

Ultra Low Dropout 1A, 2A, 3A Low Input Voltage NMOS LDOs

ISL80111, ISL80112, ISL80113

The ISL80111, ISL80112, and ISL80113 are ultra low dropout LDOs providing the optimum balance between performance, size and power consumption in size constrained designs for data communication, computing, storage and medical applications. These LDOs are specified for 1A, 2A and 3A of output current and are optimized for low voltage conversions. Operating with a V_{IN} of 1V to 3.6V and with a legacy 3.3V to 5V on the BIAS, the V_{OUT} is adjustable from 0.8V to 3.3V. With a V_{IN} PSRR greater than 40dB at 100kHz makes these LDOs an ideal choice in noise sensitive applications. The guaranteed $\pm 1.6\%$ V_{OUT} accuracy overall conditions lends these parts to supplying an accurate voltage to the latest low voltage digital ICs.

An enable input allows the part to be placed into a low quiescent current shutdown mode. A submicron CMOS process is utilized for this product family to deliver best-in-class analog performance and overall value for applications in need of input voltage conversions typically below 2.5V. It also has the superior load transient regulation unique to a NMOS power stage. These LDOs consume significantly lower quiescent current as a function of load compared to bipolar LDOs.

Features

- Ultra low dropout: 75mV at 3A, (typ)
- Excellent V_{IN} PSRR: 70dB at 1kHz (typ)
- $\pm 1.6\%$ guaranteed V_{OUT} accuracy for $-40^{\circ}\text{C} < T_J < +125^{\circ}\text{C}$
- Very fast load transient response
- Extensive protection and reporting features
- V_{IN} range: 1V to 3.6V, V_{OUT} range: 0.8V to 3.3V
- Small 10 Ld 3x3 DFN package

Applications

- Noise-sensitive instrumentation and medical systems
- Data acquisition and data communication systems
- Storage, telecommunications and server equipment
- Low voltage DSP, FPGA and ASIC core power supplies
- Post-regulation of switched mode power supplies

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information pages for [ISL80111](#), [ISL80112](#), and [ISL80113](#). For more information on MSL please see Tech Brief [TB363](#).

Absolute Maximum Ratings (Note4)

V _{IN} Relative to GND	0.3 to +6V
V _{OUT} Relative to GND	-0.3 to +4V
PG, ENABLE, SENSE/ADJ, Relative to GND (Note 5)	-0.3 to +6V
V _{BIAS} Relative to GND	-0.3V to +6V
PG Rated Current (Note 6)	10mA
ESD Rating	
Human Body Model (Tested per JESD22-A114E)	4000V
Machine Model (Tested per JESD22-115-A)	300V
Charged Device Model	2000V
Latch Up	100mA

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
10 Ld 3x3 DFN Package (Notes 7, 8)	48	4
Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see link below http://www.intersil.com/pbfree/Pb-FreeReflow.asp	

Recommended Operating Conditions (Notes 4, 6)

Junction Temperature Range	-40°C to +125°C
V _{IN} Relative to GND (ISL80113) (Note 9)	V _{OUT} + 0.4V to 5V
V _{IN} Relative to GND (ISL80112) (Note 9)	V _{OUT} + 0.3V to 5V
V _{IN} Relative to GND (ISL80111) (Note 9)	V _{OUT} + 0.2V to 5V
Nominal V _{OUT} Range	800mV to 3.3V
PG, ENABLE, SENSE/ADJ, SS Relative to GND	0V to 5.5V
V _{BIAS} Relative to GND	0V to 5.5V
V _{BIAS} Relative to V _{OUT}	+0.8V minimum

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- Absolute maximum ratings define limits of safe operation. Extended operation at these conditions may compromise reliability. Exceeding these limits will result in damage. Recommended operating conditions define limits where specifications are guaranteed.
- Absolute maximum voltage rating is defined as the voltage applied for a lifetime average duty cycle above 6V of 1%.
- Electromigration specification defined as lifetime average junction temperature of +110°C where maximum rated DC current = lifetime average current.
- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief [TB379](#).
- For θ_{JC} , the “case temp” location is the center of the exposed metal pad on the package underside.
- Minimum operating voltage applied to V_{IN} is 1V if V_{IN} - V_{DO} < 1V

Electrical Specifications Unless otherwise specified, V_{IN} = V_{OUT} + 0.4V, V_{BIAS} = 2.9V, V_{OUT} = 1.2V, C_{BIAS} = 1μF, C_{IN} = 10μF, C_{OUT} = 2.2μF, T_J = +25°C, I_L = 0mA. Applications must follow thermal guidelines of the package to determine worst-case junction temperature. Please refer to “Power Dissipation” on page 13 and Tech Brief [TB379](#).

