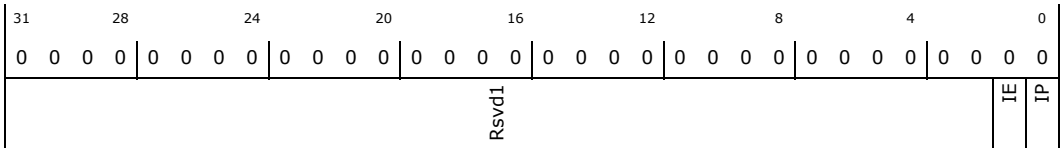
Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN8: [MBAR] + 2100h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:2	00000000h RO	**Rsvd1:** Reserved.
1	0b RW	**Interrupt Enable (IE):** Reserved.
0	0b RW/C	**Interrupt Pending (IP):** Reserved.

18.7.90 Interrupter 8 Moderation (IMOD8)—Offset 2104h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

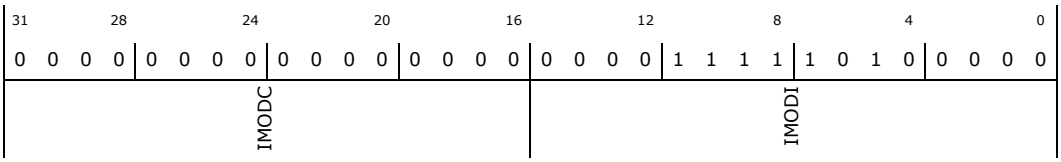
Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD8: [MBAR] + 2104h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate.
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

18.7.91 Event Ring Segment Table Size 8 (ERSTSZ8)—Offset 2108h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

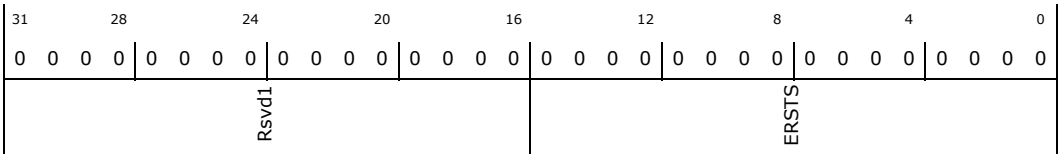
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ8: [MBAR] + 2108h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Rsvd1:** Reserved.
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

18.7.92 Event Ring Segment Table Base Address Low 8 (ERSTBA_LO8)—Offset 2110h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

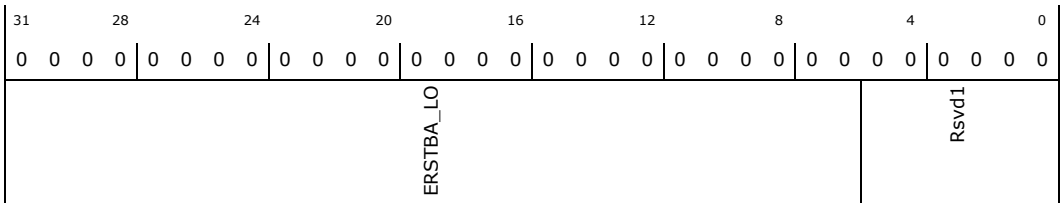
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO8: [MBAR] + 2110h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RW	**Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.
5:0	00h RO	**Rsvd1:** Reserved.

18.7.93 Event Ring Segment Table Base Address High 8 (ERSTBA_HI8)—Offset 2114h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.

Access Method

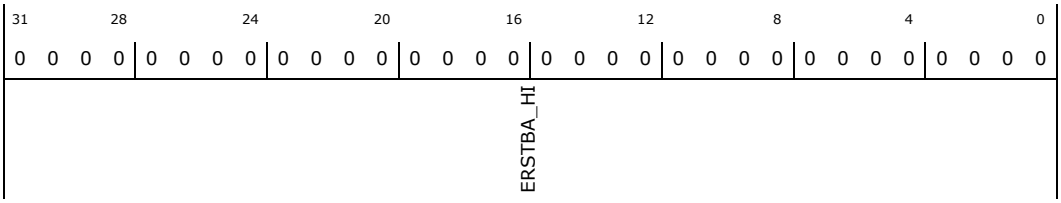
Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI8: [MBAR] + 2114h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.

18.7.94 Event Ring Dequeue Pointer Low 8 (ERDP_LO8)—Offset 2118h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

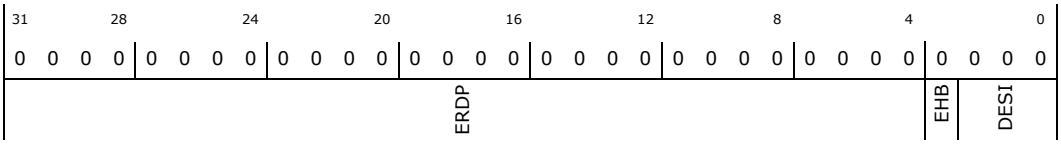
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO8: [MBAR] + 2118h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.95 Event Ring Dequeue Pointer High 8 (ERDP_HI8)—Offset 211Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

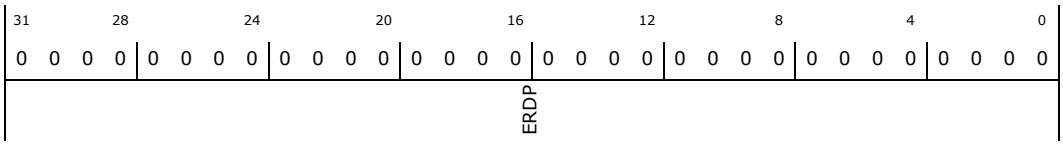
Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI8: [MBAR] + 211Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.

18.7.96 Door Bell 1 (DOORBELL1)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

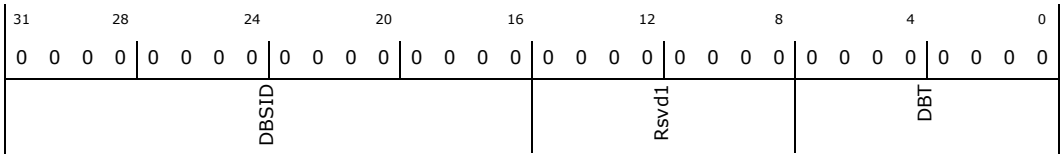
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL1: [MBAR] + 3000h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** If the endpoint of a Device Context Doorbell defines Streams, then this field shall be used to identify which Stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines Streams *(MaxPStreams) 0)*, then 0, 65535 (No Stream) and 65534 (Prime) are reserved Stream ID values and shall not be written to this field. If the endpoint does not define Streams *(MaxPStreams = 0)* and a non-'0' value is written to this field, the doorbell reference shall be ignored. This field only applies to *Device Context Doorbells* and shall be cleared to 0 for *Host Controller Command Doorbells*. [br This field returns 0 when read.

Bit Range	Default & Access	Description
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Note that Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers. • **Device Context Doorbells (1-255)** • 0 = Reserved • 1 = Control EP 0 Enqueue Pointer Update • 2 = EP 1 OUT Enqueue Pointer Update • 3 = EP 1 IN Enqueue Pointer Update • 4 = EP 2 OUT Enqueue Pointer Update • 5 = EP 2 IN Enqueue Pointer Update • ... • 30 = EP 15 OUT Enqueue Pointer Update • 31 = EP 15 IN Enqueue Pointer Update • 32:247 = Reserved • 248:255 = Vendor Defined • **Host Controller Doorbell (0)** • 0 = Command Doorbell • 248:255 = Vendor Defined This field returns '0' when read, and should be treated as 'undefined' by software. When the Command Doorbell is written, the DB Stream ID field shall be cleared to 0.

18.7.97 Door Bell 2 (DOORBELL2)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

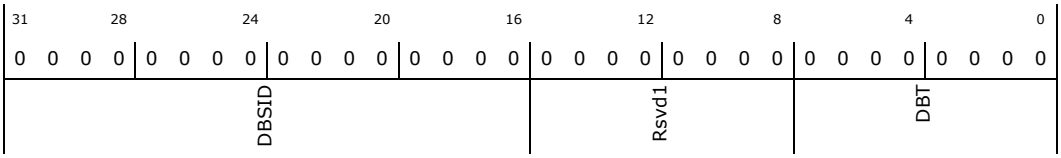
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL2: [MBAR] + 3004h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.98 Door Bell 3 (DOORBELL3)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

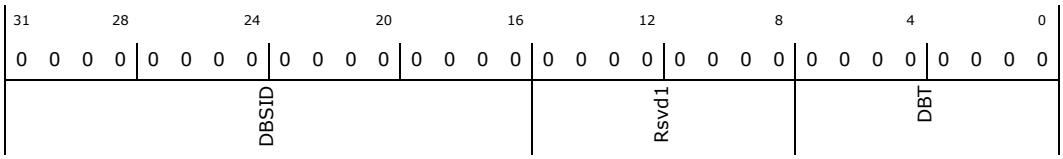
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL3: [MBAR] + 3008h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.99 Door Bell 4 (DOORBELL4)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

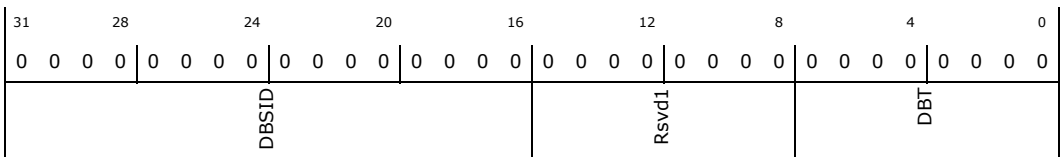
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL4: [MBAR] + 300Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.

Bit Range	Default & Access	Description
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.100 Door Bell 5 (DOORBELL5)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

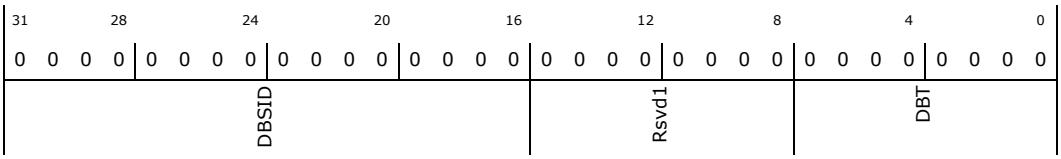
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL5: [MBAR] + 3010h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.101 Door Bell 6 (DOORBELL6)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

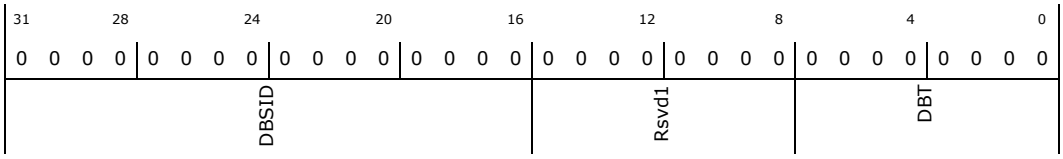
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL6: [MBAR] + 3014h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.102 Door Bell 7 (DOORBELL7)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

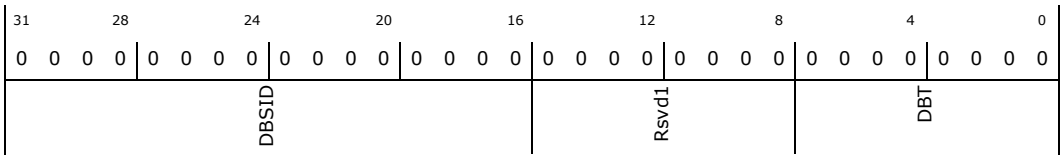
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL7: [MBAR] + 3018h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.103 Door Bell 8 (DOORBELL8)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

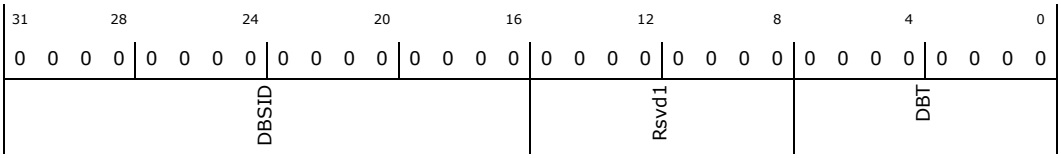
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL8: [MBAR] + 301Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.104 Door Bell 9 (DOORBELL9)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

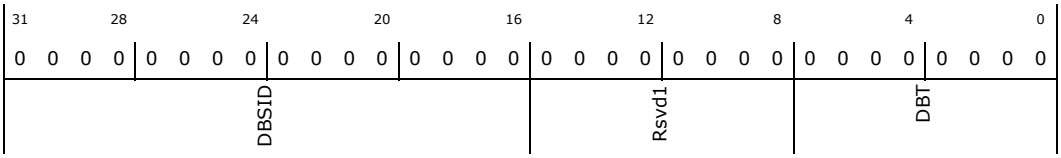
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL9: [MBAR] + 3020h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.105 Door Bell 10 (DOORBELL10)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

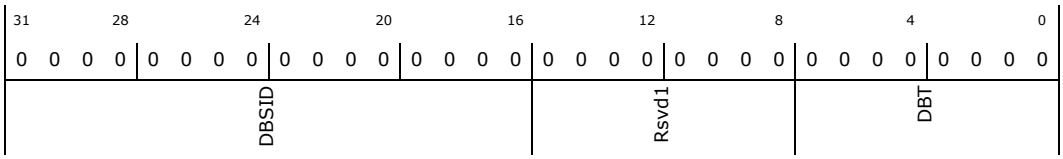
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL10: [MBAR] + 3024h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.106 Door Bell 11 (DOORBELL11)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

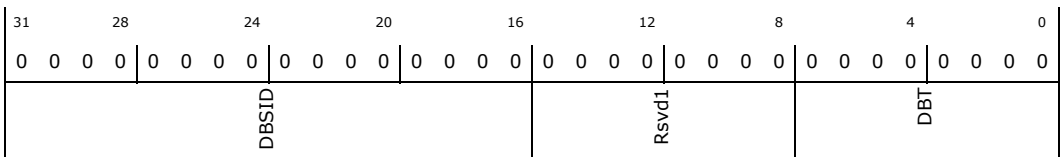
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL11: [MBAR] + 3028h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.

Bit Range	Default & Access	Description
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.107 Door Bell 12 (DOORBELL12)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

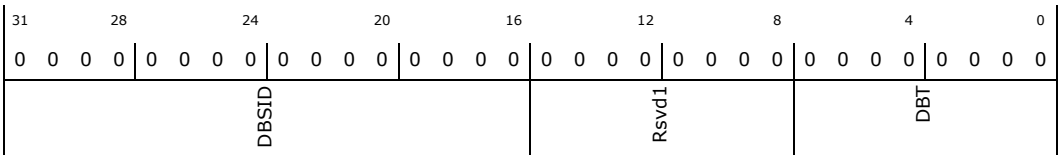
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL12: [MBAR] + 302Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.108 Door Bell 13 (DOORBELL13)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

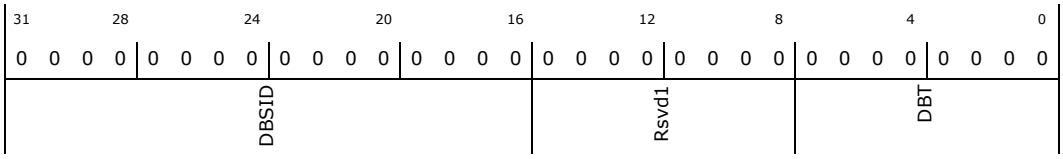
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL13: [MBAR] + 3030h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.109 Door Bell 14 (DOORBELL14)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

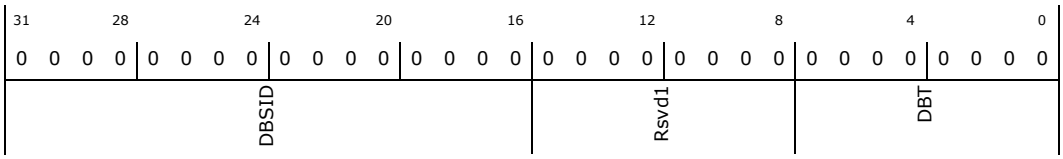
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL14: [MBAR] + 3034h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.110 Door Bell 15 (DOORBELL15)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

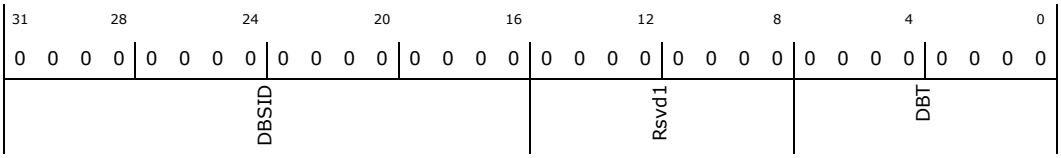
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL15: [MBAR] + 3038h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.111 Door Bell 16 (DOORBELL16)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

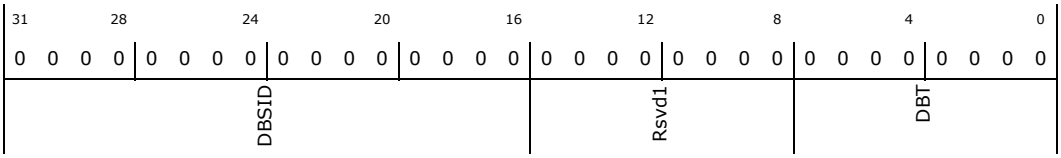
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL16: [MBAR] + 303Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.112 Door Bell 17 (DOORBELL17)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

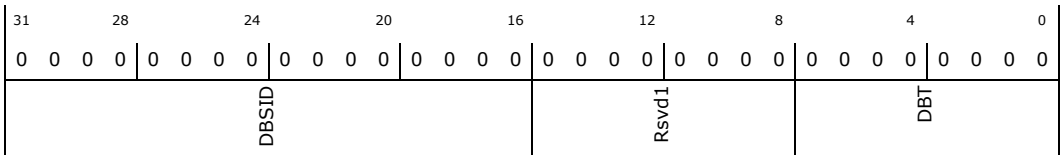
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL17: [MBAR] + 3040h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.113 Door Bell 18 (DOORBELL18)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

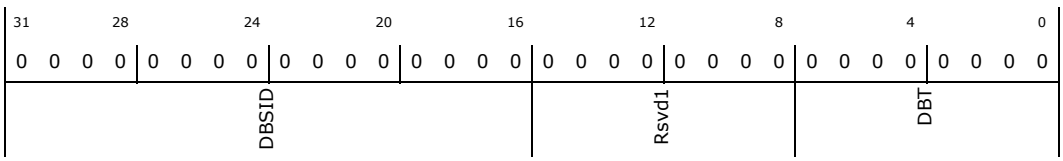
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL18: [MBAR] + 3044h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.

7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.115 Door Bell 20 (DOORBELL20)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

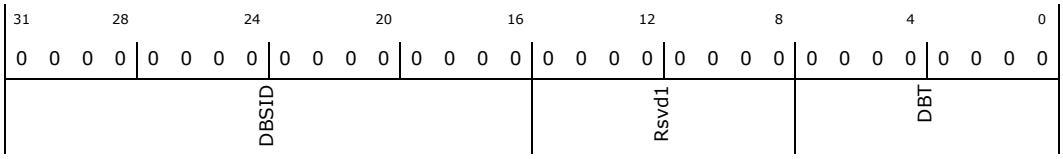
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL20: [MBAR] + 304Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.116 Door Bell 21 (DOORBELL21)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

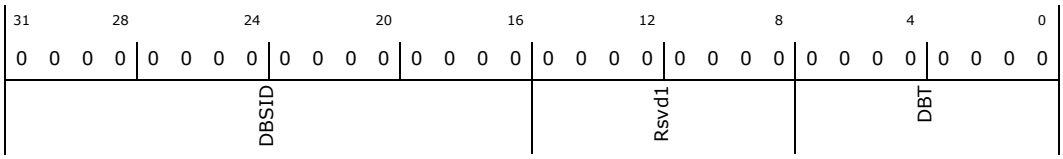
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL21: [MBAR] + 3050h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.117 Door Bell 22 (DOORBELL22)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

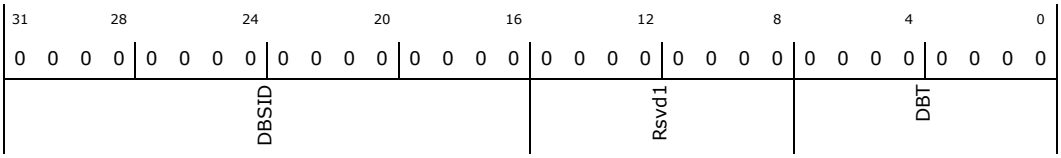
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL22: [MBAR] + 3054h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.118 Door Bell 23 (DOORBELL23)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

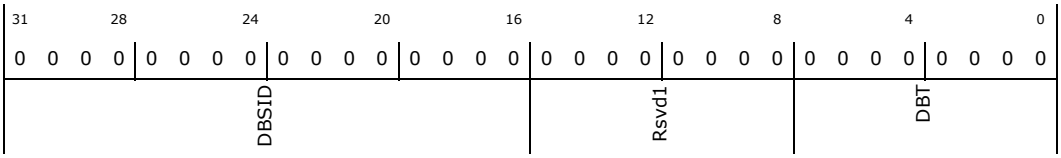
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL23: [MBAR] + 3058h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.119 Door Bell 24 (DOORBELL24)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

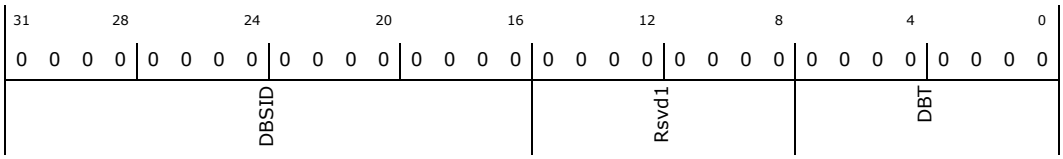
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL24: [MBAR] + 305Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.120 Door Bell 25 (DOORBELL25)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

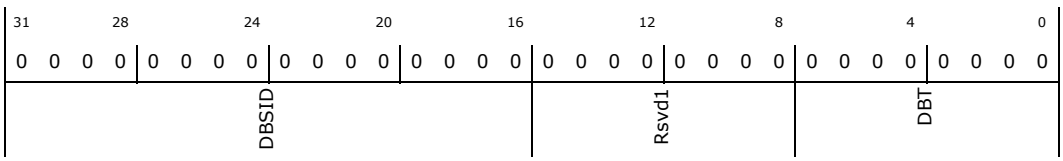
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL25: [MBAR] + 3060h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.

Bit Range	Default & Access	Description
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.121 Door Bell 26 (DOORBELL26)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

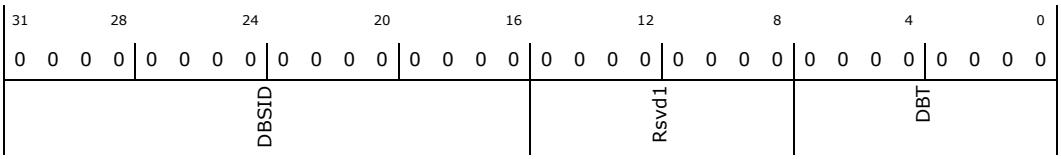
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL26: [MBAR] + 3064h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.122 Door Bell 27 (DOORBELL27)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

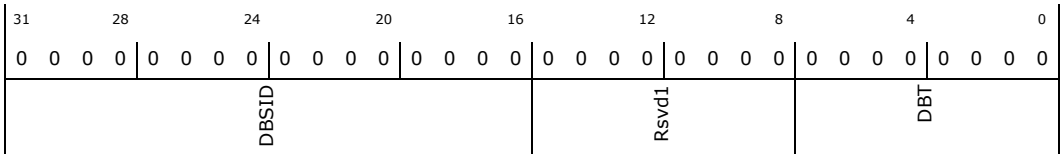
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL27: [MBAR] + 3068h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.123 Door Bell 28 (DOORBELL28)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

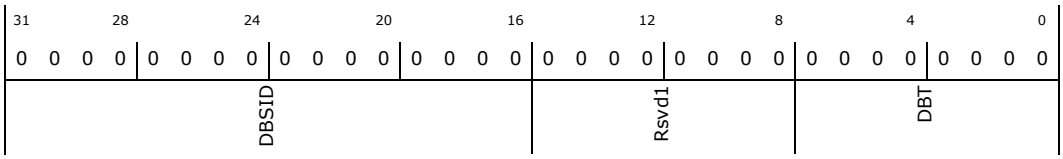
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL28: [MBAR] + 306Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.124 Door Bell 29 (DOORBELL29)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

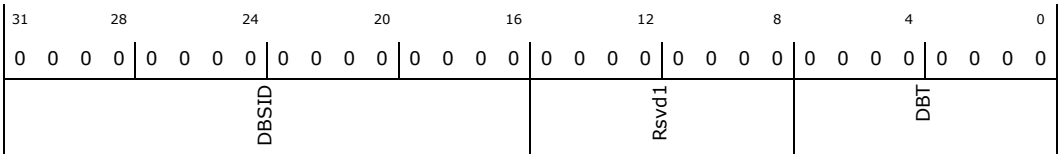
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL29: [MBAR] + 3070h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.125 Door Bell 30 (DOORBELL30)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

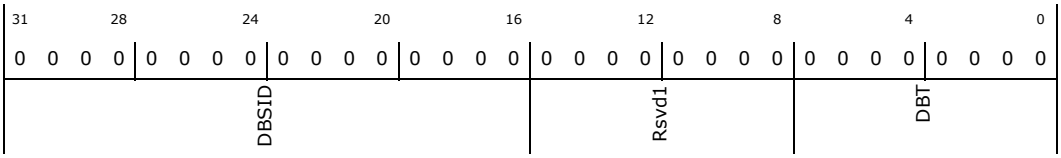
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL30: [MBAR] + 3074h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.126 Door Bell 31 (DOORBELL31)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

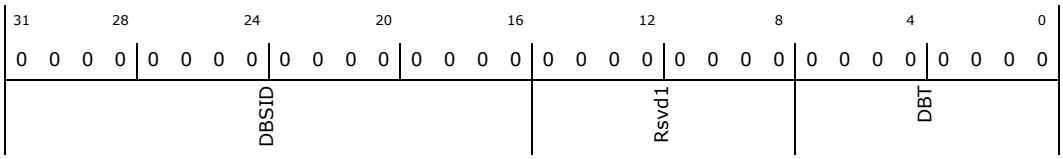
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL31: [MBAR] + 3078h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.127 Door Bell 32 (DOORBELL32)—Offset 307Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

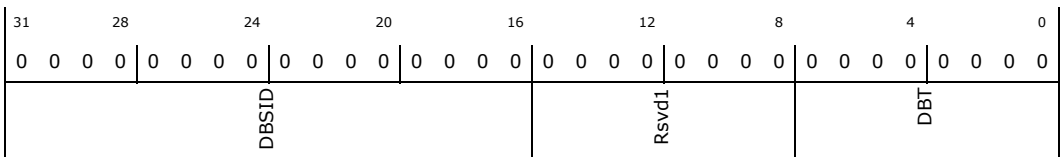
Type: Memory Mapped I/O Register (Size: 32 bits)

DOORBELL32: [MBAR] + 307Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.

Bit Range	Default & Access	Description
15:8	00h RO	**Rsvd1:** Reserved.
7:0	00h RW	**DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.

18.7.128 XECP_SUPP_USB2_0—Offset 8000h

Access Method

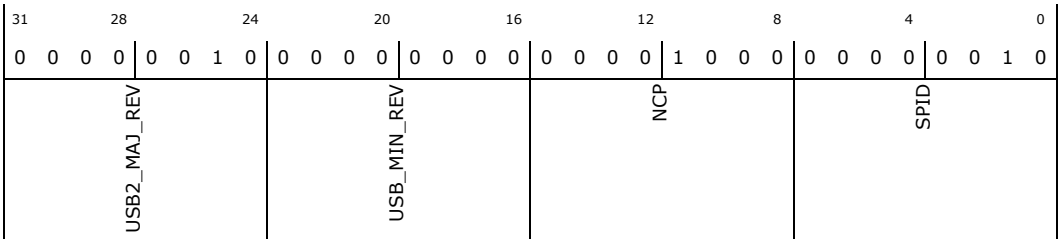
Type: Memory Mapped I/O Register (Size: 32 bits)

XECP_SUPP_USB2_0: [MBAR] + 8000h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 02000802h



Bit Range	Default & Access	Description
31:24	02h RO	**USB Major Revision: 2.0 (USB2_MAJ_REV):** Reserved.
23:16	00h RO	**USB Minor Revision (USB_MIN_REV):** Reserved.
15:8	08h RO	**Next Capability Pointer (NCP):** Reserved.
7:0	02h RO	**Supported Protocol ID (SPID):** Reserved.

18.7.129 XECP_SUPP_USB2_1—Offset 8004h

Access Method

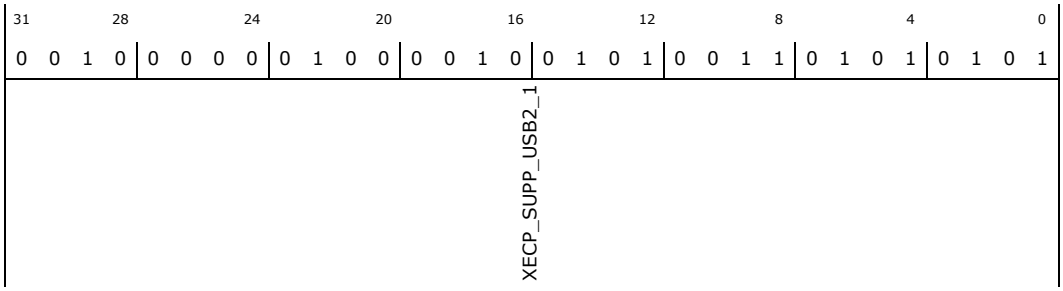
Type: Memory Mapped I/O Register (Size: 32 bits)

XECP_SUPP_USB2_1: [MBAR] + 8004h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 20425355h



Bit Range	Default & Access	Description
31:0	20425355h RO	**XECP_SUPP_USB2_1:** Namestring USB

18.7.130 XECP_SUPP_USB2_2—Offset 8008h

Access Method

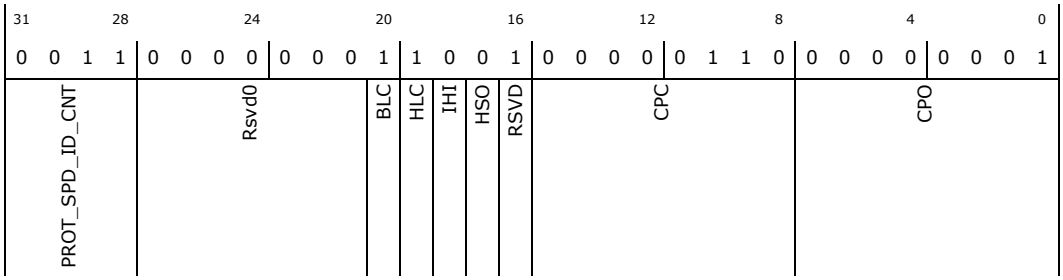
Type: Memory Mapped I/O Register (Size: 32 bits)

XECP_SUPP_USB2_2: [MBAR] + 8008h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 30190601h



Bit Range	Default & Access	Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low)
27:21	00h RO	**Rsvd0:** Reserved.
20	1b RO	**BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMC registers.
19	1b RO	**Protocol Defined - Hardware LMP Capability (HLC):** Reserved.
18	0b RO	**Protocol Defined - Integrated Hub Implementation (IHI):** Reserved.

