ISL28233I

Dual Micropower, Zero-Drift, RRIO Operational Amplifiers

FN6942
Rev 2.00
November 17, 2011

The ISL28233IUZ is a dual micropower, zero-drift operational amplifier that is optimized for single and dual supply operation from 1.65V to 5.5V and ±0.825V to ±2.75V. The low supply current of 18µA and wide input range enable the ISL28233IUZ to be an excellent general purpose op amp for a range of applications. The ISL28233IUZ is ideal for handheld devices that operate off 2 AA or single Li-ion batteries.

The ISL28233IUZ is available in an industry standard pinout 8 Ld MSOP package. It operates over the temperature range of -40°C to +85°C.

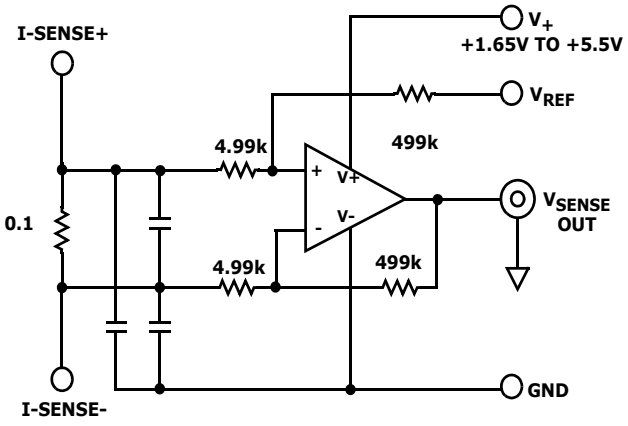
Features

- Low Input Offset Voltage . . . . . 8µV, Max.
- Low Offset Drift . . . . . 0.06µV/°C, Max
- Quiescent Current (Per Amplifier) . . . . 18µA, Typ.
- Single Supply Range . . . . . +1.65V to +5.5V
- Dual Supply Range . . . . . ±0.825V to ±2.75V
- Low Noise (0.01Hz to 10Hz) . . . . . 1.1µV_{P-P}, Typ.
- Rail-to-Rail Inputs and Output
- Input Bias Current . . . . . 110pA, Max.
- Operating Temperature Range. . . -40°C to +85°C

Applications

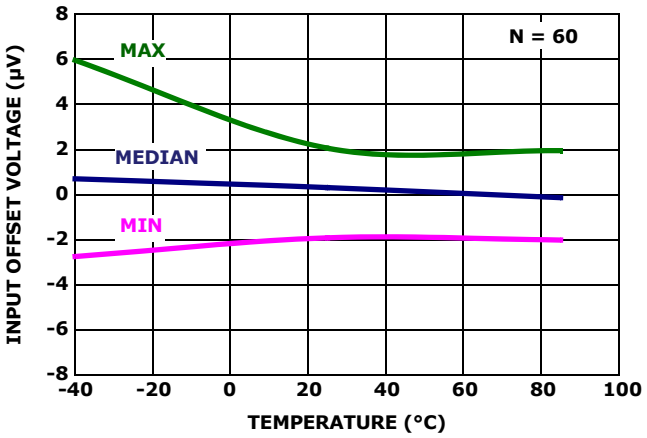
- Bi-Directional Current Sense
- Temperature Measurement
- Medical Equipment
- Electronic Weigh Scales
- Precision/Strain Gauge Sensor
- Precision Regulation
- Low Ohmic Current Sense
- High Gain Analog Front Ends

Typical Application



BI-DIRECTIONAL CURRENT SENSE AMPLIFIER

V_{OS} vs TEMP



Ordering Information

PART NUMBER (Note 3)	PART MARKING	PACKAGE (Pb-Free)	PKG. DWG. #
ISL28233IUZ (Note 2)	8233Z	8 Ld MSOP	M8.118A
ISL28233IUZ-T7 (Notes 1, 2)	8233Z	8 Ld MSOP	M8.118A

NOTES:

1. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL28233I. For more information on MSL please see techbrief TB363.