Boldface limits apply over junction temperature (T_J) range, -40°C to +125°C. Pulse load techniques used by ATE to ensure T_J = T_A where datasheet limits are defined.

PG Flag Sink Current			7	10		mA

NOTES:

- Parameters with MIN and/or MAX limits are 100% tested at $+25^\circ C$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
- Dropout is defined by the difference in supply (V_{IN} , V_{BIAS}) and V_{OUT} when the supply produces a 2% drop in V_{OUT} from its nominal value, output voltage set to 2.5V.
- For normal operation, V_{IN} must always be less than or equal to the voltage applied to V_{BIAS} . Part is protected against fault conditions where V_{IN} can be greater than V_{BIAS} .

Typical Operating Performance

$T_J = +25^\circ\text{C}$, $I_{\text{LOAD}} = 0\text{A}$.

Unless otherwise noted, $V_{\text{IN}} = 1.8\text{V}$, $V_{\text{BIAS}} = 3.3\text{V}$, $V_{\text{OUT}} = 1.2\text{V}$, $C_{\text{IN}} = C_{\text{OUT}} = 10\mu\text{F}$.

FIGURE 35. CONTINUOUS POWER LIMIT vs AIR TEMP AND FLOW

FIGURE 36. INPUT VOLTAGE NOISE vs BIAS VOLTAGE

Functional Description

The ISL80111, ISL80112 and ISL80113 are high-performance, low-dropout regulators featuring an NMOS pass device. Benefits of using an NMOS as a pass device include low input voltage, stability over a wide range of output capacitors, and ultra low dropout voltage. The ISL80111, ISL80112 and ISL80113 are ideal for post regulation of switch mode power supplies.

The ISL80111, ISL80112 and ISL80113 also integrate enable, power-good indicator, current limit protection, and thermal shutdown functions into a space-saving 3x3 DFN package.

Input Voltage Requirements

The VIN pin provides the high current to the drain of the NMOS pass transistor. The specified minimum input voltage is 1V and dropout voltage for this family of LDOs has been conservatively specified.

Bias Voltage Requirements

The VBIAS input powers the internal control circuits, reference voltage, and LDO gate driver. The difference between the VBIAS voltage and the output voltage must be greater than the VBIAS dropout voltage specified in the “Electrical Specifications” table beginning on Page 4. The minimum VBIAS input is 2.9V.

Enable Operation

The ENABLE turn-on threshold is typically 600mV with a hysteresis of 100mV. This pin must not be left floating. When this pin is not used, it must be tied to VBIAS. A 1kΩ to 10kΩ pull-up resistor is required for applications that use open collector or open drain outputs to control the ENABLE pin.

Soft-start Operation

The ISL8011x has an internal 100µs typical soft-start function to prevent excessive in-rush current during start-up.

Power-good Operation

The PGOOD flag is an open-drain NMOS that can sink up to 10mA during a fault condition. Applications not using this feature must connect this pin to ground. The PGOOD pin requires an external pull-up resistor, which is typically connected to the VOUT pin. The

PGOOD pin should not be pulled up to a voltage source greater than VBIAS. A PGOOD fault can be caused by the output voltage going below 84% of the nominal output voltage. PGOOD does not function during thermal shutdown as the VOUT is less than the minimum regulation voltage during that time.

Output Voltage Selection

An external resistor divider is used to scale the output voltage relative to the internal reference voltage. This voltage is then fed back to the error amplifier. The output voltage can be programmed to any level between 0.8V and 4V. Referring to Figure 1 the external resistor divider, R3 and R4, is used to set the output voltage as shown in Equation 1. The recommended value for R4 is 500Ω to 1kΩ. R3 is then chosen according to Equation 2.

$$V_{\text{OUT}} = 0.5\text{V} \times \left(\frac{R_3}{R_4} + 1 \right) \quad (\text{EQ. 1})$$

$$R_3 = R_4 \times \left(\frac{V_{\text{OUT}}}{0.5\text{V}} - 1 \right) \quad (\text{EQ. 2})$$

Current Limit Protection

The ISL80111, ISL80112, and ISL80113 incorporate protection against overcurrent due to a short, overload condition applied to the output and the in-rush current that occurs at start-up. The LDO performs as a constant current source when the output current exceeds the current limit threshold noted in “Electrical Specifications” on page 4. If the short or overload condition is removed from VOUT, then the output returns to normal voltage mode regulation. In the event of an overload condition, the LDO might begin to cycle on and off due to the die temperature exceeding the thermal fault condition.

