

1 Megabit 3.3V Static RAM 128K x 8-Bit Revolutionary Pinout

Features

- High-speed access times
Com'l: 9, 10, 12, 15 and 20 ns
Ind'l: 12, 15 and 20 ns
Automotive: 15 and 20 ns
- Low power operation (typical)
 - PDM31034SA
Active: 200 mW
Standby: 15 mW
- Single +3.3V ($\pm 0.3V$) power supply
- TTL-compatible inputs and outputs
- Packages
 - Plastic SOJ (400 mil) - SO
 - Plastic SOJ (300 mil) - TSO
 - Plastic TSOP (II) - T

Description

The PDM31034 is a high-performance CMOS static RAM organized as 131,072 $\times$ 8 bits. Writing is accomplished when the write enable ($\overline{WE}$) and the chip enable ($\overline{CE}$) inputs are both LOW. Reading is accomplished when $\overline{WE}$ remains HIGH and $\overline{CE}$ and $\overline{OE}$ are both LOW.

The PDM31034 operates from a single +3.3V power supply and all the inputs and outputs are fully TTL-compatible.

The PDM31034 is available in a 32-pin 400 mil plastic SOJ and 300 mil plastic SOJ, and a 32-pin plastic TSOP (II) package in revolutionary pinout.

- NOTE: 1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Appropriate thermal calculations should be performed in all cases and specifically for those where the chosen package has a large thermal resistance (e.g., TSOP). The calculation should be of the form: $T_j = T_a + P * \theta_{ja}$ where T_a is the ambient temperature, P is average operating power and θ_{ja} the thermal resistance of the package. For this product, use the following θ_{ja} values:

SOJ: 72° C/W

TSOP: 95° C/W

NOTES: (For two previous Electrical Characteristics tables)

1. The parameter is tested with $C_L = 5$ pF as shown in Figure 2. Transition is measured ± 200 mV from steady state voltage.
2. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} .
3. This parameter is sampled.
4. WE is high for a READ cycle.
5. The device is continuously selected. Chip Enable is held in their active state.
6. The address is valid prior to or coincident with the latest occurring Chip Enable.