Absolute Maximum Ratings

Max Supply Voltage V+ to V- 6.5V
Max Voltage VIN to GND . . . . . (V- - 0.3V) to (V+ + 0.3V)V
Max Input Differential Voltage 6.5V
Max Input Current 20mA
Max Voltage VOUT to GND (10s) . . . . . .±3.0V
ESD Tolerance
Human Body Model 4000V
Machine Model 400V
Charged Device Model 2000V
Latch-Up Passed Per JESD78B . . . . . +125°C

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
8 Ld MSOP (Notes 4, 5)	180	65

Maximum Storage Temperature Range . . . -65°C to +150°C
Pb-Free Reflow Profile . . . . . .see link below
http://www.intersil.com/pbfree/Pb-FreeReflow.asp

Operating Conditions

Temperature Range . . . . . -40°C to +85°C

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

4. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
5. For θ_{JC}, the “case temp” location is taken at the package top center.

Electrical Specifications

V_+ = 5V, V_- = 0V, VCM = 2.5V, T_A = +25°C, R_L = 10kΩ, unless otherwise specified. **Boldface limits apply over the operating temperature range, -40°C to +85°C.**

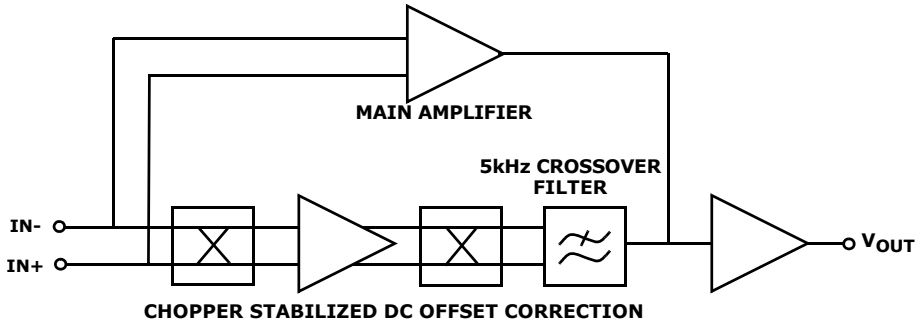

FIGURE 41. ISL28233IUZ FUNCTIONAL BLOCK DIAGRAM

Applications Information

Functional Description

The ISL28233IUZ uses a proprietary chopper-stabilized technique (see Figure 41) that combines a 400kHz main amplifier with a very high open loop gain (174dB) chopper amplifier to achieve very low offset voltage and drift (2µV, 0.02µV/°C typical) while consuming only 18µA of supply current per channel.

This multi-path amplifier architecture contains a time continuous main amplifier whose input DC offset is corrected by a parallel-connected, high gain chopper stabilized DC correction amplifier operating at 100kHz. From DC to ~5kHz, both amplifiers are active with DC offset correction and most of the low frequency gain is provided by the chopper amplifier. A 5kHz crossover filter cuts off the low frequency amplifier path leaving the main amplifier active out to the 400kHz gain-bandwidth product of the device.

The key benefits of this architecture for precision applications are very high open loop gain, very low DC offset, and low 1/f noise. The noise is virtually flat across the frequency range from a few millihertz out to 100kHz, except for the narrow noise peak at the amplifier crossover frequency (5kHz).

Rail-to-rail Input and Output (RRIO)

The RRIO CMOS amplifier uses parallel input PMOS and NMOS that enable the inputs to swing 100mV beyond either supply rail. The inverting and non-inverting inputs do not have back-to-back input clamp diodes and are capable of maintaining high input impedance at high differential input voltages. This is effective in eliminating output distortion caused by high slew-rate input signals.

The output stage uses common source connected PMOS and NMOS devices to achieve rail-to-rail output drive capability with 17mA current limit and the capability to swing to within 20mV of either rail while driving a 10kΩ load.

IN+ and IN- Protection

All input terminals have internal ESD protection diodes to both positive and negative supply rails, limiting the input voltage to within one diode beyond the supply rails. For applications where either input is expected to exceed the rails by 0.5V, an external series resistor must be used to ensure the input currents never exceed 20mA (see Figure 42).