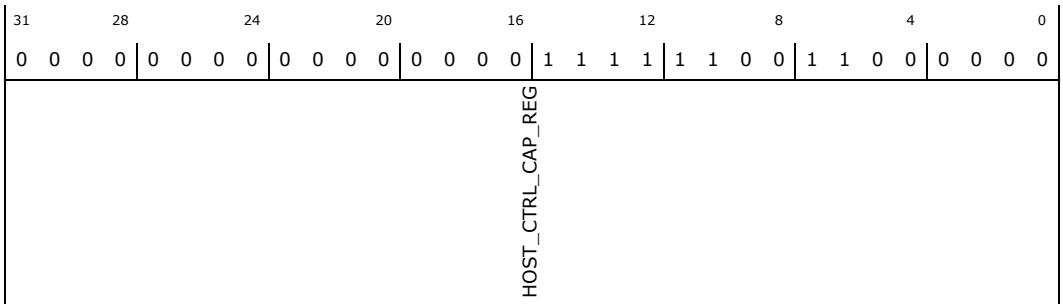
Default: 0000FCC0h



Bit Range	Default & Access	Description
31:0	0000FCC0h RW/L	**Host Controller Capability (HOST_CTRL_CAP_REG):** This is a register that describe the host controller the extended cap location. It includes the XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192

18.7.145 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

Access Method

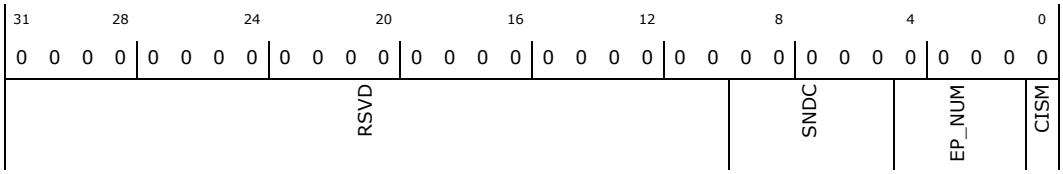
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CLR_MASK_REG: [MBAR] + 8078h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RO	**RESERVED (RSVD):** Reserved.
9:5	00h RW	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots.
4:1	0h RW	**EP Number (EP_NUM):** 4bits of EP number
0	0b RW	**Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP

18.7.146 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

Access Method

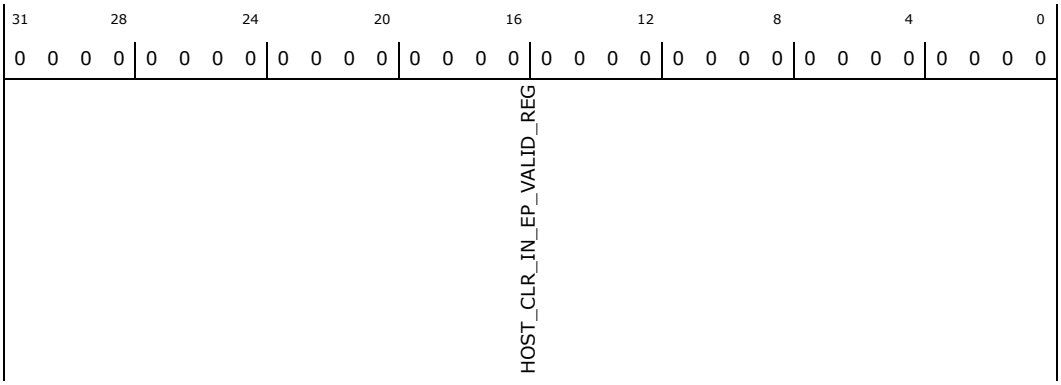
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CLR_IN_EP_VALID_REG: [MBAR] + 807Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.

18.7.147 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

Access Method

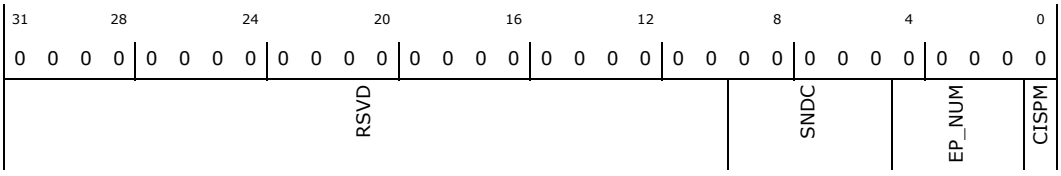
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CLR_PMASK_REG: [MBAR] + 8080h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RO	**RESERVED (RSVD):** Reserved.

Bit Range	Default & Access	Description
9:5	00h RW	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h RW	**EP Number (EP_NUM):** 4bits of EP number
0	0b RW	**Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP

18.7.148 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

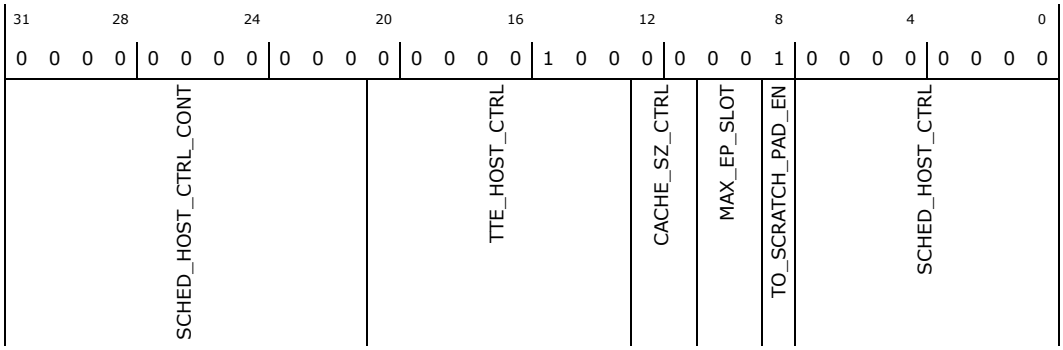
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CTRL_SCH_REG: [MBAR] + 8094h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00008100h



Bit Range	Default & Access	Description
31:21	000h RW	**Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** method of USB2 port periodic done check (off by default)
20:13	04h RW	**TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved
12:11	0h RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** • 0 = 64 • 1 = 32 • 2,3 = 16
10:9	0h RW	**Maximum EP Per Slot (MAX_EP_SLOT):** • 0 = 32 • 1 = 16 • 2 = 8 • 3 = 4
8	1b RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN):** Reserved.

Bit Range	Default & Access	Description
7:0	00h RW	**Scheduler Host Control Reg (SCHED_HOST_CTRL):** • (0): disable poll delay • (1): disable TRM active in EP valid check • (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) • (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) • (5:4) scheduler sort pattern • -- 00 (default) search ISO ahead of interrupt within each service interval • -- 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval • -- 10 - search strictly by interval • -- 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 • (6): disable 1 pack scheduling limit when ISO pending in present microframe • (7): enable check to stop scheduling on port that are not connected

18.7.149 Global Port Control (HOST_CTRL_PORT_CTRL)—Offset 80A0h

Access Method

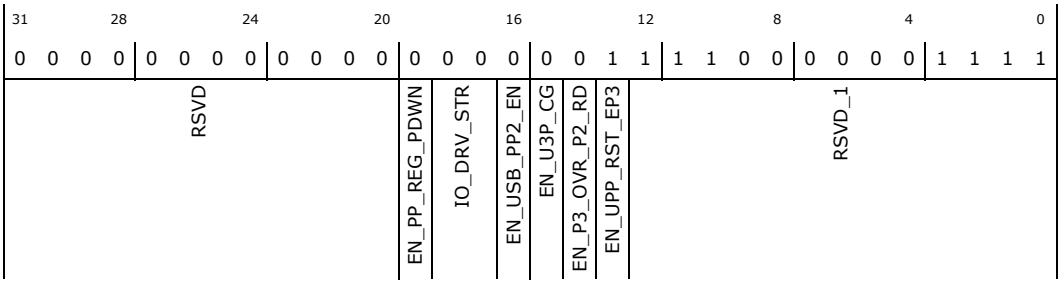
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CTRL_PORT_CTRL: [MBAR] + 80A0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00003C0Fh



Bit Range	Default & Access	Description
31:20	000h RO	**RESERVED (RSVD):** Reserved.
19	0b RW	**Enable PCIe PHY Regulator Power Down (EN_PP_REG_PDWN):** • 0 = Disable PCIe PHY regulator power down mode • 1 = Enable PCIe PHY regulator power down mode
18:17	0h RW	**IO Drive Strength (IO_DRV_STR):** This value defines IO drive strength
16	0b RW	**Enable USB PHY p2_EN (EN_USB_PP2_EN):** • 0 = Disable USB PHY P2_EN • 1 = Enable USB PHY P2_EN

Bit Range	Default & Access	Description
15	0b RW	**Enable USB3 Port Clock Gate (EN_U3P_CG):** • 0 = Disable USB3 port clock gate • 1 = Enable USB3 port clock gate
14	0b RW	**Enable P3 Override P2 RxDetect (EN_P3_OVR_P2_RD):** • 0 = Disable P3 overriding P2 in RxDetect • 1 = Enable P3 overriding P2 in RxDetect
13	1b RW	**Enable USB PHY Pipe Reset Exit P3 (EN_UPP_RST_EP3):** • 0 = Disable a USB PHY pipe reset when exit P3 • 1 = Enable a USB PHY pipe reset when exit P3
12:0	1C0Fh RO	**RESERVED (RSVD_1):** Reserved.

18.7.150 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

Access Method

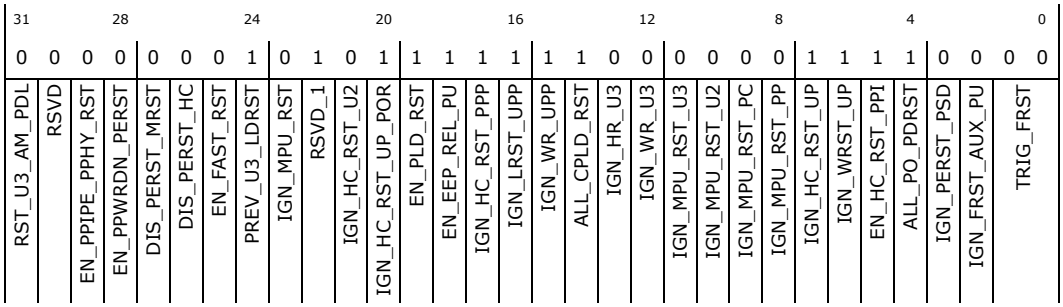
Type: Memory Mapped I/O Register (Size: 32 bits)

AUX_CTRL_REG: [MBAR] + 80C0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 015FC0F0h



Bit Range	Default & Access	Description
31	0b RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. A write of 1 to this register will issue a cold reset to USB3 ports.
30	0b RW	**RESERVED (RSVD):** Reserved.
29	0b RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.
28	0b RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.
27	0b RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.

Bit Range	Default & Access	Description
26	0b RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.
25	0b RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS
24	1b RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1, prevent a reset being generated due to the USB3 port link down condition.
23	0b RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1, ignore the main power up reset for USB3 PIPE PHY reset.
22	1b RW	**RESERVED (RSVD_1):** Reserved.
21	0b RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1', ignore HC reset to reset the USB2 Port logic.
20	1b RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1', ignore HC reset to the USB PHY power-on reset.
19	1b RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core.
18	1b RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1', enable EEPROM reload on every main power-up.
17	1b RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1', ignore HC reset to the PCIe PHY PIPE reset.
16	1b RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1', ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset.
15	1b RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1', ignore warm reset the USB PHY power on reset.
14	1b RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1', allow PCIe link down to cause a reset to the rest of the core.
13	0b RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1', ignore hot reset to the USB3 port logic.
12	0b RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1', ignore warm reset to the USB3 port logic
11	0b RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1', ignore main power up reset to USB3 port logic.
10	0b RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1', ignore main power up reset to USB2 port logic.
9	0b RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1', ignore main power up reset to PCIe core.
8	0b RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1', ignore main power up reset to PCIe PHY.
7	1b RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1', ignore HC reset to the USB PHY.
6	1b RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1', ignore warm reset to the USB PHY.
5	1b RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function.

Bit Range	Default & Access	Description
4	1b RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1', allow main power off condition to trigger a main power domain reset.
3	0b RW	**Ignore Wait For PERST# During Power Shut Down (IGN_PERST_PSD):** When set to '1', ignore waiting for PERST# deassertion during main power shut down.
2	0b RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** If this bit is set and a fundamental reset is asserted during AUX power up, then PERST# shall be ignored and a timeout will be allowed to deassert fundamental reset instead.
1:0	0h RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset

18.7.151 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Access Method

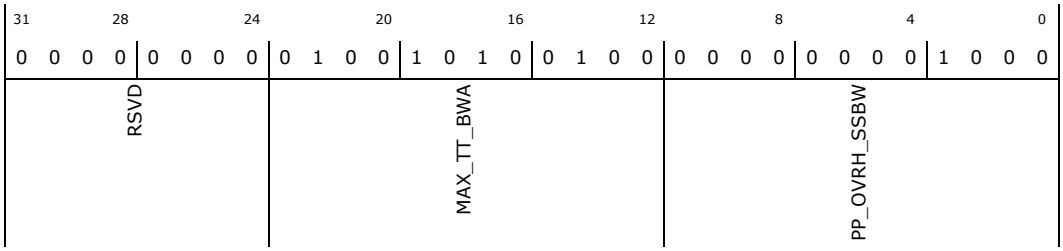
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_BW_OV_SS_REG: [MBAR] + 80C4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 004A4008h



Bit Range	Default & Access	Description
31:24	00h RO	**RESERVED (RSVD):** Reserved.
23:12	4A4h RW	**Max. TT BW Allowed (MAX_TT_BWA):** see white paper
11:0	008h RW	**Per Packet Overhead SS BW (PP_OVRH_SSBW):** BW calculation: Overhead per packet for SS BW calculations. see white paper.

18.7.152 High Speed TT Bandwidth Overload (HOST_BW_OV_HS_REG)—Offset 80C8h

Access Method

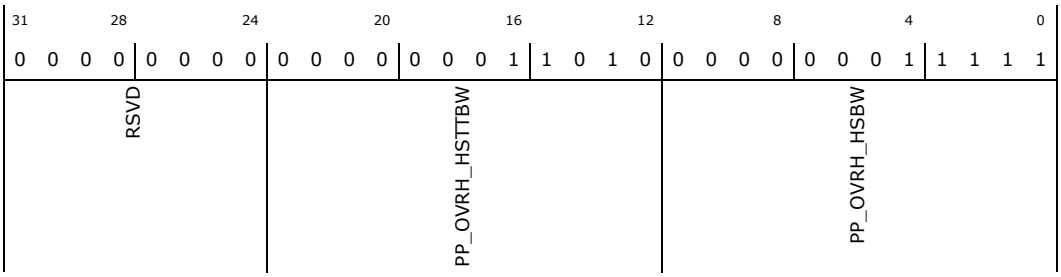
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_BW_OV_HS_REG: [MBAR] + 80C8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0001A01Fh



Bit Range	Default & Access	Description
31:24	00h RO	**RESERVED (RSVD):** Reserved.
23:12	01Ah RW	**Per Packet Overhead HS-TT BW (PP_OVRH_HSTTBW):** BW calculation: Overhead per packet for HS-TT BW calculations. see white paper.
11:0	01Fh RW	**Per Packet Overhead HS BW (PP_OVRH_HSBW):** BW calculation: Overhead per packet for HS BW calculations. see white paper.

18.7.153 Bandwidth Overload Full Low Speed (HOST_BW_OV_FS_LS_REG)—Offset 80CCh

Access Method

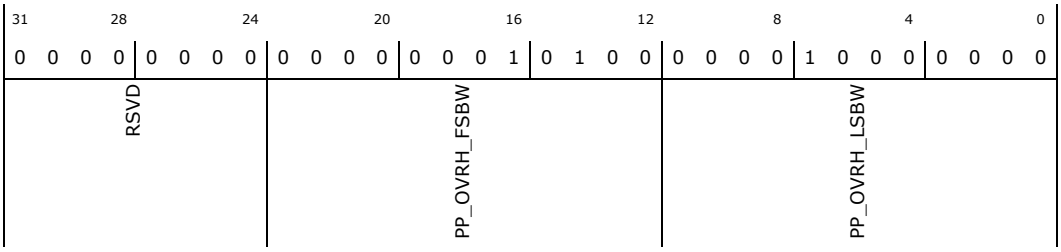
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_BW_OV_FS_LS_REG: [MBAR] + 80CCh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00014080h



Bit Range	Default & Access	Description
31:24	00h RO	**RESERVED (RSVD):** Reserved.
23:12	014h RW	**Per Packet Overhead FS BW (PP_OVRH_FSBW):** BW calculation: Overhead per packet for FS BW calculations. see white paper.
11:0	080h RW	**Per Packet Overhead LS BW (PP_OVRH_LSBW):** BW calculation: Overhead per packet for LS BW calculations. see white paper.

18.7.154 System Bandwidth Overload (HOST_BW_OV_SYS_REG)—Offset 80D0h

Access Method

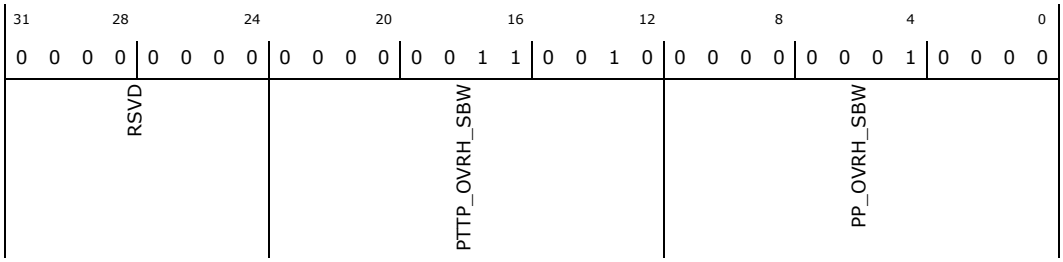
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_BW_OV_SYS_REG: [MBAR] + 80D0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00032010h



Bit Range	Default & Access	Description
31:24	00h RO	**RESERVED (RSVD):** Reserved.
23:12	032h RW	**Per TT Packet Overhead System BW (PTTP_OVRH_SBW):** BW calculation: Overhead per TT packet for System BW calculations. see white paper.
11:0	010h RW	**Per Packet Overhead System BW (PP_OVRH_SBW):** BW calculation: Overhead per packet for System BW calculations. see white paper.

18.7.155 Scheduler Async Delay (HOST_CTRL_SCH_ASYNC_DELAY_REG)—Offset 80D4h

Global defaults for inserting delays between packets in the scheduler for async. types.

Access Method

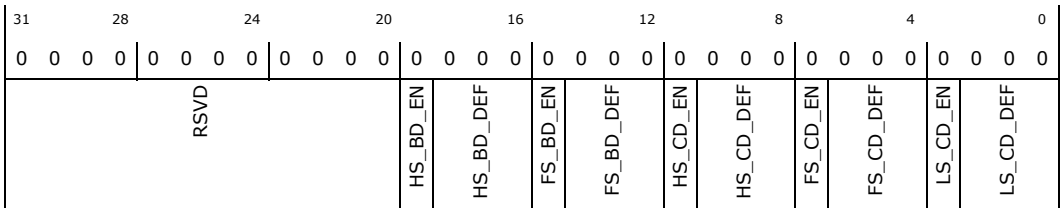
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CTRL_SCH_ASYNC_DELAY_REG: [MBAR] + 80D4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:20	000h RO	**RESERVED (RSVD):** Reserved.
19	0b RW	**High-Speed Bulk Delay Enable (HS_BD_EN):** Reserved.
18:16	0h RW	**High-Speed Bulk Delay Default (HS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
15	0b RW	**Full-Speed Bulk Delay Enable (FS_BD_EN):** Reserved.
14:12	0h RW	**Full-Speed Bulk Delay Default (FS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
11	0b RW	**High-Speed Control Delay Enable (HS_CD_EN):** Reserved.
10:8	0h RW	**High-Speed Control Delay Default (HS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
7	0b RW	**Full-Speed Control Delay Enable (FS_CD_EN):** Reserved.
6:4	0h RW	**Full-Speed Control Default (FS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
3	0b RW	**Low-Speed Control Delay Enable (LS_CD_EN):** Reserved.
2:0	0h RW	**Low-Speed Control Delay Default (LS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)

18.7.156 AUX Power PHY Reset (UPORTS_PON_RST_REG)—Offset 80D8h

Access Method

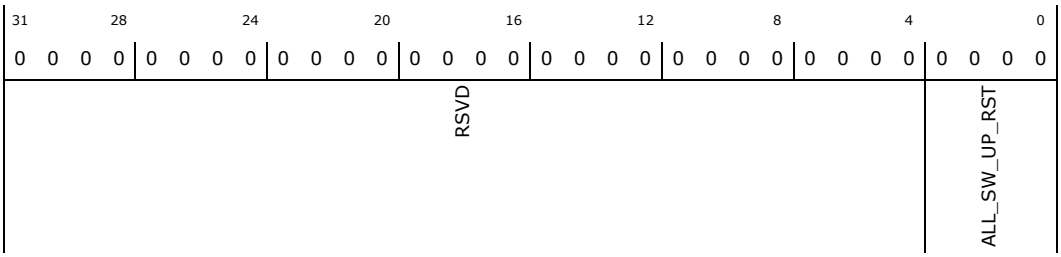
Type: Memory Mapped I/O Register (Size: 32 bits)

UPORTS_PON_RST_REG: [MBAR] + 80D8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0000000h RO	**RESERVED (RSVD):** Reserved.

Bit Range	Default & Access	Description
3:0	0h WO	**Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY

18.7.157 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

AUX_CTRL_REG1: [MBAR] + 80E0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 808DBCA0h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

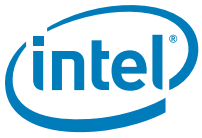
D3_HOT_FXN_EN	ALL_L1_CORE_CG	AL_EP_SEXT	ALL_EP_RCP	AL_PERST_FRST	OVR_PCIE_P2_P1	SET_ISSV_1	CLR_ISSV_0	EN_SRE_SW_LD	RSVD_1	FORCE_SR1	CPTR	CIDS1	CIDS0	EN_CFG_UP2	CCGD	EN_CFG_RDP3	EN_CFG_PIPE_RST	EN_FILT_TX_IDLE	EN_HE_GEN_PME	EN_ISOL	EN_L1_P2_OVR	EN_CORE_CG	EN_PHY_STS_TO	IGN_APE_PC	EN_P2_OVR_P1	EN_P2_REM_WAKE	FORCED_PM_STATE				INIT_FPMS

Bit Range	Default & Access	Description
31	1b RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from a pin input set to 1, but we allow software to alter it, if needed. • 1 = D3 hot enabled • 0 = D3 hot not abled.
30	0b RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.
29	0b RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.
28	0b RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.
27	0b RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset
26	0b RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.
25	0b RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.
24	0b RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.



Bit Range	Default & Access	Description
23	1b RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.
22	0b RW	**RESERVED (RSVD_1):** Reserved.
21	0b RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.
20	0b RW	**cfg pcie txreg rd (CPTR):** Reserved.
19	1b RW	**cfg iob drivestrength[1] (CIDS1):** Reserved.
18	1b RW	**cfg iob drivestrength[0] (CIDS0):** Reserved.
17	0b RW	**Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2
16	1b RW	**cfg clk gate dis (CCGD):** Reserved.
15	1b RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3
14	0b RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst
13	1b RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCie PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states.
12	1b RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to enable or not enable the host engine to generate a PME message.
11	1b RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation
10	1b RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function.
9	0b RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
8	0b RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle.
7	1b RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support
6	0b RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.
5	1b RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering
4:1	0h RW	**Forced PM State (FORCED_PM_STATE):** Reserved.
0	0b RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1

18.7.158 Battery Charge (BATTERY_CHARGE_REG)—Offset 80E4h

Access Method

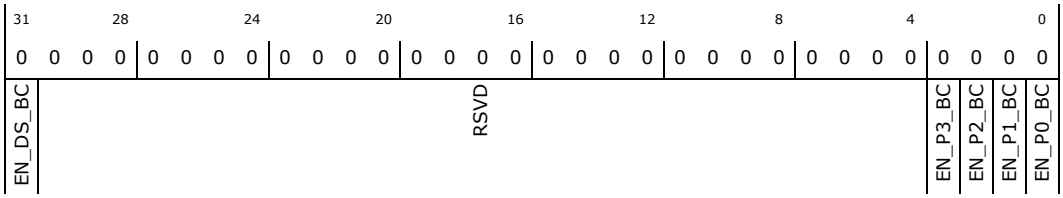
Type: Memory Mapped I/O Register (Size: 32 bits)

BATTERY_CHARGE_REG: [MBAR] + 80E4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**Enable DM_SRC Battery Charge (EN_DS_BC):** • 1 - Always enable battery charge DM_SRC if not connected. Don't wait for portable device detect. (spec. ver. 1.2) • 0 - Battery charge spec ver. 1.1.
30:4	0000000h RO	**RESERVED (RSVD):** Reserved.
3	0b RW	**Enable Port 3 Battery Charging (EN_P3_BC):** • 0 - Battery charging disabled (Physical Port #3) • 1 - Battery charging enabled (Physical Port #3)
2	0b RW	**Enable Port 2 Battery Charging (EN_P2_BC):** • 0 = Battery charging disabled (Physical Port #2) • 1 = Battery charging enabled (Physical Port #2)
1	0b RW	**Enable Port 1 Battery Charging (EN_P1_BC):** • 0 = Battery charging disabled (Physical Port #1) • 1 = Battery charging enabled (Physical Port #1)
0	0b RW	**Enable Port 0 Battery Charging (EN_P0_BC):** • 0 = Battery charging disabled (Physical Port #0) • 1 = Battery charging enabled (Physical Port #0)

18.7.159 Port Watermark (HOST_CTRL_WATERMARK_REG)—Offset 80E8h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CTRL_WATERMARK_REG: [MBAR] + 80E8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

15:0	0080h RW	**XBUF water mark (XBUF_WM):** Reserved.

18.7.160 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

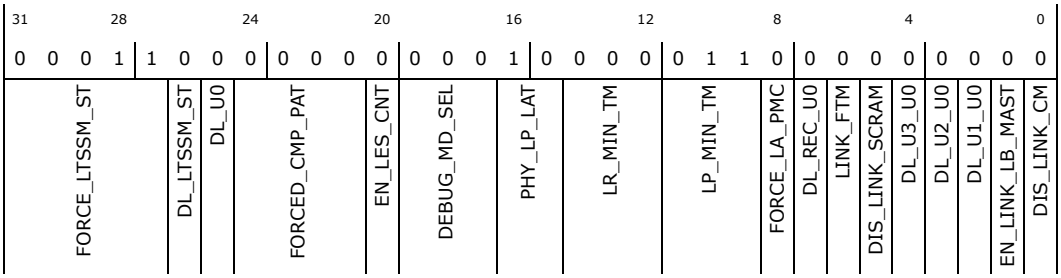
Type: Memory Mapped I/O Register (Size: 32 bits)

HOST_CTRL_PORT_LINK_REG: [MBAR] + 80ECh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 18010600h



Bit Range	Default & Access	Description
31:27	03h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be forced This value is for test purpose only.
26	0b RW	**Direct Link LTSSM State (DL_LTSSM_ST):** • 0 = Normal operation mode • 1 = Direct link to a specific state specified by bit 31:27 This bit is for test purposes only. It shall be written 0 in normal operation mode.
25	0b RW	**Direct Link To U0 (DL_U0):** • 0 = Normal operation mode • 1 = Direct link to U0 This bit is for test purposes only. It shall be written 0 in normal operation mode.
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode This value is for test purpose only.

Bit Range	Default & Access	Description
20	0b RW	**Enable Link Error Slave Count (EN_LES_CNT):** • 0 = Disable link error slave count • 1 = Enable link error slave count
19:17	0h RW	**Debug Mode Select (DEBUG_MD_SEL):** Reserved.
16:15	2h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode. • 0 = 4 cycles • 1 = 8 cycles • 2 = 16 cycles • 3 = 32 cycles
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us.
11:9	3h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us.
8	0b RW	**Force Link Accept PM Command (FORCE_LA_PMC):** • 0 = Normal operation mode • 1 = Force link to accept power management command
7	0b RW	**Direct Link Recovery U0 (DL_REC_U0):** • 0 = Normal operation mode • 1 = Direct link to Recovery from U0
6	0b RW	**Link Fast Training Mode (LINK_FTM):** • 0 = Normal operation mode • 1 = Link fast training mode This bit should be written 0 in normal operation.
5	0b RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** • 0 = Enable link scrambler • 1 = Disable link scramber
4	0b RW	**Direct Link U3 From U0 (DL_U3_U0):** • 0 = Normal operation mode • 1 = Direct link to U3 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode.
3	0b RW	**Direct Link U3 From U0 (DL_U2_U0):** • 0 = Normal operation mode • 1 = Direct link to U2 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode.
2	0b RW	**Direct Link U3 From U0 (DL_U1_U0):** • 0 = Normal operation mode • 1 = Direct link to U1 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode.
1	0b RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** • 0 = Disable link loopback master mode • 1 = Enable link loopback master mode
0	0b RW	**Disable Link Compliance Mode (DIS_LINK_CM):** • 0 = Enable link compliance mode • 1 = Disable link compliance mode

18.7.161 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

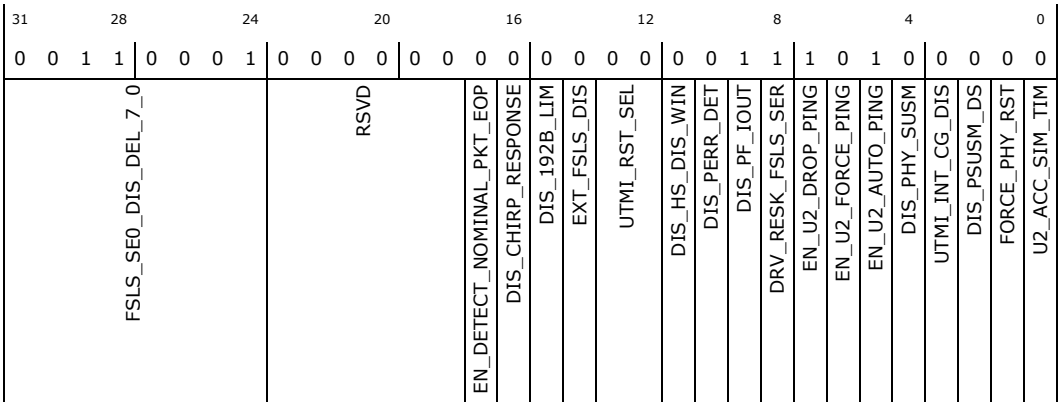
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2_LINK_MGR_CTRL_REG1: [MBAR] + 80F0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 310003A0h



Bit Range	Default & Access	Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.
23:18	00h RW	**Reserved (RSVD):** Reserved.
17	0b RW	**EN_DETECT_NOMINAL_PKT_EOP:** • 0 = Detect minimal packet EOP. • 1 = Detect nominal packet EOP.
16	0b RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** • 0 = Normal • 1 = Force full speed on host ports (disable chirp response)
15	0b RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** • 0 = Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. • 1 = Disable 192 byte limit check.
14	0b RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** • 0 = Internal FS/LS Disconnect from linestate(1:0) • 1 = External provided FS/LS Disconnect from hostdisconnect input

Bit Range	Default & Access	Description
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL):** Select UTMI Reset Source (FRD UTMI Reset Only) • 00 = HCReset or Force PHY Reset or internal reset after disconnect/suspend for restart (default) • 01,11 = UTMI reset = ~UTMI suspendm • 10 = UTMI reset = ~UTMI suspendm and synchronization to port clk.
11	0b RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN):** • 0 = Enable HS Disconnect Window Function • 1 = Disable HS Disconnect Window Function
10	0b RW	**Disable Port Error Detection (DIS_PERR_DET):** • 0 = Enable Port Error Detection (default) • 1 = Disable Port Error Detection
9	1b RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT):** • 0 = Enable Peek function for ISO-OUT (default) • 1 = Disable Peek function for ISO-OUT
8	1b RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER):** • 0 = Drive Resume-K on parallel Interface • 1 = Drive Resume-K directly on FS/LS Serial Interface (default)
7	1b RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING):** • 0 = Disable Drop-Ping Function in USB2 Protocol (default) • 1 = Enable Drop-Ping Function in USB2 Protocol
6	0b RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING):** • 0 = Disable Force-Ping Function in USB2 Protocol (default) • 1 = Enable Force-Ping Function in USB2 Protocol
5	1b RW	**Enable USB2 Auto-Ping (EN_U2_AUTO_PING):** • 0 = Disable Auto-Ping Function • 1 = Enable Auto-Ping Function in USB2 Protocol (default)
4	0b RW	**Disable PHY SuspendM (DIS_PHY_SUSM):** • 0 = PHY is suspend=U3,U2,disconnect (default) • 1 = Disable PHY SuspendM in All States
3	0b RW	**UTMI Internal Clock Gate Disable (UTMI_INT_CG_DIS):** • 0 = Normal operation (internal clock gated in U2,U3,disconnect) • 1 = UTMI Internal Clock Gate Disable
2	0b RW	**Disable PHY SuspendM in Disconnect State (DIS_PSUSM_DS):** • 0 = PHY is suspendM=0 in Disconnect State (default) • 1 = Disable PHY SuspendM in Disconnect State
1	0b RW	**Force PHY Reset (FORCE_PHY_RST):** • 0 = Normal Operation (default) • 1 = Force PHY Reset
0	0b RW	**USB2 Accelerated Simulation Timing (U2_ACC_SIM_TIM):** • 0 = Normal Operation (default - FPGA/ASIC) • 1 = USB2 Accelerated Simulation Timing (default - simulation)

18.7.162 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

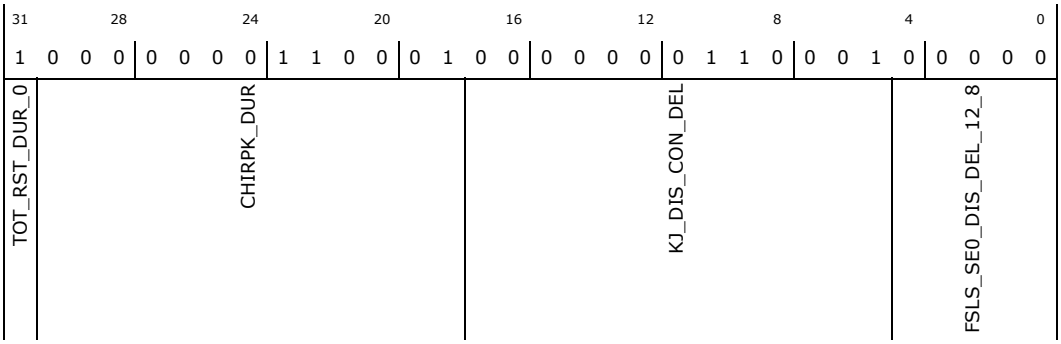
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2_LINK_MGR_CTRL_REG2: [MBAR] + 80F4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 80C40620h



Bit Range	Default & Access	Description
31	1b RW	**Total Reset Duration[0] (TOT_RST_DUR_0):** # of microseconds for total reset duration
30:18	0031h RW	**Chirp-K Duration (CHIRPK_DUR):** # of microseconds of Chirp-K to register that a device is chirping
17:5	0031h RW	**K/J Disconnect Connect Delay (KJ_DIS_CON_DEL):** # of microseconds of K/J in disconnected state to register connect has occurred.
4:0	00h RW	**FS/LS Mode SE0 Disconnect Delay[12:8] (FSLS_SE0_DIS_DEL_12_8):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.

