

HIGH-POWER & LOW-VOLTAGE AUDIO POWER AMPLIFIER

■ GENERAL DESCRIPTION

The **NJM2770** is high-power and low-voltage audio power amplifier with standby function. No external coupling capacitors required because of the differential output type. Two external resistors adjust the closed loop gain. The output power is 250mW typical at 3V-supply 8ohm-load, and 400mW typical at 4.5v-supply 16ohm-load. The standby current is only 0.1μA typical.

The package of **NJM2770** is VSP8, and suitable for PCS, codeless telephone, speaker amplifier for hands free system, and especially cellular phone because of low operating current, low standby current, and high power output.

■ CONTROL TERMINAL EXPLANATION

CHIP DISABLE CONTROL(CD PIN)

PARAMETER	CONTROL SIGNAL	STATUS
CD OFF	H(=V _{CDH})	IC is active.
CD ON	L(=V _{CDL})	IC is standby. (with Mute)

■ APPLICATION CURCUIT

note:1.The CD terminal(1pin) should connect High level(>2.0V), when NJM2770 is active.

The standby mode, when the CD terminal is Low level(<0.8V).

2.To add the C1 and C2 capacitor, the power-supply-rejection-ratio will be improved.

When C1 is large value, C2 will be unnecessary.

3.The power-up time depend on the C1 and C2 capacitor.

4.The input current of CD terminal is as shown below figure.

5.No connect oscillation-protect RC required.

To connect oscillation-protect RC, if the NJM2770 oscillate with PC board/stray capacitor/long speaker wire and others condition.