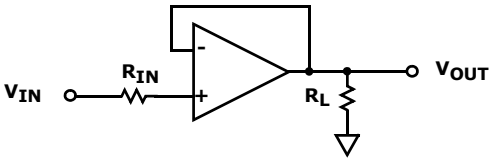

FIGURE 42. INPUT CURRENT LIMITING

Layout Guidelines for High Impedance Inputs

To achieve the maximum performance of the high input impedance and low offset voltage of the ISL28233IUZ, care should be taken in the circuit board layout. The PC board surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board will reduce surface moisture and provide a humidity barrier, reducing parasitic resistance on the board. The use of guard rings around the amplifier inputs will further reduce leakage currents. Figure 43 shows how the guard ring should be configured. The guard ring does not need to be a specific width, but it should form a continuous loop around both inputs. By setting the guard ring voltage equal to the voltage at the non-inverting input, parasitic capacitance is minimized as well.

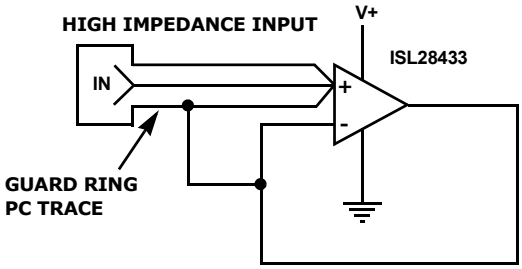

FIGURE 43. USE OF GUARD RINGS TO REDUCE

High Gain, Precision DC-Coupled Amplifier

The circuit in Figure 44 implements a single-stage DC-coupled amplifier with an input DC sensitivity of under 100nV that is only possible using a low VOS amplifier with high open loop gain. High gain DC

amplifiers operating from low voltage supplies are not practical using typical low offset precision op amps. For example, the typical ±100µV V_{OS} and offset drift 0.5µV/°C of a low offset op amp would produce a DC error of >1V with an additional 5mV/°C of temperature dependent error making it difficult to resolve DC input voltage changes in the mV range.

The ±8µV max V_{OS} and 0.06µV/°C of the ISL28233IUZ produces a temperature stable maximum DC output error of only ±80mV with a maximum temperature drift of 0.06µV/°C. The additional benefit of a very low 1/f noise corner frequency and some feedback filtering enables DC voltages and voltage fluctuations well below 100nV to be easily detected with a simple single stage amplifier.

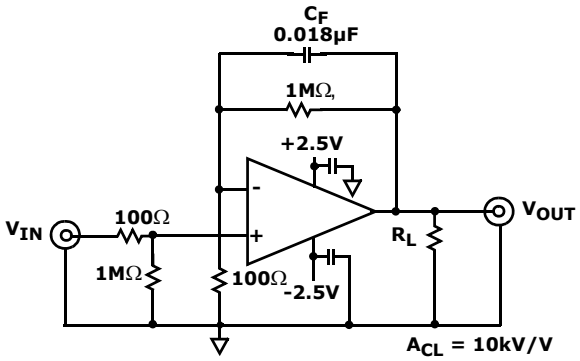

FIGURE 44. HIGH GAIN, PRECISION DC-COUPLED AMPLIFIER

ISL28233IUZ SPICE Model

Figure 45 shows the SPICE model schematic and Figure 46 shows the net list for the ISL28233IUZ SPICE model. The model is a simplified version of the actual device and simulates important parameters such as noise, Slew Rate, Gain and Phase. The model uses typical parameters from the “Electrical Specifications Table” on page 4. The poles and zeroes in the model were determined from the actual open and closed-loop gain and phase response. This enables the model to present an accurate AC representation of the actual device. The model is configured for ambient temperature of +25°C.

Figures 47 through 54 show the characterization vs simulation results for the Noise Density, Frequency Response vs Close Loop Gain, Gain vs Frequency vs CL and Large Signal Step Response (4V).

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
10/8/11	FN6942.2	Removed “UZ” from Device number top of all pages.
8/23/10	FN6942.1	Removed all ISL28433 device information from data sheet. Stamped not recommended for new designs since these parts are going to be obsolete. Recommended replacement part ISL28233FUZ.
3/25/10	FN6942.0	Initial Release.

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: ISL28233I
