

Description

These power modules are a series of high performance, 8-A rated, Integrated Switching Regulators (ISRs), housed in a low cost 14-Pin SIP (Single In-line Package). Operating from either a 3.3V or 5V standard power bus, the PT6520 series produces a high-output, low-voltage power source for the industry's latest high-speed, microprocessors, ASICs, & DSPs. This allows for the easy integration of these new low-voltage ICs into existing 3.3V or 5V systems without re-designing the power supply.

The PT6520 series features an output On/Off standby pin and output short-circuit protection.

Features

- 8A Rated Output Current
- Single Device: 3.3V/5V Input
- High Efficiency (92% for PT6521)
- Small Footprint (0.75 in², Suffix 'P')
- Output On/Off Standby Control
- Output Short-Circuit Protection
- Adjustable Output Voltage
- Soft Startup
- 16-pin Mount Option (Suffixes L, M, Q, & F)

Ordering Information

PT6521□	= 3.3 Volts
† PT6522□	= 1.5 Volts
† PT6523□	= 2.5 Volts
† PT6525□	= 2.1 Volts
† PT6526□	= 1.8 Volts
† PT6527□	= 1.2 Volts

† 3.3V Input Bus Capable

Notes: (1) The ISR will operate at no load with reduced specifications.

(2) The STBY* control (pin 3) has an internal pull-up and if it is left open circuit the module will operate when input power is applied. The open-circuit voltage is typically 12.6V, and maybe as high as 15V. Refer to the application notes for other interface considerations.

(3) See Safe Operating Area curves or contact the factory for the appropriate derating.

(4) The tab pins on the 16-pin mount package types (suffixes L & M) must be soldered. For more information see the applicable package outline drawing.

Input/Output Capacitors: The PT6520 series requires a 330 μF capacitor at both the input and output for proper operation in all applications. In addition, the input capacitance (C_{in}) must be rated for a minimum of 1.2Arms ripple current rating. For transient or dynamic load applications, additional output capacitance (C_{out}) may be necessary. The maximum allowable output capacitance is 5,000 μF . For more information consult the related application note on capacitor recommendations.

8-A 5-V/3.3-V Input Adjustable ISR
with Short-Circuit protection

Characteristic Data; $V_{in} = 5.0V$ (See Note A)

Safe Operating Area; $V_{in} = 5V$ (See Note B)

Characteristic Data; $V_{in} = 3.3V$ (See Note A)

Safe Operating Area; $3.3V$ (See Note B)

Note A: Characteristic data has been developed from actual products tested at $25^{\circ}C$. This data is considered typical data for the Converter.

Note B: SOA curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures

Using the Standby Function of the PT6520 Series of Integrated Switching Regulators

The PT6520 series of power modules are high efficiency regulators that operate off either a 3.3V or 5V input bus voltage. These regulators incorporate a *Standby* function, which may be used in applications that require power-up/shutdown sequencing, and wherever there is a requirement for the output status of the module to be controlled by external circuitry.

The standby function is provided by the *STBY** control, pin 3. If pin 3 is left open-circuit¹ the regulator operates normally, and provides a regulated output when a valid supply voltage is applied to *V_{in}* (pins 4–6) with respect to GND (pins 7–10). If a low voltage² is then applied to pin 3 the regulator output will be disabled and the input current drawn by the ISR will be reduced to about 15mA³. The standby control may also be used to hold-off the regulator output during the period that input power is applied.

Pin 3 is ideally controlled with an open-collector (or open-drain) discrete transistor (See Figure 1). The open-circuit voltage is typically 12.6V. Table 1 gives the circuit parameters for this control input.

Table 1 Standby Control Requirements ^(2, 3)

Parameter	Min	Typ	Max
Input Low (<i>V_{IL}</i>)	–0.1V		+0.4V
<i>I_{stby}</i> (pin 3 =ground)		–0.5mA	
<i>V_{stby}</i> (open circuit)		12.6V	15V

Notes:

- 1 The standby control input requires no external pull-up resistor. The open-circuit voltage of the *STBY** pin is typically 12.6V.
- 2 The standby control input is Not compatible with TTL or other devices that incorporate a totem-pole output drive. Use only a true open-collector device, preferably a discrete bipolar transistor (or MOSFET). To ensure the regulator output is disabled, the control pin must be pulled to less than 0.4Vdc with a low-level 0.5mA sink to ground.
- 3 When the regulator output is disabled the current drawn from the input source is typically reduced to 15mA.

Figure 1

Turn-On Time: In the circuit of Figure 1, turning *Q₁* on applies a low voltage to the *STBY* control (pin 3) and disables the regulator output. Correspondingly, turning *Q₁* off removes the low-voltage signal and enables the output. Once enabled, the output will typically experience a 10–15ms delay followed by a predictable ramp-up of voltage. The regulator should provide a fully regulated output voltage within 40ms. The waveform of Figure 2 shows the output voltage and input current waveforms of a PT6521 (3.3V) following the turn-off of *Q₁*. The turn off of *Q₁* corresponds to the rise in *V_{stby}*. The waveforms were measured with a 5Vdc input voltage, and 4.5A resistive load.