18.7.163 USB2 Port Link Control 3 (USB2_LINK_MGR_CTRL_REG3)—Offset 80F8h

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

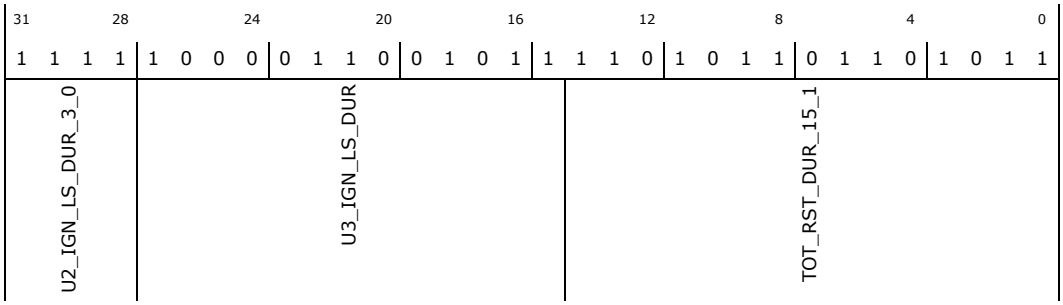
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2_LINK_MGR_CTRL_REG3: [MBAR] + 80F8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: F865EB6Bh



Bit Range	Default & Access	Description
31:28	Fh RW	**U2 Entry Ignore Linestate Changes Duration[3:0] (U2_IGN_LS_DUR_3_0):** # of microseconds after entering U2, linestate changes are ignored as bus settles
27:15	10CBh RW	**U3 Entry Ignore Linestate Changes Duration (U3_IGN_LS_DUR):** # of microseconds after entering U3, linestate changes are ignored as bus settles
14:0	6B6Bh RW	**Total Reset Duration[15:1] (TOT_RST_DUR_15_1):** # of microseconds for total reset duration

18.7.164 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

USB2_LINK_MGR_CTRL_REG4: [MBAR] + 80FCh

MBAR Type: PCI Configuration Register (Size: 32 bits)

11:5	0h RO	**BELT Value (BELTV):** Value of selected BELT is return in this field
4:0	00h RW	**Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)

18.7.175 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Access Method

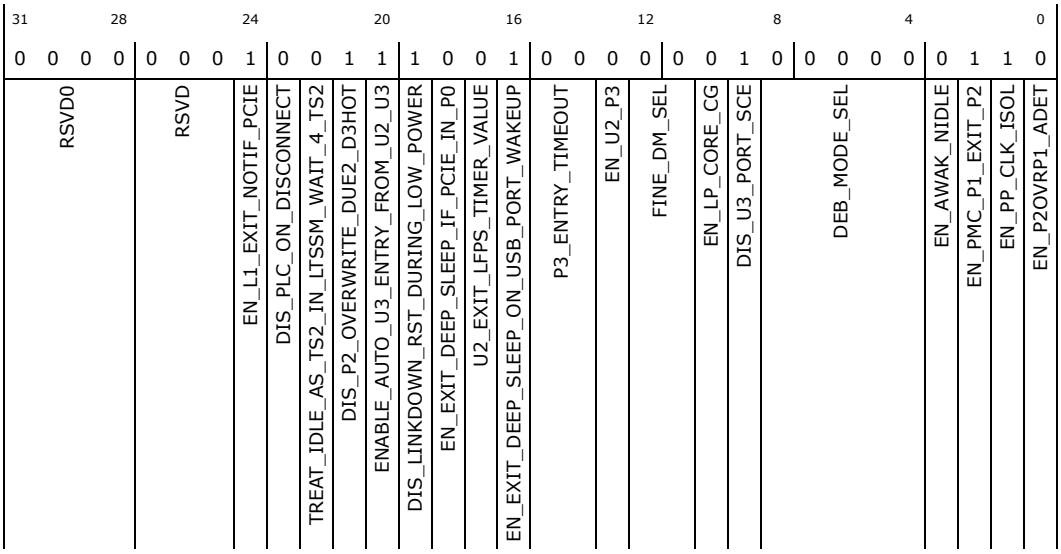
Type: Memory Mapped I/O Register (Size: 32 bits)

AUX_CTRL_REG2: [MBAR] + 8154h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: SUS

Default: 01390206h



Bit Range	Default & Access	Description
31:28	0h RW	**RESERVED0 (RSVD0):** Reserved.
27:25	0h RW	**RESERVED (RSVD):** Reserved.
24	1b RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCie core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. • 1 = enables this feature • 0 = disables this feature.
23	0b RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** • 1 = do not assert PLC for disconnection • 0 = assert PLC for disconnection
22	0b RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCie core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. • 1 = treat Logic IDLE as TS2 received when in some PCIe LTSSM state. • 0 = disable this feature.
21	1b RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. • 1 = disables p2 overwrite due to the D3HOT where PCIe core enters the L1. • 0 = enables P2 overwrite even if we are in D3Hot.
20	1b RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** • 1 = enables the port to enter U3 automatically when in U1/U2 • 0 = disables the port to enter U3 automatically when in U1/U2

Bit Range	Default & Access	Description
19	1b RW	**No linkdown reset is issued during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issued during low power state.
18	0b RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. • 1 = enable this feature • 0 = disable this feature
17	0b RW	**U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value. • 0 = 320ns 400ns in 25MHz domain • 1 = 240ns 320ns in 25MHz domain
16	1b RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. • 1 = enables this function • 0 = disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.
15:14	0h RW	**P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2. • 00 = 7us 8us • 01 = 511us 512us • 10 = disables the timer (0us) • 11 = disables the timer (0us)
13	0b RW	**Enable U2 P3 Mode (EN_U2_P3):** • 0 = Disable U2 P3 mode • 1 = Enable U2 P3 mode
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL):** Reserved.
10	0b RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1', enable core clock gating based on low power state entered
9	1b RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** • 0 = Enable USB3 port status change event generation if any change bit is not cleared • 1 = Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0
8:4	00h RW	**Debug Mode Select Register (DEB_MODE_SEL):** Reserved.
3	0b RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1, enables the auto wakeup function when engine has identified non IDLE condition.
2	1b RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set to 1, enables the PM control module to transition to P1 instead of P0 upon exit from P2.
1	1b RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1, enables the PCIe PIPE CLK to be isolated when main power is removed.
0	0b RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1, enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.

18.7.176 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Access Method

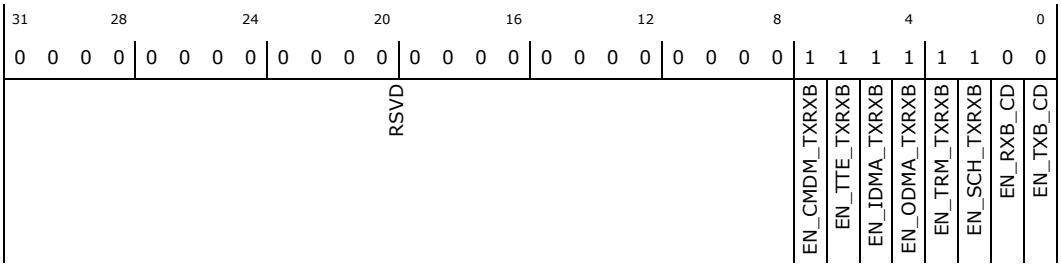
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2_PHY_PMC: [MBAR] + 8164h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 000000FCh



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved (RSVD):** Reserved.
7	1b RW	**EN_CMDM_TXRXB:** Enable Command Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
6	1b RW	**EN_TTE_TXRXB:** Enable TTE Active indication for Tx/Rx Bias circuit HS Phy PM Policy
5	1b RW	**EN_IDMA_TXRXB:** Enable IDMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
4	1b RW	**EN_ODMA_TXRXB:** Enable ODMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
3	1b RW	**EN_TRM_TXRXB:** Enable Transfer Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
2	1b RW	**EN_SCH_TXRXB:** Enable Scheduler Active indication for Tx/Rx Bias circuit HS Phy PM Policy
1	0b RW	**Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)
0	0b RW	**Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)

18.7.177 USB Power Gating Control (USB_PGC)—Offset 8168h

Access Method

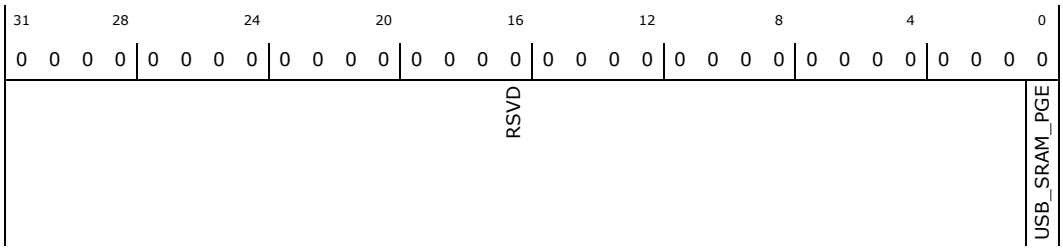
Type: Memory Mapped I/O Register (Size: 32 bits)

USB_PGC: [MBAR] + 8168h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:1	00000000h RO	**Reserved (RSVD):** Reserved.
0	0b RW	**USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse.

18.7.178 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

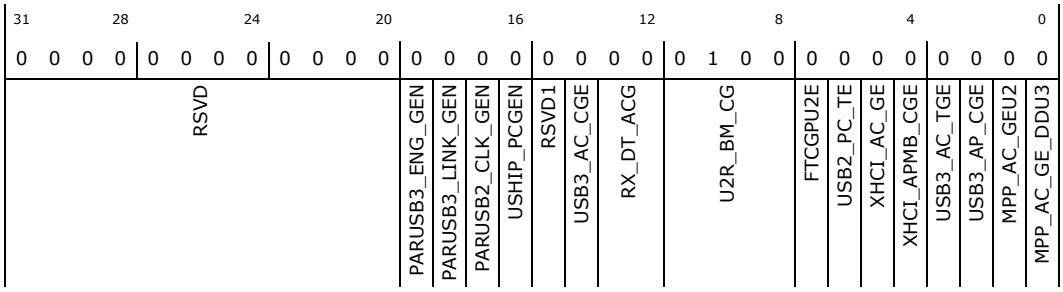
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

XHCI_AUX_CCR: [MBAR] + 816Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000400h



Bit Range	Default & Access	Description
31:20	000h RO	**Reserved (RSVD):** Reserved.
19	0b RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.
18	0b RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.
17	0b RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.

Bit Range	Default & Access	Description
16	0b RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.
15	0b RO	**Reserved1 (RSVD1):** Reserved
14	0b RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it, irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. • 0x0 = 100ms • 0x1 = 12ms • Others = Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.
11:8	4h RW	**U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. • 0x0 = 1us • 0x1 = 128us • 0x2 = 256us • 0x3 = 512us • 0x4 = 640us • 0x5 = 768us • 0x6 = 896us • 0x7 = 1024us • Others = Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.
6	0b RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.
5	0b RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
4	0b RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
3	0b RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
2	0b RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

Bit Range	Default & Access	Description
1	0b RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
0	0b RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

18.7.179 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h

Access Method

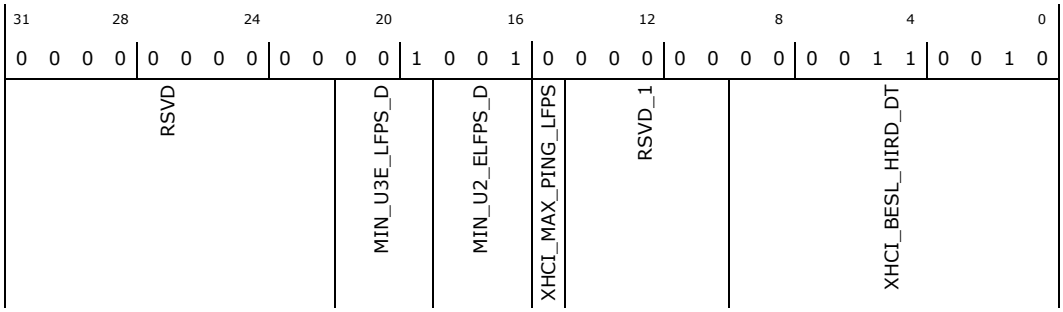
Type: Memory Mapped I/O Register (Size: 32 bits)

USB_LPM_PARAM: [MBAR] + 8170h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00090032h



Bit Range	Default & Access	Description
31:22	000h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
21:19	001b RW	**Min U3 Exit LFPS Duration (MIN_U3E_LFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U3 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller. • • 0b000 = 96us • 0b001 = 160us • 0b010 = 224us • 0b011 = 288us • 0b100 = 352us • 0b101 = 416us • 0b110 = 480us • 0b111 = 544us
18:16	001b RW	**Min U2 Exit LFPS Duration (MIN_U2_ELFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U2 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller. • 0b000 = 96us • 0b001 = 160us • 0b010 = 224us • 0b011 = 288us • 0b100 = 352us • 0b101 = 416us • 0b110 = 480us • 0b111 = 544us
15	0b RW	**Max PING LFPS Rx Detection (XHCI_MAX_PING_LFPS):** This field defines the maximum timing for PING LFPS. If an incoming LFPS will be considered a PING if it has a timing such that it is less than or equal to the selected value. Otherwise it will be considered for the other types of LFPS. • 0b Max PING LFPS timing set to 256 ns • (32 link clocks) • 1b Max PING LFPS timing set to 320 ns (40 link clocks)
14:10	00h RO	**Reserved (RSVD_1):** Reserved.
9:0	032h RW	**xHCI BESL to HIRD Distance (XHCI_BESL_HIRD_DT):** This field defines the gap between BESL and duration of Resume signalling from Host upon Host Initiated Resume from USB2.0 LPM. The default value of this register corresponds to xHCI spec defined 50us value. • Value BESL to HIRD Distance • 000h = 0us • 001h = 1us • 002h = 2us • 3FFh = 1023us

18.7.180 xHC Latency Tolerance Parameters - LTV Control (XLTP_LTV1)—Offset 8174h

Access Method

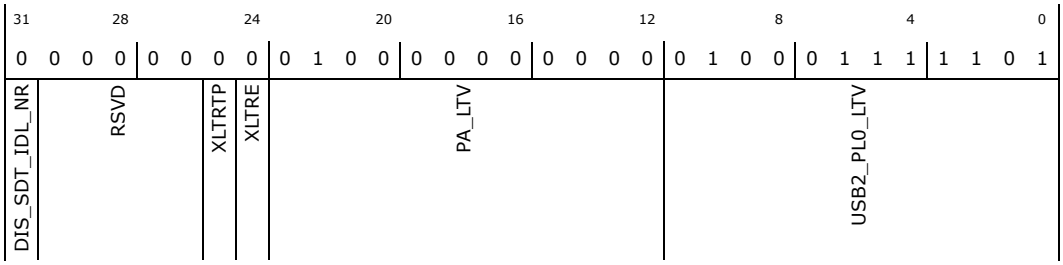
Type: Memory Mapped I/O Register (Size: 32 bits)

XLTP_LTV1: [MBAR] + 8174h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0040047Dh



Bit Range	Default & Access	Description
31	0b RW	**Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR):** • 0 = (default) allow scheduler direct transition from IDLE to NO requirement • 1 = Disable scheduler direct transition from IDLE to NO requirement
30:26	00h RW	**Reserved (RSVD):** Reserved.
25	0b RW	**XHCI LTR Transition Policy (XLTRTP):** When '0', LTR messaging state machine transitions from High, Medium, or Low LTR states to Active state upon the Alarm Timer timout and stays in Active until the next service boundary. When '1', the LTR messaging state machine transitions through High ? Med ? Low ? Active states assuming enough latency is available for each transition.
24	0b RW	**XHCI LTR Enable (XLTRE):** This bit must be set to enable LTV messaging from XHCI to the PMC.
23:12	400h RW	**Periodic Active LTV (PA_LTV):** • **23:22 Latency Scale** • 00b = Reserved • 01b = Latency Value to be multiplied by 1024 • 10b = Latency Value to be multiplied by 32,768 • 11b = Latency Value to be multiplied by 1,048,576 • • **21:12 Latency Value (ns) Defaults to 0 microseconds**
11:0	47Dh RW	**USB2 Port L0 LTV (USB2_PL0_LTV):** • **11:10 Latency Scale** • 00b = Reserved • 01b = Latency Value to be multiplied by 1024 • 10b = Latency Value to be multiplied by 32,768 • 11b = Latency Value to be multiplied by 1,048,576 • • **9:0 Latency Value Defaults to 128 Microseconds(ns)**

18.7.181 xHC Latency Tolerance Parameters LTV Control 2 (XLTP_LTV2)—Offset 8178h

Access Method

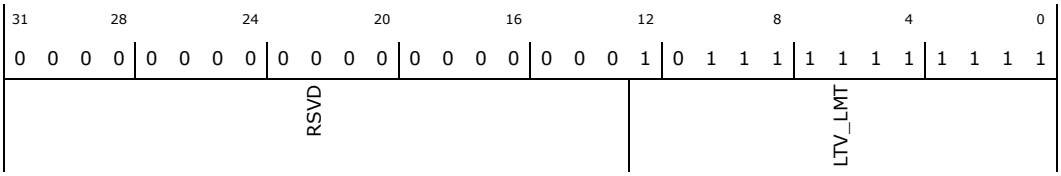
Type: Memory Mapped I/O Register (Size: 32 bits)

XLTP_LTV2: [MBAR] + 8178h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 000017FFh



Bit Range	Default & Access	Description
31:13	00000h RO	**Reserved (RSVD):** Reserved.
12:0	17FFh RW	**LTV Limit (LTV_LMT):** This register defines a maximum LTR value that is allowed to be advertised to the PMC. This is meant to be used as a workaround or mitigation if issues are discovered with the LTR values generated by the XHC using the defined algorithms. If the LTR value of the XHC is larger than the value in this register field, the value in this field is sent to the PMC instead. Default value is the highest possible - 101b • 12:10: Latency Multiplier Field • 000b - Value times 1 ns • 001b - Value times 32 ns • 010b - Value times 1,024 ns • 011b - Value times 32,768 ns • 100b - Value times 1,048,576 ns • 101b - Value times 33,554,432 ns • 110b-111b - Not Permitted • 9:0: Latency Value Default = 3FFh

18.7.182 xHC Latency Tolerance Parameters - High Idle Time Control (XLTP_HITC)—Offset 817Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

XLTP_HITC: [MBAR] + 817Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)

18.7.190 Debug Capability ID Register (DCID)—Offset 8480h

The Debug Capability *ID Register* links the USB Debug Capability into the xHCI list of Extended Capabilities and defines its basic capabilities. This register is modified and maintained by BIOS.

Access Method

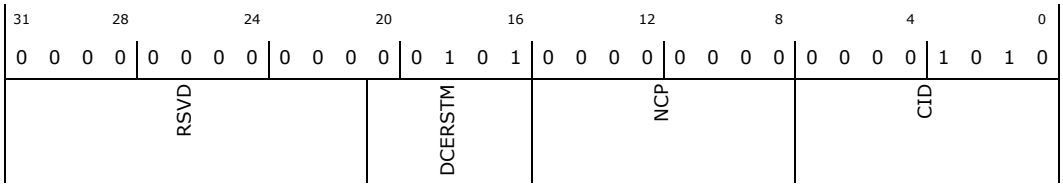
Type: Memory Mapped I/O Register (Size: 32 bits)

DCID: [MBAR] + 8480h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0005000Ah



Bit Range	Default & Access	Description
31:21	000h RO	**Reserved (RSVD):** Reserved.
20:16	05h RW	**Debug Capability Event Ring Segment Table Max (DCERSTM):** Valid values are 0 15. This field determines the maximum value supported by the Debug Capability Event Ring Segment Table Base Size registers (see xHCI USB specification), where: The maximum number of Event Ring Segment Table entries = 2^(DCERST Max) e.g. if DCERST Max = 7, then the *Debug Capability Event Ring Segment Table(s)* supports up to 128 entries, 15 then 32K entries, etc. Note: This register is sticky.

Bit Range	Default & Access	Description
15:8	00h RW	**Next Capability Pointer (NCP):** This field indicates the location of the next capability with respect to the effective address of this capability. Refer to the xHCI USB specification for more information on this field. Note: This register is sticky.
7:0	0Ah RW	**Capability ID (CID):** Refer to the xHCI USB specification for descriptions of the capabilities listed below. Note: This register is sticky. • 0 = Reserved • 1 = USB Legacy Support • 2 = Supported Protocol • 3 = Extended Power Management • 4 = I/O Virtualization • 5 = Message Interrupt • 6 = Local Memory • 7-9 = Reserved

18.7.191 Debug Capability Doorbell Register (DCDB)—Offset 8484h

Access Method

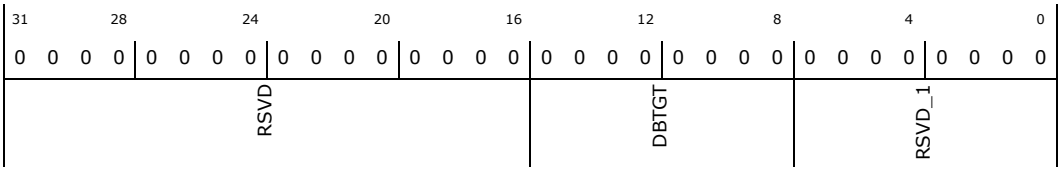
Type: Memory Mapped I/O Register (Size: 32 bits)

DCDB: [MBAR] + 8484h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	00h RW	**Reserved (RSVD):** Reserved.
15:8	00h RW	**Doorbell Target (DBTGT):** This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. • 0 = Data EP 1 OUT Enqueue Pointer Update • 1 = Data EP 1 IN Enqueue Pointer Update • 2:255 = Reserved This field returns '0' when read and the value should be treated as undefined by software.
7:0	00h RW	**Reserved (RSVD_1):** Reserved.

18.7.192 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8488h

The Debug Capability *Event Ring Segment Table Size Register* defines the number of segments supported by the Debug Capability Event Ring Segment Table.

Access Method

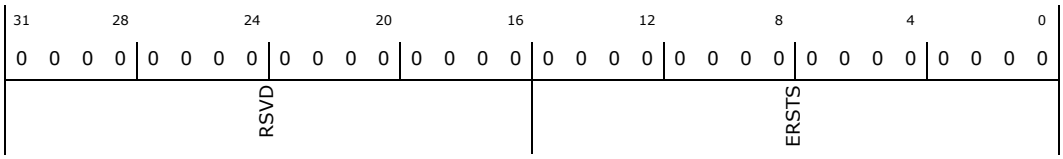
Type: Memory Mapped I/O Register (Size: 32 bits)

DCERSTSZ: [MBAR] + 8488h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**Reserved (RSVD):** Reserved.
15:0	0000h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the *Debug Capability Event Ring Segment Table Base Address* register. The maximum value supported by an xHC implementation for this register is defined by the *DCERST Max* field in the DCID register. See the xHCI USB specification for more information. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.

18.7.193 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8490h

The *Debug Capability Event Ring Segment Table Base Address Register* identifies the start address of the Debug Capability Event Ring Segment Table.

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

DCERSTBA: [MBAR] + 8490h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0000000000000000h

Bit Range	Default & Access	Description
63:4	0000000000000000h RW	**Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the *Debug Capability Enable* field in the DCCTRL register to 1.
3:0	0h RW	**Reserved (RSVD):** Reserved.

18.7.194 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8498h

The *Debug Capability Event Ring Dequeue Pointer Register* is written by software to define the Debug Capability Event Ring Dequeue Pointer location to the xHC. Software updates this pointer when it has finished the evaluation of an Event(s) on the Debug Capability Event Ring.

Access Method

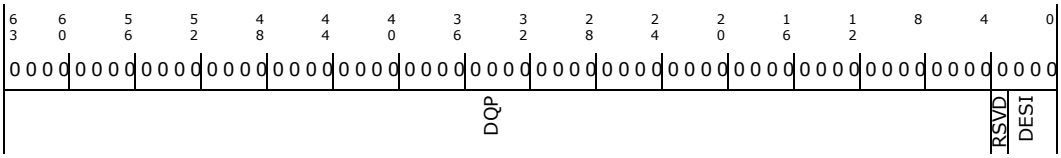
Type: Memory Mapped I/O Register (Size: 64 bits)

DCERDP: [MBAR] + 8498h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:4	0000000000000000h RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the *Debug Capability Enable* field in the DCCTRL register to '1'.
3	0b RW	**Reserved (RSVD):** Reserved.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

18.7.195 Debug Capability Control Register (DCCTRL)—Offset 84A0h

The *Debug Capability Control Register* is used to manage the Debug Capability.

Access Method

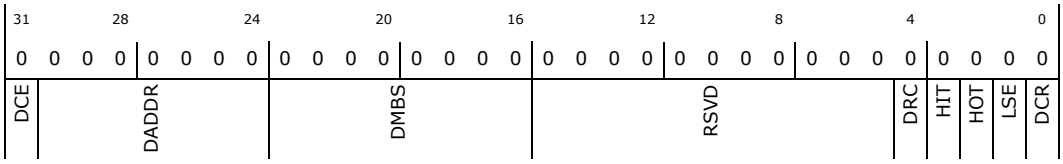
Type: Memory Mapped I/O Register (Size: 32 bits)

DCCTRL: [MBAR] + 84A0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**Debug Capability Enable (DCE):** Setting this bit to a 1 enables xHCI USB Debug Capability operation. This bit is a 0 if the USB Debug Capability is disabled. Clearing this bit releases the Root Hub port assigned to the Debug Capability, and terminates any Debug Capability Transfer or Event Ring activity.
30:24	00h RO	**Device Address (DADDR):** This field reports the USB device address assigned to the Debug Device during the enumeration process. This field is valid when the *DbC Run* bit is 1.
23:16	00h RO	**Debug Max Burst Size (DMBS):** This field identifies the maximum burst size supported by the bulk endpoints of this DbC implementation. LPT-LP USB Debug Device does not support bursting.
15:5	000h RO	**Reserved (RSVD):** Reserved.
4	0b RW/C	**DbC Run Change (DRC):** This bit shall be set to '1' when DCR bit is cleared to '0', i.e. by any DbC Port State transition that exits the DbC-Configured state. While this bit is 1 the *Debug Capability Doorbell Register* (DCDB) is disabled. Software shall clear this bit to re-enable the DCDB.
3	0b RW/S	**Halt IN TR (HIT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all OUT DPs received for the IN TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.
2	0b RW/S	**Halt OUT TR (HOT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all IN TPs received for the OUT TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.
1	0b RW	**Link Status Event Enable (LSE):** Setting this bit to a 1 enables the Debug Capability to generate Port Status Change Events due to the *Port Link Status Change* bit transitioning from a 0 to a 1. Refer to the xHCI USB specification for more information.
0	0b RO	**DbC Run (DCR):** When 0, Debug Device is not in the Configured state. When 1, Debug Device is in the Configured state and bulk Data pipe transactions are accepted by Debug Capability and routed to the IN and OUT Transfer Rings. A 0 to 1 transition of the *Port Reset* (DCPORTSC:PR) bit will clear this bit to 0.

18.7.196 Debug Capability Status Register (DCST)—Offset 84A4h

The *Debug Capability Status Register* reports capability related status information to software.

Access Method

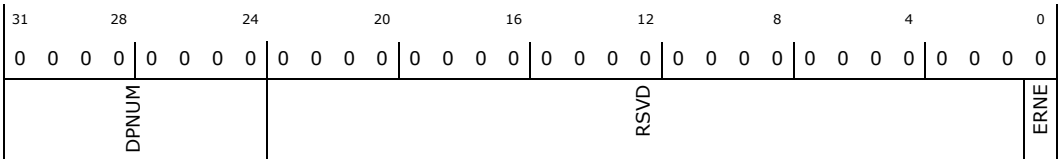
Type: Memory Mapped I/O Register (Size: 32 bits)

DCST: [MBAR] + 84A4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.
23:1	000000h RO	**Reserved (RSVD):** Reserved.
0	0b RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the *Debug Capability Event Ring Dequeue Pointer* register.

18.7.197 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 84A8h

The fields of the *Debug Capability PORTSC Register* are defined below and provide information about the state of the Root Hub port that is assigned to the Debug Capability. Note that the fields in this register function differently than those in a normal *Port Status and Control Register* (described in section 5.4.8) because the Root Hub port assigned to the Debug Capability is acting as an Upstream Facing Port, not a Downstream Facing Port.

Access Method

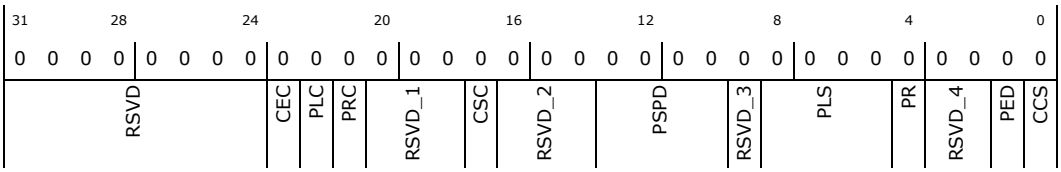
Type: Memory Mapped I/O Register (Size: 32 bits)

DCPORTSC: [MBAR] + 84A8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23	0b RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. • 0 = No change • 1 = Port Config Error detected Software shall clear this bit by writing a '1' to it.
22	0b RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: • U0 -) U3 = Suspend signaling detected from Debug Host • U3 -) U0 = Resume complete • Polling -) Disabled = Training Error • Ux or Recovery -) Inactive = Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
21	0b RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR) . • '0' = No change • '1' = Reset complete Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1):** Reserved.
17	0b RW/C	**Connect Status Change (CSC):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. • 1 = Change in Current Connect Status. • 0 = No change. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2):** Reserved.
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases, this field shall indicate Undefined Speed. • 0 Undefined Speed • 1-15 Protocol Speed ID (PSI) Refer to the xHCI for USB specification for the definition of PSIs. Note: The Debug Capability does not support LS, FS, or HS operation.
9	0b RO	**Reserved (RSVD_3):** Reserved.

Bit Range	Default & Access	Description
8:5	0h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). • 0 = Link is in the U0 State • 1 = Link is in the U1 State • 2 = Link is in the U2 State • 3 = Link is in the U3 State (Device Suspended) • 4 = Link is in the Disabled State • 5 = Link is in the RxDetect State • 6 = Link is in the Inactive State • 7 = Link is in the Polling State • 8 = Link is in the Recovery State • 9 = Link is in the Hot Reset State • 15:10 = Reserved Note: Transitions between different states are not reflected until the transition is complete.
4	0b RO	**Port Reset (PR):** • '1' = Port is in Reset • '0' = Port is not in Reset This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4):** Reserved.
1	0b RW	**Port Enabled/Disabled (PED):** • '1' = Enabled. • '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. • 0 = Debug Capability Root Hub port is disabled. • 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note: This bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0b RO	**Current Connect Status (CCS):** • '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. • '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the *Connect Status Change* (CSC) field in the *Port Status Change Event* that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

18.7.198 Debug Capability Context Pointer Register (DCCP)—Offset 84B0h

Access Method

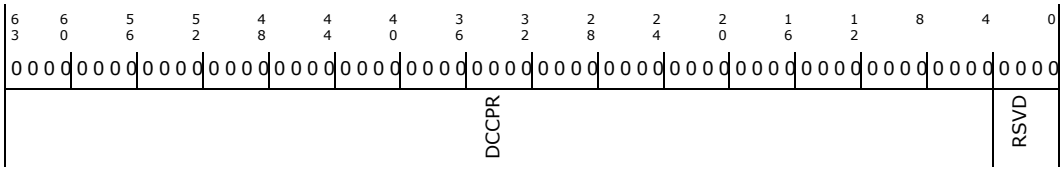
Type: Memory Mapped I/O Register (Size: 64 bits)

DCCP: [MBAR] + 84B0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:4	0000000000000000h RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.
3:0	0h RO	**Reserved (RSVD):** Reserved.