Thermal Fault Protection

If the die temperature exceeds (typically) +160°C, the LDO output shuts down until the die temperature cools to (typically) +140°C. The level of power, combined with the thermal impedance of the package (+48°C/W), determines whether the junction temperature exceeds the thermal shutdown temperature.

See Figure 35 for maximum continuous power dissipation guidance for ambient temperature and linear air flow rate. This graph ignores the insignificant power dissipation contribution of the BIAS pin.

External Capacitor Requirements

External capacitors are required for proper operation. To ensure optimal performance, careful attention must be paid to the layout guidelines and selection of capacitor type and value.

Input Capacitor

The minimum input capacitor required for proper operation is 10 μ F with a ceramic dielectric. This minimum capacitor must be connected to the V_{IN} and ground pins of the LDO no further than 0.5cm away.

Output Capacitor

The ISL8011x applies state-of-the-art internal compensation to simplify selection of the output capacitor. Stable operation over the full temperature range, V_{IN} range, V_{OUT} range, and load extremes is guaranteed for all capacitor types and values, assuming a 1 μ F X5R/X7R is used for local bypass on V_{OUT}. This minimum capacitor must be connected to the V_{OUT} and ground pins of the LDO no further than 0.5cm away.

Lower-cost Y5V and Z5U type ceramic capacitors are acceptable, if the size of the capacitor is larger, to compensate for the significantly lower tolerance over X5R/X7R types. Additional capacitors of any value, in ceramic, POSCAP, or alum/tantalum electrolytic types, can be placed in parallel to improve PSRR at higher frequencies or load-transient AC output voltage tolerances.

Bias Capacitor

The minimum input capacitor required for proper operation is 1 μ F with a ceramic dielectric. This minimum capacitor must be connected to the V_{BIAS} and ground pins of the LDO no further than 0.5cm away. When the V_{BIAS} pin is connected to the V_{IN} pin, a total of 10 μ F of X5R/X7R connected to the V_{IN} pin and ground is sufficient.

Power Dissipation and Thermals

Power Dissipation

Junction temperature must not exceed the range specified in the "Recommended Operating Conditions" section on Page 4. Power dissipation can be calculated with Equation 3.

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{BIAS} \times I_Q(BIAS) + V_{IN} \times I_Q(V_{IN}) \quad (EQ. 3)$$

The maximum allowable junction temperature, T_{J(MAX)}, and the maximum expected ambient temperature, T_{A(MAX)}, determine the maximum allowable power dissipation, as shown in Equation 4, where θ_{JA} is the junction-to-ambient thermal resistance.

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA} \quad (EQ. 4)$$

FIGURE 37. 3mmx3mm-10 PIN DFN ON 4-LAYER PCB WITH THERMAL VIAS θ_{JA} vs EPAD-MOUNT COPPER LAND AREA ON PCB

For safe operation, ensure that power dissipation calculated in Equation 3 (P_D) is less than the maximum allowable power dissipation, $P_{D(MAX)}$.

The DFN package uses the copper area on the PCB as a heat sink. For heat sinking, the EPAD of this package must be soldered to the copper plane (GND plane). Figure 37 shows a curve for the θ_{JA} of the DFN package for different copper area sizes.

General PowerPAD Design Considerations

The following is an example of how to use vias to remove heat from the IC.

Filling the thermal pad area with vias is recommended. A typical via array is to fill the thermal pad footprint with vias spaced such that they are center on center 3x the radius apart from each other. Keep the vias small but not so small that their inside diameter prevents solder from wicking through the holes during reflow.

FIGURE 38. PCB VIA PATTERN

Connect all vias to the round plane. For efficient heat transfer, it is important that the vias have low thermal resistance. Do not use "thermal relief" patterns to connect the vias. It is important to have a complete connection of the plated through-hole to each plane.

ISL80111, ISL80112, ISL80113 Split Supply LDO Evaluation Board User Guide

Description

The ISL8011XEVAL1Z provides a simple platform to evaluate performance of the ISL8011X family of split supply LDOs. Jumpers are provided to easily set popular output voltages.

The ISL80111, ISL80112, and ISL80113 are single-output LDOs specified for 1A, 2A, 3A of output current and are optimized for less than 2.5V and less output voltage conversions. The ISL8011X supports V_{IN} voltages down to 1V, provided a standard legacy 3.3V or 5V is applied on the V_{BIAS} pin. The output voltage is adjustable from 0.8V to 3.3V.