Figure 2

Adjusting the Output Voltage of the PT6520 Series of Integrated Switching Regulators

The output voltage of the PT6520 series of integrated switching regulators (ISRs) may be adjusted higher or lower than the factory trimmed pre-set voltage with the addition of a single external resistor.¹ Table 1 gives the allowable adjustment range for each model in the series as V_a (min) and V_a (max).

Adjust Up: An increase in the output voltage is obtained by adding a resistor R_2 , between pin 14 (V_o adjust) and pins 7-10 (GND).

Adjust Down: Add a resistor (R_1), between pin 14 (V_o adjust) and pin 1 V_o (sense)³.

Refer to Figure 1 and Table 2 for both the placement and value of the required resistor, either (R_1) or R_2 as appropriate.

The values of (R_1) [adjust down], and R_2 [adjust up], can also be calculated using the following formulas.

$$(R_1) = \frac{R_o (V_a - V_r)}{V_o - V_a} - R_s \quad \text{k}\Omega$$

$$R_2 = \frac{R_o \cdot V_r}{V_a - V_o} - R_s \quad \text{k}\Omega$$

Where: V_o = Original output voltage
 V_a = Adjusted output voltage
 V_r = The reference voltage (Table 1)
 R_o = The multiplier resistance (Table 1)
 R_s = The internal series resistance (Table 1)

Table 1

ADJUSTMENT AND FORMULA PARAMETERS

Series Pt #	PT6527	PT6522	PT6526	PT6525	PT6523	PT6521
V_o (nom)	1.2	1.5	1.8	2.1	2.5	3.3
V_a (min)	1.09	1.47	1.75	1.95	2.25	2.75
V_a (max)	1.52	1.73	2.05	2.45	2.85	3.75
V_r (V)	0.8	1.27	1.27	1.27	1.27	1.27
R_o (k Ω)	10.0	10.2	10.0	10.0	10.0	10.0
R_s (k Ω)	24.9	49.9	49.9	33.2	33.2	24.9

Figure 1

Notes:

1. Use only a single 1% resistor in either the (R_1) or R_2 location. Place the resistor as close to the ISR as possible.
2. Never connect capacitors from V_o adjust to either GND, V_{out} , or the Remote Sense pin. Capacitance added to the V_o adjust pin will affect the stability of the ISR.
3. If the Remote Sense feature is not being used, the resistor (R_1) may be connected between pin 14 (V_o adjust) and pins 11–13 (V_{out}).
4. Adjusting the output voltage of the PT6523 (2.5V model) higher than the factory pre-trimmed output voltage may increase the minimum input voltage specified for the part. This model must comply with the following requirements.

PT6523:

$V_{in(min)} = (V_a + 0.5)V$ or 3.1V, whichever is greater.

Capacitor Recommendations for the PT6520 Series of Integrated Switching Regulators

Input Capacitors:

The recommended input capacitance is determined by 1.0 ampere minimum ripple current rating and 330 μ F minimum capacitance (300 μ F for Oscon® or low ESR tantalum). Ripple current and <100m Ω equivalent series resistance (ESR) values are the major considerations, along with temperature, when designing with different types of capacitors. Tantalum capacitors have a recommended minimum voltage rating of 2 $\times$ the maximum DC voltage + AC ripple. This is necessary to insure reliability for input voltage bus applications.

Output Capacitors:

The ESR of the required capacitor (C_{out}) must not be greater than 150m Ω . Electrolytic capacitors have poor ripple performance at frequencies greater than 400kHz but excellent low frequency transient response. Above the ripple frequency, ceramic capacitors are necessary to improve the transient response and reduce any high frequency noise components apparent during higher current excursions. Preferred low ESR type capacitor part numbers are identified in Table 1.

Tantalum Capacitors

Tantalum type capacitors may be used for the output but only the AVX TPS series, Sprague 593D/594/595 series or Kemet T495/T510 series. These capacitors are recommended over many other tantalum types due to their higher rated surge, power dissipation, and ripple current capability. As a caution the TAJ series by AVX is not recommended. This series has considerably higher ESR, reduced power dissipation, and lower ripple current capability. The TAJ series is less reliable than the AVX TPS series when determining power dissipation capability. Tantalum or Oscon® types are recommended for applications where ambient temperatures fall below 0°C.

Capacitor Table

Table 1 identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The number of capacitors required at both the input and output buses is identified for each capacitor type.

This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The RMS ripple current rating and ESR (Equivalent Series Resistance at 100kHz) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.

Table 1: Input/Output Capacitors