18.7.199 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 84B8h

The *Debug Capability Device Descriptor Register 1* identifies the Device Protocol and Vendor ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the USB3 spec.

This register shall be initialized before enabling the DbC (DCE = '1').

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

DCDDI1: [MBAR] + 84B8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

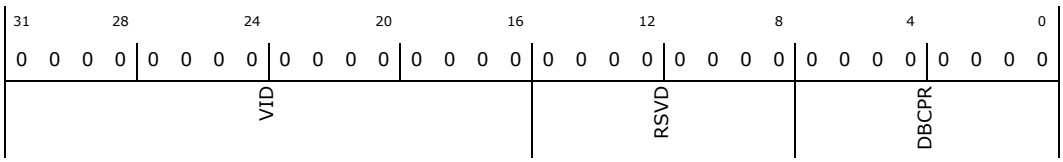
Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor *idVendor* field.
15:8	00h RO	**Reserved (RSVD):** Reserved.
7:0	00h RW	**DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor *bInterfaceProtocol* field. • 0 = Debug Target vendor defined • 1 = GNU Remote Debug Command Set supported • 2-255 = Reserved

18.7.200 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 84BCh

Access Method

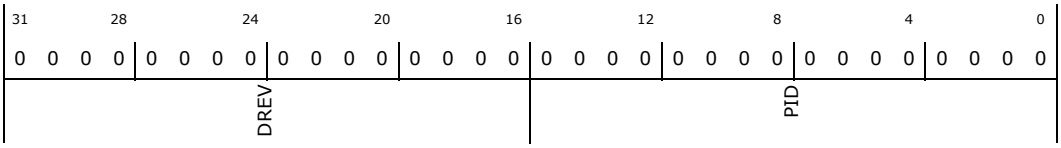
Type: Memory Mapped I/O Register (Size: 32 bits)

DCDDI2: [MBAR] + 84BCh

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW	**Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field.
15:0	0000h RW	**Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field.

18.7.201 Debug Capability Descriptor Parameters (DCDP)—Offset 8530h

The *Debug Capability Device Descriptor Register 2* identifies the Device Revision and Product ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the Universal Serial Bus 3.0 Specification.

Access Method

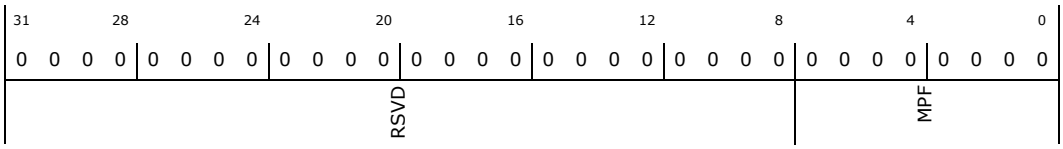
Type: Memory Mapped I/O Register (Size: 32 bits)

DCDP: [MBAR] + 8530h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved (RSVD):** Reserved.
7:0	00h RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.

18.7.202 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8538h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Access Method

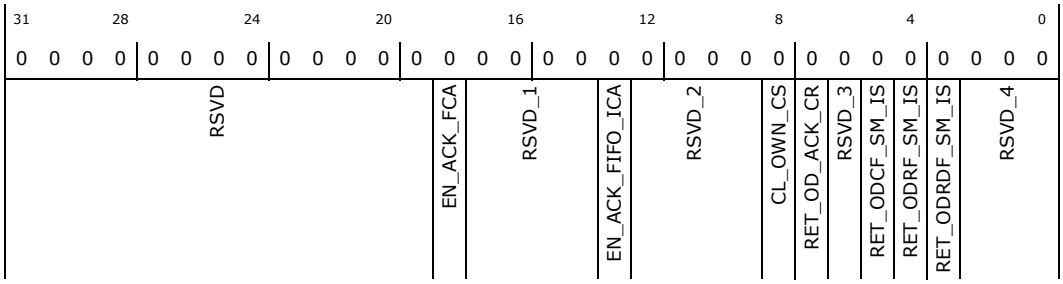
Type: Memory Mapped I/O Register (Size: 32 bits)

DBGDEV_CTRL_ODMA_REG: [MBAR] + 8538h

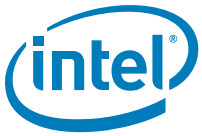
MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0000h RO	**Reserved (RSVD):** Reserved.
18	0b RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
17:14	0h RO	**Reserved (RSVD_1):** Reserved.



Bit Range	Default & Access	Description
13	0b RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
12:9	0h RO	**Reserved (RSVD_2):** Reserved.
8	0b RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines
7	0b RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports
6	0b RO	**Reserved (RSVD_3):** Reserved.
5	0b RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state
4	0b RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state
3	0b RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state
2:0	0h RO	**Reserved (RSVD_4):** Reserved.

18.8 USB EHCI PCI Configuration Registers

Table 203. Summary of USB EHCI PCI Configuration Registers—0/29/0

Offset	Size	Register ID—Description	Default Value
0h	1	"Vendor ID and Device ID (VID_DID)—Offset 0h" on page 2164	00008086h
4h	1	"Command and Device Status (CMD_STS)—Offset 4h" on page 2165	02900000h
8h	4	"Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h" on page 2167	0C032000h
Ch	4	"Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch" on page 2167	00000000h
10h	4	"Memory Base Address (MBAR)—Offset 10h" on page 2168	00000000h
2Ch	4	"USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch" on page 2168	00000000h
34h	4	"Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h" on page 2169	00000050h
3Ch	4	"Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch" on page 2169	00000000h
50h	4	"PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h" on page 2170	C9C35801h
54h	4	"Power Management Control/Status (PM_CS)—Offset 54h" on page 2171	00000008h
58h	4	"Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h" on page 2172	20A0980Ah
60h	4	"Serial Bus Release Number and Frame Length Adjustment and Port Wake Capability (SBRN_FLA_PWC)—Offset 60h" on page 2173	07FF2020h
64h	4	"Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h" on page 2173	00000000h
68h	4	"USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h" on page 2174	00000001h
6Ch	4	"USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch" on page 2175	00000000h
70h	4	"Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h" on page 2177	00000000h
74h	4	"OverCurrent Mapping (OCMAP)—Offset 74h" on page 2178	C0300C03h
7Ch	4	"EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch" on page 2179	0000408Ch
F8h	4	"Manufacturer's ID (MANID)—Offset F8h" on page 2180	00000F86h

18.8.1 Vendor ID and Device ID (VID_DID)—Offset 0h

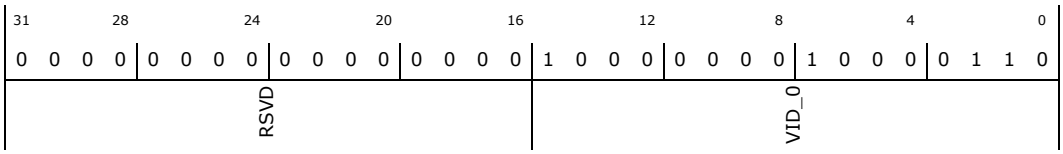
Access Method

Type: PCI Configuration Register (Size: 32 bits)

VID_DID: [B:0, D:29, F:0] + 0h

Power Well: Core

Default: 00008086h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15:0	8086h RO	**Vendor ID (VID_0):** 16-bit field which indicates company vendor as Intel.

18.8.2 Command and Device Status (CMD_STS)—Offset 4h

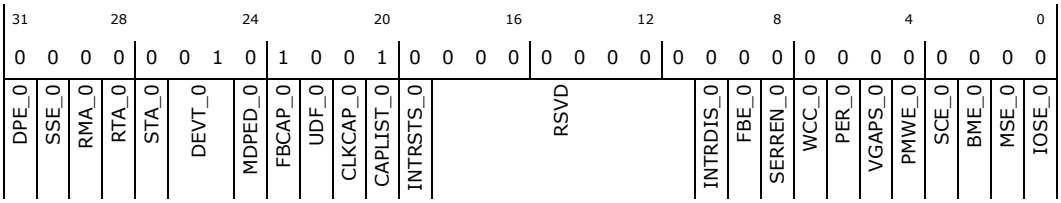
Access Method

Type: PCI Configuration Register (Size: 32 bits)

CMD_STS: [B:0, D:29, F:0] + 4h

Power Well: Core

Default: 02900000h



Bit Range	Default & Access	Description
31	0b RWC	**Detected Parity Error (DPE_0):** This bit is set whenever a parity error is seen on the internal interface to the USB2 host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a '1' to this bit location.
30	0b RWC	**Signaled System Error (SSE_0):** This bit is set whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. The following conditions can cause the generation of SERR#: a parity error is seen on address, command, or data (if the data was targeting the EHC) on the internal interface to the USB2 host controller due to a parity error on the system interface and bit 6 of the Command register is set to 1. An EHC-initiated memory read results in a completion packet with a status other than successful on the system interface (if SERR on Aborts Enable is also set) Software clears this bit by writing a '1' to this bit location.
29	0b RWC	**Received Master-Abort Status (RMA_0):** This bit is set when USB2, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.
28	0b RWC	**Received Target Abort Status (RTA_0):** This bit is set when USB2, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.
27	0b RO	**Signaled Target-Abort Status (STA_0):** This bit is used to indicate when the USB2 function responds to a cycle with a target abort. There is no reason for this to happen, so this bit will be hard-wired to '0'. Read-Only
26:25	01b RO	**DEVSEL# Timing Status (DEVT_0):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
24	0b RWC	**Master Data Parity Error Detected (MDPED_0):** This bit is set whenever a data parity error is detected on a USB2 read completion packet on the internal interface to the USB2 host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a '1' to this bit location.

Bit Range	Default & Access	Description
23	1b RO	**Fast Back-to-Back Capable (FBCAP_0):** Reserved as '1'.
22	0b RO	**User Definable Features (UDF_0):** Reserved as '0'
21	0b RO	**66 Mhz Capable (CLKCAP_0):** Reserved as '0'
20	1b RO	**Capabilities List (CAPLIST_0):** Hardwired to '1' indicating that offset 34h contains a valid capabilities pointer.
19	0b RO	**Interrupt Status (INTRSTS_0):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
18:11	00000000b RO	**Reserved (RSVD):** Reserved.
10	0b RW	**Interrupt Disable (INTRDIS_0):** When cleared to '0', the function is capable of generating interrupts. When '1', the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. This bit defaults to '0'. This bit is added as part of the PCI 2.3 Specification.
9	0b RO	**Fast Back to Back Enable (FBE_0):** Reserved as '0'.
8	0b RW	**SERR# Enable (SERREN_0):** on a memory read completion (if SERR on Aborts Enable is also set) Detection of an address or command parity error and the Parity Error Response bit is setDetection of a data parity error (when the data is going to the EHC) and the Parity Error Response bit is set
7	0b RO	**Wait Cycle Control (WCC_0):** Reserved as '0'.
6	0b RW	**Parity Error Response (PER_0):** When set to 1, the USB2 Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the EHCI specification. If it detects bad parity on the address or command phases when this bit is set to 1, the host controller does not take the cycle, halts the host controller (if currently not halted) and sets the host system error bit in the USBSTS register. Note that this applies to both requests and completions from the system interface. See section 9.19.2.4 for information regarding parity errors detected by the Prefetch DMA Engine. This bit must be set in order for the parity errors to generate SERR#.
5	0b RO	**VGA Palette Snoop (VGAPS_0):** Reserved as '0'
4	0b RO	**Postable Memory Write Enable (PMWE_0):** Reserved as '0'
3	0b RO	**Special Cycle Enable (SCE_0):** Reserved as '0'
2	0b RW	**Bus Master Enable (BME_0):** When set, bus mastering from EHCI is allowed, and will generate memory reads and writes for USB transfers. Notes on the EHC implementation: - Writes to change this bit occur immediately. Specifically, a write followed by a read will return the updated value. - When the BME bit is changed from 1 to 0, the EHC will cease accessing main memory within 2 microframes (250 usec). During this time, any number of reads and/or writes to memory may occur. - Clearing the BME bit shuts down the EHC DMA engines in the same manner that clearing the Run/Stop does. However, the schedule status bits and the HCHalted bit do not change based on the BME value.
1	0b RW	**Memory Space Enable (MSE_0):** This bit controls access to the USB2 Memory Space registers. If this bit is set, accesses to the USB2 registers are enabled. The Base Address register for USB2 should be programmed before this bit is set.

Bit Range	Default & Access	Description
0	0b RO	**I/O Space Enable (IOSE_0):** Reserved as '0'.

18.8.3 Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h

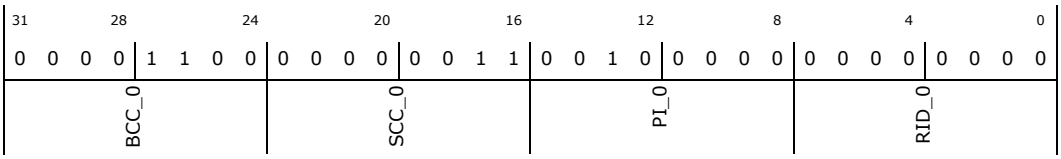
Access Method

Type: PCI Configuration Register (Size: 32 bits)

RID_PI_CC: [B:0, D:29, F:0] + 8h

Power Well: Core

Default: 0C032000h



Bit Range	Default & Access	Description
31:24	0Ch RO	**Base Class Code (BCC_0):** A value of 0Ch indicates that this is a Serial Bus controller.
23:16	03h RO	**Sub Class Code (SCC_0):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.
15:8	20h RO	**Programming Interface (PI_0):** A value of 20h indicates that this USB2 Host Controller conforms to the EHCI specification.
7:0	00h RO	**Revision ID (RID_0):** The value reported in this register indicates stepping of the host controller hardware.

18.8.4 Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch

Reserved, for padding Master Latency Timer Header Type Reserved

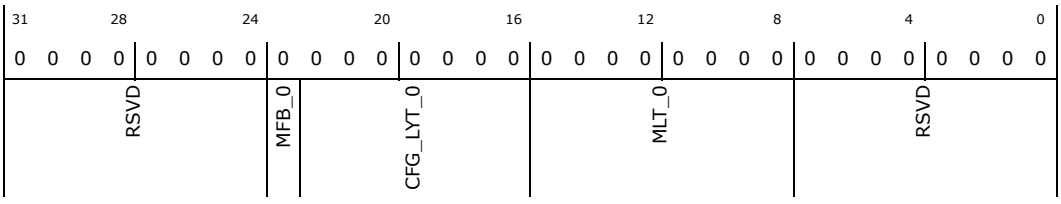
Access Method

Type: PCI Configuration Register (Size: 32 bits)

RSVD_MLT_HT: [B:0, D:29, F:0] + Ch

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23	0b RO	**Multi Function Bit (MFB_0):** When set to 1 this indicates that this is a multifunction device. Default to 0 since EHCI is at function 0, no other function beyond.
22:16	0000000b RO	**Configuration Layout (CFG_LYT_0):** Hardwired to 0 to indicate a standard PCI configuration layout.
15:8	00h RO	**Master Latency Timer (MLT_0):** Because the USB2 controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0
7:0	00h RO	**Reserved (RSVD):** Reserved.

18.8.5 Memory Base Address (MBAR)—Offset 10h

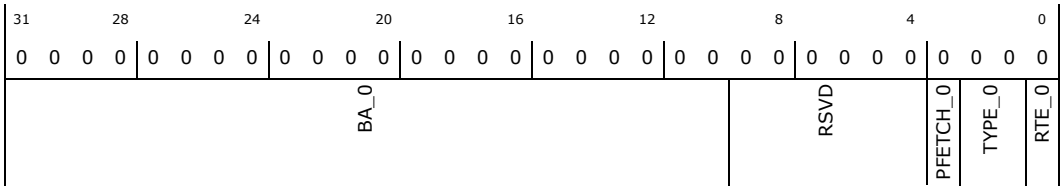
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MBAR: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:10	000000h RW	**Base Address (BA_0):** Bits (31:10) correspond to memory address signals (31:10), respectively. This gives 1 KB of relocatable memory space aligned to 1 KB boundaries.
9:4	000000b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Prefetchable (PFETCH_0):** Read Only. This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	00b RO	**Type (TYPE_0):** indicating that this range can be mapped anywhere within 32-bit address space.
0	0b RO	**Resource Type Indicator (RTE_0):** Read Only. This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

18.8.6 USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch

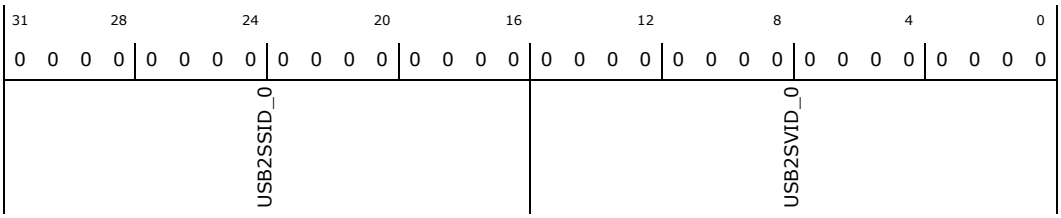
Access Method

Type: PCI Configuration Register (Size: 32 bits)

SSVID_SSID: [B:0, D:29, F:0] + 2Ch

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/L	**USB2 Subsystem ID (USB2SSID_0):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Writes should be done as a single 16-bit cycle. Reset: none
15:0	0000h RW/L	**USB2 Subsystem Vendor ID (USB2SVID_0):** This register, in combination with the USB2 Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Reset: none

18.8.7 Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h

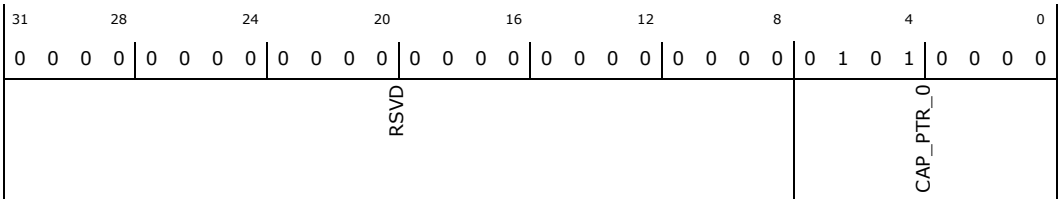
Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAP_PTR_RSVD: [B:0, D:29, F:0] + 34h

Power Well: Core

Default: 00000050h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved (RSVD):** Reserved.
7:0	50h RO	**Capabilities Pointer (CAP_PTR_0):** This register points to the starting offset of the USB2 capabilities ranges.

18.8.8 Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch

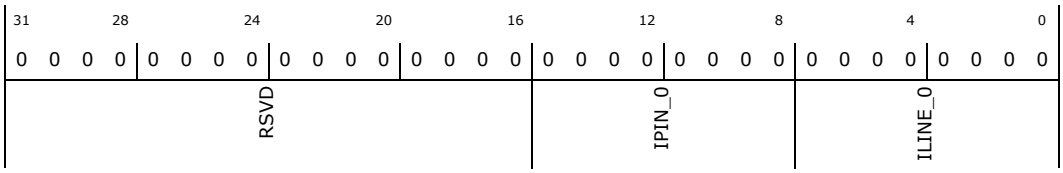
Access Method

Type: PCI Configuration Register (Size: 32 bits)

ILINE_IPIN_RSVD: [B:0, D:29, F:0] + 3Ch

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15:8	00h RO	**Interrupt Pin (IPIN_0):** Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. NOTE: As a single function device, only INTA# may be used while the other three interrupt lines have no meaning. (refer to PCI 3.0 spec section 2.2.6 Interrupt Pins)
7:0	00h RW	**Interrupt line (ILINE_0):** This data is not used by the SOC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Reset: core well and D3-to-D0.

18.8.9 PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h

PCI Power Management Capabilities ID Next Item Pointer #1 Power Management Capabilities

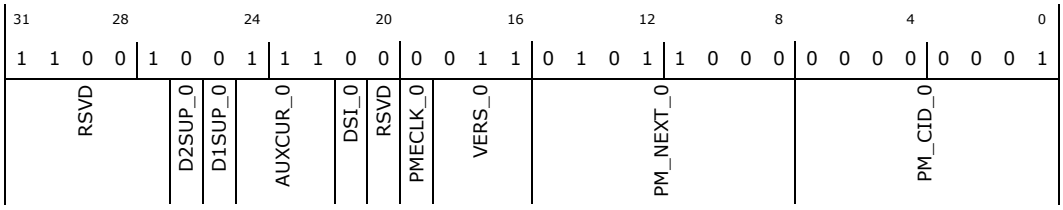
Access Method

Type: PCI Configuration Register (Size: 32 bits)

PM_CID_NEXT_CAP: [B:0, D:29, F:0] + 50h

Power Well: Core

Default: C9C35801h



Bit Range	Default & Access	Description
31:27	11001b RO	**Reserved (RSVD):** Reserved.
26	0b RO	**D2_Support (D2SUP_0):** The D2 state is not supported. Reset: core well, but not D3-to-D0.
25	0b RO	**D1_Support (D1SUP_0):** The D1 state is not supported. Reset: core well, but not D3-to-D0.
24:22	111b RW/L	**Aux_Current (AUXCUR_0):** The USB2 SIP EHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
21	0b RO	**DSI (DSI_0):** The Intel EHC reports 0, indicating that no device-specific initialization is required. Reset: core well, but not D3-to-D0.

Bit Range	Default & Access	Description
20	0b RO	**Reserved (RSVD):** Reserved.
19	0b RO	**PME Clock (PMECLK_0):** The Intel EHC reports 0, indicating that no PCI clock is required to generate PME#. Reset: core well, but not D3-to-D0.
18:16	011b RW/L	**Version (VERS_0):** Version: The Intel EHC reports 011, indicating that it complies with Revision 1.21 of the PCI Power Management Specification. Note: As contigency plan, the bit can be reverted by BIOS to 010b to support PCI PM Revision 1.1, by manipulating the offset80h Access Control register's WRT_RDONLY bit.
15:8	58h RW/L	**Next Item Pointer #1 (PM_NEXT_0):** This register defaults to 58h, which indicates that the next capability registers begin at configuration offset 58h. This register is writable when the WRT_RDONLY bit is set. This allows BIOS to effectively hide the Debug Port capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of 58h implies Debug Port and FLR capabilities visible 98h implies Debug Port invisible, next capability is FLR 00h implies that both Debug port and FLR capability are hidden Note that this value is never expected to be programmed. Reset: core well, but not D3-to-D0
7:0	01h RO	**PCI Power Management Capability ID (PM_CID_0):** A value of 01h indicates that this is a PCI Power Management capabilities field.

18.8.10 Power Management Control/Status (PM_CS)—Offset 54h

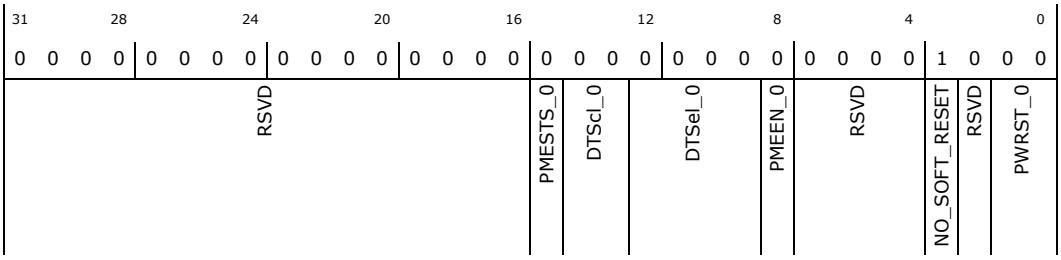
Access Method

Type: PCI Configuration Register (Size: 32 bits)

PM_CS: [B:0, D:29, F:0] + 54h

Power Well: Core

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15	0b RWC	**PME_Status (PMESTS_0):** This bit is set when the EHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	00b RO	**Data_Scale (DTScl_0):** because it does not support the associated Data register.
12:9	0h RO	**Data_Select (DTSel_0):** because it does not support the associated Data register.

Bit Range	Default & Access	Description
8	0b RW	**PME_En (PMEEN_0):** A '1' enables the EHC to generate an internal PME signal when PME_Status is '1'. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0000b RO	**Reserved (RSVD):** Reserved.
3	1b RO	**No Soft Reset (NO_SOFT_RESET):** A '0' indicates device does perform an internal reset upon D3hot to D0 transition via software control of the PowerState bits. Configuration Context is lost. Full re-initialization sequence is needed to return the device to D0 Initialized.(Default to '1') Note: As contigency plan, the bit can be reverted by BIOS to 0, by manipulating the offset80h Access Control register?s WRT_RDONLY bit.
2	0b RO	**Reserved (RSVD):** Reserved.
1:0	00b RW	**PowerState (PWRST_0):** This 2-bit field is used both to determine the current power state of EHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3hot state, the accesses to the EHC memory range must not be accepted; but the configuration space must still be accessible. When not in the D0 state, the generation of the interrupt output is blocked. Specifically, the PIRQ[H] is not asserted when not in the D0 state. When software changes this value from the D3hot state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

18.8.11 Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h

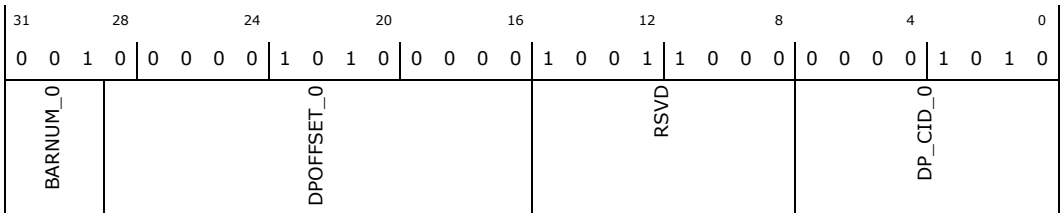
Access Method

Type: PCI Configuration Register (Size: 32 bits)

DP_CID_NEXT_BASE: [B:0, D:29, F:0] + 58h

Power Well: Core

Default: 20A0980Ah



Bit Range	Default & Access	Description
31:29	001b RO	**BAR Number (BARNUM_0):** Read-Only. This field is hardwired to 001b to indicate the memory BAR at offset 10h in the EHCI configuration space. Reset: Not applicable.
28:16	00A0h RO	**Debug Port Offset (DPOFFSET_0):** This field is hardwired to 0A0h to indicate that the debug port registers begin at offset A0h in the EHCI memory range. Reset: Not applicable.
15:8	98h RO	**Reserved (RSVD):** Reserved.
7:0	0Ah RO	**Debug Port Capability ID (DP_CID_0):** This register is hardwired to 0Ah which indicates that this is the start of a Debug Port Capability structure. Reset: Not applicable.

18.8.12 Serial Bus Release Number and Frame Length Adjustment and Port Wake Capability (SBRN_FLA_PWC)—Offset 60h

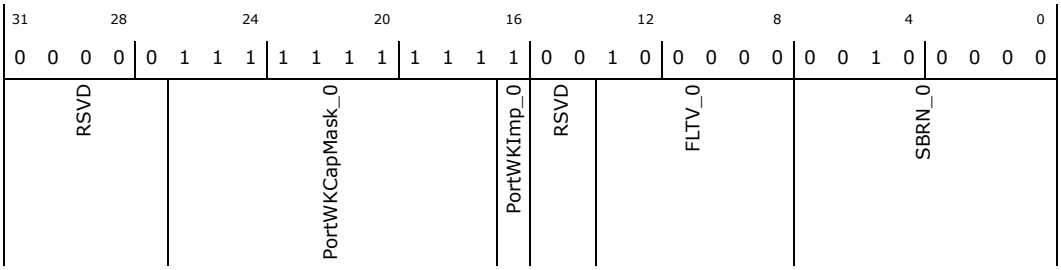
Access Method

Type: PCI Configuration Register (Size: 32 bits)

SBRN_FLA_PWC: [B:0, D:29, F:0] + 60h

Power Well: Resume

Default: 07FF2020h



Bit Range	Default & Access	Description
31:27	00000b RO	**Reserved (RSVD):** Reserved.
26:17	3FFh RW	**Port Wake Up Capability Mask (PortWKCapMask_0):** Bit positions 1 through 8 correspond to a physical port implemented on this host controller. For example, bit position 1 corresponds to port 1, position 2 port 2, etc. Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
16	1b RW	**Port Wake Implemented (PortWKImp_0):** A '1' in bit 0 indicates that this register is implemented to software. Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
15:14	00b RO	**Reserved (RSVD):** Reserved.
13:8	100000b RW	**Frame Length Timing Value (FLTV_0):** Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
7:0	20h RO	**Serial Bus Release Number (SBRN_0):** value of 20h indicates that this controller follows USB release 2.0

18.8.13 Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h

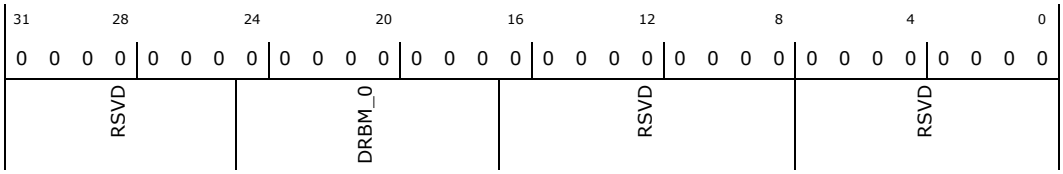
Access Method

Type: PCI Configuration Register (Size: 32 bits)

PDO_RMHDR: [B:0, D:29, F:0] + 64h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0000000b RO	**Reserved (RSVD):** Reserved.
24:17	00h RW	**Device Removable Bit Map (DRBM_0):** A 1 in a given bit position in this field indicates that the corresponding downstream port of the RMH is connected to a non-removable device. A 0 indicates that the port is exposed to the user. Bits 8:1 are mapped to Ports 8:1. This bits control the value returned by the RMH in the Deviceremovable field of the Hub Descriptor. A 1 in a given bit position in this register will result in the corresponding bit in the DeviceRemovable field of the hub descriptor being set to 1 as well (indicating that the port is connected to a non-removable device). System BIOS is expected to set these values upon Boot and resume from Sx states.
16:8	000000000b RO	**Reserved (RSVD):** Reserved.
7:0	00h RO	**Reserved (RSVD):** Reserved.

18.8.14 USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h

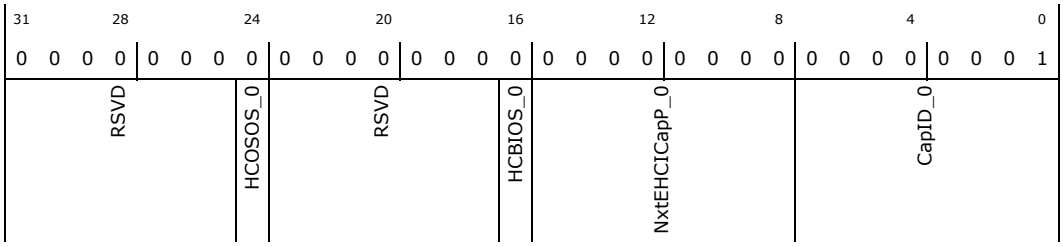
Access Method

Type: PCI Configuration Register (Size: 32 bits)

ULSEC: [B:0, D:29, F:0] + 68h

Power Well: Resume

Default: 00000001h



Bit Range	Default & Access	Description
31:25	0000000b RO	**Reserved (RSVD):** Reserved.
24	0b RW	**HC OS Owned Semaphore (HCOSOS_0):** System software sets this bit to request ownership of the EHCI controller. Ownership is obtained when this bit reads as 1 and the HC BIOS Owned Semaphore bit reads as clear. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
23:17	0000000b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
16	0b RW	**HC BIOS Owned Semaphore (HCBIOS_0):** The BIOS sets this bit to establish ownership of the EHCI controller. System BIOS will clear this bit in response to a request for ownership of the EHCI controller by system software. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
15:8	00h RO	**Next EHCI Capability Pointer (NxtEHCICapP_0):** A value of 00h indicates that there are no EHCI Extended Capability structures in this device. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
7:0	01h RO	**Capability ID (CapID_0):** A value of 01h indicates that this EHCI Extended Capability is the Legacy Support Capability. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.