An enable input, having a threshold $< 1V$, allows the part to be placed into a low quiescent current shutdown mode. A submicron CMOS process is utilized for this product family to deliver best-in-class analog performance and overall value for applications in need of input voltage conversions to typically below 2.5V. It also has the superior load transient regulation unique to a NMOS power stage.

These LDOs consume significantly lower quiescent current as a function of load compared to bipolar LDOs. This lower consumption translates into higher efficiency and the ability to consider packages with smaller footprints. The quiescent current has been modestly compromised in design to enable leading class fast load transient response and load regulation.

What's Inside

- The evaluation kit contains the following:
- The ISL80113EVAL1Z with the appropriate parts installed
- The ISL80111, ISL80112, ISL80113 data sheet

Test Steps

1. Select the desired output voltage by shorting one of the jumpers from JP2 through JP5.
2. Connect both the BIAS and V_{IN} supplies and the load. Enable the IC using jumper JP6 (bottom position) or via a signal on the center post, observe the output.
3. The shipped configuration is enabled and $V_{OUT} = 3.3V$.
4. Scope shots taken from ISL8011XEVAL1Z boards.

Bill of Materials

REFERENCE DESIGNATOR	VALUE	DESCRIPTION	MANUFACTURER	PART NUMBER
U1		ISL80111, ISL80112 or ISL80113 as noted on the evaluation board	Intersil	ISL80111IRAJZ, ISL80112IRAJZ, ISL80113IRAJZ
C1, C3	10µF	CAP, SMD, 0805, 50V, 10%	Generic	
C2	1µF	CAP, SMD, 0603	Generic	
R1	1kΩ	RES, SMD, 0603, 1%	Generic	
R2	2.05kΩ	RES, SMD, 0603, 1%	Generic	
R3	2.61kΩ	RES, SMD, 0603, 1%	Generic	
R4	4.02kΩ	RES, SMD, 0603, 1%	Generic	
R5	5.62kΩ	RES, SMD, 0603, 1%	Generic	
R6	1kΩ	RES, SMD, 0603, 1%	Generic	
R7	100kΩ	RES, SMD, 0603, 1%	Generic	
JP1, JP2, JP3, JP4, JP5, JP6		Jumper	Generic	
TP1, TP2, TP3 TP4, TP5, TP6		Terminal Connector	Generic	

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
November 1, 2013	FN7841.2	Electrical Spec table: Bold the Min and Max values. Page 4- Electrical Spec table title area: Removed "Unless otherwise noted, all parameters are guaranteed over the conditions specified as follows" and replaced by "Unless otherwise specified". Updated POD to latest revision from rev 7 to rev 8. The changes as follow: Corrected L-shaped leads in Bottom view and land pattern so that they align with the rest of the leads (L shaped leads were shorter)
June 5, 2012	FN7841.1	Ordering Information table on Page 3: Changed evaluation board names from: ISL80111IRAJEVALZ, ISL80112IRAJEVALZ and ISL80113IRAJEVALZ to ISL80111EVAL1Z, ISL80112EVAL1Z and ISL80113VAL1Z. Changed POD L10.3x3 on Page 17 to latest revision from Rev 6 to Rev 7. Change to POD is as follows: Removed package outline and included center to center distance between lands on recommended land pattern. Removed Note 4 "Dimension b applies to the metallized terminal and is measured between 0.18mm and 0.30mm from the terminal tip." since it is not applicable to this package. Renumbered notes accordingly. Figure 6 VADJ Distribution , corrected "Y" scale units from (0.18, 0.16, 0.14, 0.12, 0.10, 0.08, 0.06, 0.04, 0.02, and 0.00) to (18, 16, 14, 12, 10, 8, 6, 4, 2, and 0). Electrical Specifications table on Page 4 "Added UVLO rising spec to show max of 2.9V so implementation at 3.3V is not a math problem".
March 30 2012	FN7841.0	Initial Release and Added "UVLO_BIAS_r" spec on pg 4. Modified Figures 13 - 17.

About Intersil

Intersil Corporation is a leader in the design and manufacture of high-performance analog, mixed-signal and power management semiconductors. The company's products address some of the largest markets within the industrial and infrastructure, personal computing and high-end consumer markets. For more information about Intersil, visit our website at www.intersil.com.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com. You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/en/support/ask-an-expert.html. Reliability reports are also available from our website at <http://www.intersil.com/en/support/qualandreliability.html#reliability>

For additional products, see www.intersil.com/product_tree

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

For information regarding Intersil Corporation and its products, see www.intersil.com