18.8.15 USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch

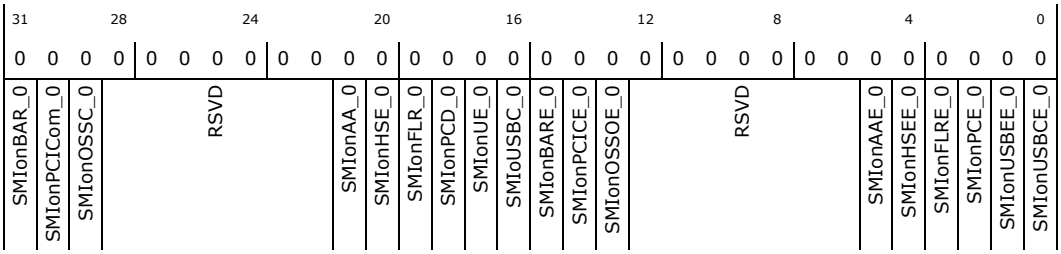
Access Method

Type: PCI Configuration Register (Size: 32 bits)

ULSCS: [B:0, D:29, F:0] + 6Ch

Power Well: Resume

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RWC	**SMI on BAR (SMIonBAR_0):** This bit is set to '1' whenever the Base Address Register (BAR) is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
30	0b RWC	**SMI on PCI Command (SMIonPCICom_0):** This bit is set to '1' whenever the PCI Command Register is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
29	0b RWC	**SMI on OS Ownership Change (SMIonOSSC_0):** This bit is set to '1' whenever the HC OS Owned Semaphore bit in the USB2 Legacy Support Extended Capability register transitions from 1 to a 0 or 0 to a 1. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
28:22	00h RO	**Reserved (RSVD):** Reserved.
21	0b RO	**SMI on Async Advance (SMIonAA_0):** Shadow bit of the Interrupt on Async Advance bit in the USB2STS register. To clear this bit system software must write a one to the Interrupt on Async Advance bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.

Bit Range	Default & Access	Description
20	0b RO	**SMI on Host System Error (SMIonHSE_0):** Shadow bit of Host System Error bit in the USB2STS. To clear this bit system software must write a one to the Host System Error bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
19	0b RO	**SMI on Frame List Rollover (SMIonFLR_0):** Shadow bit of Frame List Rollover bit in the USB2STS register. To clear this bit system software must write a one to the Frame List Rollover bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
18	0b RO	**SMI on Port Change Detect (SMIonPCD_0):** Shadow bit of Port Change Detect bit in the USB2STS register. To clear this bit system software must write a one to the Port Change Detect bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
17	0b RO	**SMI on USB Error (SMIonUE_0):** Shadow bit of USB Error Interrupt (USBERRINT) bit in the USB2STS register. To clear this bit system software must write a one to the USB Error Interrupt bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
16	0b RO	**SMI on USB Complete (SMIoUSBC_0):** Shadow bit of USB Interrupt (USBINT) bit in the USB2STS register. To clear this bit system software must write a one to the USB Interrupt bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
15	0b RW	**SMI on BAR Enable (SMIonBARE_0):** When this bit is '1' and SMIonBAR_0 is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
14	0b RW	**SMI on PCI Command Enable (SMIonPCICE_0):** When this bit is '1' and SMI on PCI Command is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
13	0b RW	**SMI on OS Ownership Enable (SMIonOSSOE_0):** When this bit is a one AND the OS Ownership Change bit is one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
12:6	00h RO	**Reserved (RSVD):** Reserved.
5	0b RW	**SMI on Async Advance Enable (SMIonAAE_0):** When this bit is a one, and the SMI on Async Advance bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
4	0b RW	**SMI on Host System Error Enable (SMIonHSEE_0):** When this bit is a one, and the SMI on Host System Error is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
3	0b RW	**SMI on Frame List Rollover Enable (SMIonFLRE_0):** When this bit is a one, and the SMI on Frame List Rollover bit is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
2	0b RW	**SMI on Port Change Enable (SMIonPCE_0):** When this bit is a one, and the SMI on Port Change Detect bit is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.
1	0b RW	**SMI on USB Error Enable (SMIonUSBEE_0):** When this bit is a one, and the SMI on USB Error bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.

Bit Range	Default & Access	Description
0	0b RW	**SMI on USB Complete Enable (SMIonUSBCE_0):** When this bit is a one, and the SMI on USB Complete bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.

18.8.16 Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h

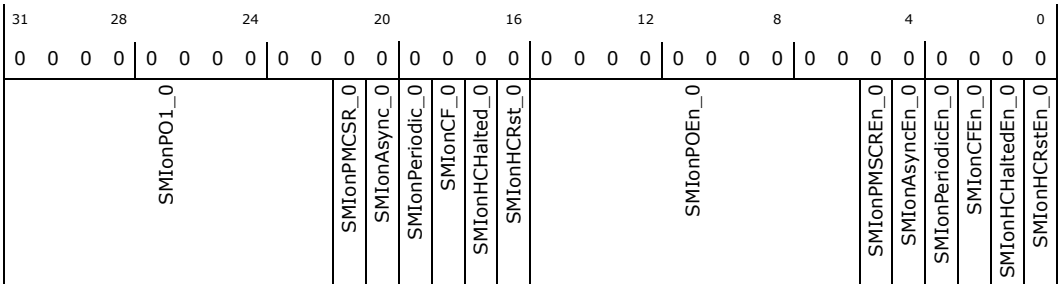
Access Method

Type: PCI Configuration Register (Size: 32 bits)

ISU2SMI: [B:0, D:29, F:0] + 70h

Power Well: Resume

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RWC	**SMI on PortOwner (SMIonPO1_0):** Bits 29:22 correspond to the Port Owner bits for ports 1 (22) through 8 (29). These bits are set to '1' whenever the associated Port Owner bits transition from 0-)1 or 1-)0. Software clears these bits by writing a one. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
21	0b RWC	**SMI on PMCSR (SMIonPMCSR_0):** This bit is set to '1' whenever software modifies the Power State bits in the Power Management Control/Status register. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
20	0b RWC	**SMI on Async (SMIonAsync_0):** This bit is set to '1' whenever the Async Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
19	0b RWC	**SMI on Periodic (SMIonPeriodic_0):** This bit is set to '1' whenever the Periodic Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
18	0b RWC	**SMI on CF (SMIonCF_0):** This bit is set to '1' whenever the Configure Flag transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
17	0b RWC	**SMI on HCHalted (SMIonHCHalted_0):** This bit is set to '1' whenever HCHalted transitions to '1' as a result of the Run/Stop bit being cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition

Bit Range	Default & Access	Description
16	0b RWC	**SMI on HCReset (SMIonHCRst_0):** This bit is set to '1' whenever HCRESET transitions to '1'. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
15:6	000h RW	**SMI on PortOwner Enable (SMIonPOEn_0):** When any of these bits are '1' and the corresponding SMI on PortOwner bits are '1', then the host controller will issue an SMI. Unused ports should have their corresponding bits cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
5	0b RW	**SMI on PMSCR Enable (SMIonPMSCREn_0):** When this bit is '1' and SMI on PMSCR is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
4	0b RW	**SMI on Async Enable (SMIonAsyncEn_0):** When this bit is '1 and SMI on Async is '1' , then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
3	0b RW	**SMI on Periodic Enable (SMIonPeriodicEn_0):** When this bit is '1 and SMI on Periodic is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
2	0b RW	**SMI on CF Enable (SMIonCFEn_0):** When this bit is '1' and SMI on CF is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
1	0b RW	**SMI on HCHalted Enable (SMIonHCHaltedEn_0):** When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition
0	0b RW	**SMI on HCReset Enable (SMIonHCRstEn_0):** When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition

18.8.17 OverCurrent Mapping (OCMAP)—Offset 74h

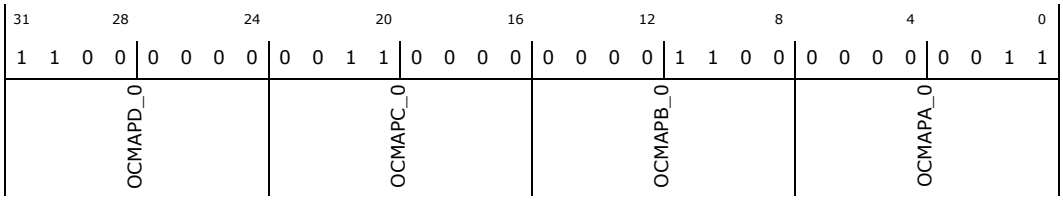
Access Method

Type: PCI Configuration Register (Size: 32 bits)

OCMAP: [B:0, D:29, F:0] + 74h

Power Well: Resume

Default: C0300C03h



Bit Range	Default & Access	Description
31:24	C0h RW	**OC Mapping D (OCMAPD_0):** Each bit position maps OC4, for EHCI1 to a set of ports as follows: The OC4 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.

Bit Range	Default & Access	Description
23:16	30h RW	**OC Mapping C (OCMAPC_0):** OC Mapping C. Each bit position maps OC3, for EHCI1 to a set of ports as follows: The OC3 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.
15:8	0Ch RW	**OC Mapping B (OCMAPB_0):** OC Mapping B. Each bit position maps OC2, for EHCI1 to a set of ports as follows: The OC2 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.
7:0	03h RW	**OC Mapping A (OCMAPA_0):** OC Mapping A: Each bit position maps OC1, for EHCI1 to a set of ports as follows: The OC1 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.

18.8.18 EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch

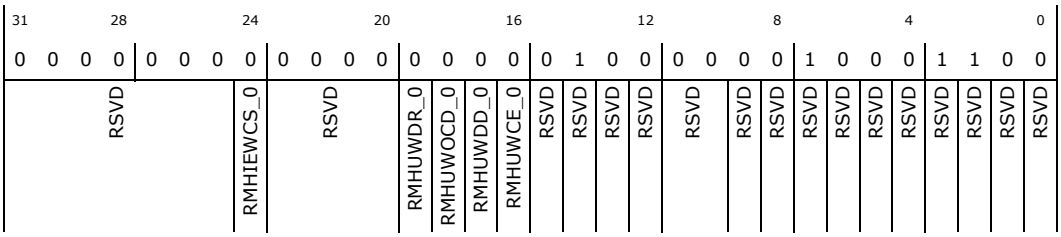
Access Method

Type: PCI Configuration Register (Size: 32 bits)

EHCSUSCFGRMHWC: [B:0, D:29, F:0] + 7Ch

Power Well: Resume

Default: 0000408Ch



Bit Range	Default & Access	Description
31:25	0000000b RO	**Reserved (RSVD):** Reserved.
24	0b RW	**RMH Inherit EHCI Wake Control Settings (RMHIEWCS_0):** When this bit is set, the RMH behaves as if bits 2:0 of this register reflect the appropriate bits of EHCI PORTSC0 bits 22:20.
23:20	0000b RO	**Reserved (RSVD):** Reserved.
19	0b RW	**RMH Upstream Wake on Device Resume (RMHUWDR_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to device initiated resume events as system wake-up events. i.e, the hub will initiate a resume on its upstream port and cause a wake when a device resume occurs on an enabled DS port When this bit is set to 1 and a device resume event is seen on a downstream port, the hub does not initiate a wake upstream and does not cause a wake.
18	0b RW	**RMH Upstream Wake on OC Disable (RMHUWOCD_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to overcurrent conditions as system wake-up events. i.e,, the hub will initiate a resume on its upstream port and cause a wake when an OC condition occurs on an enabled DS port When this bit is set to 1 and an over current event is seen, the hub does not initiate a wake upstream and does not cause a wake.

Bit Range	Default & Access	Description
17	0b RW	**RMH Upstream Wake on Disconnect Disable (RMHUWDD_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, the globally suspended hub treats disconnect events on downstream port as resume events to be propagated upstream. In this case, it is allowed to initiate a wake on its upstream por and cause a system wake in response to a disconnect event on a downstream port When this bit is set to 1, and the hub is globally suspended, the hub does not initiate a resume on its upstream port or cause a resume when a disconnect event occurs on a downstream port.
16	0b RW	**RMH Upstream Wake on Connect Enable (RMHUWCE_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, and the hub is globally suspended, the hub treats connect events on a downstream port as resume events to be propagated upstream. As well as waking up the system. When this bit is set to 1,and the hub is globally suspended, the hub does not wake the system nor does it initiate a resume on its upstream port when a connect event occurs on a downstream port.
15	0b RO	**Reserved (RSVD):** Reserved.
14	1b RO	**Reserved (RSVD):** Reserved.
13	0b RO	**Reserved (RSVD):** Reserved.
12	0b RO	**Reserved (RSVD):** Reserved.
11:10	00b RO	**Reserved (RSVD):** Reserved.
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RO	**Reserved (RSVD):** Reserved.
7	1b RO	**Reserved (RSVD):** Reserved.
6	0b RO	**Reserved (RSVD):** Reserved.
5	0b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3	1b RO	**Reserved (RSVD):** Reserved.
2	1b RO	**Reserved (RSVD):** Reserved.
1	0b RO	**Reserved (RSVD):** Reserved.
0	0b RO	**Reserved (RSVD):** Reserved.

18.8.19 Manufacturer's ID (MANID)—Offset F8h

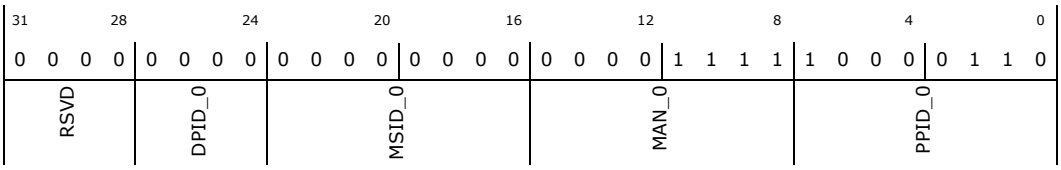
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:29, F:0] + F8h

Power Well: Core

Default: 00000F86h



Bit Range	Default & Access	Description
31:28	0h RO	**Reserved (RSVD):** Reserved.
27:24	0h RO	**Dot portion of Process ID (DPID_0):** Dot portion of Process ID: Indicates the dot Note: Process is reflected in bits [7:0] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly.
23:16	00h RO	**Manufacturing Stepping Identifier (MSID_0):** Stepping ID: This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: A single Stepping ID can be implemented that is readable from all functions in the chip because all of them are incremented in lock-step.
15:8	0Fh RO	**Manufacturer (MAN_0):** 0Fh = Intel
7:0	86h RO	**Process portion of process ID (PPID_0):** Process portion of process ID: Indicates the process. Note: Dot is reflected in bits [27:24] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: It is recommended that the Manufacturing ID is implemented in one place and readable from all functions. This minimizes the changes required for a process shrink.

18.9 USB EHCI Memory Mapped IO Registers

Table 204. Summary of USB EHCI Memory Mapped I/O Registers—MBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Capability Registers Length and HC Interface Version Number (CAP_HCIV)—Offset 0h" on page 2182	01000020h
4h	1	"Host Controller Structural Parameters (HCSPARAMS)—Offset 4h" on page 2183	00200008h
8h	4	"Host Controller Capability Parameters (HCCPARAMS)—Offset 8h" on page 2184	00036881h
20h	4	"USB2 Command Register (USB2CMD)—Offset 20h" on page 2185	00080000h
24h	4	"USB2 Status (USB2STS)—Offset 24h" on page 2187	00001000h
28h	4	"USB2 Interrupt Enable (USB2INTR)—Offset 28h" on page 2189	00000000h
2Ch	4	"Frame Index (FRINDEX)—Offset 2Ch" on page 2189	00000000h
30h	4	"Control Data Structure Segment Register (CTRLDSSEGMENT)—Offset 30h" on page 2190	00000000h

7Ch	4	"Port Status and Control (PORTSC7)—Offset 7Ch" on page 2208	00003000h
80h	4	"Port Status and Control (PORTSC8)—Offset 80h" on page 2211	00003000h
A0h	1	"Debug Port Control/Status Register (DP_CTRLSTS)—Offset A0h" on page 2214	00000000h
A4h	1	"USB PIDs Register (DP_USB_PIDs)—Offset A4h" on page 2215	00000000h
A8h	8	"Debug Port Data Buffer Bytes 7:0 (DP_DATA_BUF_B)—Offset A8h" on page 2216	0000000000000000h
B0h	4	"Debug Port Config Register (DP_CFG)—Offset B0h" on page 2217	00007F01h

18.9.1 Capability Registers Length and HC Interface Version Number (CAP_HCIV)—Offset 0h

Access Method

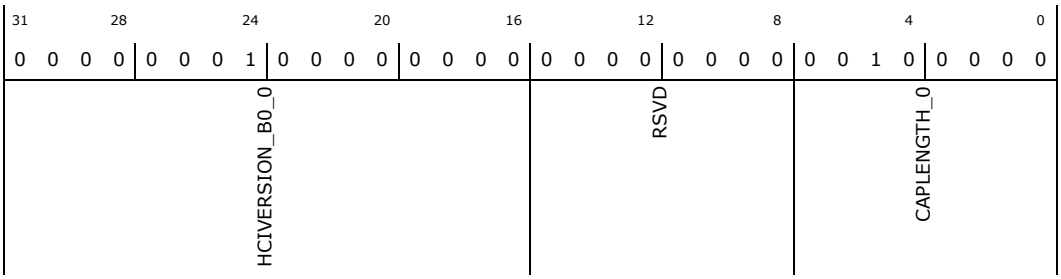
Type: Memory Mapped I/O Register (Size: 32 bits)

CAP_HCIV: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 01000020h



Bit Range	Default & Access	Description
31:16	0100h RO	**Host Controller Interface Version Number (HCIVERSION_B0_0):** This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms.
15:8	00h RO	**Reserved (RSVD):** Reserved.
7:0	20h RO	**Capability Registers Length (CAPLENGTH_0):** This register is used as an offset to add to the Memory Base Register to find the beginning of the Operational Register Space. This is fixed at 20h, indicating that the Operation Registers begin at offset 20h.

18.9.2 Host Controller Structural Parameters (HCSPARAMS)—Offset 4h

Access Method

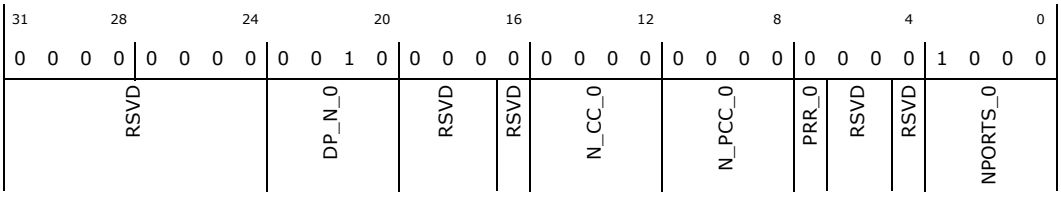
Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00200008h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23:20	2h RO	**Debug Port Number (DP_N_0):** Hardwired to 2h, indicating that the Debug Port is on the 2nd port on the EHC. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)
19:17	000b RO	**Reserved (RSVD):** Reserved.
16	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
15:12	0h RO	**Number of Companion Controllers (N_CC_0):** This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than one in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports. There are no companion controllers. This field is set to '0' as Read-Only bit.
11:8	0h RO	**Number of Ports per Companion Controller (N_PCC_0):** This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. Read-Only. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)
7	0b RO	**Port Routing Rules (PRR_0):** This field indicates the method used by this implementation for how all ports are mapped to companion controllers. This is hardwired to 0, indicating that the first N_PCC (=2) ports are routed to the lowest numbered function companion host controller, the next N_PCC ports are routed to the next lowest function companion controller, and so on
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3:0	8h RW	**N_PORTS (NPORTS_0):** This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. The default value for the EHCI controller indicates 8 ports. BIOS may overwrite the default value to properly describe the board or chip SKU . (please refer to RMH Configuration Details in section 1.23.2). A zero in this field is undefined. Integrated RMH - If USBr is disabled, this should be updated by BIOS to 2 such that the EHC reports 2ports to be default, port 0 assigned to the RMH and port 1 assigned to the debug device. If USB-R is enabled, the number reported should be updated to 3 by BIOS (port 2 will be assigned to USB-R in this case) Legacy Mode - The default value for the EHCI controller indicates 8 ports. If USB-R support is enabled, BIOS should account for the additional ports in calculating the value to write to this field.

18.9.3 Host Controller Capability Parameters (HCCPARAMS)—Offset 8h

Access Method

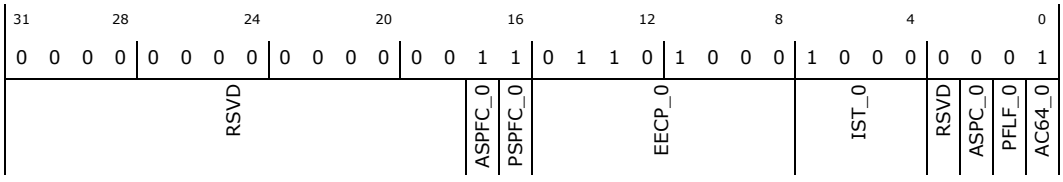
Type: Memory Mapped I/O Register (Size: 32 bits)

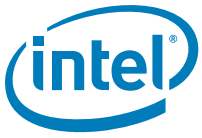
HCCPARAMS: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Resume

Default: 00036881h





Bit Range	Default & Access	Description
31:18	00000000000000b RO	**Reserved (RSVD):** Reserved.
17	1b RW	**Asynchronous Schedule Prefetch Capability (ASPFC_0):** This bit indicates that tthe hardware support the Asynch schedule prefetch enable bit in the USB command register.
16	1b RW	**Periodic Schedule Prefetch Capability (PSPFC_0):** This bit indicates that the EHC hardware supports the Periodic Schedule prefetch bit in the USB2 Command Register.
15:8	68h RO	**EHCI Extended Capabilities Pointer (EECP_0):** This field is hardwired to 68h, indicating that the EHCI capabilities list exists and begins at offset 68h in the PCI configuration space.
7:4	8h RO	**Isochronous Scheduling Threshold (IST_0):** This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. Refer to the EHCI specification for details on how software uses this information for scheduling isochronous transfers. The Intel USB2 hardwires this field to 8h.
3	0b RO	**Reserved (RSVD):** Reserved.
2	0b RO	**Asynchronous Schedule Park Capability (ASPC_0):** This bit is hardwired to 0 indicating that the Host Controller does not support this optional feature.
1	0b RO	**Programmable Frame List Flag (PFLF_0):** If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. If set to a one, then system software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous. The Intel EHC does not support different frame list lengths. This bit is read-only '0'.
0	1b RO	**64-bit Addressing Capability (AC64_0):** This field documents the addressing range capability of this implementation. The value of this field determines whether software should use the 32-bit or 64-bit data structures. Values for this field have the following interpretation:0b data structures using 32-bit address memory pointers; 1b data structures using 64-bit address memory pointers The USB2 SIP supports 64-bit addressing only. This bit is read-only '1'.

18.9.4 USB2 Command Register (USB2CMD)—Offset 20h

Access Method

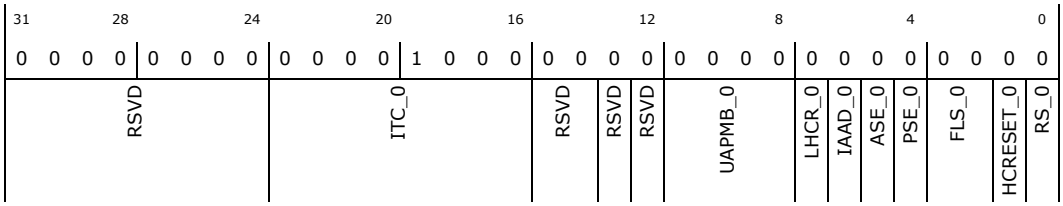
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2CMD: [MBAR] + 20h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00080000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23:16	08h RW	**Interrupt Threshold Control (ITC_0):** This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equates to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Refer to Section 4 in the EHCI specification for interrupts affected by this field.
15:14	00b RO	**Reserved (RSVD):** Reserved.
13	0b RO	**Reserved (RSVD):** Reserved.
12	0h RO	**Reserved (RSVD):** Reserved.
11:8	0h RO	**Unimplemented Asynchronous Park Mode Bits (UAPMB_0):** This field is hardwired to 000b because the host controller does not support this optional feature.
7	0b RO	**Light Host Controller Reset (LHCR_0):** Read Only 0b. The Intel EHC does not implement this optional reset and hardwires this bit to 0.
6	0b RW	**Interrupt on Async Advance Doorbell (IAAD_0):** This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state , it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. See the EHCI specification for operational details. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.
5	0b RW	**Asynchronous Schedule Enable (ASE_0):** This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule.
4	0b RW	**Periodic Schedule Enable (PSE_0):** This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule.
3:2	00b RO	**Frame List Size (FLS_0):** This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. . This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean:00b 1024 elements (4096 bytes) Default value; 01b 512 elements (2048 bytes); 10b 256 elements (1024 bytes) - for resource-constrained environments

Bit Range	Default & Access	Description
1	0b RW	**Host Controller Reset (HCRESET_0):** This control bit used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Note: PCI Configuration registers and Host Controller Capability Registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership will be disowned by the host controller(s), with the side effects described in the EHCI spec. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior. This reset must be used to leave EHCI port test modes.
0	0b RW	**Run / Stop (RS_0):** 1=Run. 0=Stop. When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 microframes after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software should not write a 1 to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). The following table explains how the different combinations of Run and Halted must be interpreted: Run/Stop Halted Interpretation 0 0 Valid- in the process of halting 0 1 Valid- halted 1 0 Valid- running 1 1 Invalid- the HCHalted bit clears immediately Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being cleared (and also affect the Host Error bit).

18.9.5 USB2 Status (USB2STS)—Offset 24h

Access Method

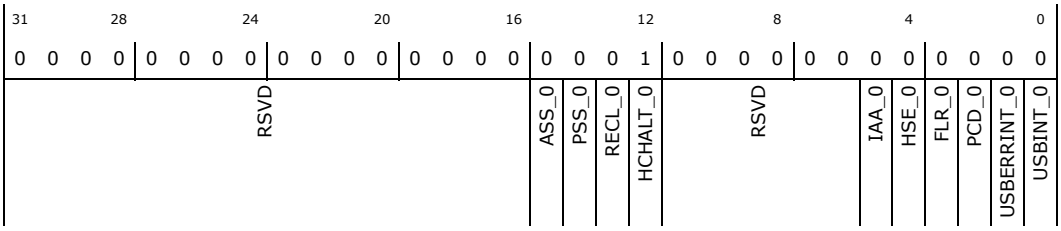
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2STS: [MBAR] + 24h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00001000h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
15	0b RO	**Asynchronous Schedule Status (ASS_0):** This bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).
14	0b RO	**Periodic Schedule Status (PSS_0):** This bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it currently has a request pending, in addition to the regular Periodic DMA engine.
13	0b RO	**Reclamation (RECL_0):** This is a read-only status bit, which is used to detect an empty asynchronous schedule. The operational model and valid transitions for this bit are described in Section 4 of the EHCI Specification.
12	1b RO	**HCHalted (HCHALT_0):** This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it is currently has a request pending, in addition to the regular DMA engines.
11:6	000000b RO	**Reserved (RSVD):** Reserved.
5	0b RWC	**Interrupt on Async Advance (IAA_0):** System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.
4	0b RWC	**Host System Error (HSE_0):** The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being set. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs. A hardware interrupt is generated to the system (if enabled in the Interrupt Enable Register).
3	0b RWC	**Frame List Rollover (FLR_0):** The Host Controller sets this bit to a one when the Frame List Index (see Section 9.3.2.4) rolls over from its maximum value to zero. Since the USB2 SIP only supports the 1024-entry Frame List Size, the Frame List Index rolls over every time FRNUM[13] toggles.
2	0b RWC	**Port Change Detect (PCD_0):** The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a zero to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change). Regardless of the implementation, whenever this bit is readable (i.e., in the D0 state), it must provide a valid view of the Port Status registers.
1	0b RWC	**USB Error Interrupt (USBERRINT_0):** The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and Bit 0 are set. See the EHCI specification for a list of the USB errors that will result in this interrupt being asserted.
0	0b RWC	**USB Interrupt (USBINT_0):** The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes).

18.9.6 USB2 Interrupt Enable (USB2INTR)—Offset 28h

Access Method

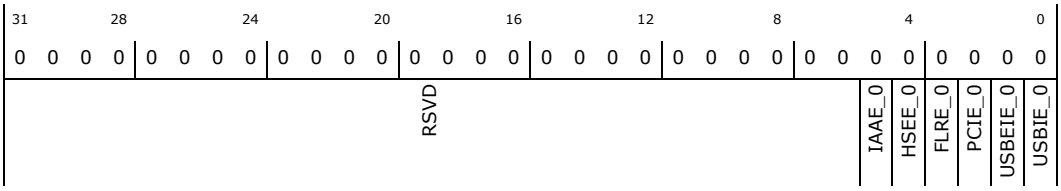
Type: Memory Mapped I/O Register (Size: 32 bits)

USB2INTR: [MBAR] + 28h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0000000h RO	**Reserved (RSVD):** Reserved.
5	0b RW	**Interrupt on Async Advance Enable (IAAE_0):** When this bit is a one, and the Interrupt on Async Advance bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit.
4	0b RW	**Host System Error Enable (HSEE_0):** When this bit is a one, and the Host System Error Status bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Host System Error bit.
3	0b RW	**Frame List Rollover Enable (FLRE_0):** When this bit is a one, and the Frame List Rollover bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Frame List Rollover bit.
2	0b RW	**Port Change Interrupt Enable (PCIE_0):** When this bit is a one, and the Port Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port Change Detect bit.
1	0b RW	**USB Error Interrupt Enable (USBEIE_0):** When this bit is a one, and the USBERRINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software by clearing the USBERRINT bit.
0	0b RW	**USB Interrupt Enable (USBIE_0):** When this bit is a one, and the USBINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software by clearing the USBINT bit.

18.9.7 Frame Index (FRINDEX)—Offset 2Ch

Access Method

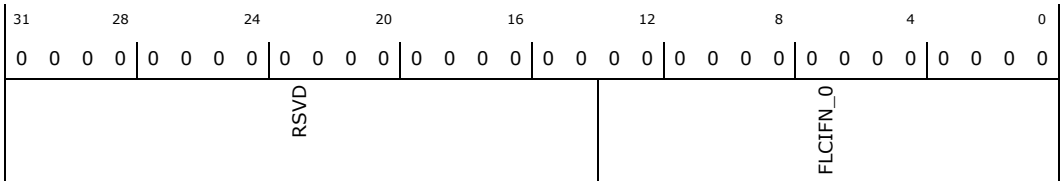
Type: Memory Mapped I/O Register (Size: 32 bits)

FRINDEX: [MBAR] + 2Ch

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:14	00000000000000000b RO	**Reserved (RSVD):** Reserved.
13:0	0000000000000b RW	**Frame List Current Index/Frame Number (FLCIFN_0):** The value in this register increments at the end of each time frame (e.g. micro-frame). Bits (12:3) are used for the Frame List current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index

18.9.8 Control Data Structure Segment Register (CTRLDSSEGMENT)—Offset 30h

Access Method

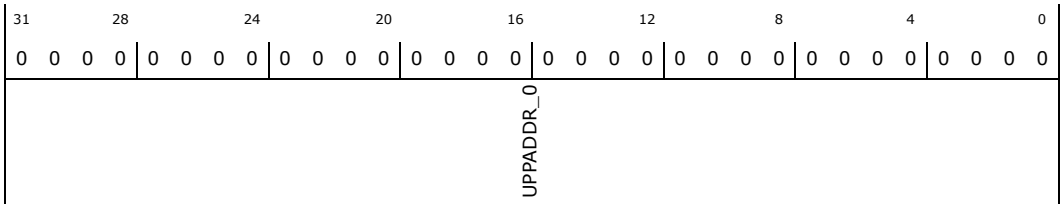
Type: Memory Mapped I/O Register (Size: 32 bits)

CTRLDSSEGMENT: [MBAR] + 30h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**Upper Address[63 (UPPADDR_0):** 32]: This 32-bit field corresponds to address bits 63:32 when forming a control data structure address.

18.9.9 Periodic Frame List Base Address (PERIODICLISTBASE)—Offset 34h

Access Method

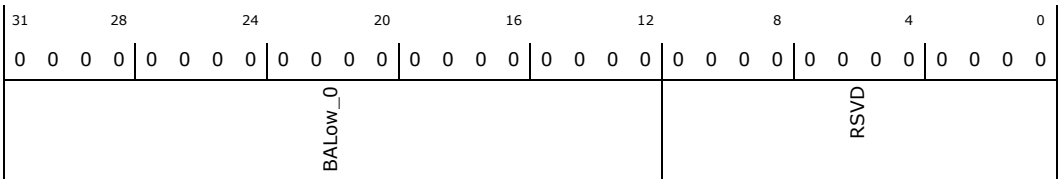
Type: Memory Mapped I/O Register (Size: 32 bits)

PERIODICLISTBASE: [MBAR] + 34h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**Base Address (BALow_0):** These bits correspond to memory address signals (31:12), respectively.
11:0	000000000000b RO	**Reserved (RSVD):** Reserved.

18.9.10 Current Asynchronous List Address (ASYNCLISTADDR)—Offset 38h

Access Method

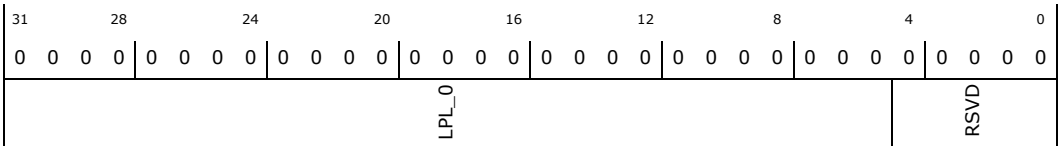
Type: Memory Mapped I/O Register (Size: 32 bits)

ASYNCLISTADDR: [MBAR] + 38h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:5	0000000h RW	**Link Pointer Low (LPL_0):** These bits correspond to memory address signals (31:5), respectively. This field may only reference a Queue Head (QH).
4:0	0000b RO	**Reserved (RSVD):** Reserved.

18.9.11 Configure Flag Register (CONFIGFLAG)—Offset 60h

Access Method

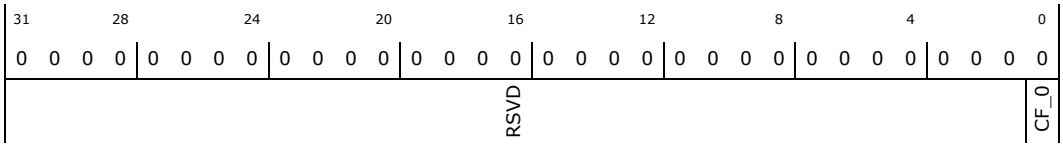
Type: Memory Mapped I/O Register (Size: 32 bits)

CONFIGFLAG: [MBAR] + 60h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Resume

Default: 00000000h



Bit Range	Default & Access	Description
31:1	00000000h RO	**Reserved (RSVD):** Reserved.
0	0b RW	**Configure Flag (CF_0):** Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below. See section 4 of the EHCI spec for operation details. 0b Port routing control logic default-routes each port to the classic host controllers. 1b Port routing control logic default-routes all ports to this host controller. This register is in the suspend power well. It is only reset by hardware when the suspend power is initially applied or in response to a host controller reset.

18.9.12 Port Status and Control (PORTSC1)—Offset 64h

Access Method

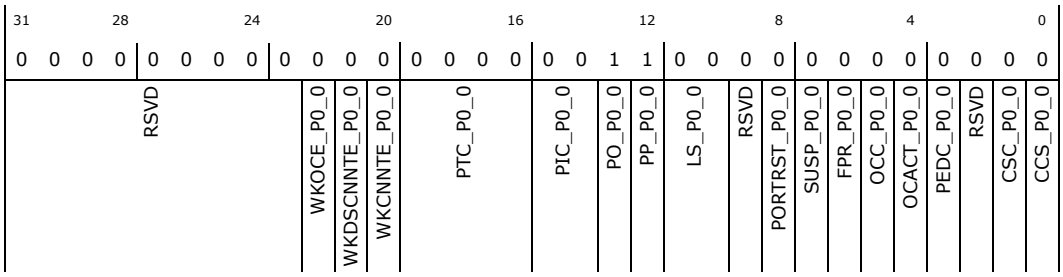
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC1: [MBAR] + 64h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Resume

Default: 00003000h



Bit Range	Default & Access	Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).

Bit Range	Default & Access	Description
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.

Bit Range	Default & Access	Description
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable / Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

18.9.13 Port Status and Control (PORTSC2)—Offset 68h

Access Method

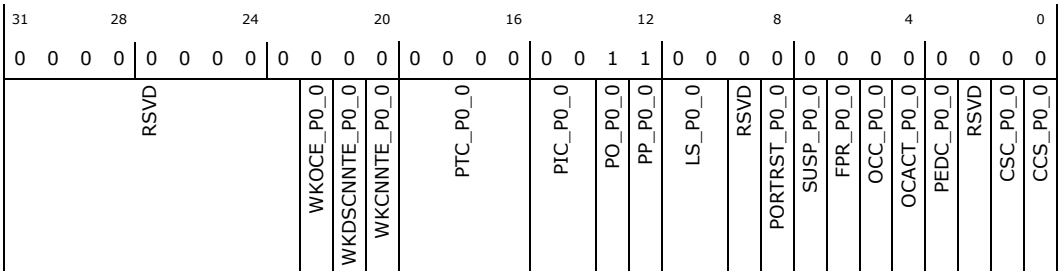
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC2: [MBAR] + 68h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

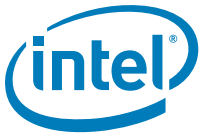
Power Well: Resume

Default: 00003000h



Bit Range	Default & Access	Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.

Bit Range	Default & Access	Description
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.



Bit Range	Default & Access	Description
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable / Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

9	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.

Bit Range	Default & Access	Description
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

18.9.16 Port Status and Control (PORTSC5)—Offset 74h

Access Method

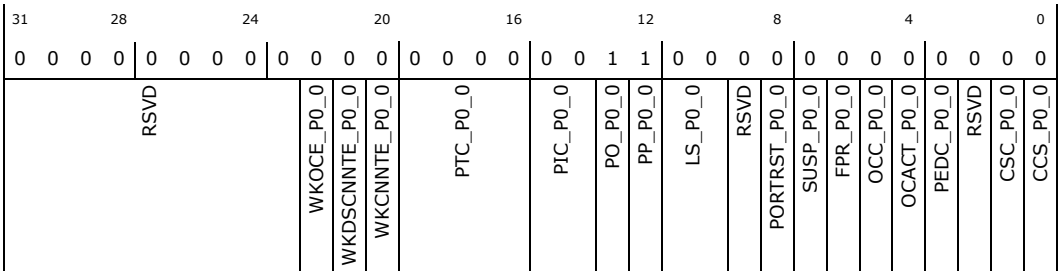
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC5: [MBAR] + 74h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

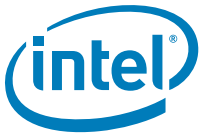
Power Well: Resume

Default: 00003000h



Bit Range	Default & Access	Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).

Bit Range	Default & Access	Description
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.



Bit Range	Default & Access	Description
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable / Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.

Bit Range	Default & Access	Description
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.

Bit Range	Default & Access	Description
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

18.9.19 Port Status and Control (PORTSC8)—Offset 80h

Access Method

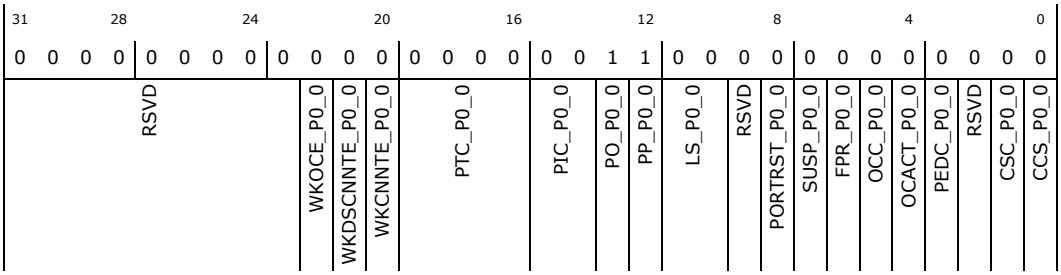
Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC8: [MBAR] + 80h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Resume

Default: 00003000h



Bit Range	Default & Access	Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.

Bit Range	Default & Access	Description
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset
9	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Description
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.

Bit Range	Default & Access	Description
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.

18.9.20 Debug Port Control/Status Register (DP_CTRLSTS)—Offset A0h

Access Method

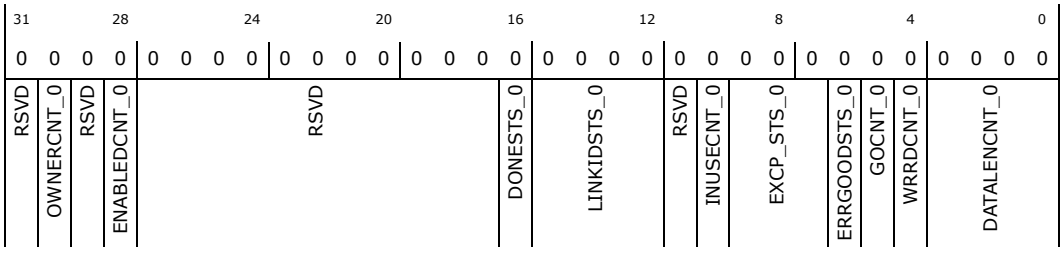
Type: Memory Mapped I/O Register (Size: 32 bits)

DP_CTRLSTS: [MBAR] + A0h

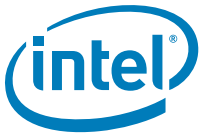
MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RW	**OWNER_CNT (OWNERCNT_0):** When software writes a 1 to this bit, the ownership of the debug port is forced to the EHCI controller (i.e. immediately taken away from the companion Classic USB Host Controller) If the port was already owned by the EHCI controller, then setting this bit has no effect. This bit overrides all of the ownership-related bits in the standard EHCI registers. Note that the value in this bit does not affect the value reported in the PORTSC Port Owner bit.
29	0b RO	**Reserved (RSVD):** Reserved.
28	0b RW	**ENABLED_CNT (ENABLEDCNT_0):** This bit = 1 if the debug port is enabled for operation. Software can clear this by writing a zero to it. The hardware clears the bit for the same conditions where hardware clears the Port Enable/Disable bit (in the PORTSC register). (Note this bit is not cleared when software clears the Port Enabled/Disabled bit in the PORTSC.) Software can directly set this bit if the port is already enabled in the associated Port Status and Control register (this is enforced by the hardware). Reset default = 0.



Bit Range	Default & Access	Description
27:17	00000000000b RO	**Reserved (RSVD):** Reserved.
16	0b RWC	**DONE_STS (DONESTS_0):** Read/Write-Clear. This bit is set by hardware to indicate that the request is complete. Writing a 1 to this bit will clear it if it is set. Writing a 0 to this bit has no effect. Reset default = 0
15:12	0000b RO	**LINK_ID_STS (LINKIDSTS_0):** Read-Only. This field identifies the link interface. It is hardwired to 0h to indicate that it is a USB Debug Port.
11	0b RO	**Reserved (RSVD):** Reserved.
10	0b RO	**IN_USE_CNT (INUSECNT_0):** Set by software to indicate that the port is in use. Cleared by software to indicate that the port is free and may be used by other software. This bit is cleared after reset. (This bit has no affect on hardware.)
9:7	000b RO	**EXCEPTION_STS (EXCP_STS_0):** Read-Only. This field indicates the exception when the ERROR_GOOD#_STS bit is set. This field should be ignored if the ERROR_GOOD#_STS bit is 0. 000 No Error. Note: this should not be seen, since this field should only be checked if there is an erro. 001 Transaction error: indicates the USB2 transaction had an error (CRC, bad PID, timeout, etc.) 010 HW error. Request was attempted (or in progress) when port was suspended or reset. All Others are reserved Reset default = 000b
6	0b RO	**ERROR_GOOD_STS (ERRGOODSTS_0):** Read-Only. The hardware clears this bit to 0 upon the proper completion of a read or write. The hardware sets this bit to indicate that an error has occurred. Details on the nature of the error are provided in the Exception field. Reset default = 0.
5	0b RW	**GO_CNT (GOCNT_0):** Software sets this bit to cause the hardware to perform a read or write request. Writing a 0 to this bit has no effect. Writing a 1 to this bit when it is already set may result in undefined behavior. When set, the hardware clears this bit when the hardware sets the DONE_STS bit. Reset default = 0.
4	0b RW	**WRITE_READ_CNT (WRRDCNT_0):** Software sets this bit to indicate that the current request is a write. Software clears this bit to indicate that the current request is a read. Reset default = 0.
3:0	0000b RW	**DATA_LEN_CNT (DATALENCNT_0):** This field is used to indicate the size of the data to be transferred. Reset default = 0h. For write operations, this field is set by software to indicate to the hardware how many bytes of data in Data Buffer are to be transferred to the console. A value of 0h indicates that a zero-length packet should be sent. A value of 1-8 indicates 1-8 bytes are to be transferred. Values 9-Fh are illegal and how hardware behaves if used is undefined. For read operations, this field is set by hardware to indicate to software how many bytes in Data Buffer are valid in response to a read operation. A value of 0h indicates that a zero length packet was returned and the state of Data Buffer is not defined. A value of 1-8 indicates 1-8 bytes were received. Hardware is not allowed to return values 9-Fh. The transferring of data always starts with byte 0 in the data area and moves toward byte 7 until the transfer size is reached.

18.9.21 USB PIDs Register (DP_USB_PIDs)—Offset A4h

Access Method

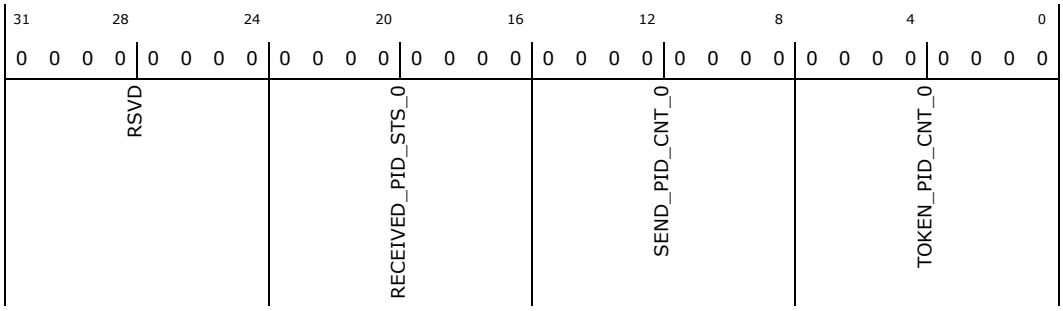
Type: Memory Mapped I/O Register (Size: 32 bits)

DP_USB_PIDs: [MBAR] + A4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23:16	00h RO	**RECEIVED_PID_STS (RECEIVED_PID_STS_0):** The hardware updates this field with the received PID for transactions in either direction. When the controller is writing data, this field is updated with the handshake PID that is received from the device. When the host controller is reading data, this field is updated with the data packet PID (if the device sent data), or the handshake PID (if the device NAKs the request). This field is valid when the hardware clears the GO_DONE#_CNT bit. Reset Default = 0.
15:8	00h RW	**SEND_PID_CNT (SEND_PID_CNT_0):** The hardware sends this PID to begin the data packet when sending data to USB (ie. WRITE_READ#_CNT is asserted). Software will typically set this field to either DATA0 or DATA1 PID values. Reset Default = 0
7:0	00h RW	**TOKEN_PID_CNT (TOKEN_PID_CNT_0):** The hardware sends this PID as the Token PID for each USB transaction. Software will typically set this field to either IN, OUT or SETUP PID values. Reset Default = 0.

18.9.22 Debug Port Data Buffer Bytes 7:0 (DP_DATA_BUF_B)—Offset A8h

Access Method

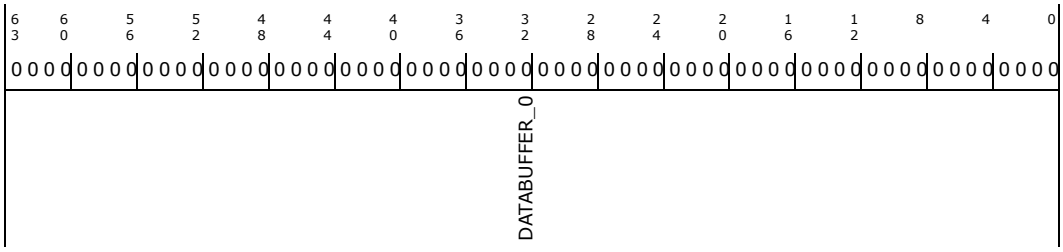
Type: Memory Mapped I/O Register (Size: 64 bits)

DP_DATA_BUF_B: [MBAR] + A8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 0000000000000000h



Bit Range	Default & Access	Description
63:0	0000000000000000h RW	**DATABUFFER (DATABUFFER_0):** These are the 8 bytes of the data buffer. Bits 7:0 correspond to least significant byte (byte 0). Bits 63:56 correspond to the most significant byte (byte 7). The bytes in the Data Buffer must be written with data before software initiates a write request. For a read request, the Data Buffer contains valid data when DONE_STS is set by the hardware, ERROR_GOOD#_STS is cleared by the hardware, and the DATA_LENGTH_CNT field indicates the number of bytes that are valid. Reset Default = 0.

18.9.23 Debug Port Config Register (DP_CFG)—Offset B0h

Access Method

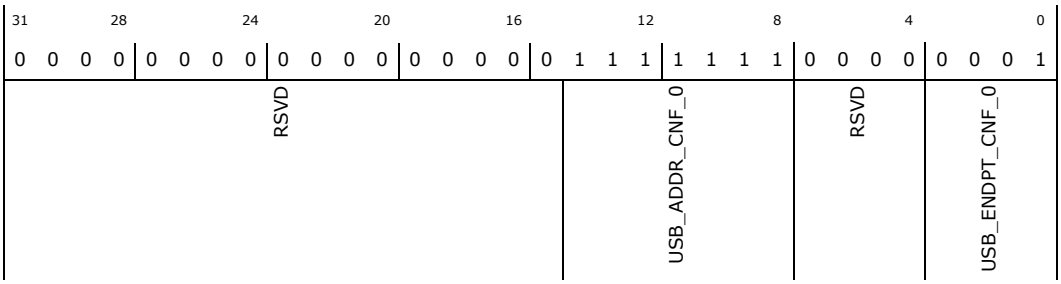
Type: Memory Mapped I/O Register (Size: 32 bits)

DP_CFG: [MBAR] + B0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Power Well: Core

Default: 00007F01h

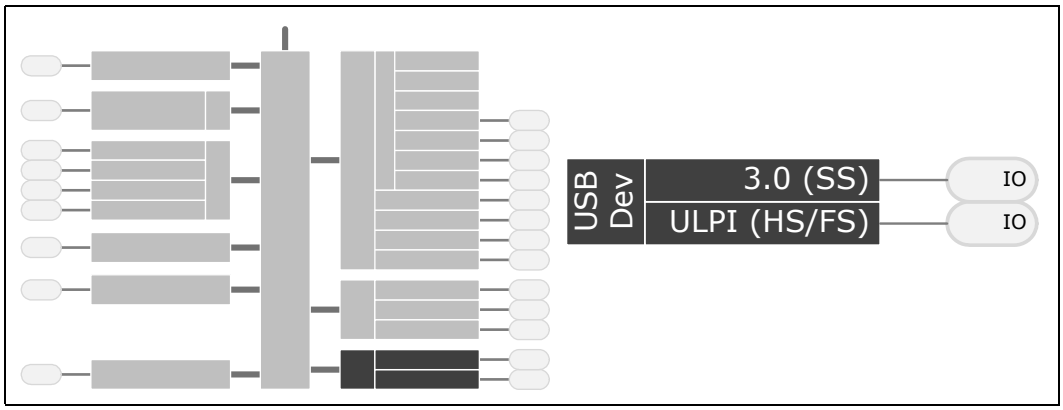


Bit Range	Default & Access	Description
31:15	0000000000000000b RO	**Reserved (RSVD):** Reserved.
14:8	7fh RW	**USB_ADDRESS_CNF (USB_ADDR_CNF_0):** 7-bit field that identifies the USB device address used by the controller for all Token PID generation. This is a R/W field that is set to 7Fh after reset
7:4	0000b RO	**Reserved (RSVD):** Reserved.
3:0	01h RW	**USB_ENDPOINT_CNF (USB_ENDPT_CNF_0):** This 4-bit field identifies the endpoint used by the controller for all Token PID generation. This is a R/W field that is set to 01h after reset.

19 USB Device Controller Interfaces (3.0, ULPI)

The SoC implements a single USB 3.0 device controller, where the platform acts as a peripheral to another device or another PC.

The USB Device controller supports connections at Super Speed (3.0) on the USB3DEV interface, and High and Full speeds (2.0/1.x) on the ULPI interface. To support High and Full Speed devices on ULPI, an external PHY is required.



19.0.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

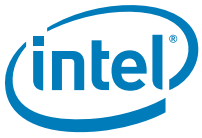


Table 205. USB 3.0 Device Signals

Signal Name	Direction Plat. Power	Description
USB3DEV_RXP/N[0]	I V1P0S	**Data In:** High speed serialized data inputs
USB3DEV_TXP/N[0]	O V1P0S	**Data Out:** High speed serialized data outputs.
USB3DEV_REXT[0]		**Resistor Compensation:** An external resistor must be connected between this pin and package ground. Please contact your Intel representative for details.

Table 206. USB ULPI Device Signals

Signal Name	Direction Plat. Power	Description
USB_ULPI_CLK	I V1P8A	**Interface Clock** By default, control and data signals are synchronous to clock.
USB_ULPI_DATA[7:0]	I/O V1P8A	**Bi-directional data bus** Driven low by the Link during idle. The Link starts a transfer by sending a non-zero pattern. The PHY must assert USB_ULPI_DIR before using the data bus. A turnaround cycle is required every time that USB_ULPI_DIR toggles.
USB_ULPI_DIR	I V1P8A	**Direction of the data bus** By default, USB_ULPI_DIR is low and the PHY listens for non-zero data from the Link. The PHY asserts USB_ULPI_DIR to get control of the data bus.
USB_ULPI_NXT	I V1P8A	**Next Data** The PHY drives USB_ULPI_NXT high to throttle the data bus
USB_ULPI_STP	O V1P8A	**Stop data** The Link drives USB_ULPI_STP high to signal the end of its data stream. The Link can also drive USB_ULPI_STP high to request data bus access from the PHY
USB_ULPI_REFCLK	O V1P8A	**Reference clock** ULPI reference clock for external PHY
USB_ULPI_RST#	O V1P8A	**Reset** Used to reset the external PHY. Not part of ULPI specification. Optionally used by driver.

19.1 USB Device Controller

The USB device controller can control one USB 3.0 Device port. Either a combo SS + ULPI Device port, or UPLI only port. It supports hosts conforming to USB 3.0 at bit rates up to 5 Gbps on USB3DEV interface as well as USB 2.0 hosts at up to 480 Mbps via a PHY on ULPI.

19.1.1 Features

Features supported by the Device Controller include:

- Enumerable by both ACPI and PCI. The USB3 device subsystem is designed to appear to the OS as a true PCI device. It will also support ACPI-enumerated methods.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.
- Support for LPM (Link Power Management)

Some of the key features of the ULPI device controller are:

- Supports up to 8 endpoints when acting as device
- 8-bit data interface transmitted at 60 MHz ULPI clock

Note: Recommended not to disconnect the connection when a debug session is in progress.

19.1.2 Power Management Features

The USB 3.0 device subsystem supports the following device power states:

- D0: Functional and highest power state.
- RTD3 (D3): Software managed deepest low power state in which state is saved/ restored if needed prior to entry/exit

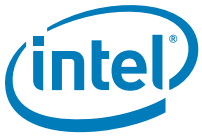
19.1.2.1 D0

This is the Functional and highest power state. The USB 3.0 device subsystem is in this state when the USB link is in U0 (U0 is the normal operational state where packets can be transmitted and received).

19.1.2.2 D3

D3 is a low power state that is used when the link is suspended; for example, U3 (U3 is a link state where a device is put into a suspend state. Significant link and device powers are saved).

This is a software directed state in which the controller is either power gated or the power is disabled.



19.1.3 Interrupts

A Functional Interrupt is generated by the logic in the USB device controller core to indicate the occurrence of an event needing application intervention. The design of the USB device core is such that events such as "link change" that would traditionally trigger an interrupt through an interrupt status register, are instead delivered to an 'Event buffer' in host memory, together with an interrupt indicating this.

19.4.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

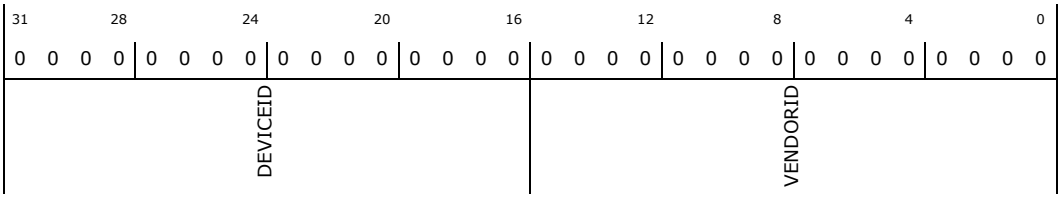
DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

DEVVENDID: [B:0, D:22, F:0] + 0h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RO	**DEVICEID:** Reserved.
15:0	0000h RO	**VENDORID:** Reserved.

19.4.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

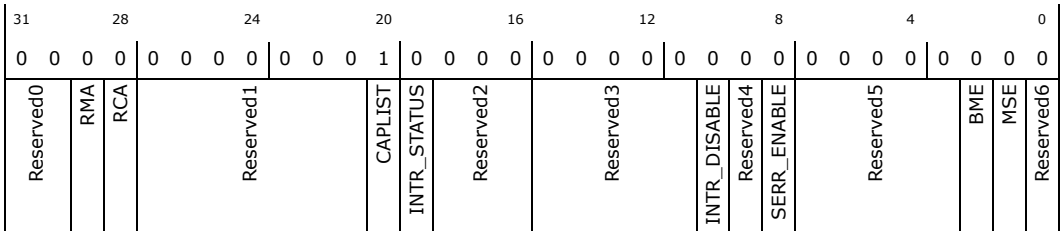
STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register (Size: 32 bits)

STATUSCOMMAND: [B:0, D:22, F:0] + 4h

Default: 00100000h



Bit Range	Default & Access	Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**RMA:** Reserved.
28	0h RW/1C	**RCA:** Reserved.
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**CAPLIST:** Reserved.
19	0h RO	**INTR_STATUS:** Reserved.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**INTR_DISABLE:** Reserved.
9	0h RO	**Reserved4:** Reserved.
8	0h RW	**SERR_ENABLE:** Reserved.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**BME:** Reserved.
1	0h RW	**MSE:** Reserved.
0	0h RO	**Reserved6:** Reserved.

19.4.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

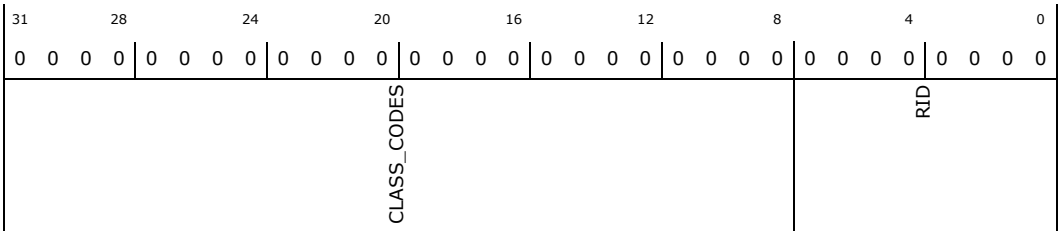
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:22, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

19.4.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

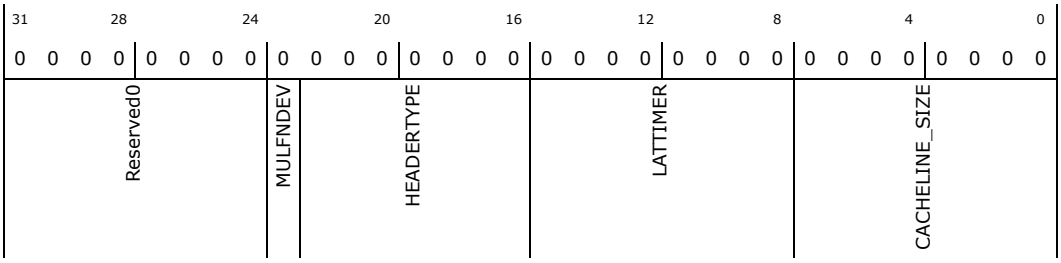
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:22, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

19.4.5 reg_BAR_type (BAR)—Offset 10h

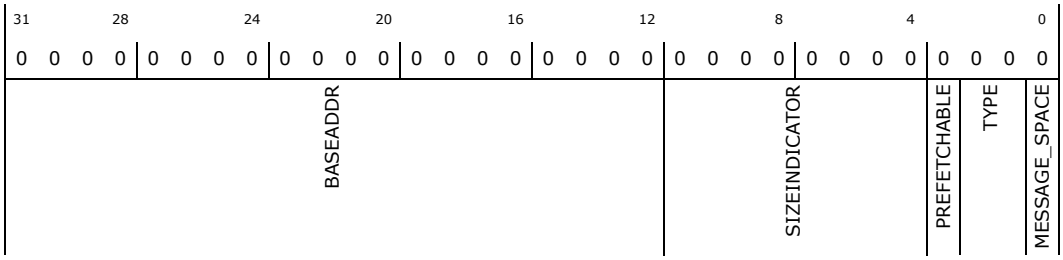
BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR:** Reserved.
11:4	00h RO	**SIZEINDICATOR:** Reserved.
3	0h RO	**PREFETCHABLE:** Reserved.
2:1	0h RO	**TYPE:** Reserved.
0	0h RO	**MESSAGE_SPACE:** Reserved.

19.4.6 reg_BAR1_type (BAR1)—Offset 14h

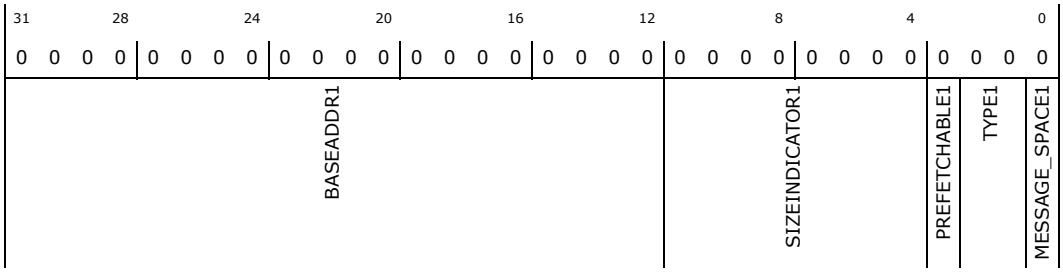
BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BAR1: [B:0, D:22, F:0] + 14h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	00000h RW	**BASEADDR1:** Reserved.
11:4	00h RO	**SIZEINDICATOR1:** Reserved.
3	0h RO	**PREFETCHABLE1:** Reserved.
2:1	0h RO	**TYPE1:** Reserved.
0	0h RO	**MESSAGE_SPACE1:** Reserved.

19.4.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

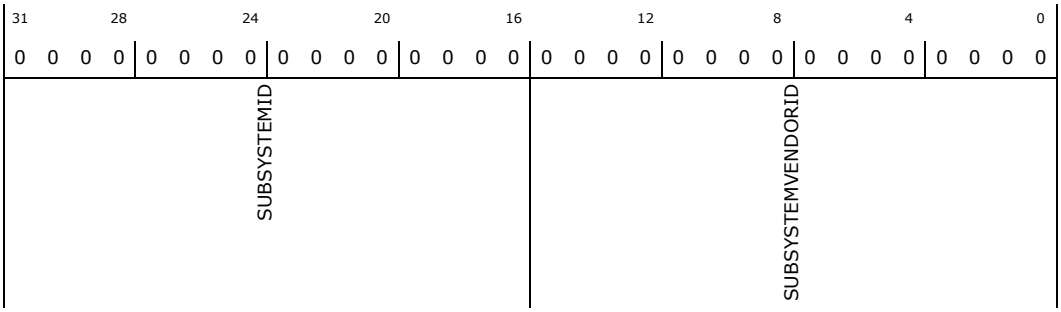
SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:22, F:0] + 2Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

19.4.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

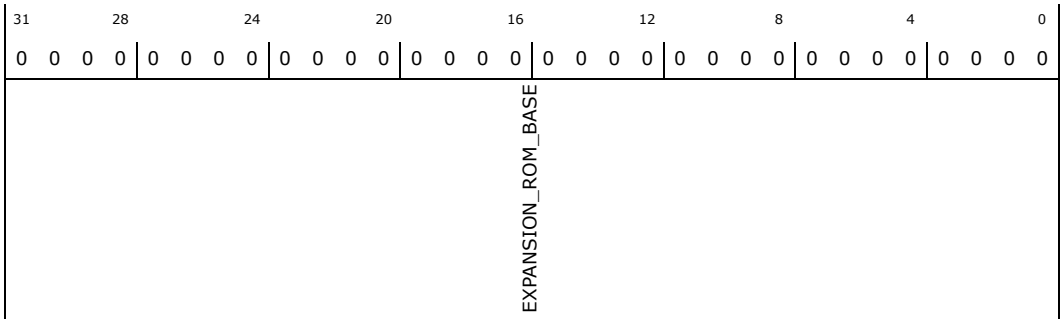
EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

EXPANSION_ROM_BASEADDR: [B:0, D:22, F:0] + 30h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

19.4.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

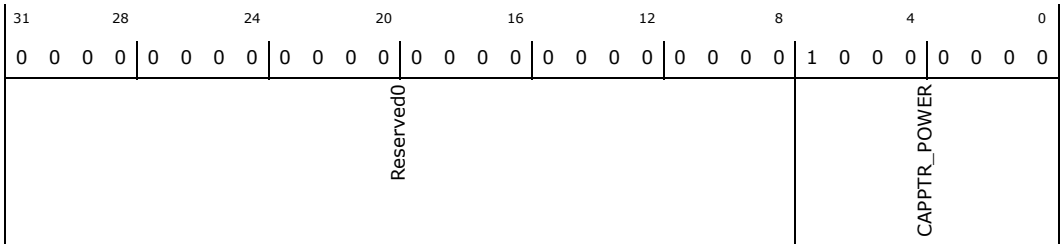
CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPABILITYPTR: [B:0, D:22, F:0] + 34h

Default: 00000080h



Bit Range	Default & Access	Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**CAPPTR_POWER:** Reserved.

19.4.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

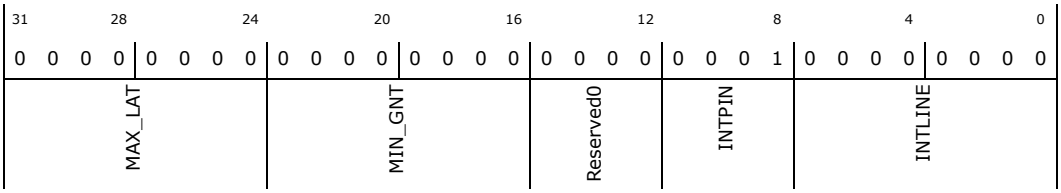
INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTERRUPTREG: [B:0, D:22, F:0] + 3Ch

Default: 00000100h



Bit Range	Default & Access	Description
31:24	00h RO	**MAX_LAT:** Reserved.
23:16	00h RO	**MIN_GNT:** Reserved.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**INTPIN:** Reserved.
7:0	00h RW	**INTLINE:** Reserved.

19.4.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

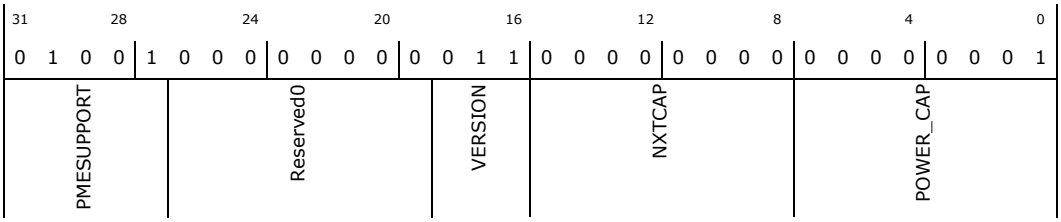
POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

POWERCAPID: [B:0, D:22, F:0] + 80h

Default: 48030001h



Bit Range	Default & Access	Description
31:27	09h RO	**PMESUPPORT:** Reserved.
26:19	00h RO	**Reserved0:** Reserved.
18:16	3h RO	**VERSION:** Reserved.
15:8	00h RO	**NXTCAP:** Reserved.
7:0	01h RO	**POWER_CAP:** Reserved.

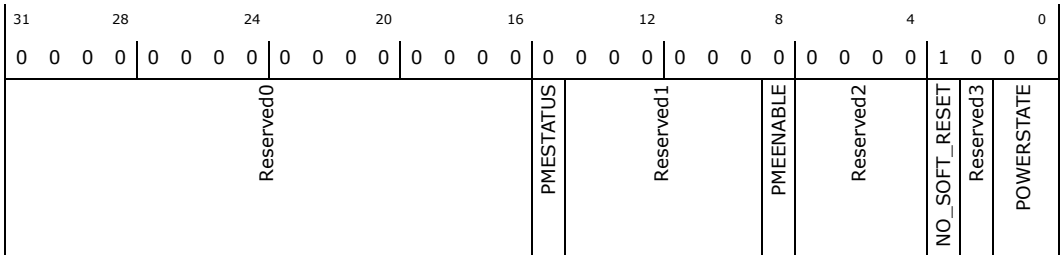
19.4.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMECTRLSTATUS: [B:0, D:22, F:0] + 84h

Default: 00000008h



Bit Range	Default & Access	Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PMESTATUS:** Reserved.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PMEENABLE:** Reserved.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**NO_SOFT_RESET:** Reserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**POWERSTATE:** Reserved.

19.4.13 reg_MANID_type (MANID)—Offset F8h

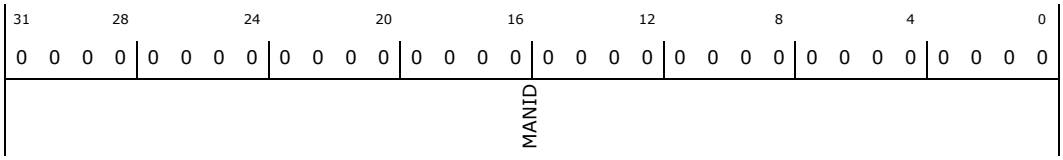
Manufacturers ID

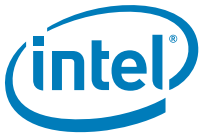
Access Method

Type: PCI Configuration Register (Size: 32 bits)

MANID: [B:0, D:22, F:0] + F8h

Default: 00000000h





Bit Range	Default & Access	Description
31:0	00000000h RO	**MANID:** Reserved.

19.5 USB 3.0 Device PCI Configuration Registers

Table 208. Summary of USB 3.0 Device PCI Configuration Registers—0/22/0

Offset	Size	Register ID—Description	Default Value
A0h	4	"reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h" on page 2232	00000000h
A4h	4	"reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h" on page 2233	00000000h
A8h	4	"reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h" on page 2234	00000000h
ACh	4	"reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh" on page 2234	00000000h
C0h	4	"reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h" on page 2235	00000000h

19.5.1 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

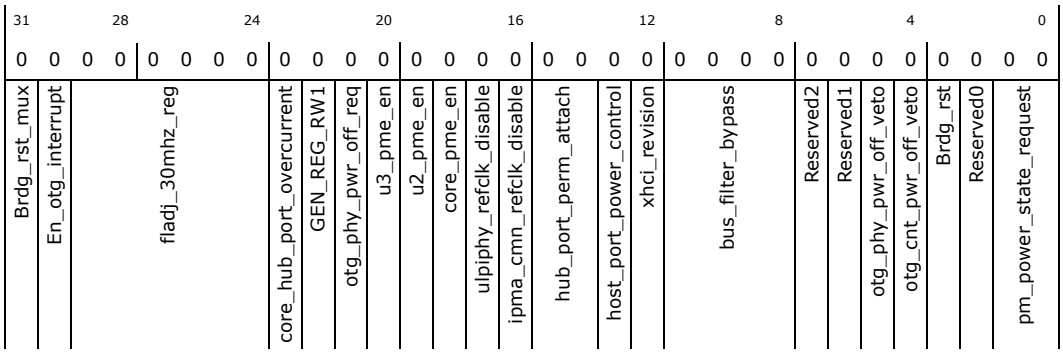
General Purpose Read Write Register1

Access Method

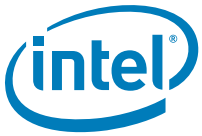
Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:22, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**Brdg_rst_mux:** This is a mux the core reset between the normal reset or reset and with bdg_reset regRW1[3]
30	0b RW	**En_otg_interrupt:** enable the OTG interrupt
29:24	000000b RW	**fladj_30mhz_reg:** HS jitter adjusment
23	0b RW	**core_hub_port_overcurrent:** This is a generic register provided for product specific behavior
22	0b RW	**GEN_REG_RW1:** This is a generic register provided for product specific behavior
21	0b RW	**otg_phy_pwr_off_req:** Indicates that the PHY power (both core and suspend well) can be turned off. Valid for D0 and RTD3hot
20	0b RW	**u3_pme_en:** Determines whether USB3 flis PME events are allowed to trigger PME events to brige/GPIO



Bit Range	Default & Access	Description
19	0b RW	**u2_pme_en:** Determines whether ULPI flis PME events are allowed to trigger PME events to brige/GPIO
18	0b RW	**core_pme_en:** Determines whether core PME events are allowed to trigger PME events to brige/GPIO
17	0b RW	**ulpiphy_refclk_disable:** Feeds logic that generates the 19.2MHz clkreq signal
16	0b RW	**ipma_cmn_refclk_disable:** Feeds through PIMA PHY into 25MHz clkreq signal
15:14	00b RW	**hub_port_perm_attach:** Indicates if the device attached to a downstream port is permanently attached or not
13	0b RW	**host_port_power_control:** This port defines the bit [3] of Capability Parameters (HCCPARAMS). Change the PPC value through the pin Port Power Control (PPC). This indicates whether the host controller implementation includes port power control. ? 0 - Indicates that the port does not have port power switches. ? 1 - Indicates that the port has port power switches.
12	0b RW	**xhci_revision:** This signal is used to select the xHCI revision that the host controller complies with
11:8	0000b RW	**bus_filter_bypass:** Bus Filter Bypass. Disables the internal bus filters that are enabled by DWC_USB3_EN_BUS_FILTERS coreConsultant parameter. This static signal is present only when DWC_USB3_EN_BUS_FILTERS is 1. It is expected that this signal is set or reset at power-on reset and is not changed during the normal operation of the core.
7	0b RW	**Reserved2:** reserved
6	0b RW	**Reserved1:** reserved
5	0b RW	**otg_phy_pwr_off_veto:** Indicates that PHY suspend power should not power off even on RTD3hot (Note that the PHY core power is turned off during RTD3hot in line with the OTG core, as a function of otg_cnt_pwr_off_veto)
4	0b RW	**otg_cnt_pwr_off_veto:** Indicates that controller power should not power off even on RTD3hot.Also a veto signal to keep LPPLL on. Note: Currently LPPLL results in a veto for S0iX flows
3	0b RW	**Brdg_rst:** reset the core see also regRW1[31]
2	0b RW	**Reserved0:** reserved
1:0	00b RW	**pm_power_state_request:** This port defines the PCI power management state requested by the software. When the core is configured with two power rail support (DWC_USB3_EN_PWROPT=2), the valid states are: ? 00: D0 ? 11: D3 Active State

19.5.2 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

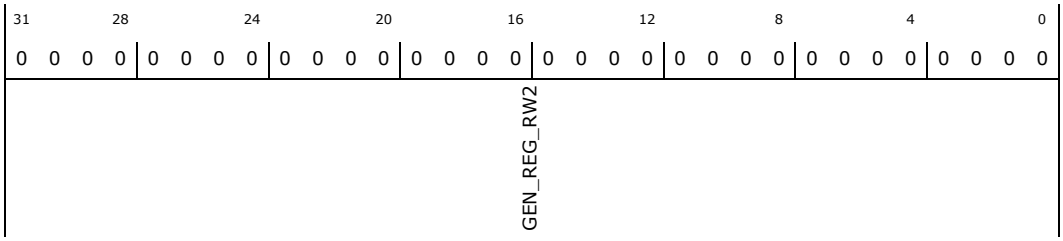
General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW2: [B:0, D:22, F:0] + A4h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW2:** Reserved.

19.5.3 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

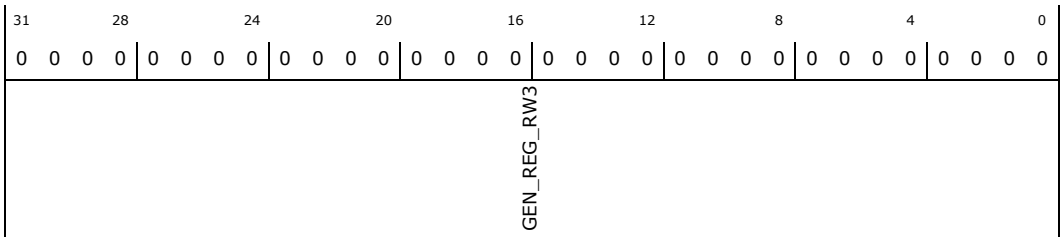
General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW3: [B:0, D:22, F:0] + A8h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

19.5.4 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

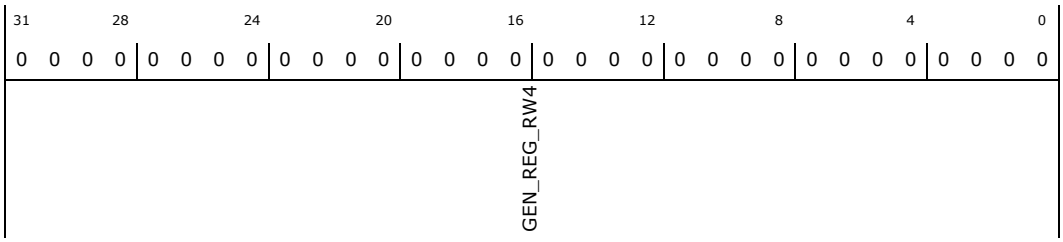
General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW4: [B:0, D:22, F:0] + ACh

Default: 00000000h



Bit Range	Default & Access	Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

19.5.5 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

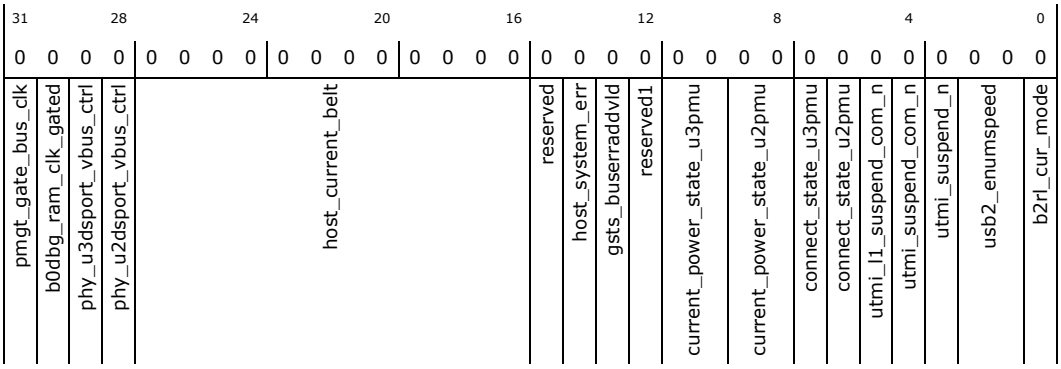
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:22, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**pmgt_gate_bus_clk:** Indicates that the conditions are appropriate for some internal modules to receive a gated bus_clk. This signal is used by the test environment to verify low power operation.
30	0b RO	**b0dbg_ram_clk_gated:** Indicates that the internal ram_clk is being gated. It indicates whether ram_clk_gated is turned on or off. This signal is used by the test environment to verify low power
29	0b RO	**phy_u3dsport_vbus_ctrl:** When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u3dsport_vbus_ctrl
28	0b RO	**phy_u2dsport_vbus_ctrl:** When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u2dsport_vbus_ctrl
27:16	000h RO	**host_current_belt:** Current BELT Value. This signal indicates the minimum value of all received BELT values and the BELT that is set by the Set LTV command. This signal is valid only in Host mode.
15	0b RO	**reserved:** Reserved.
14	0b RO	**host_system_err:** Host System Error. Indicates that a Host System Error has occurred as reflected in the USBSTS.HSE field.
13	0b RO	**gsts_buserraddvld:** Bus error
12	0b RO	**reserved1:** Reserved.

Bit Range	Default & Access	Description
11:10	00b RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	00b RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0b RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0b RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0b RO	**utmi_l1_suspend_com_n:** Common L1 suspend
4	0b RO	**utmi_suspend_com_n:** Common suspend
3	0b RO	**utmi_suspend_n:** USB 2.0 Port Suspend
2:1	00b RO	**usb2_enumspeed:** Device Enumerated Speed
0	0b RO	**b2rl_cur_mode:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device

19.6.1 CAPLENGTH—Offset 0h

This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

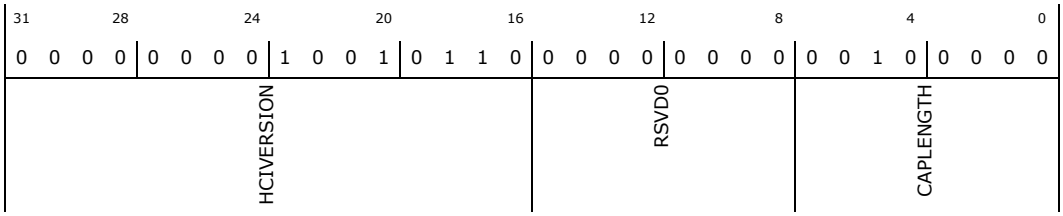
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CAPLENGTH: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00960020h



Bit Range	Default & Access	Description
31:16	096h RO	**HCIVERSION:** This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. e.g. 0100h corresponds to xHCI version 1.0.xs
15:8	0h RO	**RSVD0:** Reserved.
7:0	20h RO	**CAPLENGTH:** This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

19.6.2 HCSPARAMS1—Offset 4h

number of ports implemented is 2 because there is 1 DWC_USB2_HOST_NUM_U2_ROOT_PORTS and 1 DWC_USB3_HOST_NUM_U3_ROOT_PORT

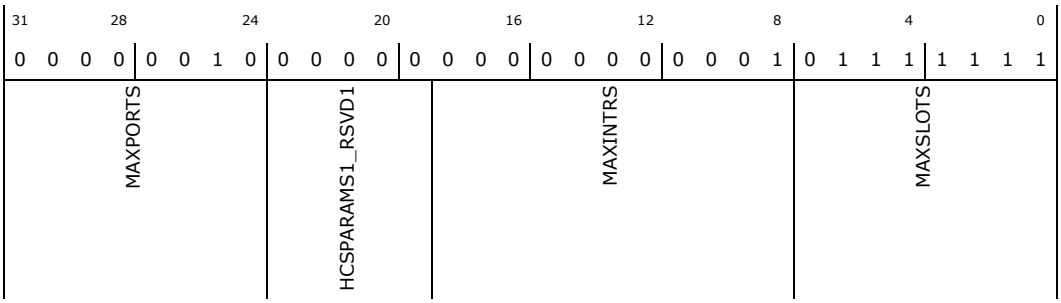
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS1: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0200017Fh



Bit Range	Default & Access	Description
31:24	02h RO	**MAXPORTS:** Number of Ports (MaxPorts). This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Set that are addressable in the Operational Register Space (refer to Table 29). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.
23:19	0h RO	**HCSPARAMS1_RSVD1:** reserved
18:8	1h RO	**MAXINTRS:** Number of Interrupters (MaxIntrs). This field specifies the number of Interrupters implemented on this host controller. Each Interrupter may be allocated to a MSI or MSI-X vector and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to section 5.5). Valid values are in the range of 1h to 400h. A 0 in this field is undefined.
7:0	7fh RO	**MAXSLOTS:** Number of Device Slots (MaxSlots). This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255. The value of 0 is reserved.

19.6.3 HCSPARAMS2—Offset 8h

Host Controller Structural Parameters 2

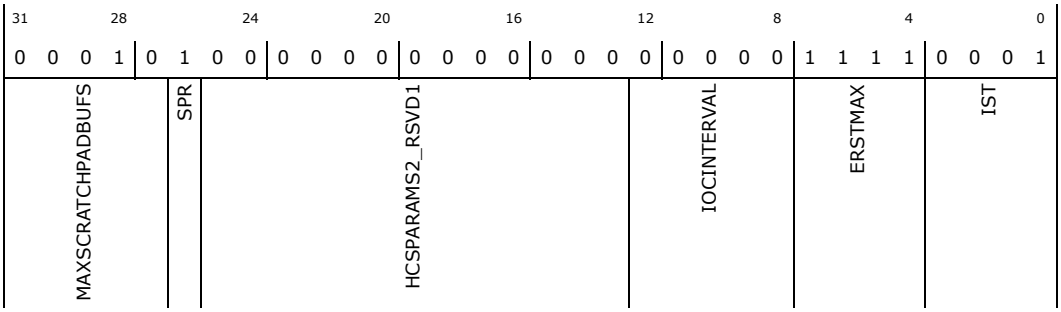
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS2: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 140000F1h



Bit Range	Default & Access	Description
31:27	02h RO	**MAXSCRATCHPADBUFS:** For xHCI 0.96,this field is Max Scratchpad Bufs / For xHCI 1.0, this field is Max Scratchpad Bufs Lo
26	1h RO	**SPR:** Scratchpad Restore (SPR)
25:13	0h RO	**HCSPARAMS2_RSVD1:** reserved
12:8	0h RO	**IOCINTERVAL:** This field is valid only for xHCI 0.96. For xHCI 1.0, this field is Reserved.
7:4	fh RO	**ERSTMAX:** Event Ring Segment Table Max (ERST Max)
3:0	1h RO	**IST:** Isochronous Scheduling Threshold (IST)

19.6.4 HCSPARAMS3—Offset Ch

Structural Parameters 3 Register

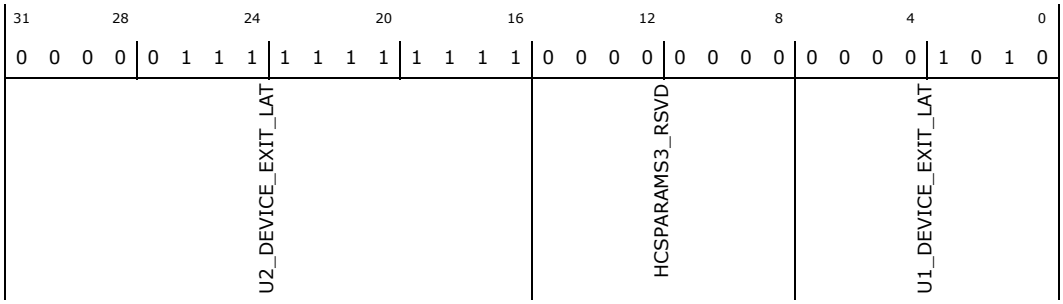
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS3: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 07FF000Ah



Bit Range	Default & Access	Description
31:16	07ffh RO	**U2_DEVICE_EXIT_LAT:** Reserved.
15:8	0h RO	**HCSPARAMS3_RSVD:** Reserved.
7:0	0ah RO	**U1_DEVICE_EXIT_LAT:** Reserved.

19.6.5 HCCPARAMS—Offset 10h

Capability Parameters Register

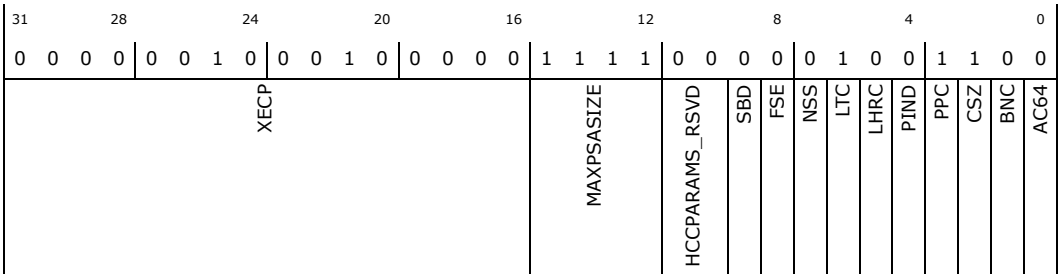
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCCPARAMS: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0220F04Ch



Bit Range	Default & Access	Description
31:16	220h RO	**XECP:** Based on configuration, core automatically updates it
15:12	fh RO	**MAXPSASIZE:** Maximum Primary Stream Array Size
11:10	0h RO	**HCCPARAMS_RSVD:** Reserved
9	0h RO	**SBD:** Secondary Bandwidth Domain Reporting (SBD)
8	0h RO	**FSE:** For xHCI 0.96, this field is Force Stopped Event (FSE) / For xHCI 1.0, this field is Parse All Event Data (PAE)
7	0h RO	**NSS:** No Secondary SID Support (NSS). This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. (refer to Sections 4.12.2 and 6.2.3).
6	1h RO	**LTC:** Latency Tolerance Messaging Capability (LTC). This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to section 4.13.1 for more information on LTM.
5	0h RO	**LHRC:** Light HC Reset Capability (LHRC). This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USBCMD register (refer to Section 5.4.1).
4	0h RO	**PIND:** Port Indicators (PIND). This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. Refer to Section 5.4.8 for definition of the Port Indicator Control field.
3	1h RO	**PPC:** Port Power Control (PPC). This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register (refer to Section 5.4.8).
2	1h RO	**CSZ:** Context Size (CSZ). If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts.

Bit Range	Default & Access	Description
1	0h RO	**BNC:** BW Negotiation Capability (BNC). This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: for Value 0 Description BW Negotiation not implemented. for Value 1 DescriptionBW Negotiation implemented. Refer to section 4.16 of XHCI specification for more information on Bandwidth Negotiation.
0	0h RO	**AC64:** 64-bit Addressing Capability (AC64). This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: for Value 0 Description 32-bit address memory pointers implemented. for Value 1 description 64-bit address memory pointers implemented. If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.

19.6.6 DBOFF—Offset 14h

Doorbell Offset Register

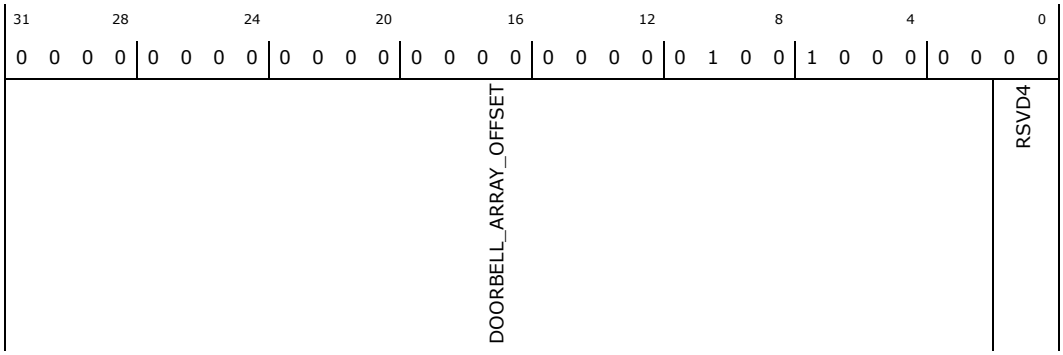
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

DBOFF: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000480h



Bit Range	Default & Access	Description
31:2	120h RO	**DOORBELL_ARRAY_OFFSET:** Based on configuration, core automatically updates it
1:0	0h RO	**RSVD4:** Reserved

19.6.7 RTSOFF—Offset 18h

Runtime Register Space Offset Register

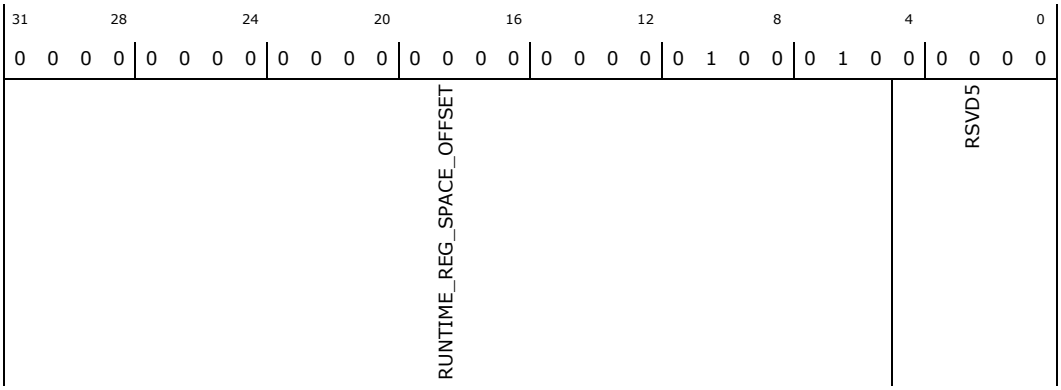
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RTSOFF: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000440h



Bit Range	Default & Access	Description
31:5	22h RO	**RUNTIME_REG_SPACE_OFFSET:** Based on configuration, core automatically updates it
4:0	0h RO	**RSVD5:** Reserved

19.6.8 Rsvd_HC—Offset 1Ch

reserved

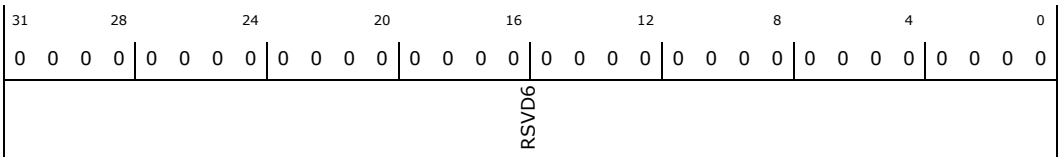
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Rsvd_HC: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**RSVD6:** Reserved.

19.6.9 USBCMD—Offset 20h

USB Command Register Bit Definitions

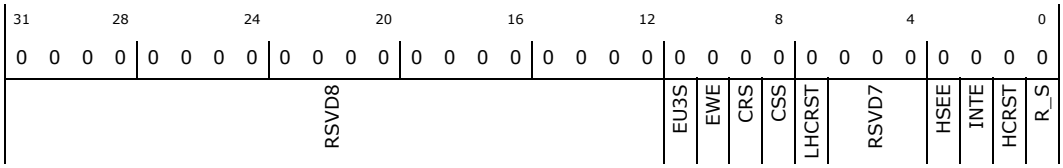
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

USBCMD: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:12	0h RO	**RSVD8:** reserved
11	0h RW	**EU3S:** Enable U3 MFINDEX Stop (EU3S) - RW. Default = 0. When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to section 4.14.2 for more information.
10	0h RW	**EWE:** Enable Wrap Event (EWE) - RW. Default = 0. When set to 1, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to section 4.14.2 for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.
9	0h RW	**CRS:** Controller Restore State: This command is similar to the USBCMD. CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'.
8	0h RW	**CSS:** Controller Save State: This command is similar to the USBCMD. CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'.
7	0h RW	**LHCRST:** Light Host Controller Reset (LHCRST) RO or RW. Optional normative. Default = 0. If the Light HC Reset Capability (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the Light Host Controller Reset has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. Refer to section 4.23.1 for more information. When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. Disable the VFs device slots and set the associated VF Run bit to Stopped. Refer to section 8 for more information.
6:4	0h RO	**RSVD7:** Reserved
3	0h RW	**HSEE:** Host System Error Enable (HSEE) RW. Default = 0. When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to section 4.10.2.6 for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to section 8 for more information.

Bit Range	Default & Access	Description
2	0h RW	**INTE:** Interrupter Enable (INTE) RW. Default = 0. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, e.g. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. Refer to section 7.7.2 for more information.
1	0h RW	**HCRST:** Host Controller Reset (HCRST) RW. Default = 0. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reset shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller as described in Section 4.1 in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to section 8 for more information.
0	0h RW	**R_S:** Run/Stop (R/S) RW. Default = 0. 1 = Run. 0 = Stop. When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may result in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. Refer to section 8 for more information.

19.6.10 USBSTS—Offset 24h

USB Command Register Bit Definitions

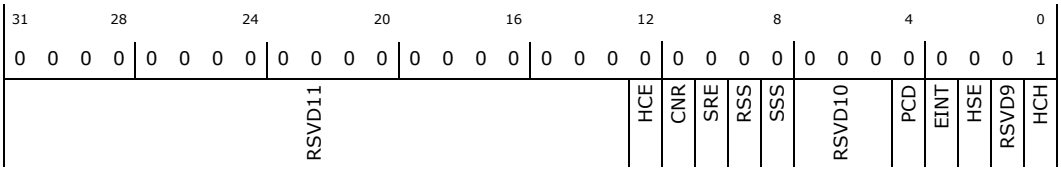
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

USBSTS: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000001h



Bit Range	Default & Access	Description
31:13	0h RO	**RSVD11:** reserved
12	0h RO	**HCE:** Host Controller Error (HCE) - RO. Default = 0. 0' = No internal xHC error conditions exist '1' = Internal xHC error condition. This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of xhci specification for more information.
11	0h RO	**CNR:** Controller Not Ready (CNR) - RO. Default = '1'. '0' = Ready '1' = Not Ready. Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared ('0') until the next Chip Hardware Reset.
10	0h RO	**SRE:** Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 of xhci specification for more information.
9	0h RO	**RSS:** Restore State Status: This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.RSS to '0'.
8	0h RO	**SSS:** Save State Status: This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0'
7:5	0h RO	**RSVD10:** reserved
4	0h RW	**PCD:** Reserved.
3	0h RO	**EINT:** Reserved.
2	0h RO	**HSE:** Reg field HSE
1	0h RO	**RSVD9:** reserved
0	1h RO	**HCH:** Reg field HCH

19.6.11 PAGESIZE—Offset 28h

Page Size Register Bit Definitions. This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A Notification Enable (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset all notifications are disabled. Refer to section 6.4.2.7. This register shall be written as a Dword. Byte writes produce undefined results.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PAGESIZE: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

19.6.13 CRCR_LO—Offset 38h

Register CRCR_LO

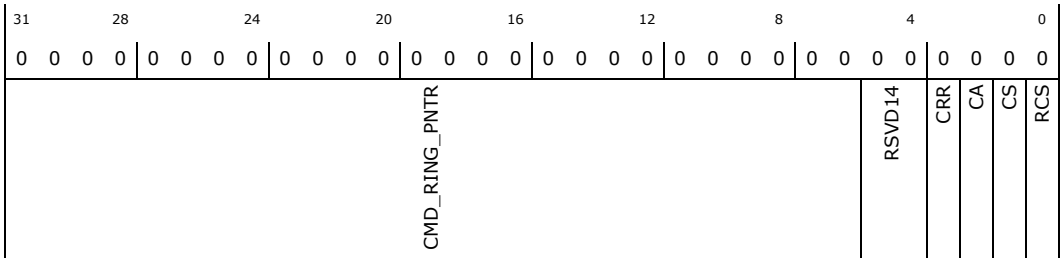
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CRCR_LO: [BAR] + 38h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0h RW	**CMD_RING_PNTR:** Command Ring Pointer - RW. Default = 0. This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when Command Ring Running (CRR) = 1. If the CRCR is written while the Command Ring is stopped (CCR = 0), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CCR = 0) then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0.
5:4	0h RO	**RSVD14:** reserved
3	0h RW	**CRR:** Command Ring Running (CRR) - RO. Default = 0. This flag is set to 1 if the Run/Stop (R/S) bit is 1 and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0 when the Command Ring is stopped after writing a 1 to the Command Stop (CS) or Command Abort (CA) flags, or if the R/S bit is cleared to 0.
2	0h RW	**CA:** Command Abort (CA) - RW1S. Default = 0. Writing a 1 to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to section 4.6.1.2 for more information on aborting a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit always returns 0.
1	0h RW	**CS:** Command Stop (CS) - RW1S. Default = 0. Writing a 1 to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to section 4.6.1.1 for more information on stopping a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit shall always return 0.
0	0h RW	**RCS:** Ring Cycle State (RCS) - RW. This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. Refer to section 4.9.3 for more information. Writes to this flag are ignored if Command Ring Running (CRR) is 1. If the CRCR is written while the Command Ring is stopped (CRR = 0), then the value of this flag shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0), then the Command Ring shall begin fetching Command TRBs using the current value of the internal Command Ring CCS flag. Reading this flag always returns 0.

19.6.14 CRCR_HI—Offset 3Ch

Register CRCR_HI

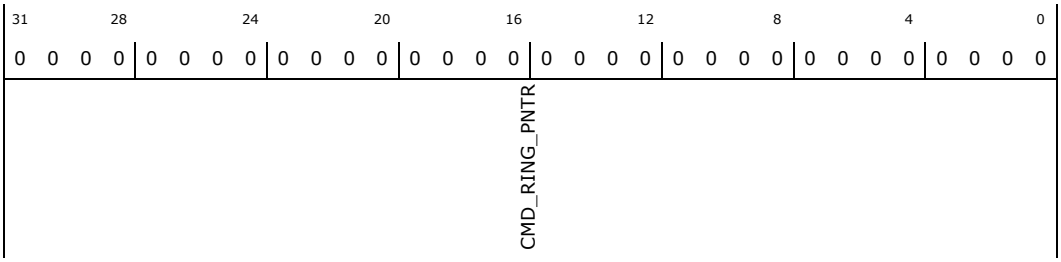
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CRCR_HI: [BAR] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**CMD_RING_PNTR:** Reg field CMD_RING_PNTR

19.6.15 DCBAAP_LO—Offset 50h

Register DCBAAP_LO

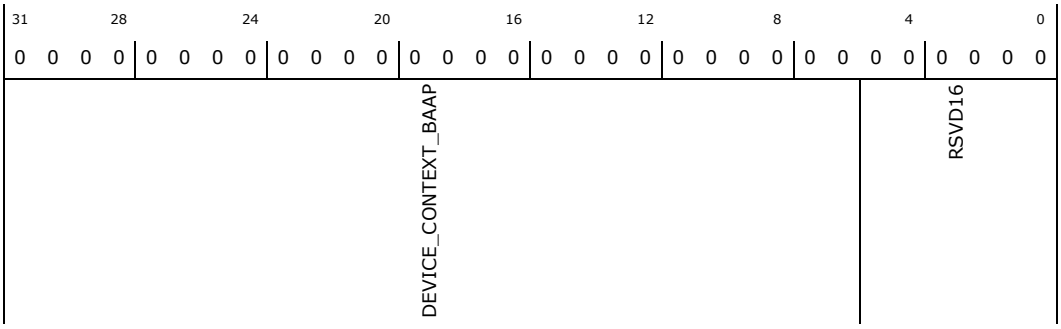
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

DCBAAP_LO: [BAR] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:6	0h RW	**DEVICE_CONTEXT_BAAP:** Reg field DEVICE_CONTEXT_BAAP
5:0	0h RO	**RSVD16:** reserved

19.6.16 DCBAAP_HI—Offset 54h

Register DCBAAP_HI

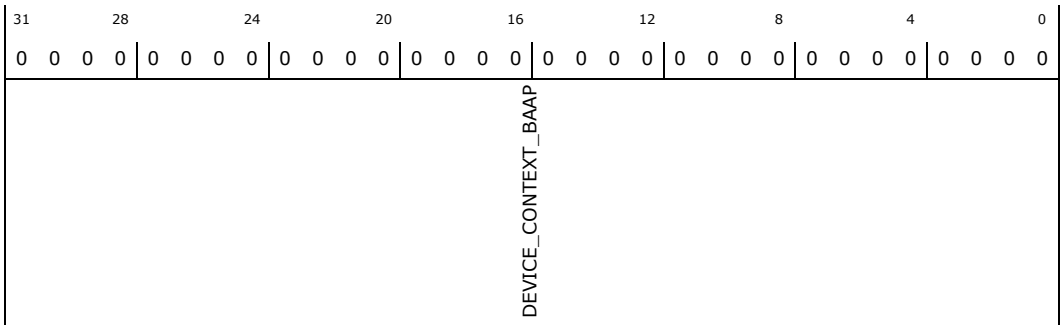
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

DCBAAP_HI: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**DEVICE_CONTEXT_BAAP:** Reg field DEVICE_CONTEXT_BAAP

19.6.17 CONFIG—Offset 58h

Configure Register Bit Definitions. This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a Host Controller Reset (HCRST). The initial conditions of a port are described in section 4.19 of xhci specification .

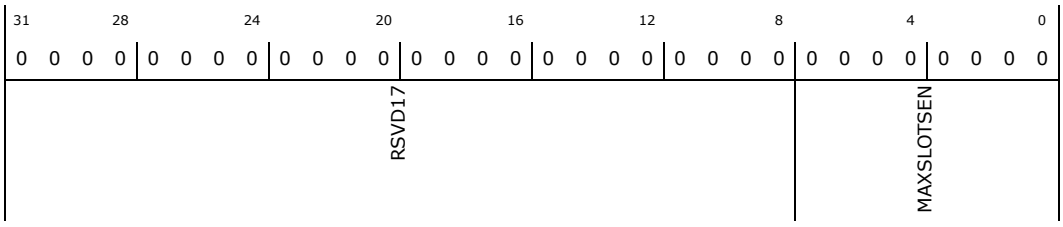
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CONFIG: [BAR] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0h RO	**RSVD17:** reserved
7:0	0h RW	**MAXSLOTSEN:** Reg field MAXSLOTSEN

19.6.18 PORTSC1—Offset 420h

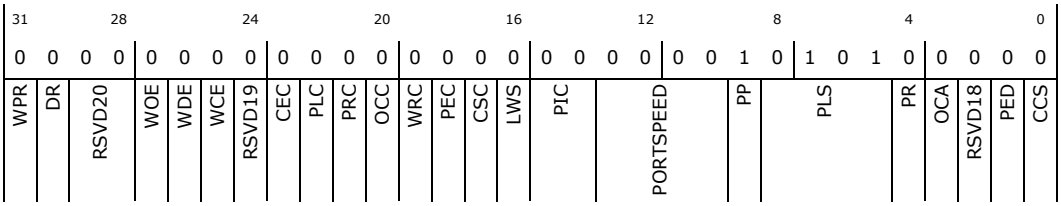
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTSC1: [BAR] + 420h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 000002A0h



Bit Range	Default & Access	Description
31	0h RW	**WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. of XHCI specification. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	**DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	**RSVD20:** reserved
27	0h RW	**WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up eventsn. Refer to section 4.15 for operational model.
26	0h RW	**WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model.
25	0h RW	**WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model.
24	0h RO	**RSVD19:** reserved
23	0h RW	**CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	**PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the following PLS transitions mentioned in the XHCI specification

Bit Range	Default & Access	Description
21	0h RW	**PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5. Refer to section 4.19.2 for more information on change bit usage.
20	0h RW	**OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	**WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	**PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.
17	0h RW	**CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	**LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	**PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0.
13:10	0h RW	**PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed. (more information in the XHCI specification)
9	1h RW	**PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.

Bit Range	Default & Access	Description
8:5	5h RW	**PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.
4	0h RW	**PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. This flag is 0 if PP is 0.
3	0h RW	**OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.
2	0h RO	**RSVD18:** reserved
1	0h RW	**PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit . This flag is 0 if PP is 0.
0	0h RW	**CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0.

19.6.19 PORTPMSC1—Offset 424h

TBD

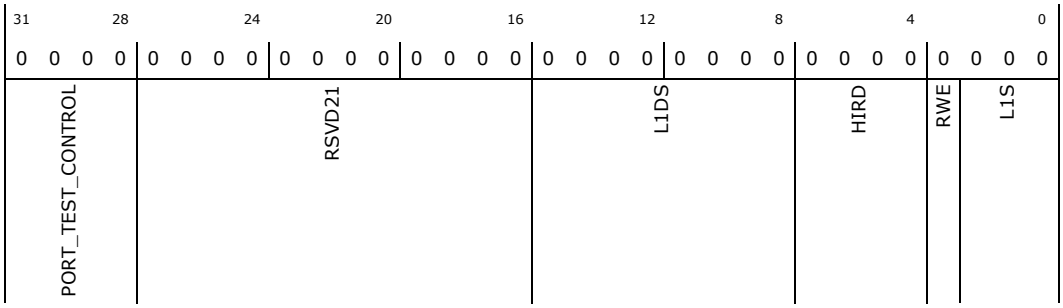
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTPMSC1: [BAR] + 424h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:28	0h RW	**PORT_TEST_CONTROL:** TBD
27:16	0h RO	**RSVD21:** reserved
15:8	0h RW	**L1DS:** Reg field L1DSLOT
7:4	0h RW	**HIRD:** Host Initiated Resume Duration (HIRD) - RW. Default = '0'. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. The HIRD value is encoded as follows: Value Description 0h 50 s. (default) 1h 125 s. 2h 200 s. Fh 1.175 ms. The value of 0000b is interpreted as 50 s. Each incrementing value up adds 75 s. to the previous value. For example, 0001b is 125 s, 0010b is 200s and so on. Based on this rule, the maximum value resume drive time is at encoding value 1111b which represents 1.2ms. Note that the HIRD field is used by both software and hardware controlled LPM. Refer to section 4.23.5.1.1 of xhci specification for more information on HIRD use. Refer to Section 4.1 of the USB2 LPM spec for more information on the use of the HIRD field.
3	0h RW	**RWE:** Port Test Control
2:0	0h RO	**L1S:** L1 Status (L1S) - RO. Default = 0. This field is used by software to determine whether an L1based suspend request (LMP transaction) was successful, specifically: Value Meaning 0 Invalid - This field shall be ignored by software. 1 Success - Port successfully transitioned to L1 (ACK) 2 Not Yet - Device is unable to enter L1 at this time (NYET) 3 Not Supported -Device does not support L1 transitions (STALL) 4 Timeout/ Error -Device failed to respond to the LPM Transaction or an error occurred 5-7 Reserved The value of this field is only valid when the port resides in the L0 or L1 state (PLS = '0' or '2'). Refer to section 4.23.5.1.1 for more information.

19.6.20 PORTLI—Offset 428h

Port Link Info Register

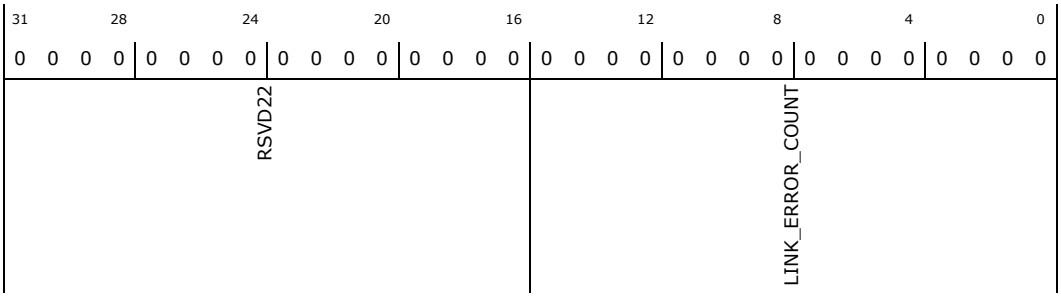
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTLI: [BAR] + 428h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RO	**RSVD22:** reserved
15:0	0h RO	**LINK_ERROR_COUNT:** Reg field LINK_ERROR_COUNT

19.6.21 PORTHLPMC—Offset 42Ch

The definition of the fields in the PORTHLPMC register depend on the USB protocol supported by the port. This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a Host Controller Reset (HCRST).

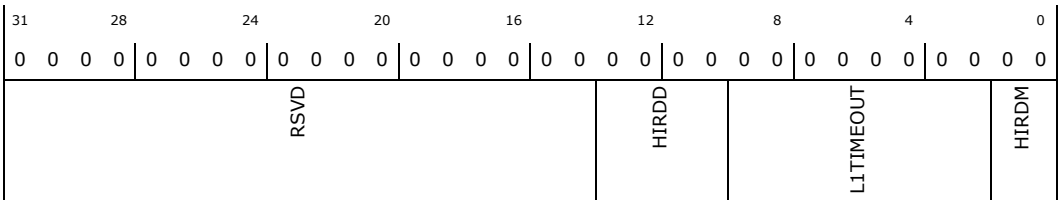
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTHLPMC: [BAR] + 42Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RO	**RSVD:** reserved
13:10	0h RW	**HIRDD:** Best Effort Service Latency Deep (BESLD) - RWS. Default = 0. System software sets this field to indicate to the recipient device how long the xHC will drive resume on an exit from U2. Refer to section 4.23.5.1.1.1 for more information on BESLD use. The BESLD value encoding is defined in Table 13. Refer to section 5.2.6 for information on how DBESLD may be used to establish an initial value for BESLD
9:2	0h RW	**L1TIMEOUT:** L1 Timeout RWS. Default = 00h. Timeout value for the L1 inactivity timer (LPM Timer). This field shall be set to 00h by the assertion of PR to 1. Refer to section 4.23.5.1.1.1 for more information on L1 Timeout operation. The following are permissible values: for 00h 128 s. (default). for 01h 256 s. for 02h 512 s. for 03h 768 s. . . . for FFh 65,280 s.

Bit Range	Default & Access	Description
1:0	0h RW	**HIRDM:** Host Initiated Resume Duration Mode (HIRDM) - RWS. Default = 0h. Indicates which HIRD value should be used. The following are permissible values: for 0 Initiate L1 using BESL only on timeout. (default). for 1 Initiate L1 using BESLD on timeout. If rejected by device, initiate L1 using BESL. for 3-2 Reserved.

19.6.22 PORTSC2—Offset 430h

A host controller shall implement one or more port registers. The number of port registers implemented by a particular instantiation of a host controller is documented in the HCSPARAMS1 register (Section 5.3.3). Software uses this information as an input parameter to determine how many ports need to be serviced

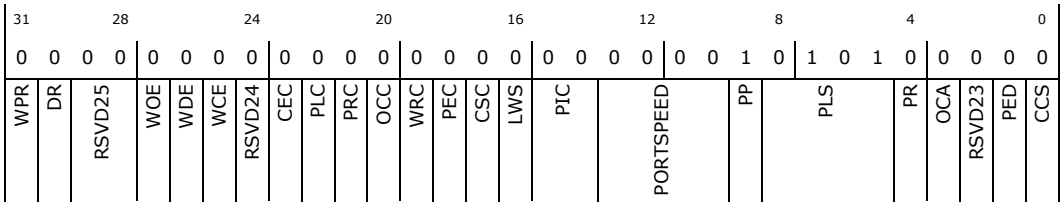
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

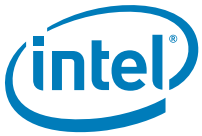
PORTSC2: [BAR] + 430h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 000002A0h



Bit Range	Default & Access	Description
31	0h RW	**WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	**DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	**RSVD25:** reserved
27	0h RW	**WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up eventsn. Refer to section 4.15 for operational model.
26	0h RW	**WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model.
25	0h RW	**WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model.
24	0h RO	**RSVD24:** reserved



Bit Range	Default & Access	Description
23	0h RW	**CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 of XHCI specification for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	**PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the PLS transitions in the XHCI specification
21	0h RW	**PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.of XHCI specification. Refer to section 4.19.2 of XHCI specification. for more information on change bit usage.
20	0h RW	**OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	**WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	**PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.
17	0h RW	**CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	**LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	**PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0
13:10	0h RW	**PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed.

Bit Range	Default & Access	Description
9	1h RW	**PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.
8:5	5h RW	**PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.
4	0h RW	**PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. of XHCI specification. This flag is 0 if PP is 0.
3	0h RW	**OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.
2	0h RO	**RSVD23:** reserved
1	0h RW	**PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. of xhci specification. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit. This flag is 0 if PP is 0.
0	0h RW	**CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0.

19.6.23 PORTPMSC2—Offset 434h

TBD

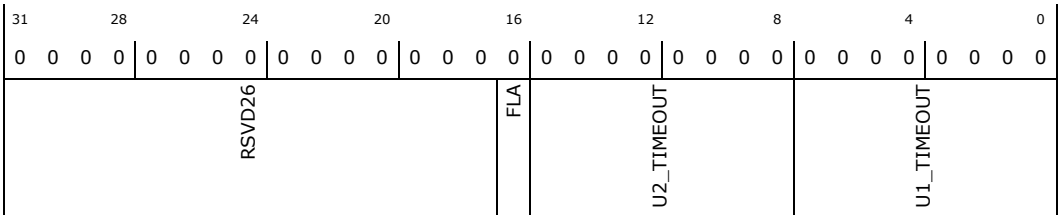
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PORTPMSC2: [BAR] + 434h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:17	0h RO	**RSVD26:** reserved
16	0h RW	**FLA:** Reg field FLA
15:8	0h RW	**U2_TIMEOUT:** Reg field U2_TIMEOUT
7:0	0h RW	**U1_TIMEOUT:** Reg field U1_TIMEOUT

19.6.24 MFINDEX—Offset 440h

Microframe Index Register Bit Definitions.

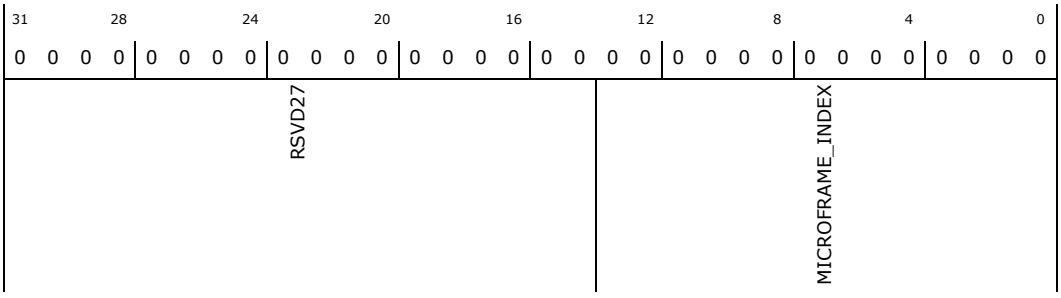
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

MFINDEX: [BAR] + 440h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:14	0h RO	**RSVD27:** reserved

Bit Range	Default & Access	Description
13:0	0h RO	**MICROFRAME_INDEX:** Reg field MICROFRAME_INDEX

19.6.25 RsvdZ—Offset 444h

reserved

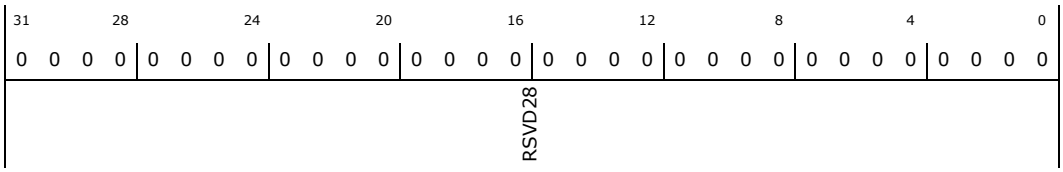
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RsvdZ: [BAR] + 444h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RO	**RSVD28:** reserved

19.6.26 IMAN—Offset 460h

Interrupter Management Register Bit Definitions.

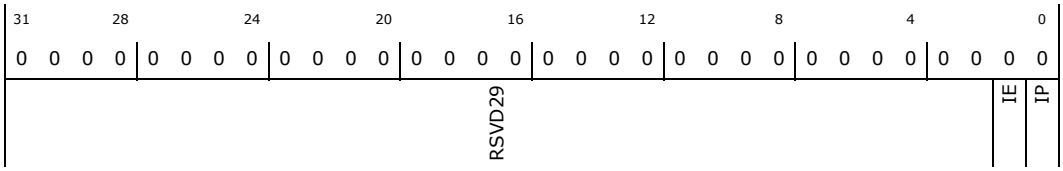
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IMAN: [BAR] + 460h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:2	0h RO	**RSVD29:** reserved
1	0h RW	**IE:** Interrupt Enable (IE) RW. Default = 0. This flag specifies whether the Interrupter is capable of generating an interrupt. When this bit and the IP bit are set (1), the Interrupter shall generate an interrupt when the Interrupter Moderation Counter reaches 0. If this bit is 0, then the Interrupter is prohibited from generating interrupts.

Bit Range	Default & Access	Description
0	0h RW	**IP:** Interrupt Pending (IP) - RW1C. Default = 0. This flag represents the current state of the Interrupter. If IP = 1, an interrupt is pending for this Interrupter. A 0 value indicates that no interrupt is pending for the Interrupter. Refer to section 4.17.5 of XHCI specification for the conditions that modify the state of this flag.

19.6.27 IMOD—Offset 464h

Interrupter Moderation Register. Software may use this register to pace (or even out) the delivery of interrupts to the host CPU. This register provides a guaranteed inter-interrupt delay between interrupts asserted by the xHC, regardless of USB traffic conditions. To independently validate configuration settings, software may use the following algorithm to convert the inter-interrupt Interval value to the common 'interrupts/sec' performance metric:

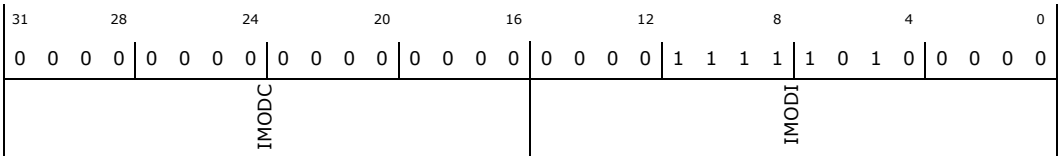
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IMOD: [BAR] + 464h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000FA0h



Bit Range	Default & Access	Description
31:16	0h RW	**IMODC:** Interrupt Moderation Counter (IMODC) - RW. Default = undefined. Down counter. Loaded with the IMODI value whenever IP is cleared to '0', counts down to '0', and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be directly written by software at any time to alter the interrupt rate.
15:0	fa0h RW	**IMODI:** Interrupt Moderation Interval (IMODI) - RW. Default = '4000' (~1ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

19.6.28 ERSTSZ—Offset 468h

Event Ring Segment Table Size Register Bit Definitions.

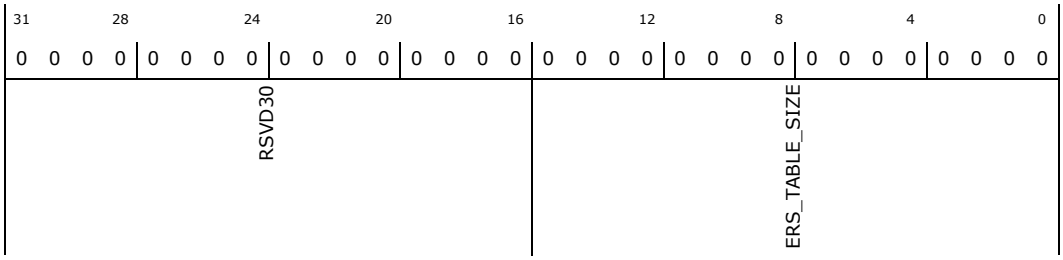
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTSZ: [BAR] + 468h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RO	**RSVD30:** reserved
15:0	0h RW	**ERS_TABLE_SIZE:** Event Ring Segment Table Size RW. Default = 0. This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (5.3.4). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

19.6.29 RsvdP—Offset 46Ch

reserved

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RsvdP: [BAR] + 46Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

31:0	0h RO	**RSVD31:** reserved

19.6.30 ERSTBA_LO—Offset 470h

Register ERSTBA_LO

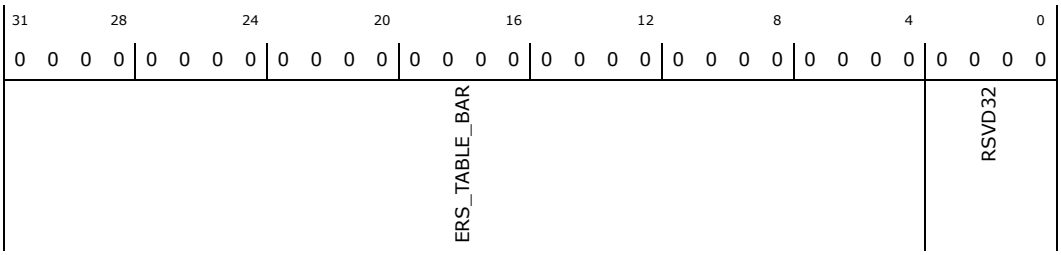
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_LO: [BAR] + 470h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**ERS_TABLE_BAR:** Reg field ERS_TABLE_BAR
3:0	0h RO	**RSVD32:** reserved

19.6.31 ERSTBA_HI—Offset 474h

Register ERSTBA_HI

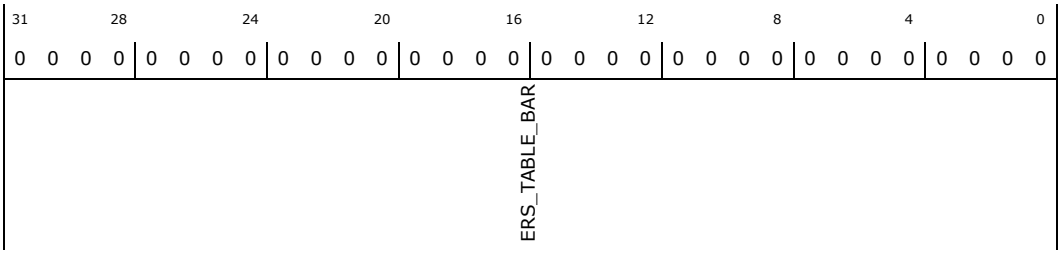
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERSTBA_HI: [BAR] + 474h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ERS_TABLE_BAR:** Reg field ERS_TABLE_BAR

19.6.32 ERDP_LO—Offset 478h

Register ERDP_LO

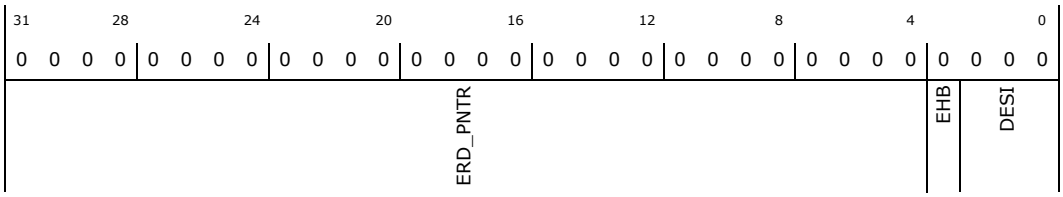
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_LO: [BAR] + 478h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:4	0h RW	**ERD_PNTR:** Reg field ERD_PNTR
3	0h RW	**EHB:** HC OS Owned Semaphore HC BIOS Owned Semaphore USB SMI Enable SMI on Host System Error Enable SMI on OS Ownership Enable SMI on PCI Command Enable SMI on BAR Enable SMI on Event Interrupt SMI on Host System Error SMI on OS Ownership Change SMI on PCI Command SMI on BAR Compatible Port Count HC OS Owned Semaphore HC BIOS Owned Semaphore USB SMI Enable SMI on Host System Error Enable SMI on OS Ownership Enable SMI on PCI Command Enable SMI on BAR Enable SMI on Event Interrupt SMI on Host System Error SMI on OS Ownership Change SMI on PCI Command SMI on BAR Compatible Port Count
2:0	0h RW	**DESI:** Dequeue ERST Segment Index (DESI) RW. Default = 0. This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

19.6.33 ERDP_HI—Offset 47Ch

Register ERDP_HI

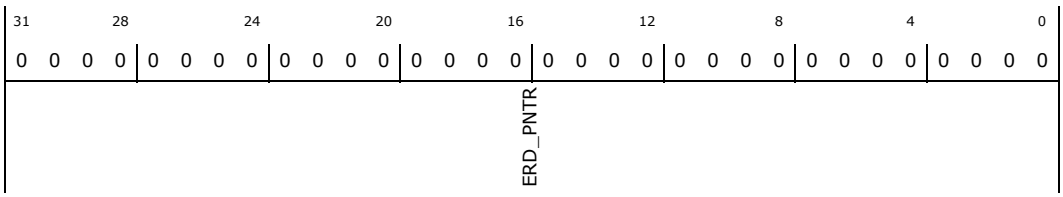
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ERDP_HI: [BAR] + 47Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**ERD_PNTR:** Reg field ERD_PNTR

19.6.34 DB_0—Offset 480h

The Doorbell Array is organized as an array of up to 256 Doorbell Registers. One 32-bit Doorbell Register is defined in the array for each Device Slot. System software utilizes the Doorbell Register to notify the xHC that it has Device Slot related work for the xHC to perform.

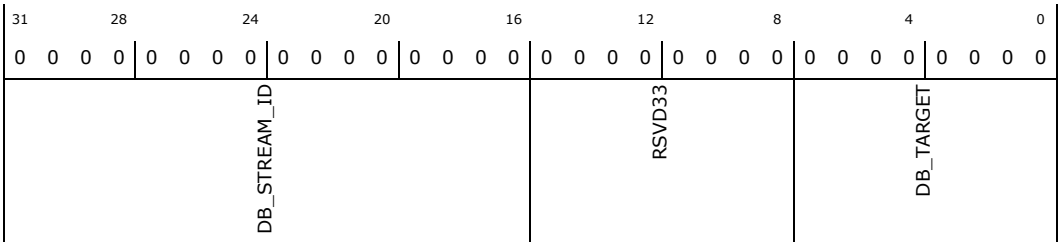
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

DB_0: [BAR] + 480h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:16	0h RW	**DB_STREAM_ID:** DB Stream ID - RW. Doorbell Stream ID. If the endpoint of a Device Context Doorbell defines Streams, then this field shall be used to identify which Stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines Streams (MaxPStreams) 0), then 0, 65535 (No Stream) and 65534 (Prime) are reserved Stream ID values and shall not be written to this field. If the endpoint does not define Streams (MaxPStreams = 0) and a non-'0' value is written to this field, the doorbell reference shall be ignored. This field only applies to Device Context Doorbells and shall be cleared to 0 for Host Controller Command Doorbells. This field returns 0 when read.
15:8	0h RO	**RSVD33:** reserved
7:0	0h RW	**DB_TARGET:** DB Target RW. Doorbell Target. This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Note that Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers.
